The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Gail Rosenquist 1514 N. 8th Av. E. Duluth, MN 55805

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Gail Rosenquist 1514 N. 8th Av. E. Duluth, MN 55805

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Gail Smallridge 1310 Boston Corners Road Millerton, NY 12546 US

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, Please do not let mining destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. Comments apply to both the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands plus as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. I live near Silver Bay and a number of the once fishable streams have been reduced to foul smelling drainage ditches void of the once healthy aquatic system due to leachate from the taconite settling ponds. I fish the St Louis River and Lake Superior and do not want to see additional pollution entering them. Wetlands in the 100 Mile Swamp and Partridge River Headwaters are priceless natural resources that help protect out waters and provide habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so less of it will travel downstream and accumulate in fish causing harm and brain development problems in the children who eat St Louis River and Lake Superior fish. 2/3 of North Shore children have already been shown to have harmful levels in their systems. The problem should not knowingly be allowed to worsen. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Deny the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to tr

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Greetings, I wish to throw in my input concerning the proposed mining project taking place in northern Minnesota. I will state my background and bias first: I am an Iron Ranger, raised (not born), and I am a graduate of a liberal arts school, Bethel University, in St Paul which gives me a left leaning, environmentalist sentiment. I do value the habitat in northern Minnesota. I get the privilege of fishing the boundary water lakes every fishing opener, and I own 1500 shares in Polymet stock. As one can see, I can be a very torn character in this debate. My conclusion is this: There is a demand for nickel, copper, and other precious metals in the market today. If we do not mine these resources in Minnesota, another country, state, or providence will mine these resources. And I'm afraid if another region mines these minerals, tight restrictions, regulation and watchdogs will be less existent in those regions – resulting in a greater risk for environmental loss, employee exploitation, business mis-management. If these precious metals are mined in Minnesota, a very strident-progressive state; the commonwealth would keep a close watch on the company PolyMet which will pressurize them into making responsible business decisions when it comes to preserving the environment. We need the environmentalist community in this debate; not to terminate the project as a whole, but push for it and hold it accountable during its development. Much thanks. -Garret Wright Dept. of Human Services Caution: This e-mail and attached documents, if any, may contain information that is protected by state or federal law. E-mail containing private or protected information should not be sent over a public (nonsecure) Internet unless it is encrypted pursuant to DHS standards. This e-mail should be forwarded only on a strictly need-to-know basis. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Garrett Bonem 6400 Heaven Dr Howell, MI 48855

Garrett Ferderber

22744

Dear Ms Fay, Below is a form letter that I sort of believe in. I will say that I am concerned about this project as a former resident of Ely, MN and as someone who hopes to share the wonders of that area and of Lake Superior with my future children and grandchildren. I hate when science gets muddled by politics and money. It is really hard to tell what is really going on with this project because the information available is from two sides that seem to be taking extreme views of each other. I would like for there to be some sort of response to the allegations made in this letter and in the comments you are receiving regarding the NorthMet project. I would like to hear relatively easy to understand information about how the NorthMet site is or is not actually proceeding in accordance with state and federal laws. I would like to know that the people of Minnesota actually stand to gain more than a polluted hole in the ground in the long term and that our leaders are fulfilling their obligations to our future and not acting irresponsibly for short term gain. But like I said, it is a challenge to feel like there is honesty from both sides and usable information for the public. I would love for representatives from both sides to sit down and talk over the concerns. Thank you for your time. Garrett Ferderber Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Garrett Ferderber 4021 11th Ave S Minneapolis, MN 55407 6122268658

DEAR BOARD, I HAVE LOTS OF CONCERNS ABOUT YOUR DIRECTIONS ON PERMITTING TO NONE AMERICAN BUSINESS. OVER FLOW SPILLS WILL HAPPEN, HOLDING A NON-AMERICAN FIRM LIABLE FOR TOTAL DOLLARS IS A WISP-IN-WIND WISH.TAILING PONDS IN EUROPE HAVE NOT HELD, YOU SHOW NO DATA FOR A EPIC RAIN EVENT. I HAVE BEEN CAMPING IN THAT REGION WHEN WE GOT 11 INCHES IN TWO HOURS. HOW ABOUT THAT EXTENDING FOR SEVERAL HOURS. SULFATE PARTS PER MILLION YOU CALL TO THE PARTRIDGE RIVER SYS AND HYPERLINK "http://B.W.CA"B.W.CA. LEAD AND ALUMINUM SEEPAGE IS EXPECTED. MERCURY IN TAILING,LIMITED.. TO WHAT. NO FROM ME, GARRY BUDOLFSON , STACY MN

Garry Leaf 58121

I am sorry I am unable to be at the last of three public hearings this evening on the Supplemental Draft Environmental Statement for the proposed PolyMet mine.As you can imagine, Sportsmen are following this closely, as we live and breathe the outdoors. Minnesota is one of the best places in the world for hunting and angling. For example, we have amazing trout and walleye fishing throughout the state. Deer hunting is so important to our culture that the opener is designated each year as a hunting opportunity for Minnesota's Governor. And we have association organizations for virtually anything that can be hunted or fished.Setting aside for a moment the tremendous job prospects for our states (and many hunters and anglers for that matter), I wanted to add my comments to this issue as it relates to the process itself.Sportsmen have strongly supported Commissioner Landwehr and I believe Minnesota has some of the most responsible environmental permitting standards in the United States. They are far better than so many places in the world, where these critical metals, like copper and nickel, are currently coming from.There are passions that erupt during a permitting process like this. My comment is that the DNR needs to be trusted to do its job, and if companies like PolyMet are able to show that they can meet or exceed the standards, we should welcome the jobs that will result.Thank you for all that the DNR does, and for protecting Sportsmen and women here in our great state. Thank you for your responsible permitting process and for efficiently bringing jobs online for those companies that can meet the standards.

Here's the link to the SDEIS as posted on the DNR website. There you can download and read chapter by chapter <http://www.dnr.state.mn.us/input/environmentalreview/polymet/index.html> And here's a good article written by Carla Arneson, who lives near Ely. <http://www.tcdailyplanet-net/news/2014/01/05/community-voices-polymet-s-sdeis-perpetual-water-treatment-and-sulfide-mining-are-sy> It's shaping up to be an interesting battle. But of course, there is huge money in the pockets of these companies, and there are politicians who fear for their re-election status if they oppose it. So, we'll see. Peace, GC From: HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"*NorthMetSDEIS (DNR) Sent: Friday, December 06, 2013 7:18 PM To: Undisclosed recipients: Subject: ATTN: Notice of Availability of Supplemental Draft EIS for PolyMet NorthMet Mining Project and Land Exchange DO NOT REPLY TO THIS EMAIL. THIS MESSAGE AUTOGENERATED. [419] You are receiving this email because our records indicate you have participated in the ongoing Environmental Impact Statement (EIS) for PolyMet's proposed NorthMet Mining Project and Land Exchange. The purpose of this message is to alert interested parties of the availability of the Supplemental Draft Environmental Impact Statement (SDEIS) for the project. Attached please find the transmittal letter from the three Co-lead Agencies: US Army Corps of Engineers (USACE); US Forest Service (USFS); Minnesota Department of Natural Resources (MDNR). The text of the transmittal letter is provided below. Thank you for your interest in the project. To Interested Parties: The Minnesota Department of Natural Resources (MDNR), the US Army Corps of Engineers (USACE), and the US Forest Service (USFS) have jointly prepared the Supplemental Draft Environmental Impact Statement (SDEIS) for the NorthMet Mining Project and Land Exchange. The SDEIS describes the anticipated environmental and socioeconomic impacts of the proposed PolyMet Mining, Inc. (PolyMet) NorthMet Mining Project and Land Exchange, located near the cities of Hoyt Lakes and Babbitt in northeastern Minnesota. The SDEIS is posted on MDNR's website at: <http://www.dnr.state.mn.us/input/environmentalreview/polymet/index.html>. The NorthMet Project would create an open pit copper, nickel, cobalt and precious metals mine with adjacent stockpile areas; refurbish a portion of the former LTV Steel Mining Company (LTVSMC) processing plant and construct a new hydrometallurgical facility at the plant site; construct a new tailings basin facility on the site of LTVSMC tailings facilities; and add to existing utility infrastructure and rail lines. The Land Exchange would consist of USFS conveyance of Superior National Forest Lands encompassing the NorthMet mine site and surrounding lands to PolyMet, and USFS acquisition from PolyMet of up to five tracts of private lands within the Superior National Forest proclamation boundary. The Land Exchange is subject to Forest Service Project-Level Predecisional Administrative Review Process (objections process) regulations at 36 CFR 218, Subparts A and B. The Land Exchange legal notice, identifying requirements under 36 CFR 218, will be available on the Superior National Forest website, <http://www.fs.usda-gov/goto/superior/northmet>. The Biological Assessment and Biological Evaluation for the proposed NorthMet project are also posted on the Superior National Forest website. The USACE public notice for the SDEIS and public meetings, and the public notice for the USACE Section 404 Clean Water Act Permit, are available on the Army Corps of Engineers, St Paul District website, <http://www.mvp.usace.army.mil/Missions/Regulatory/ProjectsStudies/PolyMet.aspx>. Following the anticipated publishing of the SDEIS notice in the Federal Register on December 13, 2013, the MDNR, USACE, and USFS invite written comments on the SDEIS during the public comment period that ends March 13, 201

To whom it may concern, I am greatly concerned about allowing the PolyMet mine to proceed. There are so many ways the environment can be irreparably damaged even if there are funds set aside and plans made for these damages. So much death will occur if the nearby waters are poisoned or the surrounding land is poisoned, how can you repair or replace that. Recovery could take a century or more. How can we leave that as a legacy to our children and grandchildren. Please don't allow our pristine North to suffer the fate of so many locations already poisoned across this country, even when safeguards were put in place, Alaska, the Gulf of Mexico, Alabama, many places on the East coast Thank you for considering my concerns. ---Original Message--- From: gar6@juno-com [mailto:gar6@juno-com] Sent: Tuesday, March 11, 2014 12:53 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Gary A Russell 4301 11th Ave S Minneapolis, MN 55407-3213

Gary and Connie DeGrote

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Gary and Connie DeGrote 1108 Woodland Trl Northfield, MN 55057-5285

Dear Mr Jimenz, Along with a group of friends I spend a lot of time at our camp next to the Superior National Forest outside of Findland, MN. I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives

Dear Ms Fay, Dear Federal and State Agency Leaders: The SDEIS for the PolyMet sulfide mine is still inadequate and environmentally unsatisfactory. It makes unsubstantiated claims without facts, often based on assumptions that are flawed. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. There are several local wells in the area; yet there is no analysis of how these wells might be affected. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. Sulfate and mercury pollution increase mercury contamination of fish. St Louis River mercury contamination of fish is already higher than in other Northeastern Minnesota regional waters and higher downstream than upstream. One out of 10 infants in Minnesota's Lake Superior Region are born with mercury in their blood above safe levels. This is a very significant danger to the human population. Clear and thorough analysis of the effect of additional sulfates in the St Louis River and Lake Superior on the uptake of mercury in fish must be studied. We cannot risk mercury poisoning of our human population. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. These wetlands are irreplaceable. This is a rich habitat for biodiversity, both plant and animal; it should not be sacrificed. It is not replaced by adding dissimilar pieces of land in other parts of the state. The significant function that the wetlands play in this region would be lost to both plant life, animal life, and the natural processes related to purification, sedimentation, and natural water regulation. Polymet's waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. Its plan to purify the water is inadequate. Reverse osmosis systems need to be significantly expanded. It is ridiculous to make the assumption that there will not be significant leakage and seepage in several directions. PolyMet would dump tailings in an unlined tailings basin designed in the 1950's on top of streams in order to leak. This old LTV basin already violates water quality standards. The SDEIS does not adequately address leach out from this basin. With the immense amount of blasting in the area, it is likely that significant rock fractures will occur. PolyMet has not substantiated its claims that nearly all seepage could be captured by pumps at one end of the 2-mile wide tailings basin. Fractures already known to exist at the PolyMet mine and plant site would transport pollution. There is geological evidence to suggest that seepage must be treated in several locations, and there must be back-up systems in the event of failure. PolyMet's 526-acre permanent, unlined Category 1 waste rock pile would be less protective than its old proposal, which would have provided lined stockpiles for long-term waste heaps. Finally, we must seriously ask the question whether or not it is environmentally responsible to propose a mining process in a water-rich environment that will require water purification systems to operate effectively for 100 or 200 or 300 or 400 years, especially when it is clear that seepage and run-off would affect wild rice growth-a sacred food for tribal members of the region; when it is clear that seepage would make its way to Lake Superior and raise the mercury level in fish which when eaten raises the level of mercury in humans. Polymet's own analysis allows 1506 micrograms per liter (ug/L) criterion of manganese at the plant which is 15 times higher than the health risk limit set by the Minnesota Health Department to prevent brain damage in infants, children and adults. The PolyMet project would

If a terrorist showed up in our backyard, and polluted the water, land, and air, but he created a few jobs in the process, would that be a good thing or a bad thing in the long run. The intentions of the Polymet corporation are, on the surface, good ones for some people, but not for everyone, and not in the long run. They want to create jobs, and create a small amount of wealth for a few people, and create a large amount of wealth for an even smaller group of people. They also want to make people in this area dependent on them for the jobs they create, and the money it will, supposedly, bring to the area, but this will only be true for as long as the mine also makes them extremely wealthy. It's been written that if a person wants to be free, they not only have to be responsible for their intentions and their decisions, they also have to be responsible for the CONSEQUENCES of their decisions. I have yet to see any mining company, any fracking company, any oil company, any coal company, any nuclear company, any too-large-to-fail bank, or any corporate CEO or corporate board, put down in writing that they will, in full measure, be financially responsible for any problems or hardships they create, and for as long as it takes to fully fix the problems or hardships. If the Polymet corporation was able to guarantee that they would hold themselves financially accountable for any problem or hardship they created, I might consider their business proposal valid. If the corporation was a not-for-profit business, I might consider them to be sincere. I don't see either of these things happening. Most corporations of this nature want to socialize risk and responsibilities, and privatize profits. They really don't care whose back does the labor, as long as the money keeps rolling in to their bank accounts. I doubt that any of them will live next door or downstream from any of the pollution or problems they create. I believe the CEO and board of Polymet will, as much as possible, try to keep themselves isolated from any of the consequences that result from their economic intentions and decisions. What I see is a corporation that is willing to do anything, or say anything, to get their way. If you scratch the surface of this corporation, I believe you will find a bully who wants to control the way other people think and react towards them. I also believe that if you scratch the surface of any bully, you will find a coward. It is only those who are afraid that feel the need to control other people, and how people think and act. When you deal with a corporation like this, with the priorities they are based on, what you almost always have is a group of people who will tell you the part of the truth that makes them look good, or, at least, doesn't make them look bad. They love the lie that preserves their image, but never the unflattering truth. And yet, if we are to make any kind of rational decisions about this corporation, and their business proposition, we need to get to the full truth, and not just the part that makes them look good, such as the jobs they boast will be created. I don't believe this corporation will ever hold themselves fully accountable for the consequences of their intentions and their decisions, which means they will never be free of their need for half-truths, intrigue and subterfuge. The people that work for them, or try to work with them, will never be free either. Such is the nature of the current corporate mentality.

19952

It's been written that the person who can see both sides of an issue, usually doesn't have money tied up in either side. Here are some simple questions that cannot be easily answered. What was the carbon footprint of the Super Bowl and the Sochi Olympics. What is the carbon footprint of a NASCAR race. What will the carbon footprint of the World Cup soccer games be. What will the carbon footprint be for building the new Viking's stadium. What was the carbon footprint of the current SI Swimsuit edition. And what is the carbon footprint of the PolyMet and G-Tac mines going to be. For what it's worth, you can pick any major event, or any major mining and fossil fuel situation, and ask the same question. The list is endless. For the people who are involved in, and dependent on, any event which is connected to their livelihood, one will probably find them adamantly on the side of holding that event. They will probably not be very interested in giving up or curtailing their event of choice. So how do we choose which events to give up, when every event will evoke the same kind of resistance. Ironically, if things continue as they are, the more fossil fuels we use, and the more events we hold and attend, the less options the earth will eventually allow us to have, when the temperature rises, and the weather gets really crazy. If things continue as they are, the population is expected to end up around nine billion people by the year 2050- If things continue as they are, the temperature of the earth is expected to rise by 4 to 6 degrees Centigrade by 2100- When that happens, the earth will only be able to support half a billion people at most. What is going to happen to the other 8-5 billion people in the 50 years before 2100- If that happens, events like the Super Bowl, the Olympics, World Cup soccer, NASCAR, the Vikings, the swimsuit issue, PolyMet and G-Tac will be meaningless. The main irony, which most people continue to ignore, is that we would all be on the side of change, and saving the earth, if we were a rational breed of mammals. But, no, we would rather continue supporting and being involved in "events," even though it will kill most, if not all of us, in the long run, if things continue as they are. From: Gary [mailto:gclm@visi-com] Sent: Wednesday, February 19, 2014 2:43 PM To: TDabney@fs.fed.us; Fay, Lisa (DNR); douglas.w.bruner@usace.army.mil Subject: Public comment on the Polymet SDEIS Greetings, As representatives of the Co-Lead Agencies for the study of this mining proposal, I'm including all of you in my comments. It occurs to me that each of your organizations has a particular expertise and interest in how this plays out, and I thank you for the opportunity to comment. I recognize, as I'm sure you do, that there is an extremely delicate balance of factors to be considered as the decision is made whether this SDEIS is an adequate improvement over the one that failed so miserably, or whether the questions that remain are still essentially unanswered. For me, there are several key questions that have not been adequately addressed. The first is the question of the proposed land exchange. It is clear to me that the original legislation that created the Superior National Forest recognized the undesirable nature of mining for sulfide bearing ores. The proposed exchange clearly violates the intent of that legislation, if not the letter of it. And I believe that the proposal also would be in clear violation of Section 404 of the Clean Water Act, because of the total imbalance of the wetlands acreage that Polymet's operation would destroy, and also because I cannot find any definitive study of the relative assessed valuation of the two parcels. I believe that such a valuation is required as part of any land exchange. Therefore I believe that it would be wrong, if not illegal, for the Forest Service to go ahead with this exchange as proposed. The second major question that has not been answered for me is the question of water treatment, both from the current LTV plant tailings pit, which is already known to be leaking, and the area where the sludge that is to eventually be captured from the reverse osmosis process is to be dumped. In fact, it seems inconclusive just where that sludge, which contains an even more highly toxic mix of pollutants, will wind up. Is it to be in some off-site landfill, where it poses even more untreated harmful potential, or is it to be in the area shown on the map near the mine site itself. In either case, this material is the worst of the worst, and the plan for its long term treatment protection is very unclear. Even worse is the totally inadequate study of the ground water flowage in the area. The Minnesota Geological Survey studies show fracturing beneath the mine and plant site areas that go well beyond what is stated by Polymet, and to use only "computer models" as a definitive statement of how much leakage there might be out the bottom of the system, and exactly where that groundwater flows, is pretty much ridiculous. Let's see an actual physical study of what waters are down there and where they feed. Do they feed the Partridge River. Do they supply Colby Lake, a source of city water for Hoyt Lakes. Do these ground waters supply a number of area rural wells. The Polymet estimations include millions of gallons that will escape treatment. Just how much magnesium, mercury, and arsenic will end up being leached from the earth as these waters flow into that ground water. A third major question is the one of the reverse osmosis procedure itself. I know that this procedure has been used on small scales to take particulate matter out of drinking water, but to use, again, a computer model rather than hard actual experience somewhere to extrapolate that this process will actually work on this massive scale across this massive time period totally stretches the imagination. The Flambeau mine in Wisconsin that is cited as an example is known to have been in violation at several points during its operation, and does not give us the scale of experience we need in order to have confidence that this kind of system will actually work in an operation the size o

Hi, I just commented on PolyMet's open-pit copper-sulfide mine plan and wetland destruction permit. To build its mine, PolyMet proposes to directly destroy 913 acres of high quality headwater wetlands and indirectly harm up to an additional 7,351 acres of headwaters wetlands due to air pollution, water pollution, and water diversions. These wetlands are in the headwaters of the Partridge River, an important tributary to the St Louis River and ultimately Lake Superior. Most absurdly, PolyMet's plan includes NO replacement of any indirect wetland losses. Headwater wetlands are critical to protecting water quality and fish populations downstream. Please join me in telling State and Federal agencies to reject PolyMet's inadequate mine plan and wetland destruction permit. There are many, many, many more different industries that would bring a lot more jobs, that would not compromise on the Nation's finest canoeing and camping wildlife areas. Thank you, Gary Duggleby Minnetonka, MN 55345

---Original Message--- From: garyfifield@comcaStnet [mailto:garyfifield@comcaStnet] Sent: Wednesday, March 12, 2014 10:07 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board I am sure you have all of the numbers and reasons for not approving the mining proposal. I am sure you have received many of the pre-written letters from concerned individuals through the Environmental Partnership. This is not one of them. My statement is simple: We cannot afford the risk that is inherent in this project. The forces of mining for profit are very strong. The people living in the area, many of them, see jobs and livelihood resulting from the project. I do not think the number of jobs or the time they will last is adequate to justify the risk involved. We must not let the large absentee corporations make our future for us if it is too risky for those living here. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, I am told, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS and, in fact, the idea of mining in the proposed area. Thank you. Sincerely, Gary Fifield 1893 Berkeley Ave Saint Paul, MN 55105-1631

Duty to Warn The Corporation as Psychopath: Do Mining Corporations like PolyMet and GTac Meet the Definition. by Gary G. Kohls, MD An earlier version of this essay was posted at: <http://www.globalresearch.ca/the-us-corporation-as-psychopath/5345811> "Slavery is the legal fiction that a person is property. Corporate personhood is the legal fiction that property is a person." - Anonymous The NeoConservative, pro-corporate, anti-democratic Roberts' 5/4 Supreme Court's decision in the 2010 Citizens United vs. Federal Election Commission ruling (granting personhood to corporations and allowing unlimited, anonymous monetary contributions to political candidates) has emboldened the already powerful and very corruptible multinational corporations (that now have achieved dominion over politics and the economy in the United States) to "buy" any number of politicians and brain-wash many voters in many state and national elections. The US Supreme Court has made legal the absurd notion that inanimate corporations like PolyMet and GTac, potential despoilers of northern Minnesota and Wisconsin's irreplaceable wetlands, aquifers and aboriginal land and water rights deserve the same privileges (but not the same responsibilities) as living humans. Soberingly, after the ruling came down, there was only a brief bit of anger and outrage from our national leadership over this democracy-threatening decision, and the outrage was quickly drowned out of the public consciousness by a well-timed, mainstream media-orchestrated "tempest in a teapot", namely Toyota's recall of tens of thousands of accelerator pedals (that had only infrequently been the cause of significant accidents). The following question must be asked: If corporations are given the privileges of personhood shouldn't they also bear the same responsibilities and incur the same punishments as individuals when living breathing humans commit crimes against humanity, poison the drinking water or rape the land. Peace and justice activists briefly applauded when the citizens of Shapleigh, Maine protected their water rights last March from the insatiable water-extracting corporate giant Nestle. (See video and more information on this episode at: (<http://www.afterdowningstreet-org/node/40335>)). Nestle, one of the most infamous of the countless number of multinational corporate exploiters, has no allegiance to Maine, Minnesota or Wisconsin or any other locality where they try to extract water that never was theirs; but when the water is gone or polluted and when the minerals have been depleted, so will Nestle, PolyMet and GTac, and so will be Exxon/Mobil, British Petroleum, Halliburton, Deep Water Horizon, British Petroleum, Coca-Cola and Perrier or whatever other corporate intruder that poisons or extracts the people's resources for the benefit of their shareholders and the predators at the corporate headquarters, none of whom will have to live with the poisoned environment that they leave behind. The good citizens of Maine recognized the foxes that tried to get inside their henhouse, and they did the right thing by vigorously resisting, and little David - with justice and his little slingshot on his side - won a rare victory against the evil giant Goliath. This small victory for justice should illustrate what must be done if real democracy is ever to thrive again in America. The disastrous, unconstitutional Citizens United decision must be reversed with a constitutional amendment. The future of the nation, our children, the planet, our drinking water, natural habitat and aboriginal rights are all at stake. And corporations, just like most psychopathic entities, don't seem to care. It is important to understand that the allegiance of corporations is to its shareholders, executives and management teams, and not to the people whose lives and health depend on the sustainability of the land, water, air and food supplies. Most corporate sha

Regarding my testimony below: my phone # is 218-728-9756 and my mailing address is 1306 8th St, Duluth, MN 55805- Thank you for your interest Gary G. Kohls, MD
Duty to Warn The Corporation as

Sociopath: Do Mining Corporations like PolyMet Meet the Definition. by Gary G. Kohls, MD "Slavery is the legal fiction that a person is property. Corporate personhood is the legal fiction that property is a person." - Anonymous In 2010 the NeoConservative, pro-corporate, anti-democratic Roberts' 5/4 Supreme Court's decided in the Citizens United vs. Federal Election Commission ruling to grant personhood to corporations by allowing unlimited, anonymous monetary contributions to political campaigns and candidates. This ruling, called by many to be the worst Supreme Court decision of the past century, has emboldened the already powerful and corruptible multinational corporations (that now have achieved dominion over US politics as well as the economy) to "buy" any number of politicians and brain-wash voters by multi-million dollar ad campaigns that the rest of us can't afford to counter in state and national elections. The US Supreme Court has thus made legal the absurd notion that inanimate corporations like PolyMet and GTac (potential despoilers of northern Minnesota and northern Wisconsin's irreplaceable wetlands, aquifers and aboriginal land and water rights) deserve the same privileges (but not the same responsibilities) as living humans. After the ruling came down, there was only a brief bit of outrage from the so-called national leadership of our essentially "one-party system" (one-party, that is, when it comes to the GOP and Democratic Party's corporate and militarist agendas). What outrage was expressed was quickly drowned out by a well-timed, mainstream media-orchestrated "tempest in a teapot", namely Toyota's recall of tens of thousands of accelerator pedals (that had only infrequently been the cause of significant accidents). >> The following question about the consequences of the Supreme Court's democracy-threatening decision must be asked: If corporations are given the privileges of personhood, shouldn't they also bear the same responsibilities and incur the same punishments as individuals when they commit crimes, poison the water and air or rape the land. Peace and justice activists applauded when the citizens of Shapleigh, Maine protected their water rights last year from the insatiable water-extracting corporate giant Nestle. (See video and more information on this episode at: (<http://www.afterdowningstreet-org/node/40335>)). Nestle, one of the many multinational corporate exploiters, has no allegiance to Maine, Minnesota or Wisconsin or any other state where this foreign entity tries to extract water or minerals that never were theirs to begin with. But when the minerals have been depleted and the water has been polluted or drained, Nestle, PolyMet and GTac will be gone, and so will Exxon/Mobil, British Petroleum, Halliburton, Deep Water Horizon, British Petroleum, Coca-Cola, Perrier or whatever other corporate intruder that ruthlessly extracts or poisons the people's resources - all for the economic benefit of their faceless investors, shareholders and CEOs at their out-of-state corporate headquarters, none of whom will have to live with the poisoned environment that they have left behind. The good citizens of Shapleigh recognized the foxes that tried to get inside their henhouse, and they did the right thing by vigorously resisting; and another underdog David - with a lot of justice, a lot of pluck and a little luck on his side - won a rare victory against another evil giant. >> That small victory against injustice should illustrate what must be done if American democracy is ever to thrive again. The outrageous Citizens United decision must be overturned with a constitutional amendment. (See www.movetoamend-org for more.)

Duty to Warn The Corporation as Sociopath: Do Mining Corporations like PolyMet Meet the Definition. – Part Two By Gary G. Kohls, MD "Slavery is the legal fiction that a person is property. Corporate personhood is the legal fiction that property is a person." – Anonymous Experienced psychologists tell us that sociopathic individuals that have committed crimes have to be locked away or otherwise isolated to protect society from them. As a review of last week's column, part 1, I reprint below the seven diagnostic criteria that are used to diagnose antisocial (aka, sociopathic or psychopathic) personality disorder in humans. Be mindful that only three of the seven are needed to make the diagnosis. 1) callous disregard for the feelings of other people 2) the incapacity to maintain human relationships 3) reckless disregard for the safety of others 4) aggressiveness 5) deceitfulness (repeated lying and conning others for profit) 6) incapacity to experience guilt and 7) the failure to conform to social norms and respect for the law. Other helpful traits that are commonly manifested by sociopaths include: Lack of conscience Lack of remorse for evils done to others Indifference to the suffering of its victims Rationalizes (makes excuses for) having hurt, mistreated or stolen from others Willingness to exploit, seduce or manipulate others No sign of delusional or irrational thinking Cunning, clever Usually above average intelligence Always looking for ways to make money or achieve fame or notoriety Willing to cause or contribute to the financial ruin of others Untrustworthy Cannot be trusted to adhere to conventional standards of morality. So a number of questions need to be asked. Given the fact that human sociopaths need to be avoided, marginalized or locked up, we need to ask what needs to be done with corporate entities that meet three of the seven criteria above. What needs to be done with corporations that have a history of deceiving, lying, cheating, raping the land, poisoning the water, fouling the air or otherwise acting unethically. Given the anti-constitutional 2010 Roberts' Supreme Court ruling granting personhood to corporations (Citizens United), shouldn't sociopathic corporations be dealt with just like their human counterparts when they act criminally. Shouldn't long prison sentences be given to the CEOs, Boards of Directors and management teams. Shouldn't there be confiscation of property or even capital punishment in the case of egregious cases including mass deaths as in the cases of Union Carbide, Coca-Cola and Merck (examples: the Vioxx and Gardasil deaths). I hasten to add that I am against capital punishment for humans, but any person with a conscience and more than a double digit IQ knows that corporations are not really human. Corporations don't bleed and don't cry out in pain during the execution process, although they may plead for mercy while shedding insincere crocodile tears. Capital punishment for corporations, contrary to the data on capital punishment for humans, would prevent a lot of future sociopathic behaviors. <<<What Should be Done With Corporate Rapists.>>> What about the crime of rape as applied to corporations. Rape has several definitions, including the following ones that are in my dictionary: 1) Any violent seizure or hostile action against a weaker opponent; 2) to rob or plunder; 3) the act of seizing and carrying off by force; 4) the crime of having forcible sexual intercourse without consent. Corporations that plunder, pollute or poison Mother Earth or execute hostile mergers and acquisitions of weaker companies meet some of the above definitions for rape. Shouldn't our society punish corporate rapists as severely as we punish the human kind. What about the known lethal poisons that thousands of unregulated chemical corporations knowingly discharge into the water, air, soil and food. Should the

Dear Ms Fay, We oppose the PolyMet copper-nickel mine proposal. Human civilization is unsustainable in it's present form. The negative affects of global warming due to our ever-increasing fossil fuel emissions are predicted to accelerate, even if we were to end all our consumption tomorrow. It's quite possible, even probable, that civilization will eventually collapse as severe droughts, violent storms and rising sea levels disrupt the production and distribution of food and energy supplies to our ever-growing populations. I'm afraid a lot of potential customers of this new copper source, will wind up dead. Clean water will become an increasingly rare resource for the future generations that survive. Do you really think they'll be able to maintain another poisonous legacy of our short sighted folly for many centuries to come without the equipment and know-how to do so. Sincerely, Gary and Sara Geisler St Cloud, MN

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

After reading several editorials and attending the meeting in St Paul, the state should realize that PolyMet will hire the best attorneys available to negotiate clean up and water treatment costs. So should the state. If we simply rely on DNR regulators, we will lose. We need to go outside and hire very aggressive and skilled negotiators that will watch out for the taxpayer. PolyMet only cares about their bottom line, not us. Do not let the state get taken to the cleaners like Uncle Zigi did to Uncle Mark. Gary Horning 13810 26th St N Stillwater MN. 55082 651 430-2058

I am writing to voice my absolute disgust with the Polymet project. Northeastern Minnesota, and the BWCAW in particular contain some of the greatest natural places not only in Minnesota, but in the entire nation. Clean air, beautiful forests, and magnificent lakes and streams with high water quality are why people live in this state and why countless numbers of people want to visit here. People don't visit Minnesota and spend their tourist dollars so that they can see how wonderful the open-pit mines are. The NorthMet deposits are located on National Forest System (NFS) lands. NFS land by definition is co-owned by all of the people of the USA, not just Minnesotans. Therefore, this is a decision that can not exclude what is in the best interests of ALL stakeholders involved (not just the less than 2000 people of northeast MN that might get jobs). There is so much more at stake here than the jobs that might be generated from such a project. I understand that the residents in northeast MN would benefit greatly from the jobs, but they are not the only and most important stakeholders that need to be considered here. According to the NorthMet project documents, operations of the mine would only last approximately 20 years. It would create approximately 500 direct jobs during the 18 month peak construction phase and only 360 direct jobs during the operation phase. There would be additional 'indirect' and 'induced' employment of 332 'estimated' additional construction-phase jobs and 631 'estimated' operations-phase jobs. There is the disclaimer that these 'indirect' and 'induced' employment numbers include temporary, part-time, full-time, long-term and short-term positions. There is an added note that states 'Some of the skilled workers would relocate from outside the region'. According to the NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) 'it is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be a very long time'. The 'models' estimate that the water at the mine site will have to be mechanically treated for a minimum of 200 years and at the plant site for a minimum of 500 years (of which you will not be demanding the money to pay for the 500 years of water treatment up front and placed into an escrow account prior to starting the project). I guess you are so desperate to have them tear-up and pollute our State that this never entered the equation. On 3/12/2014, the MPCA was supposed to recommend new standards for sulfate emissions for the protection of the wild rice crop in Minnesota. After two years of studying the issue, they concluded that they aren't certain of how sulfate affects the wild rice crop. In fact, the sulfate may not have any affect on the crop, but it may be when the sulfate settles to the bottom of the lake and becomes sulfide is when the issues affecting the wild rice may be occurring. But, they stated that until they analyze the actual data more thoroughly and more scientists look at it they aren't willing to make any conclusions or set any new standards at this time. Also this week, it was reported that the EPA at the request of the MPCA granted a variance to the Clean Water Act allowing Mesabi Nuggets to release chemicals including sulfate into the environment in northeastern Minnesota. And if not for the lawsuits of some environmental groups, they would still be allowing Mesabi Nuggets to release these chemicals. The EPA issued an apology and said they should have never allowed the variance. These two examples show how difficult it is to know the effects of pollution even a couple years down the road. So now you think that your model of water treatment for 500+ years makes perfectly good sense and can easily be supported by your 'modeled' data. What kind of stewards of our land, water and air are you trying to masquerade behind. No one with any credibility could even dare to extrapolate data from a 'model' projected 500 years out

Gary Johnson

43719

The PolyMet mine will provide a few good jobs for 20 years, or so, and then it will leave behind 500 years of devastation. It would be impossible to escrow enough money to deal with that aftermath. Additionally, it would be absolute insanity to permit something which will leave behind such a huge need for toxic cleanup. Not to mention all the issues that are more important than money-such as the health issues this mine will cause in the while it's in operation. Gary Johnson | President – MAPE Local 501

Mar 4, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Please be aware that multinational corporations share most of the characteristics of antisocial personality disordered individuals (aka psychopaths/sociopaths). That means that they tend to lie, cheat and deceive while appearing normal and acting trustworthy. They are motivated by greed, wealth, power and prestige and will do anything necessary (even illegal if they can get away with it) to achieve their goals. Although they often are charismatic, they ultimately lack in empathy. When they are caught in criminal behavior, they usually show no remorse and only compensate their victims for losses when court-ordered to do so. When ordered into therapy/rehabilitation they are very good at pretending to rehabilitate, often fooling even the best psychotherapists or judges. I wrote an essay about the corporation as psychopath, a version of which can be found at <http://www.globalresearch.ca/the-us-corporation-as-psychopath/5345811> - Please read it thoughtfully before risking becoming a sucker for a Big Lie con job that might make Minnesota regulators a laughingstock in the smoke-filled rooms of the Big Mining bosses of PolyMet. Gary G. Kohls, MD, Duluth, MN PS: Please access another article of mine about the consequences of giving carte blanche to multinational mining corporations at: http://duluthreader.com/articles/2013/03/09/1513_bringing_death_to_your_hometown. It is titled Bring Death to Your Hometown (after the Bruce Springsteen song of the same title). The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Gary Kohls, Md 1306 E 8th St Duluth, MN 55805-1632 (218) 728-9756

20075

To Whom It May Concern: I believe that any sulfide mining in Northeastern Minnesota will not only destroy surface in the area including Lake Superior, but it will also destroy much of the ground water in that area. A substantial part of the economy of Northeastern Minnesota depends on surface water of many lakes including Lake Superior, and obviously ground water is necessary for that economy to prosper. It seems very foolish to put at risk thousands of jobs related to the recreational economy including all the related jobs for a few hundred temporary jobs provided by the sulfide mining project. In addition, many people have retired in Northeastern Minnesota because of the pristine surface water including good ground water for their wells and the related recreational opportunities. Thousands of more jobs have been created in many areas that are the result of numerous people retiring or having a cabin in Northeastern Minnesota. MN Rule 6132-3200 does not allow perpetual treatment: "To receive a permit to mine, the permittee must be able to close the mine in such a way that it is stable, free of hazards, minimizes hydrologic impact and release of substances, and is maintenance free." The PolyMet SDEIS states that "long term" (>500 years at the Plant Site and >200 years at the Mine Site) treatment of wastewater is needed which means the site will not be maintenance free at closure. Low sulfur rock (Duluth Complex 0-15% S, Virginia Formation 0-2-1% S) will produce acid mine drainage. The Virginia formation comprises the north wall of the east pit. In-pit disposal of waste rock with sulfur concentrations of 0-2% has required perpetual wastewater treatment for the Zortman Landusky mine in Montana, a superfund site, requiring \$948,000 per year for reclamation maintenance paid for by taxpayers. This would mean that on a related basis the Polymet mine will require over \$500,000,000 of reclamation treatment at the Plant Site and over \$200,000,000 at the Mine Site. If Polymet goes bankrupt after mining that area, Minnesota taxpayers will not be very happy to pay the above mentioned bills. Polymet should be required to set aside at a minimum the above mentioned amount of funds or no mining permit should be issued. Heavy metal leaching is one of the greatest environmental liabilities associated with mining, especially in pristine environments like the Project mine site, that have economically and ecologically valuable natural resources (Reclamation Research Group (Bozeman, MT) for USFWS Anchorage, Alaska, "Acid Mine Drainage and Effects on Fish Health and Ecology: A Review" (2004), Ex. G.) There are no hard rock surface mines that exist today that can demonstrate that heavy metal leaching can be stopped once it occurs on a large scale. (Earthworks Factsheet, "Hardrock Mining: Acid Mine Drainage"). Inaccurate pre-mining characterization and interpretation often results in a failure to predict impacts to water quality and aquatic life. (J.R. Kuipers et al., Comparison of Predicted and Actual Water Quality at Hardrock Mines, 2006). Evidence from literature and field observations suggests that permitting large scale surface mining in sulfide-hosted rock with the expectation that no degradation of surface water will result due to acid generation conveys enormous risk to water quality and fisheries. (Id.) Finally, the word "Moose" does not appear at all in the SDEIS cumulative effects analysis, despite consistent concerns raised by tribal cooperating agency staff to co-lead agency staff during the environmental review process. As of August 19, 2013, moose are now listed as a MNDNR species of concern. Gary J. Maciejewski P.O. Box 323 Lutsen, MN 55612

Gary Markfort

38207

Hello, I am really against this mine. There is no copper mine in existence that has not done extensive damage to the environment. This mine threatens our most important resource, fresh water. Fresh water is more valuable than any other natural resource. We'll I believe the mine is going to happen, regardless of any input against it. Therefore, those who prosper most should be the ones cleaning up the mess and paying back the people of MN for irreparable damage. My firm belief is that the owners of Polymet, (not the company) employees, their subcontractors, individual shareholders, should pledge their personal fortunes to repairing all damage. Once they have pledged and the pledge is in writing, and mn has the right to confiscate their individual fortunes, then they can start mining. To often we hold the company responsible, but companies have an automatic out, they change leadership, they go bankrupt, they just cease to exist We need to hold the individual's responsible and throw away the corporate veil. Thank you for reading this communication. It is a bit extreme, but no freshwater is a very serious business. Freshwater is one of the main reasons I live here. I lived for awhile in Texas where you can not drink the tap water, bathing in it is not real cleansing either. Look at west Virginia near Charlotte. More jobs will be lost in the end than are gained by this mine. Just say no to the mine. Sent from mobile device Gary Markfort Every time you wake up on the right side of the grass; its gonna be a great day.

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

The expected contamination and water treatment requirement for 500 years cannot be seen as a reasonable trade-off for jobs, and even prosperity, for only 20 years. Moreover, the cost of treatment for 500 years cannot be calculated with any reasonable certainty. How can we expect a company, or a bonding company, or even a state held escrow fund to be available in 500 years. We can't trade our valuable resources for such a ridiculously small return. Mar 9, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Gary Tubb 387 Pinewood Spur Copley, OH 44321-1241 (330) 668-8496

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Gary Wernersbach 26745 128th St NW Zimmerman, MN 55398-4683 (763) 856-5204

Gary Zarling

16206

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I would like everyone's parents, children and selfs to be able to drink freely from our refreshing ground water. PolyMet can do better than their current SDEIS. I believe even though the mining will create jobs that doesn't mean that our workers should be subjected to making our groundwater less drinkable. Money and economy are important but at what price. PolyMet is mistaken by relying on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because there are people in this state that care about the environment more than money and have taken time to speak out for the welfare of this clean beautiful state. Keep it clean should be just as important to PolyMet. I'd like to see answer and comments on the following issues with the current PolyMet's SDEIS: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Would it hurt to be very thorough when making sure a resource that keeps us alive stays healthy for us. Sincerely yours, Gavin Danfelt-Martin -a concerned citizen and water drinker Gavin Danfelt-Martin 209 5th St SE #101 Minneapolis, MN 55414

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Gavin Spraby Hibbing, Minnesota

My name is Trachsel, spelled T-R-A-C-H-S-E-L. I am from Duluth and I'm a scientist and I have worked in the health field for 40 years. My sister died from mesothelioma. She was not a miner. She did live, though, within mining sites and drank the water, as well as breathed the air contaminated with mining particles. I do not see any reference to the major health risks to mining districts and surrounding communities to lifetime exposures. Please, I ask you to include in the SDEIS the risk for workers and the surrounding communities for at least 70 years, as Minnesota uses for guidelines, not for 35 years, as the SDEIS does on Page 5421-426. My sister was older than 30, but she was less than 60 when she died. Also, the projected healthcare costs to the State of Minnesota should be included in this statement and they are not. As a scientist, I know that some assumptions are made because models are used; not actual data. And in making conclusions in this case, the idea that this mine can be 99 percent sure that seepage will be contained and decontaminated and will flow in a certain direction, north, is not a fact, but it is an assumption. The SDEIS needs to prepare a statement with alternative water models and the impact of the seepage that most likely will occur and what contaminants will be in the seepage. This mine is an experiment. The material that is presented in this SDEIS has never occurred in copper-nickel mining anywhere else and it is imperative that alternatives will be looked at that will protect the streams that feed the three watersheds. We are now at the peak fresh water in the world. We can't afford to destroy it. Alternatives are imperative. 300 jobs for 20 years is not a good trade for 500 years of irreversible water contamination. A lot of those jobs will be for contamination cleanup and health care workers. So that at the end we can say, "We poisoned the water, but we created a lot of jobs."

Dear Ms Fay, Dear Ms Fay and Mr Bruner, I am a health care worker and I have seen the implications of polluted water and air. It is required that the public interest is addressed by Minnesota law. Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-sit

Gayathri Ramanathan

38605

Dear Ms Fay, Dear Ms Fay and Mr Bruner, This is regarding the PolyMet NorthMet SDEIS which I feel is inadequate in addressing the public health concerns. I am very concerned about 1)Mercury pollution besides others like manganese, lead and aluminum in water and the fish population 2) air pollution resulting from all the mining-related activities - diesel, asbestos-like fibers, nickel and other particulates which are carcinogenic. Plus I think there are huge gaps in the SDEIS on various other pollution concerns. Corporations should take full responsibility and not externalise cost of doing business to the communities/taxpayers by polluting the air and water and our food supplies and causing diseases . I hence request you to reject the SDEIS. Thanks Gayathri Ramanathan 115 2nd avenue south Minneapolis, MN 55401 612-333-7981

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Gayl Gustafson 229 Earl St St Paul, MN 55106

Gayle VanGuilder

3/13/14 I have reviewed the SDEIS for the Polymet Project, and fully approve of the proposed processes and mitigation systems as well as the science used in designing them, and ultimately constructing them. I also believe from an economic standpoint, that expediting the current processes so Polymet could begin construction immediately would bring a desperately needed, immediate economic boost to the Iron Range, not to mention the added benefit of more public lands, through the land exchange. I fully support the SDEIS in its entirety. Gayle J VanGuilder 6853 Wilson Rd Makinen Mn. 55763

Gaylyn Bickug

54160

I do not support Poly Met mining! [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Gene

3437

Hello, Poly Met wants to ruin one of Minnesota's true pristine northern forests. Not only will it ruin the Minnesota treasure for generations to come, the pollution from I will be all but irreversible for decades to come. The assurance money that is supposed to be set aside to clear up the pollution and damage caused by mining, won't be there for pollution clean up and restoration of the pristine treasure. Like the tobacco settlement money that was for stop smoking campaigns and to help people quit smoking, the legislature will use that assurance money for other purposes. The jobs created by mining won't be worth the destruction to this Minnesota treasure and the damage to the environment. How will they even start to clean up the pollution this will cause to the ground water. This is an ecological disaster waiting to happen. I would hope that this project would be given the thumbs down. Sincerely, Gene

I'm Gene Betts. I live in Knife River, Minnesota. I represent myself, and I moved up to Knife River, North Shore area in 1975 because I came from Minneapolis up here almost every single weekends. I love this area. I do support the PolyMet Project. The reason that I think that the PolyMet Project will be a good project and they'll do what they say they're are going to do is because Minnesota has some of the strongest regulating bodies anywhere in the world. Do I trust PolyMet? No. PolyMet would have to build a relationship with me just as any of you would before I would trust you. So I'm depending on these regulatory agencies to do their job. One of the other reasons I think PolyMet will do this is because they're going to spend between \$400 million and \$500 million before they make a nickel. If they don't do their environmental work, they will be shut down and somebody's going to lose \$400 million or someplace along that. Another reason I think they will do their job is because there are four or five other projects similar to this that will be looking at PolyMet, and if they don't do it, those projects won't happen. The environmental area that's impacted I think will end up being cleaner simply because what PolyMet is required to do will help clean up the pollution that's already here. It's been mentioned a couple of times about if this project were built in China, all you got to do is watch your TV about once a week and find out you can't see a block in China. They don't care in China. It's all about money. I want to thank the people who are considered the real environmentalists, although I consider myself a real environmentalist, because they have made this project so much better, and they another reason I believe it will be successful, because they're not going to quit. They're going to keep watching this. One of the other big quality-of-life issues is a living wage, and living wages support all the infrastructure below them. All the service jobs, all our hardware stores, all our garages. Thank you, very much.

18332

My name is Gene Betts. B-E-T-T-S. I live in Knife River, Minnesota. And I represent myself. Little bit of mining history. A lot of people -- hundreds of years the way it sounds -- but I moved here in 1975 so that I could enjoy the quality of life that is available in Northeastern Minnesota. I think it's really important to not just look at the environmental impact statement for what it is. It's really important to look at the regulatory agencies that are going to enforce what PolyMet says it's going to do. Because I truthfully don't trust PolyMet. I truthfully don't trust any of you. You're going to have to work on me pretty hard to get me to trust you. But I do trust these regulatory organizations. And I watched them help clean up Minnesota from when I moved here. I watched them clean up other messes left by other mining organizations. I watched those mining organizations declare bankruptcy. Part of the reason I think PolyMet will work is because somebody is willing to put \$500 million of money before they even open the door, before they make a dime. And if they're in business for 30 days, they can get shut down by a regulatory organization and somebody is going to lose \$500 million. The next thing is, this probably is the first one of these big copper-nickel mining things. And those other companies they don't want PolyMet to fail. If PolyMet fails, they don't get a chance. So I support PolyMet. I support their good jobs. Part of the quality of life in this area is good jobs. Good paying jobs. Part of the tourist industry survives because I'm here in the winter to pay for going to the restaurant and going to those other places. I understand the concern. I love this area. I don't want it to be contaminated or ruined. And I don't believe it will be. Thank you.

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. As a Special Education Teacher and Consultant I am keenly aware of the link between heavy metals and learning difficulties in children. I am also aware of the increased risk of cancer from living in the mining ranges of the Upper Great Lakes / Lake Superior Region. We cannot afford to recklessly go forward for a quick economic fix that will not only cost millions and possibly billions of dollars down the road in remedial education and menial job skill training due to health impacts on the central nervous system. The cost of needlessly throwing productive lives away because we rushed forward carelessly without assessing all of our risk and options is unthinkable. The minerals are going nowhere. They will still be in the ground for years to come. The only benefit in rushing into this without assessing all of the risk is to the mining company. The public may end of paying billions in untold costs if we do not do this right. Private profit and socialized costs are an unacceptable violation of the public truSt PLEASE, conduct a Health Impact Assessment before moving forward with this or similar future projects. Best practices net best results. Sincerely, Gene Champagne PO Box 21 Big Bay, MI 49808-0021

Gene Christenson

39260

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. There is no real need, except profit motive, to create tailing ponds that need decades to treat. Why isn't the water treated in real time like other industries. Why are the tailings not put to beneficial use at some other location instead of creating an environmental nightmare that everyone knows PolyMet will eventually walk away from. If proper operations are not financially viable for PolyMet then they should not be doing this project. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Gene Christenson 1312 Portland Ave Saint Paul, MN 55104-6905 (657) 645-9373

I would like to direct my comments not to the specific issue of PolyMet's Environmental Impact Statement, but to the larger issue of copper/nickel mining in Minnesota. I know that this may not what you are looking for, but I want to go on public record as being totally opposed to any copper/nickel/sulfide mining in the state. There has never been a copper mine anywhere in the world, ever, in any environment other than a total desert, that did not leach sulfuric acid into the groundwater. It has never been done and can not be done. Water combines with the sulfides to produce sulfuric acid. Large quantities of sulfuric acid can not be contained over long periods of time. That is an indisputable fact and all one has to know to reject PolyMet's permit application. It doesn't matter what is in their Environment Impact Statement - it is all smoke and mirrors to maintain the fiction that copper mining can be done environmentally safely. It can't. Minnesota should ban all copper/nickel/sulfide mining in the state unless and until it has been proven to be environmentally safe somewhere else. We should not be wasting time and money evaluating meaningless Environment Impact Statements. Meaningless, because they are offered in support of something that can not be done. More specific to PolyMet, why would one ever consider granting a mining permit to a company which has no competency in mining. Here are excerpts from PolyMet's 2013 annual report, signed by Jonathan Cherry, the CEO and Douglas Newby, the CFO: From page 9: "We have had no production history and we do not know if we will generate revenues in the future. While we were incorporated in 1981, we have no history of producing minerals. We have not developed or operated any mines, and we have no operating history upon which an evaluation of our future success or failure can be made. We currently have no mining operations of any kind. Our ability to achieve and maintain profitable mining operations is dependent upon a number of factors, including our ability to successfully build and operate mines, processing plants and related infrastructure ourselves. We may not successfully establish mining operations or profitably produce metals at any of our properties. As such, we do not know if we will ever generate revenues. We have a history of losses, which we expect will continue for the future. If we do not begin to generate revenues we may either have to suspend or cease operations. As a development stage company with no holdings in any producing mines, we continue to incur losses and expect to incur losses in the future. As at January 31, 2013, we had an accumulated deficit of \$88-4 million. We may not be able to achieve or sustain profitability in the future. If we do not begin to generate revenues we may either have to suspend or cease operations. We currently have negative cash flow from operating activities. The Company cannot predict if or when it will operate profitably, to generate positive cash flows." From page 10: "We may not have adequate, if any, insurance coverage for some business risks that could lead to economically harmful consequences to us. Our businesses are generally subject to a number of risks and hazards, including: • industrial accidents; • railroad accidents; • labor disputes; • environmental hazards; • electricity stoppages; • equipment failures, and • severe weather and other natural phenomena. These occurrences could result in damage to, or destruction of, mineral properties, production facilities, transportation facilities, or equipment. They could also result in personal injury or death, environmental damage, waste of resources or intermediate products, delays or interruption in mining, production or transportation activities, monetary losses and possible legal liability. The insurance we maintain against risks that are typical in our business may not provide adequate coverage. Insurance against some risks (including liabil

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Gene Smith 11701 Van Buren St NE Blaine, MN 55434-3062

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Geneva Wychor Geneva Wychor East 1st Street Apartment 2 Duluth, MN 55812

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Genya Welch 1813 Red Oak Rdg Carver, MN 55315-4568 (952) 448-0535

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Genya Welch 1813 Red Oak Rdg Carver, MN 55315-4568 (952) 448-0535

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Genya Welch 1813 Red Oak Rdg Carver, MN 55315-4568 (952) 448-0535

Feb 21, 2014 Ms Lisa Fay MN Dear Ms Fay, I've lived in Minnesota now for close to 7 years. I grew up in a state (Montana) where the legacy of mining has dotted the land with Superfund sites including many where the water will need to be treated perpetually. While jobs and the economy are important, resource extraction provides temporary benefits, typically at long term cost to the environment and to many who will never benefit from the economic impact. Mining companies have a long track record of irresponsibility, regardless of the promises they make. I am against this development and am strongly urging my friends and family in Minnesota to voice their opposition. Sincerely, Mr Geoff Lynn 1605 Marshall Ave Apt B Saint Paul, MN 55104-6205 (406) 431-7286

I am Geoffrey Gates, G-E-O-F-F-R-E-Y G-A-T-E-S. I went to college here and went to medical school here. I didn't live here for 25 years and then I came back. And the reason I came back was partly "Minnesota Nice." This is incredibly a heated (phonetic) topic, and yet people clap for one side or another. And this is incredible, actually absolutely incredible, and I thank you all. My comments are I am opposed to this particular proposal, but I'm for resource management. I am proud of this state for having honest regulatory agencies, with democrats, republicans, and even wrestlers. I am very proud that this steel from this state built the nation, the forest built the nation. We still have an extraordinary state to live in up here in the northeast. This project is different, though, for us or for iron mining. This has a toxic waste, which has to be cared for almost as long as this continent has been around. Well, Christopher Columbus, 1492 -- that even goes back before Washington. Okay, that's 500 years. Um, we have difficulty with financial assurance for something as simple as teacher pension funds. They were fully funded 20, 30 years ago, and now the taxpayers may have to bail them out for reasons that -- oh, I don't for certain understand it. But it has to be done. How are we going to take care of this toxic material long after this company is gone? Twice the length of the country. We do need these materials. In World War II there were nickel issues in armor, copper issues in shell casings, so what we did is we went to our coins and we took the nickel out of circulation and we put it in different materials, we took the penny out of circulation and we made it out of different materials, because we needed the nickel and the copper, the nickel. We took that out of circulation. If we are really that desperate, we can look at the 140 million or billions of pennies that are out there, we can look at the 40 billion nickels that are out there, which have more copper and nickel than this mine can produce. It is not that critical; the tailings are. Thank you.

Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, After reviewing the details, even with slight economic reasons, I believe the proposed mining is too risky to our unique resources in Minnesota, and I am fairly conservative in beliefs and would still agree with this. I am an outdoors-man, hunter, fisher, and Eagle Scout. Although I am all for other projects which can help the national and state economic resources, and eliminate our foreign dependence, I do not think this mining should happen at this time. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Geoffrey Rich 11460 17th Pl NE Saint Michael, MN 55376-4237 (763) 242-8101

Just think about the fact that none of us will be here 500 yrs from now. What will those people think of our decisions today. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

George Halvorson

6285

Dear Ms Fay, Dear Federal and State Agency Leaders: Don't put your faith in PolyMet's willingness or ability to satisfy future claims in the event that something goes wrong. A brief survey of pollution litigation should inform you that even where states are able to claw back compensation for environmental pollution, they spend an enormous amount of money doing so and the return rarely reflects the damage done. As the population of MN grows, the Boundary Waters will only increase as an economic resource for the state. Don't risk them. Best, Charles Former employee of Gunflint Lodge and a longtime enjoyer of the BWCA George Halvorson 131 W 110th Street Apt. 6F New York, NY 10026

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

As a resident of NE Minnesota since 1960, I have seen many ups and downs economically and environmentally. While the pendulum has swung positively and negatively for both concerns we generally are able to maintain a healthy balance. The natural resources of our area are the basis for the majority of our economy. Not only from an environmental/tourism standpoint, but also from a harvest/production standpoint. I applaud both sides of the issues regarding the Polymet proposal for their hard work and diligence. Because of the concerns on both sides I believe that a healthy balance has been reached. Polymet can and will provide essential metals to the global economy and will do so in an environmentally conscious fashion. Now is the time to move ahead with this project for the people of NE Minnesota. George A. Lah 805 W Prospect Ave Cloquet, MN 55720 218 393-8045 glah@compudyne-net

Lisa Fay MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement ("PolyMet SDEIS") fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates. The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate. For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project. We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of t

To Whom It May Concern: See below and attached my Public Comments on Proposed PolyMet Mining Project: Public Comments on Proposed PolyMet Mining Project From: George R. Dunn 1707 Taylor Avenue, Saint Paul, MN 55104 (651) 224-7687 HYPERLINK "mailto:grdunn@juno-com"grdunn@juno-com I write to urge the Minnesota DNR to reject the draft EIS and to eventually deny any permits for the proposed project. It is time for the debate about sulfite mining to end. This project and the other numerous proposed sulfite mining projects are dangerous, destructive, and divisive. This proposal and other perspective projects create an unacceptable risk to the environment and ecosystems of northeast Minnesota. For my public comments regarding the proposed PolyMet Mining Project, please note the following: The comment period should be extended. The shortened public comment period should be extended to at least the customary length of time. Although this is an amended Environmental Impact Statement ("EIS"), the issues and complexities of the project demand that the comment period be extended. The amended EIS is essentially a complete workover of the original EIS. The volume of material, complexities of the issues, evolving revelations, and recently discovered discrepancies all demand that the comment period be extended. Information has come out since the release of the draft EIS calling into question issues of hydrology assumptions, effectiveness of the reverse osmosis process, and the plan for future water treatment. These issues are of such significance that meaningful public input can only be achieved through an extension of the current comment deadline. Failure to explain the long-term plan. The applicant's failure to explain the plan for long-term water treatment is a fatal defect in the proposal. Although the EIS, itself, also fails to identify the length of time water treatment will be necessary, all parties agree that water treatment will be needed for essentially an indefinite period of time (eg, 500+ years). It is sobering to think that the State of Minnesota would even contemplate relying on a corporation to treat water for 500+ years in connection with a mining project that is scheduled to last 20 years. Time and time again across this country and throughout the world corporations have made promises similar to what PolyMet has made in its proposal, yet in every instance they have failed to follow through. The current state of corporate and bankruptcy law is such that there are no legally binding mechanisms to get a commitment from PolyMet (or its multinational corporate overlords) to treat the water for the length of time that will be necessary. The inevitable conclusion is that the financial responsibility for treating the impacted water will fall on the shoulders of the taxpayers of the State of Minnesota. This future financial obligation that would be assumed by the taxpayers of this state far outweighs any possible economic advantage the state and/or its people would benefit from by granting PolyMet the right to use the state's mineral resources and water. Additionally, the EIS fails to outline what sort of financial assurances and security PolyMet would be required to post in order to go forward with the project. I would submit that there are no financial assurances or security that PolyMet could offer that could possibly balance out the future cost of water treatment and, more importantly, the future cost of remediation that would be required in the case of an environmental disaster. Additionally, with the increase in the frequencies of severe weather events it seems increasingly likely that a catastrophic event like a dike rupture or a containment pond overflow is likely. Let us not forget the rain that fell in Duluth in June of 2012- Questions regarding the effectiveness of the proposed reverse osmosis process. Recent information from independent experts call into question the effectiveness of th

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I have been lucky enough to have canoed Boundary Waters Area on many occasions and find it to be one of the most pristine areas in the midWest if not the nation. It would be criminal, in my opinion, to permit any mining of resources in the region that would contaminate, and eventually kill, this national treasure, So please do not allow the PolyMet Mining Corp. NorthMet mining project Supplemental to operate anywhere near this treasured land. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, George Rounds 2735 Park Pl # D Evanston, IL 60201-1336 (847) 864-5671

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Remember Silver Bay & Reserve M [illegible] dumping asbestos rock & water into Lake Superior. Thanks to Myles Lord the man responsible. Thank you for stopping this tragedy. In 201 Duluth Metals signed a \$227 million agreement with a Chilean firm to advance mining 3 miles from the wilderness. PolyMet Mining Corp a Canadian Co has never actually operated a mine. Please stop this from happening. Do not permit the damage which will take over 2000 years and for 20 years of mining?

George Withbroe

To: Tim Dabney, U.S. Forest Service Superior National Forest 8901 Grand Ave. Place Duluth, MN 55808 From: George Withbroe, Ph.D. Subject: The proposed PolyMet mine. I am deeply concerned about the proposal to develop a large copper-nickel sulfide mine near the BWCA, or, for that matter anywhere in Minnesota. It appears that this mine will be a major source of pollution, particularly to water. How can we develop a mine which will be a major source of toxic pollutants for hundreds of years, a mine which will have a high probability of becoming a financial burden to the taxpayers for decades after the owners of the mine have made their profits and left the state. For a decade I was a senior executive at NASA headquarters. I am well aware of how things go wrong on complicated projects, failures resulting from unanticipated problems which occur in spite of intense efforts to have a failsafe system. I doubt that a mining company whose primary goal is financial gain will be as careful as is required when dealing with a product that offers so many opportunities to produce destructive, long lasting, toxic pollutants. This is a beautiful state. Its beauty and wonderful natural resources should not be compromised by an industry that has a well earned reputation for being environmentally unfriendly. I have a daughter and four grandsons living in Minnesota. What legacy will we leave them? George L. Withbroe

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. It is short sighted to risk long term damage to a pristine area that presently is heavy into tourism. To be risking centuries of damage for an industry that will only exist while it is profitable to themselves is a morally corrupt thought. What little the residents of Minnesota might gain from this industry will be long forgotten when PolyMet abruptly shuts down and leaves an environmental mess. If PolyMet is anything like similar industries, they will respond with a huge team of lawyers that will fight every effort in court rather than doing anything. No man made correction to fix an environmental disaster will ever approach what nature gave us from the start. Sincerely, George Wollenburg 19646 Ulysses St NW Elk River, MN 55330-2135 (763) 441-3233

From: georgiana anderson [mailto:simba@backpack-net] Sent: Saturday, March 08, 2014 3:50 PM To: Stine, John (MPCA) Subject: PolyMet I write because the proposed PolyMet mining project is a dismal idea and one that evades any proper Environmentally-sound treatment. The very idea that you could get PolyMet to be responsible in 500 years for the degradation that will follow that mine, is ridiculous and obscene. The environmental issues/problems will arise immediately and will need to be addressed immediately. The areas that support Wild Rice culture will be affected and may never be reversed if sulfide is allowed to invade those Wild Rice wetlands. So we will lose a uniquely Minnesota treasure not to mention the damage that the Native Americans would sustain to their history and legacy. Sulfide mining will have other more insidious results, Sulfuric Acid. Is that something we want to produce. Not that way. There is another treasure that will be threatened, a national park that draws in people from all over the country and Europe, The Boundary Waters. Those lakes are vulnerable to acid drainage and toxic metal as are indeed, the Wild Rice growing areas, and the water supply for communities around the proposed mine. The Environmental Review process should be lengthened. This is too complicated an issue to be hurried along. You need to take the time to evaluate. There are very few pros to this plan. Only one that I can think of and that is jobs. Well, lot of jobs will be created for people cleaning up this mess forever and ever. Is that the way we want to develop jobs. I hardly think so. Why did the EPA give the PolyMet EIS a failing grade. Why is Minnesota not paying attention. Why is the Minnesota Environmental Review board complicit in this process. There is only one answer; corrupt politics and ignorance. There is only one solution: deny a permit. Thank You, Georgiana Anderson Georgiana Anderson, 436 Holly Ave, St Paul, Mn. 55102

-Poly Met is predicted to be a hazard that may still be a threat for 500 years. PolyMet is going to put up enough money to deal with this degradation for the next 500 years. I doubt that that can be accomplished. -Wild Rice requires clean water and sulfide will kill the rice if it invades the Wild Rice wetlands. They are a unique treasure for Minnesotans with great meaning for Native American's history and legacy.. -When sulfide is mined, it has the potential to produce Sulphuric Acid. -The Boundary Waters are visited by Americans and Europeans. This tourism brings money to the state. Those waters are vulnerable to acid drainage and toxic metals. The Environmental Review process needs to be extended. The period allowed is too short. This is too important for Minnesota for it to be cut short. -I have heard that the EPA gave the PolyMet EIS a failing grade. All the more reason for the period to be extended. The permit should be denied. -I understand that this means jobs. 500 years of jobs cleaning up the mess. Thank You, Georgiana Anderson

Geraldine Davidson

57349

My name is Geraldine Davidson. They said that this pollution being created is a new type of pollution to this area. According to the studies, they say it's in compliance. My concern is the accumulation or the cumulative effect of all of these different pollutions that are in compliance, but added together, what types of health complications are there? Especially since it is new, they just probably don't know yet. Because they said none of them are related to cancer, but there are other problems. For example, there is a study out of Canada that methylmercury, a byproduct of mining, is in our streams. They have now made a link that it suppresses your body's natural ability to break down plaque. And so now they are finding that methylmercury is contributing to cardiovascular disease because of the plaque not being able to be broken down. So what responsibility will the company have when they do make this link in the future, 50 years from now, when they make a link of the different health problems that are created by this new pollution? Now I am changing subjects here. The mineral rights, how much are they paying? The mineral rights that they are mining? Because they are going to be destroying that land. How much are they going to be making in the open market versus how many union jobs will there be for the total number of jobs that are created? How many of those are going to be union wages, with benefits, compared to their profits? My concern, too, is the quality of the air. They claim that they are going to be cleaning it, but are they going to have natural ways to clean up the land? Other than the usual methods of pollution control, such as probably having filters and that kind of stuff. But what other efforts or measures will they take to help clean the air and clean the water from all of this? Like planting more trees. I know they say they will have containment measures in place, in reservoirs, and all of their safety containment, but who is responsible 50 years from now when it breaks down and all of that pollution is brought out into the environment? Who is going to be paying for that? Who is going to be paying for the health complications that people just don't know are there? Like mesothelioma, they didn't know about it back when those miners were working. Now, is the mining company paying for their health or is it the government; us, the taxpayers? One last thing is that some of the land that they want to mine is next to the Boundary Waters Canoe Area. I oppose this Land Exchange because it will ruin that pristine area. Okay. That is it.

Geraldine Polasky

41622

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Geraldine Polasky Gheen, Minnesota

To whom it may concern, I come from three generations of miners from all over the Iron Range in Minnesota. I know you have seen all sorts of comments both pro and con about the PolyMet project. Both to save your time and not give you a load of baseless conjecture and stats about pollution and destruction of the earth I have only one comment. Take a look at the Cuyuna Iron Range in Crosby MN which is now a state recreation area. The mining started here in the early 1900 and ended in 1985, and is now a state recreation area with Trout fishing, boating, canoeing, and Mountain Biking. If the mining industry could do there job and leave us this wonderful rec area with old and outdated technology just think what we can do today. The benefits for this project will be seen for hundreds of years. If the committee wants to see a beautiful old mining area come to Crosby MN and take a look you will not be disappointed, There is no reason to not proceed with Polymets plan. Thank you Kendall L Johnson US Army ret 218-772-0206 [HYPERLINK "mailto:ger64@charter-net"ger64@charter-net](mailto:ger64@charter-net)

geri Jensen 20205

Feb 26, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. February 26, 2014 As a biologist and a resident of northern Minnesota, and with a mining engineer in the family, I have reviewed the options and submit a strong plea against the PolyMet copper-nickel mining proposal for our northern Minnesota. As a major retirement destination with an ever increasing tourism industry northern Minnesota depends on a sustained natural environment with exceptional fresh water quality which is in direct conflict with the proposed mining. Creating the mine itself would first destroy thousands of acres of living plant and animal life and jeopardize the fresh water system which supports all life. There is no acceptable land trade or replacement of such destroyed communities. When we are so concerned and protective of our water resources that we demand a permit to add a 6'X8' deck on a house and disallow building an outhouse, how can PolyMet possibly rank consideration. What about common good. And jobs. When our nation permitted environmental destruction to build the Panama Canal and dams such as the Grand Coulee, we had less knowledge of ecology, and there were presumed centuries of benefit expected. This is not the case with mining. Mining by its very purpose is an extraction process, finite, non-renewable, take and run with all mines at some point abandoned. A civil engineer friend describes mining as the rape of the earth. PolyMet would have a few decades at best and would begin and end leaving a wake of destruction. There is no proven, safe and lasting containment method nor treatment, and there are always mishaps, accidents, acts of God, and mistakes made. The cost of any is far greater than the benefits. Money can't fix it. How desperate can we be. What national crisis or need could be so dire as to entice the DNR to even consider a permit to deliberately destroy a well-functioning and highly valued resource, a Parthenon of nature. Some have held up a cell phone to illustrate our need for copper and other valued minerals for high tech devices. Then we should be less careless with the copper we alrea

Geri Wellem's 39317

I was born and raised on the Iron Range. I am 100% opposed to copper/nickel mining in MN. Our environment is more important than jobs. I remember Reserve Mining and I have been to Milepost 7- As usual, the mining companies will take what they want and leave us with environmental damage that will be with us for eternity. All for a few jobs for a few years. I say NO. Geri Wellem's Sent from my iPad

What does the MN DNR stand for. If not to protect and manage our natural resources. I am appalled that the MN DNR is allowing mining companies to pollute our natural resources FOREVER. And for what.. I am a resident of Ely, Mn and have lived in Ely, MN for 18 years. Before that, in Minneapolis for 10 years. I am so grateful to have enjoyed 28 years of Minnesota's beautiful natural resources and I am ashamed and saddened that future generations will never know the Minnesota that I have known. The mining companies WILL pollute our water, air and land. It's what they do. And mining companies will get out of paying for all the damage they have done. It's what they do BEST It's unfortunate that you will allow sulfide mining. As well as not extending the comment period. Not allowing MN tax payers a chance to voice our concerns. Obviously, it doesn't matter what the MN tax payers think, you've already made up your mind. Sulfide mining must NOT be allowed in MN. Germain Walseth Ely, MN

Gerri Williams

18330

Good evening. My name is Gerri Williams, G-E-R-R-I. And I'm a resident of Duluth. I'm not Slovenian. My most recent position was as a research associate at the Water Resource Research Institute in Washington, DC. But I represent no organization. I speak for myself. I grew up enjoying the beauty that Minnesota offers. I'm now a Duluth resident. I'm grateful for the stewardship of previous generations who passed on this heritage to me. I am not anti-mining. I recognize the benefits of the tools and technologies of modern life that enable (inaudible), including that of mining. But the public interest demands that a mining operation must prove it's appropriate to drain the location and then minimize risk to the natural habitat and to human communities. It is very troubling the proposed mine located on one of the state's most sensitive and environmental rich areas of wetlands is an open-pit mine. PolyMet (inaudible) natural resources has rejected the approach of an underground mine. The mine site itself would destroy 913 acres of wetlands and endanger more than 7,000 plus acres of surrounding wetlands. What I would add is that we really have to accept what PolyMet says on faith, because PolyMet has never operated a copper mine before. That's right. A fledging untested company is going to experiment with the health and safety of our water as part of its learning curve. Minnesota officials recognize the importance of wetlands as stated in section 103A202 stating, "The legislature finds that it is public interest to preserve the wetlands of the state to conserve surface water, maintain water quality, and promote comprehensive and total water management planning." In conclusion, it is a given the open-pit mining method that PolyMet proposes will harm wetlands. I ask the co-leading agencies to take into account that just five years ago the citizens of this state voluntarily agreed to raise their own taxes to fund a 25-year effort to enhance, protect, and restore water quality in Minnesota. Preserving wetlands must be considered crucial to this goal.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: As a Duluth resident, I have spent months of reviewing materials, both pro and con, about the proposed Polymet mine—articles, videos, letters to the editor, and the SDEIS executive summary and appended documents. I have also spoken at one of the public meetings. To me it comes down to the extensive – and potentially permanent – damage to wetlands, watersheds, animal habitat and human health that such a mine (like all other copper mines) would inflict. This is balanced against the possibility of a handful of comparatively short-term jobs and the efficacy of an untested mining conglomerate operate to avoid this damage. The record is clear that every copper mine in the world leaves in its wake destruction and damage that lingers for decades, and could persist for centuries. It is apparently the case that safe copper mining is an impossibility in its present state of development, and that reverse osmosis and other improved technologies remain unproven at the scale and duration required for industrial mining. In the case of Minnesota, copper mining situated in sensitive wetlands would add to the potential disaster. Please help Minnesota maintain its record as a forward-looking, environmentally strong model for the nation and the world. Please deny the permit for the proposed Polymet copper mine. Sincerely yours, Gerri Williams Gerri Williams 326 N. 12th Avenue E Duluth, MN 55805

Dear Ms Lisa Fay, PolyMet's proposed NorthMet open-pit mining project is the 1st of many attempts to mine copper and nickel from sulfide ores in northeast MN. The initial draft EIS was harshly criticized by EPA. The supplemental draft EIS proposes irreversible environmental damages and should be denied. The mine would include 3 open pits, 2 at depths of 600 feet. 1,000 acres of high-quality wetlands would be eliminated in the region, which has already lost many 1000s of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is now home to dramatically declining lynx and moose. The sdeIS vaguely acknowledges the mine would "adversely impact" 4,000 acres of wildlife habitat, which is critical lynx habitat. It barely mentions moose, except to acknowledge the mine "will affect moose individuals." Affect, as in extirpate. Lakes and streams near and downstream of the mine site already violate state water-quality standards. To meet standards for sulfates, mercury, and other chemical poisons and pollutants, the sdeIS acknowledges PolyMet would need to mechanically treat its wastewater for 500 years. But it doesn't explain just how PolyMet can assure funds will be available for 100s of years after the mine has closed. According to EPA hardrock mining is the country's most toxic industry: 40% of Superfund sites are now devoted to cleaning it up. How will PolyMet's mine be different. The sdeIS gives no answers. It doesn't ask the question. The proposed mine site is on Superior National Forest The Forest Service recognizes that open-pit mines are prohibited here. But it is proposing to exchange these lands to allow the open-pit mine to proceed. It has provided no information to demonstrate that this is in the public interest This sdeIS should be rejected. I write as an emeritus member of the American Institute of Biological Sciences (AIBS). Gerry Rosenberg 39811

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Gib Ahlstrand

47507

Hello, I am simply forwarding the 3 points about some sketchy financial details in the Polymet mining proposal as expressed today by my State representative, Phyllis Kahn. I completely agree with these concerns and urge that they be given serious consideration before this project is approved or even allowed to go ahead into the Permit to Mine phase. Sincerely, Gib Ahlstrand, 50 Barton Ave SE, Mpls. MN 55414- I. In chapter 3, pages 136 to 138, you list information that includes the preliminary cost estimate of closure. The source cited is "Foth 2013-" I've looked at the Foth memo cited in the SDEIS. The Minnesota DNR has simply copied information from PolyMet's hired consultant without confirming or fact-checking their work. If the Minnesota DNR and its co-lead agencies are unable to fact-check the work they presented on financial assurance, how are we to expect that they are capable of the adequately protecting the citizens of Minnesota. II. This project should not go forward unless a third-party insurer, such as Lloyd's of London, can be found. The simple fact is, if a third-party private entity will not take on PolyMet, the state shouldn't. Private insurers have expertise in managing risk that the State of Minnesota can't match. Additionally, policymakers could tap the assurance funds for other purposes. Private insurance is clearly superior to a state managed approach in this case. III. In the SDEIS you say that financial assurance will be done in the Permit to Mine stage. Looking at the most recent MinnTac Permit to Mine document, there is one short paragraph on financial assurance. This project shouldn't go forward without robust public debate, and the opportunity for legislative hearings, if what we can expect is a paragraph from the DNR in the Permit to Mine phase. You must ensure that the public, including financial experts and those elected to represent the citizens of Minnesota, have a chance to weigh in on financial assurance. It has not been your practice to do so in the past; will it be in this case.

Gil Baldich

18356

Hi there. I would like to start off by saying this is not a project, it is an experiment. It has never been done in Minnesota. I am Gil Baldich (phonetic). I am from Ely, Minnesota. I am in a band with the Baldich nephews and I am good friends with them. He was saying that China has a lot of copper right now, and that's funny, because that copper is from here and is going to go to China. So, to give them more copper doesn't make sense to me. And then I would like to talk about mining as well. I have grown up and seen them swimming in the mine pools. You know, that is a different kind of mining. That is iron ore mining. This is a completely different kind of thing. It is like fishing. Like I always remind people like crab fishing and salmon fishing, they are completely different things, but you can't be a salmon fisherman and fishing for crabs. It is completely different. Now I got to get to my paper because I only have two minutes. I was born and raised in Bemidji, Minnesota and I was a college student at St. Scholastica in Duluth. I am very concerned about the effects this so-called mining project will have on my home. Not very far away from this PolyMet mining site, the effect on the (inaudible) Tailings Basin. It will be four times (phonetic) more higher in the groundwater than the levels currently are. At the LTV tailings basin, manganese is far above Minnesota's health risk limit, but that is also expected to increase by 45 percent (phonetic). All of this is on SDEIS Page 159, Chapter 5 (phonetic). Lead (phonetic) in drinking water is known can cause brain damage. Manganese can cause neurological damage and reduce IQ in children. (Reading.) This is very alarming to my family and me because PolyMet in the EIS reports that 27 (inaudible) wells downstream of the tailings basin. As citizens, your town will be drinking this water. And some of those wells already have high levels of toxic metals. SDEIS Chapter 4, "(inaudible) does not contain any knowledge whether or not pollution from tailings basin affect these wells." (Reading.) The SDEIS must be redone to analyze any impact from the tailings basin groundwater of the wells my family and friends drink from. Why has there not been an analysis of the pollution of the drinking water of the Minnesota citizens just downstream from the tailings basin? What is protecting the water that my family and friends and daughter drink from year-round and day after day. Go Ely.

Gina Everett

44868

Hello my name is Gina Everett. I am a lifelong resident of the state of Minnesota and I have a few concerns that I am hoping can be addressed. I believe the Polymet SDEIS is inadequate in the following areas: •It does not adequately look at reducing impacts to wetlands by considering underground mining vs. open pit mining. Economic feasibility is not supposed to be the primary factor for alternative methods in an EIS. •What evidence is there that the proposed treatment of contaminated water by reverse osmosis actually works on projects of this scale. •The water treatment process is not specific enough. What are the plans for the toxic sludge generated by reverse osmosis. How is the reverse osmosis system guaranteed to keep up with the quantity and continuous supply of contaminated water. •The proposed wetland reclamation and regeneration would not equal the high quality wetlands that the mine will destroy. •What are the effects on human health, especially in the unborn and very young, of exposure to the pollutants emitted into the air and water, especially as these pollutants accumulate to higher levels. •What insurance is there against underground drinking water contamination and what procedures will be followed to clean up any contamination that occurs. •As abundant clean water becomes more scarce world-wide and thus more valuable, this resource should be weighted higher for impact considerations the farther the timeline of impacts goes into the future. For example, clean water is likely to be more economically and environmentally valuable 100 years from now than it is today, therefore, any long term negative impacts done now should be assessed as more harmful than is currently considered. •What are the health risks to employees who are exposed to sulfide mining conditions. •What is the potential for soil contamination away from the mine site and what health risks are present for people who come into contact with this soil, especially for those growing their own food. •The Superior National Forest is a national asset and the proposed land exchange is not adequate compensation for US citizens. •How will the survival and reintroduction of rare species found in the disturbed wetlands be assured after mine closure. •Adequate funding is not guaranteed in the event of any environmental accidents while the mine is still operating or for the extensive period of water treatment needed after the mine closes. I am a mother and plan on raising my children here in Minnesota where I also hope my children can raise their children. So i'm sure you can see why these issues would be of my concern. Thank you My email address is GMOMMYEVERETT@GMail-com

March 6, 2014 Attention: Lisa Fay EIS Project Manager, MDNR Division of Ecological and Water Resources, Environmental Review Unit, 500 Lafayette Road, Box 25- St Paul, MN 55155-4025 RE: Public / Written Comment re the PolyMet Project Supplemental Draft Environmental Impact Statement Dear Ms Fay, Please include the below comments to the public record regarding PolyMet's proposed copper-nickel mining project and the Supplemental Draft Environmental Impact Statement ("SDEIS"). Any environmental impact assessment (draft, supplemental, or final) that fails to comprehensively analyze the issue of "financial assurance" in the context of addressing pollution remediation / treatment work for up to the 500-year period that this project's lingering effects will require is a completely inadequate review. It therefor fails to comply with the legal requirements for adequate environmental review under both federal and state law. The time for the responsible parties producing the SDEIS to perform a detailed analysis of this issue is now long past due, and cannot wait until the permitting process commences. Until and unless the public has an opportunity to provide comment on a comprehensive analysis of the "financial assurance" issue, the true possible environmental impacts of the PolyMet project cannot be known. If the DNR is incapable of providing this analysis now, then it is self-evident that that agency is unfit to do its job as the lead party in performing the environmental review. Respectfully submitted, Gina Holje, 5333 Oliver Avenue South, Minneapolis, MN 55419, gholje@usa-net

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Gina McKenzie 602 4th St NE Minneapolis, MN 55413 US

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, gina rueck schinkelst reutlingen, ot 72768 DE

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please don't put our natural resources in jeopardy. We live in a valuable area and don't need to have any of our water resources contaminated. Sincerely, Ginga Beza Newton 5814 Elinor St Duluth, MN 55807 Sincerely, Ms Ginga Newton 5814 Elinor St Duluth, MN 55807-1215 (218) 390-1694

We must protect our land! Please do not let mining take place Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

I wish to voice my support for the Polymet project. I have lived in the Ely area for 59 years. I love the area and trust that the state and federal agencies will do their job and protect our air and water. Enough is enough. Please get in with the permitting process and allow our area to gain hundreds of jobs so that our children can also live in this area. It shouldn't have to be just a retirement community or for tourism. Please put people to work. Thank you. Virginia Anderson 90 W Chandler St Ely, MN 55731 Sent from my iPhone

Ginny Knapp 552

Please prevent acid mine drainage from polluting our waters and to save us the huge future taxpayer costs of trying to cleanup the mess. No new mines. Virginia Knapp 2483 79th St E. Inver Grove Heights MN 55076

giuliano rigotti 40401

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, giuliano rigotti via vicenza trento, ot 38061 IT

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Gladys Schmitz 170 Good Counsel Drive Mankato, MN 56001

Glen Helgeson

I recommend the DNR not approve the EIS for the proposed PolyMet mine project. This nickel sulfide mine would be a short-term gain for an unnecessary long-term risk. Trading 200-500 years worth of mining pollution for only 20 years worth of jobs is irresponsible. Furthermore, treatment costs could exist forever. Do we really want to treat water pollution at a mine that has been closed for centuries just for 20 years of operations and 400 jobs. I say, "no". Trading 200-500 years worth of mining pollution for these jobs is simply irresponsible. PolyMet environmental study is inconclusive on water treatment. The EIS only covers the 20-year plan and is only specific about how much area would be mined and how much waste would be generated. The EIS doesn't provide details on how PolyMet would pay for water treatment. It doesn't provide details on how state officials can be sure the required financial guarantees will be there to adequately treat the water for centuries to come. The DNR and PolyMet is not really sure exactly how long will water treatment will be needed. Even the PolyMet officials say it's very uncertain. Furthermore, they won't know enough about potential contaminants until PolyMet begins unearthing and monitoring their impact. It would be too late for the public to stop the project if this were to happen. No one knows if PolyMet will be able to capture all the contaminated water. Even though they plan to treat the water with a reverse osmosis process, they won't know for sure whether they can capture all the water at the mine site and at the tailings basin. Acid mine drainage could potentially seep into the fractured bedrock allowing contaminated water to seep through and reemerge outside the mine site. Historically copper-nickel mines have never operated without polluting surrounding waterways, even when environmental impact statements for projects have been approved. It's too risky to permit mines with this track record in a water-rich and sensitive environment that drains into Lake Superior or the Boundary Waters. Glen Helgeson 901 Parkview Terrace Golden Valley MN 55416

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dr Glenn Barth Eden Prairie, MN 55346 glenn@goodcities-net Glenn Barth 7340 Hunters Run Eden Prairie, MN 55346

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

To the Commissioner of the Minnesota DNR: I have attended one of the informational meetings on the Polymet SDEIS and have reviewed the document and watched the news carefully. What concerns me is that the SDEIS acknowledges that the mine site will require water treatment and monitoring for 100s of years after the mine closes. And of course, during operations, there will be significant land disturbance and development of piles of tailings. The potential environmental damage and the enormous cost of protecting the environment outweigh the 200 or so jobs and the value of the minerals to be extracted. No such mineral mine has ever been shown to be environmentally protective; every instance world wide has caused a great deal of damage to surface and ground water, wetlands, and the landscape in general. It is virtually impossible to estimate the cost of 200-500 YEARS of containing the sulfate and other toxins and treating the water; no amount of assurance bonding or trust fund will be enough to cover the risk of failure of the protective measures. Consider the recent disasters of coal ash spills, 500 year flood in Duluth, and other rare but entirely possible disaster. This is no routine treatment process. We do not know whether the rock to be mined contains gunnerite, a mineral that is known to cause mesothelioma and one that the state has gone to great lengths to prevent becoming airborne. This alone is a huge risk. This mine will be in the Lake Superior watershed and has the potential to poison wild rice beds in our waterways and lakes. Recent studies have shown that 10 ug/L or more cause wild rice to decline in viable seed production and the growth is damaged. We cannot risk this important cultural and economic resource, as well as the riverine and riparian wetlands that might be damaged by sulfide containing water. As much as we all use the metals that Polymet would generate in our technology, we cannot afford to risk so much costly and long-lasting environmental damage for a few years of jobs. As much as I oppose the NIMBY attitude, we must protect our freshwater resources for future generations. the SDEIS recognizes the threats and the evidence convinces me that we should not permit sulfide mining in northern Minnesota. The integrity of our fresh water and our Minnesota culture that is based on clean fresh water and healthy watersheds for our quality of life cannot be put at risk. I urge the Minnesota DNR to refuse the permit the Polymet mine and other similar proposals (especially any that affect the BWCA or the Lake Superior watershed). We need to find alternatives to the metals required for technology - let's encourage such innovation in our state instead of ruining our natural resources for what is becoming old technology. Thank you for the opportunity to comment on the Polymet SDEIS. I am proud that our State of Minnesota is a democracy that gives all our citizens a chance to voice their opinion on these important matters. Sincerely, Janet Keough 2787 Northwoods Lane Duluth, MN 55803 nyssa52@northlccom

Glenn Oliver

Sirs: I believe that we need to maintain the pristine conditions of the BWCAW and not allow PolyMet to mine the land as they propose. We need to act as stewards of the environment because if this proposed mine is completed then you can bet your bottom dollar that chemicals will leech and the whole site will be impacted and useless. It just isn't worth the risk in the long term as a mine in the short term will poison the environment for generations to follow. No to PolyMet.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. If you give permission for a SULFIDE mine to operate in ANY PORTION OF THE GREAT LAKES, YOU ARE BASICALLY POISONING THE LARGEST SOURCE OF FRESH WATER IN THE WORLD. CAN YOU DRINK IT NO. WILL IT KILL THE WILDLIFE THAT DEPEND ON A FRESH WATER SUPPLY. YES WILL THE CITIES, THAT DEPEND ON A FRESH WATER SUPPLY WITHER AND DIE. YES. IS ALL THIS WORTH PUTTING MORE MONEY IN CORPORATIONS POCKETS. NO, NO, NO. Are you going to let GOOD SENSE PREVAIL, or are you going to be INCREDIBLY STUPID AND RUIN MORE OF OUR PRECIOUS RESOURCES. THIS COUNTRY ABSOLUTELY CANNOT AFFORD MORE CORPORATE ABUSES . Sincerely, Gloria Nugent 3854 Washington Rd Carsonville, MI 48419-9311

Gloria Scoonover

16003

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, As a concerned citizen and environmentalist, I submit these comments on the PolyMet Mining Corporation NorthMet Mining Project Supplemental Draft Environmental Impact Statement. My first reaction was what are these people thinking and do we never learn to consider the unintended consequences. Sulfide mining has never been done in Minnesota. It threatens wetlands, rivers, lakes and streams across the Arrowhead Region, which includes Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I see nothing that assures me that this will not happen should this project go forward I have grave concerns about this project's potential impacts on the region's natural resources and public health. Among these are risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is decidedly not in the public interest Sincerely, Glory-June Greiff 1753 S Talbott St Indianapolis, IN 46225-1758 (317) 637-6163

After reviewing the SDEIS we submit the following comments for response: The ability of PolyMet Corporation to perform this large scale project or meet the long term financial commitments called for is not proven. PolyMet has no record of successful mining. The average life of a multi-national corporation engaged in large scale business is estimated to be 40 – 50 years. It cannot be assumed they can or will perform the expanded, difficult and long term commitments described in the SDEIS. The SDEIS does not fully or adequately describe or project the cost of the following: Reclamation and Closure Fixed Engineering Controls Annual Post-closure Monitoring and Maintenance for the 200 to 500 year monitoring period Contingency Mitigation Transition From Mechanical to Non-Mechanical Water Treatment methods Due to the serious consequences and long term exposure described in this proposal we believe the SDEIS must fully address the potential for PolyMet to cease existence and performance of financial obligations. In order to make an intelligent decision regarding this proposal we believe the following questions need to be answered. What potential failures or problems exist for long term maintenance and environmental protection. If they happen, what will be the mitigation and correction required. What is the annual cost of Monitoring and Maintenance for the years after mine closure. Who will pay for it if and when PolyMet no longer exists. The SDEIS states \$3-5 – 6-0 million per year for Monitoring and Maintenance. What is the annual projected cost per year in the time period 50 – 500 years expressed in 2014 dollars. What assumptions about inflation and economic conditions can rationally exist to make these projections valid. Who will pay for shortfalls in long term Monitoring and Maintenance funding. What legal and financial obligations exist for the permitting agencies and governmental bodies that participated in this SDEIS and / or approved permits. What process exists for securing binding commitments now for financial participation in the 200 – 500 year period of exposure. If none, we believe this is a valid reason for not approving this SDEIS according to State law and regulations. Will the State of Minnesota be liable to cover shortfalls in long term Monitoring and Maintenance funding. What percentage. What is the potential cost expressed in 2014 dollars. What is the likelihood the State will be able to and be willing to cover costs for the critical long term Maintenance and Monitoring time period. Will St Louis County, the cities of Aurora and Hoyt Lakes be asked to help cover shortfalls in long term Monitoring and Maintenance funding if needed. What percentage. What is the potential cost expressed in 2014 dollars. What is the likelihood they will be able to and be willing to cover costs for this time period. What mechanisms can be put place that obligates these governmental bodies to participate in funding long term Maintenance and Monitoring/ Sincerely, Gordon H. Kimball Nancy O. Kimball 3036 Edgerton Street Little Canada, MN 55117

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, gordon marino northfield, Minnesota

Gordon Murdock 38758

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. That said, I also urge you to do everything possible to create environmentally safe jobs in NE Minnesota. Unfortunately the PolyMet mine does not meet this criterion. Sincerely, Dr Gordon Murdock 1489 Hythe St Saint Paul, MN 55108-1426

Gordon Palzer 39127

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Gordon Palzer 2221 Scheffer Ave Saint Paul, MN 55116-1161

Gordon Shetter 58060

The lands and waters will exist long after mining, and any potential benefits, is gone. It isn't worth the risk of our resources for corporate profits. The people need solutions that produce long term jobs and local prosperity, not resource extraction. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Gordon Sirvio

11329

From: Gordon Sirvio 42302 Chase Lake Road Deer River, MN 56636 To: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Memo: The PolyMet environmental standards needs to reflect the fact that our climate is changing. Climate at the mining site will become more extreme. Generally, it is projected, there will be lower natural precipitation but there will also be more frequent severe storms. Holding ponds need to be managed for not just a single 100 year storm using the climate standard from the 20th Century but the more likely event of this type of storm occurring 2 or more times in the same period of time. So we have a dual problem. With the diversion of water to the mining process, plans need to be made for how the surrounding land will be affected. Plus drain fields, dams and erosion controls need to be modified for the increase in periodic severe weather. This will mean modifying the accepted 20th Century environmental standards. Also, unless there is a 'real' current pollution cleanup solution, all protection standards for waste materials will need to be considered for the top timeframes actually experienced for cleanups of past mining sites. This means that, if in the past a 50 year projected safe zone that has not been successfully passed with mining waste sites of current and past projects, the projected time period should be extended to 75 or possibly 100 years. People have a tendency to plan for the future with an assumed increase in technology. This should not be done until that technology actually exists. It is unwise to bet the environment on a guessed future. HYPERLINK "<http://www.paulbunyan-net/users/gsirvio>"Sirvio's Keep

March 5, 2014 Mr, Bruner, Thank you for taking the time to collect public comments regarding the Sulfide Mining Proposal for Northeast Minnesota. We would appreciate your understanding why we are in TOTAL OPPOSITION to sulfide mining, and in particular, the sulfide mining proposal in our back yard in Ely and we want the proposal to sulfide mine Rejected. It is apparent to us, that under the quest to create jobs and for a questionable long term economic gain, there is a willingness to risk the environment, not be concerned for MN citizens and Northeast residents, ignore the devastating impact to existing Northeast tourism, real estate markets and the wild rice industry. Environment Sulfide mining has never been done successfully, without a huge negative impact to the environment. This damage cannot be repaired by just creating a Super clean-up fund, but in addition would take many lifetimes to correct, if ever. The acid runoff and ground water contamination would devastate lakes, rivers, the BWCA and Lake Superior. This is exactly why Wisconsin has now put a moratorium on any further sulfide mining in the State without demonstrated proof sulfide mining can be done without impact to the environment. ie the Flambeau mine. We in Minnesota are blessed with a pristine wilderness area of Northeast Minnesota and the BWCA which truly sets us apart from anything in the lower 48 states- is that worth risking. Economy Copper and nickel are currently in the limelight due to high prices, demand and availability- this too will go the way of iron ore-taconite and steel when China and other countries, all with low labor and process rates, start mining and processing these metals. When the US becomes a high cost producer, and they lose the demand for their product, then watch the mining companies pack up and leave with no regard to what is left or happens to the jobs, environment or economy in the Northeast. People need to wake-up and start measuring the TOTAL DOLLAR impact to the Northeast when mining and the ruined environment cause the current real estate market, tourist industry and wild rice industry to dry up. Personal My wife and I have spent 50 years in the Ely, Bear Head State Lake Park area. Over 30 years ago we purchased 5+ acres on Eagles Nest Lake #3. We cleared the property and built a year round log home. This home is a heritage for my daughter to retire to and for our grandson to enjoy as he grows up. The Eagles Nest Lakes Chain of 4 lakes, are pristine wilderness spring fed lakes. If this sulfide mining proposal goes through we stand a huge risk of ground and surface water contamination which would render our lakes and wells not usable. With that our property which we poured over 30 years of time, money, sweat and tears into would be worthless. Thanks for taking time to read this and we pray that all the folks involved with this sulfide mining proposal weigh the decision with common sense and facts and then VOTE THIS SULFIDE MINING PROPOSAL Down. Thanks for your time and consideration. Regards, Gordon and Kay Meier 6101 Century Blvd. Brooklyn Park, MN 55429 763-561-0676 AND 3780 Rustic Wood Rd Ely, MN 55731 218-365-5567 E-mail HYPERLINK "<mailto:GHM1942@gmail-com>"GHM1942@gmail-com

Gosia Mitros

40412

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Gosia Mitros 3112 Creekbend Ct Sachse, TX 75048 US

Grace A. Nelson

43470

Dear [Decision Maker], My name is Grace Nelson, a student at the University of St Thomas and furthermore an advocate for protecting the land of my home state Minnesota. I am writing to you as a concerned resident of Minnesota. I can see where you see the sulfide mining benefiting our state with the use of its minerals and providing jobs, but I do not see how those benefits outweigh the long term negative effects of the sulfide mining. As a homegrown Minnesotan, it is hard for me to think that the beautiful landscape of Minnesota will be dug up in order to make room for these mines. I also am not very fond of the negative effects of sulfide mining in terms of pollution of the land and its natural resources. I am a resident of Minnesota and would like to protect our land. I have many childhood memories of adventures up north and I know that the beautiful landscape and natural bodies of water are some of Minnesota's greatest treasures. I do not think that the benefits of 20 years of mining outweigh the negative long term effects on the land and on the people living in the surrounding area. Thank you, Grace Nelson

Grace Christenson

39773

Lisa Fay MDNR Division of Ecological and Water Resources Tim Dabney U. S. Forest Service Douglas Bruner U.S Army Corps of Engineers DENY THAT MINE. My name is Grace Christenson and I am 11 years old. I am against the proposed PolyMet sulfide mining. I care for northern Minnesota and all animals that could be affected. I think of northern Minnesota as a beautiful place for animals and humans to experience. The PolyMet sulfide mining would harm animals, the food chain and nature. The 11 endangered species population would decrease even greater than it currently is because of pollution and loss of habitat. Both lynx and moose are endangered and are protected by the Endangered Species Act. Unique wetlands would be harmed by PolyMet's mine. PolyMet does not state the matter of how they will clean up the mess from the mining. Only 1% is useful, the remaining 99% is toxic waste. This will leave us with hundreds of years of clean up, impacting human health. Babies born on the north shore already have a high mercury level from iron ore mining and a even higher level would occur from sulfide mining. Tourism is a big part in northern Minnesota jobs, if mining were to occur people would stop visiting. I am opposed to Polymet mining. I have written this from my heart and I hope you care about it as much as do. Sincerely, Grace Christenson Grace Christenson 12309 Fiona Ave N White Bear Lake MN 55110 [HYPERLINK "mailto:gracekchristenson@gmail-com"gracekchristenson@gmail-com](mailto:gracekchristenson@gmail-com)

14838

Dear Lisa Fay, EIS Project Manager I am writing to voice my opposition to the proposed PolyMet mining operation in our beautiful northern forest area of Minnesota. I have traveled to several western states and seen first hand the long-term damages done by copper mining. As a property owner in northeastern Minnesota, I ask you to not let this environmental disaster happen. The long-term damage done by this project will continue for years after you and I are gone. It is just not worth it. Sincerely, Bruce A. Palmer 418 Otis Avenue St Paul, MN 55104

14970

Dear Madam or Sir, Pure water, clean air, and viable soil are our only true wealth. The proposed PolyMet mine threatens all these, thus threatening the health of generations to come. The mine could close after 20 years, providing only one generation with jobs, while the monitoring of the watershed will need to go on for hundreds of years, becoming the responsibility of countless generations. The mining company could declare bankruptcy at any time, leaving financial guarantees unmet and taxpayers to pay for necessary closure, clean-ups and endless future monitoring. The risks so far outweigh the possible benefits that no guarantees of money are adequate. Please stop this mining project from going forward Protect our and our children's only true wealth. Sincerely, Grace Palmer 418 Otis Avenue St Paul, MN 55104

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Miss Grace Erba 410 Roy St Winona Lake, IN 46590-1804 (574) 269-0067

Grace Geier 1772

I would like to take this opportunity to say no to sulfide mining. Sulfide mines have historically been environmental disasters, and when mining companies disappear, it is left to the state and the federal government to do the clean up- don't let this happen to our beautiful state. Furthermore, I understand that mineral resources are important But water is a resource too- and one more instrumental to our survival. Moving forward with sulfide mining in a region where we don't understand ground water and where some of the largest fresh water reserves are located is pure insanity. Protect our state, protect our water. Please do not move forward on sulfide mining.

Grace Heitkamp 37178

To Whom it May Concern: NO, NO, NO, NO, NO, NO, NO to PolyMet. I do not trust that they have the best interests of the state of MN and especially its people at heart. How can we gamble with our natural beauty and life-sustaining water. Sincerely, Grace Heitkamp 11677 Gilbert Trail, Lonsdale, MN 55046 507-744-4661 artist

Grace Kelly 46938

Minnesota is being sold a false choice between picking between jobs and environment. We can do both. The Solutions Project maps out an transition project of going to wind, water and solar that would create 63,500 construction jobs and 39,300 operation jobs. Contrast that with the 360 jobs that Polymet is promising. Polymet is proposing a different type of mining than we have had before. It is a mining that is heavily polluted with heavy metals and sulfates. Storage is simply done in open pits, open to the weather, open to seepage. Even the company's own models show pollution with expensive treatment for 500 years or more. Let's be real. Once pollution gets into the underground aquifer, there is no undoing it. Our rivers will carry the pollution all over. At that point, we will have to treat all our drinking water or suffer the health effects. We have an incredible growing brewing industry that will be put at risk because good water is essential to brewing. Let's face it, we are being held hostage for 360 jobs. Polymet can go elsewhere and will go elsewhere if it has to pay for safe mining. There are still third world countries who will allow any type of toxic mining. Minnesota wants to lose those 360 jobs, because the cost of losing safe drinking water is way too high. Do any green energy project from the Solutions Project. Please consider raising my income taxes now for green projects instead of having me pay more for clean water forever. It will cost me much less. Companies are good at ducking financial consequences. They simply bankrupt the shell company or change the laws. Even if you can get a company to pay there is still no financial amount can cover permanent water pollution. Tell me what amount would make you want to watch loved one die early from these toxic effects. Lets face it, there is no financial amount of money that can fix this pollution. No compromise is acceptable. Just say NO. Grace Kelly 1660 Hague Av St Paul, MN 55104 651 246 6717

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining in and of itself may not be considered dangerous in many areas. However, when such action is taken in an area, any area, close to one of our most precious natural resources, fresh water, it must not be permitted. Sure, proponents will tell us that have done everything possible to assure the safety of our precious and limited fresh water supply, that there is no danger of such being contaminated. until one of two things are involved .greed and stupidity. We can perhaps control greed and the poorly designed process shortcuts that develop from that; However . stupidity has no cure. We simply cannot put ourselves in a position to second guess this pending disaster. . Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt I strongly oppose it. Sincerely, Graham Murdock 937 S Feldkamp Ave Springfield, IL 62704-2311

Grant Johnson 18225

My name is Grant Johnson, G-R-A-N-T, J-O-H-N-S-O-N. I have a master's degree in public health at the University of Minnesota in community health promotion. I'm from Duluth, currently living in Minneapolis, but working up north in Aurora and other cities on the East Range. I run and -- well, more snowshoe these days on the trails behind Giant's Ridge, swimming in Lake Embarrass almost every day in the summer when I drive by in Biwabik and fish up there every chance I get. And before I begin, I want to give a nod to my great grandfather, who worked in the mines in Hibbing when the mines were just starting. So with my connections up north, if someone were to ask me do I support mining, my reply is yes. I do support mining and the Iron Range, but I do not support the kind of mining that is proposed with the copper-nickel mining. I believe that this mining is a threat to the environment and to our water supply. We are fortunate that the iron ore mining that has been done in the past is fairly clean and at the end of the process is just a big pit and mounds that we all see with little to no toxicity. But I have major doubts about this current copper-nickel mining and the impact that it will have. From what I've read in the research, the risks to our water supply is potentially compromised. This is our water we need to live, not just playing. So we are fortunate to have such a vast water supply in Minnesota and I want to keep this safe. The environmental threats to our water supply puts risks -- health risks to our towns up north and moreover, even puts at risk the tourism industry up north. And more on the -- more on the economic impact, I am disappointed that most of the profits from the mining won't stay in Northern Minnesota or even Minnesota. As we talked about PolyMet, it's not from Minnesota or even the United States. Again, it's from Toronto. So I feel that they're not completely invested into our community, even though we may think they are, being from up north, but they're not. So again, if anyone asks me if I support mining, my answer is yes, but at this time, with the risks involved and potential major financial gains being exported, I cannot support the copper-nickel project. Thank you.

grant k 15471

As a native to Minnesota state, I would like to voice my OPPOSITION to the Northmet mining project. As a child i frequently visited much of the wilderness on the range and would like it to stay as just that, wilderness. I would like to see northeast minnesota to remain pristine and untouched by industrial pollution so my children will be able to experience the wonder of our pristine lakes and rivers and our great forests. The north met mining project is a bad news for the future of Minnesota's natural environment. Sincerely Grant E Kahl 5751 Bergquist RD Duluth MN 55804

Grant Thrall 3875

Mining for these metals is not in anyone's interest, other than those who would profit financially, foreign or local, in the short term. Our environment is far too precious to even consider damaging our nation's, or Canada's, watersheds in the short term. But 500 to 2,000 years of pollution management for the short term gain is unconscionable. Grant Thrall 4038 Blaisdell Avenue South Minneapolis, MN 55409 612-827-7054

10727

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, properly, which will provide legal justification for rejecting the sulfide ore mining plan. I am a father, lover of nature and Minnesota taxpayer. The proposed mining endangers my children, the BWCAW and guarantees Minnesota will be on the hook to pay for the perpetual cleanup of a project that would give a small number of people jobs, and little revenue for the state. Sincerely yours, Grant Thrall Grant Thrall 4038 Blaisdell Avenue South Minneapolis, MN 55409

Grant Thrall 15094

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: Please reject the PolyMet Land Exchange as just plain wrong. National forests are created to be preserved, in perpetuity. Any land swap would be one that would diminish the concept of national forests, especially in favor of a commercial interest. It is also inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. Sincerely Grant Thrall Grant Thrall 4038 Blaisdell Avenue South Minneapolis, MN 55409 612-827-7054

The cumulative effects analysis area must include the St. Louis River. The EIS limits the area to the Partridge and Embarrass River watersheds. This decision was not scientifically supported. There must be additional work to assess cumulative effects on the St. Louis River as the St. Louis is in a watershed where the mining discharge occurs. There's no scientific rationale for not including the St. Louis River. The impacts of the St. Louis should be top priority due to the size and importance of this watershed. Grant Wesley Anderson 6783 Nelson Rd Culver, MN 55779

Dear DNR People: Please confirm that you have received this and it is added to the record. The proposed Mine's EIS is full of gaps, incomplete analysis, and problems that call into question how accurately it describes the environmental impact of the proposal. The mine plan inaccurately describes wild rice waters, understating the area that supports stands of wild rice. In addition, the mine plan claims to reduce sulfates, but that assumes that expensive water treatment will continue for hundreds of years. Millions of gallons of untreated polluted water will escape every year, and the mine plan predicts an increased chance that water exceeding the sulfate standard will be released at times, years after closure. PolyMet is proposing something Minnesota has never allowed before. The company's own computer models show that hundreds of years after the mine closes, water seeping into groundwater and flowing into streams and rivers at the site will be polluted with heavy metals and sulfates. Unless all of this water is captured and treated, the mine will pollute surrounding waters. Minnesota law requires that a closed mine site be "maintenance free," but PolyMet's mine plan calls for hundreds of years of monitoring and expensive water treatment. Worse, these models don't even show that the pollution stops after 500 years. They just stopped modeling at 500 years. In other words, the pollution could go on for even longer. PolyMet would be a huge consumer of electricity, much of it coming from the dirtiest coal power plants in Minnesota. PolyMet's electricity supplier, Minnesota Power, got 85% of their power from coal in 2013- PolyMet would emit 707,342 metric tons of carbon dioxide into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. One part of the PolyMet mine plan is an estimate of how much in taxes the mine would pay if permitted. The tax estimates in the PolyMet mine plan lack detail, are full of discrepancies and contain explained changes. From one draft of the mine plan to the next the estimated taxes jumped 500% without explanation. This is important, since the state taxes that would apply to a copper-nickel sulfide mine have never been used before. The copper-nickel mining industry is exempt from several state and local taxes, such as property tax and corporate income tax, and has its own unique tax structure. Therefore, the State of Minnesota should confirm these tax estimates, and not just rely on the company to provide them. There are many other problems to the proposal so I list a few important ones here. Please reject this EIS with prejudice and refuse to allow this destructive mine to be created. Thank you. Energetically, Christopher LaForge Great Northern Solar 77480 Evergreen Road, Suite #1 Port Wing, WI 54865 715 774 3374

Greenwood Vytautas Champ

Something to keep in mind: there is no need for mining. I only care about the safety of our planet, and its life. Please stop doing what the doped masses want. Mining is detrimental to watersheds, the air, food, etc. Why mine for the sake of greed? It is fact that mining is terrible for the ecosystem. Any study which states that there is no detrimental is conducted by a corporation. This is tampered data. And what about the fishes which are in danger? Mining and fracking can eliminate fish like Black Redhorse, greater Redhorse, River Redhorse, Gravel Chub, Topeka Shiner, Plains Top minnow, Pallid Shiner, Wetern Sand Darters, Crystal Darter, and Bluntnose Darter. We lost the Ghost Shiner, let's not lose any more species. I know mining will occur in the southeast corner (where the species I mentioned occur) in addition to the north.

Greg Allen

18106

Good evening. My name is Greg Allen and I'm superintendent of Mesabi East Schools, this school right here; home of the Giants. I am an avid outdoorsman. I care about the environment. I use our natural resources. I canoe, camp, fish, hunt and enjoy this area. I enjoy the natural beauty of the state and believe mining can co-exist. We live in a beautiful area, where mining has existed for generations. I care about protecting the environment as much as the next guy. I support the PolyMet project. As the Iron Range's population has steadily declined, naturally, so has our school enrollment. As you may know, or may not know, school funding from the state is based on a per pupil count, which is why over the years so many schools have consolidated. And if you take a look in the large commons, you will see about 21 different school buildings that are now all students are housed in one. It is quite a wall of buildings. Many districts have been forced into short-term borrowing to cover costs. Schools on the range do not receive property tax from the mines. They receive a taconite tax, when the mines are producing. This extra funding helps, but it is not stable funding. PolyMet mining will bring in new jobs, which will bring in new families. School enrollments and our ability to add teachers, class offerings and new technology will increase as a result. I support PolyMet. The mine's economic impact will directly affect the Iron Range's schools' ability to provide a top-notch education for our children. The DNR U.S. Forest Service and the U.S. Army Corps of Engineers have done great work. If I were grading it, I would give you an A+. Thank you for your comprehensive work. I support this project and the PolyMet project on behalf of one of the many schools that will benefit of this well-designed project. I encourage you to move forward. Thank you.

Greg bastien 43115

Dear Ms Fay: The Polymet mine proposal for northern Minnesota has some immediate benefits and long term hazards. At the financial hearing conducted by the House it was clear that the review process for possible catastrophic events only takes in short term events. The failure of a holding pond or undetected ground water infiltration could leave the state with liabilities that extend to other states and Canada with only sufficient funds to handle short term plugging of holes. The \$2-4 billion down payment in a trust fund would be difficult to administer and with successors likely for the company in the future distributing any excess at the end of the period when the material from the mine is safe would be problematical. On a purely technical basis the reuse of the old mine facilities is economically prudent for the company the difference in sulfide mining and taconite mining is considerable and the safety net for water resources is and would be insufficient. All ponding would have to meet a 300-500 year impermeability standard. All processing would have to be contained with no release to outside air and water. While not impossible these safeguards would drive the cost so high that the promised 20 year window of production would close much sooner the short term gain would be that much less with fewer jobs and less payroll. Until we have mined our garbage dumps for old copper and nickel I would pass on any new ventures involving perhaps decades of debatable clean up if the worst happened. Sincerely, Greg bastien 2709 E. Minnehaha Parkway Minneapolis, Minnesota

Greg Benedict 26618

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I come from a hunting and fishing background that has a deep love for the outdoors. Much of my childhood was spent in Superior National Forest, and I know the aesthetic value that it has for many people. I have witnessed already, in the past 4 years, the extensive logging and deforestation of many of the areas me and my dad would go hunting. I know of the water pollution problems on the north shore from the refining processes. I watch slowly through the years as irresponsible mining and logging operations degrade the habitats where grouse and deer used to be numerous. Its not just about the wild game, but of the ecosystem health as well. The more forest/protected land that goes to these giant excavations, the more pollution and disruption of natural processes will occur. I won't throw statistics and numbers out there to make myself more "credible," there is no need. You don't need a scientist or a mathematician to tell you that something is wrong with polluting and depleting the very environment that we need for survival. I would feel deeply disappointed if I witnessed any more significant damage to the places I love to visit like Superior National Forest and BWCAW. They aren't just places to go, they are places that facilitate spiritual growth and understanding. Places that are relaxing, slow, peaceful, and calm. The experiences of complete wilderness are beyond anything in a book. If the money and the jobs conquer the argument, I understand. Many push the idea of money over everything. Its never about the everyday people who make connections, memories, and above all harmony with the land. However, I hold the utmost respect to you, who hear the actual voices of the people. I wrote this short testimony to let you know that this mining proposal is a ludicrous, destructive endeavor. Don't let the money cloud your vision in making the decision, and don't allow them to destroy and abuse more beauty in Superior National Forest. Sincerely, Greg Benedict 151 Excelsior Ave S Annandale, MN 55302-9610

Greg Benson 38887

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Greg Benson 1525 Woodcrest Dr Duluth, MN 55804-1426

Greg Boom 6198

Minnesota has strong environmental laws - Polymet will be environmentally responsible. The environment safety will be covered by Minnesota laws. This project will create tax money which every state needs. It will provide jobs for a area that is not over flowing with employment. Greg Boom 103 Woodland Springs Road, Denver, IA 50622

Greg Chester

11005

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: As a resident of Northern Minnesota I urge you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. This would allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to the Ojibwe Nation. The Land Exchange sacrifices our sacred lands to a foreign corporation, not for the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. It will endanger both a valuable watershed and Lake Superior, one of the largest fresh water lakes in the world. Its diminution or loss resulting from this and several other existing and proposed mines would be a global tragedy. Its pristine waters are far more valuable than the momentary gains of a temporary mine. Rejecting the PolyMet SDEIS as inadequate, the proposed PolyMet sulfide mine, and Land Exchange would be for the long term benefit of those of us living in the region. The dangers far outweigh the benefits. We live here for the clean air, soils and water and the health of our future generations. And we honor our treaties with the Ojibwe Nation. Please do not put these at risk. Sincerely Greg Chester 6312 164th St NW Cass Lake, MN 56633 218-335-6501

44601

Dear Ms Fay, Dear Ms Fay and Mr Bruner, The proposed PolyMet NorthMet SDEIS is in my backyard I live in Northern Minnesota and live here because of its natural beauty, healthy environment to raise children and grandchildren and healthy water and fish and wild game to enjoy and eat at times without fear of contamination. We can drink our well water without fear of contaminants. Most of the continent was like this a few hundred years ago. This is one of the last areas left where a person can sink a 25 foot well and drink sweet clean water. Please do not poison this area like others have done with so much of the rest of it. I urge you to reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine as well as the wastes proposal because of its unacceptable risks to human and the natural ecosystems' health. Mercury is just one threat to our environment and health. This should not be dug up and released into the environment including our streams, rivers, and lakes. Some of our fish are already tainted with mercury from coal fired power plants. We do not need more. The threat to humans is very real as well as eagles and osprey. The cost benefit ratio shows that we may lose far more than we gain from the mine. What tourist would want to leave an urban environment to come to a contaminated rural area. This poisoning may drive many away. They might as well stay at home and drink their city water and breath exhaust fumes. Thank you for considering my views. Sincerely, Dr Greg Chester Greg Chester 6312 164th St NW Cass Lake, MN 56633 218-335-6501

Dear Minnesota DNR representative, I hope this email finds you well. I am writing to provide personal comment on the proposed PolyMet copper-nickel Mines in Northeastern Minnesota. I write this not only as a concerned outdoorsman, but also as an economist with a master's degree in natural resource economics from the University of Wisconsin-Madison - one of the leading economics programs in the world. I am well aware of the cost-benefit analysis project that precedes such projects, and am also aware of the demand for precious metals for household items like cell phones and electronics. However, I strongly urge the state DNR to consider the true and lasting impacts this proposed mine may have on current and future generations. I am concerned that the analysis has not fully included the economic benefits of the landscape as is - including the recreational use, bequest, and existence value so many Minnesotans and Americans place on the Boundary Waters. Tens of thousands of recreators from around the state, country, and world, not only visit the BWCA annually, but many like myself behold the region as one of the last unspoiled wilderness areas in the continental United States. Imagining a headline that reads: "Sulphur leeches into lakes, pollutes nearby rivers, fish and wildlife at risk". I am a supporter of extraction and manufacturing jobs, especially in economically depressed areas, however, I am not convinced that the proposal as it stands now will guarantee that a) negative environmental impacts will be avoided, and b) that jobs created will last and profits from the extracted minerals will stay in Minnesota. I urge you and your colleagues to apply the highest possible standards to your review of the proposal, and to consider the long-term impacts of the project on future generations - generations who have yet to experience the wonder and quiet of the northwoods. In an increasingly fast-paced and noisy world, we need places that are unspoiled by human intrusion, and my money is on keeping the BWCA free from mining. I appreciate your time in reading this letter. Sincerely, Greg Jackson Conservation Crew Leader, Angler, Minnesotan.

Greg Keilback

2508

To those opposing the audacious activity: I ask as strongly as I can for you to have me do more. I am an ecologist and am currently working out of a nature center in Northern Illinois. I lived in the Ely area for three years while attending school before transferring on. In my position I have brought many folks back to the area and will do so again this spring. Last year we met with some of the mining speculators and listened to what they had to say. This is the same fight that the Superior National Forest and the BWCAW has seen before, just with new faces. I wish Sig was here to help fight this one too. Like Sig, I am a writer and been fortunate enough to see my work on land issues published on a national scale, although to no degree of Sig's work. Please let me know how I can be of a greater resource in spreading the word that the fight is not over. I believe that as long as there is a fight and conversation there is active hope. Greg Keilback From: *NorthMetSDEIS (DNR) [mailto:NorthMetSDEIS.dnr@state.mn.us] Sent: Thursday, December 12, 2013 7:44 AM To: Greg Keilback Subject: RE: Comment on PolyMet NorthMet SDEIS Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. Feb 15, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Mr Greg Korelich 1840 Albany Dr Santa Rosa, CA 95401-3605

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr greg lee 5501 Thomas Ave S Minneapolis, MN 55410-2545

greg mcneely 41884

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, greg mcneely Stpaul, Minnesota

Greg Olson 39878

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Greg Olson 7373 Ann Ct Eden Prairie, MN 55346-3111 (952) 943-0839

Greg Perrell 6243

5 generations of my family have enjoyed the benefits of living on the Iron Range. This last generation will hopefully see mining continue in a responsible way (Polymet) or they will see the demise of Northern Minnesota. God gave everything on this earth to use and enjoy. Polymets approach to use what God gave us responsibly is a perfect example of that Greg Perrell 218-969-1411 Sent from my LG Optimus G Pro™, an ATandT 4G LTE smartphone

Greg Pittelli 57539

Berkeley Pit. Learn from it. Don't destroy this beautiful place forever. Minnesota is smarter than that.

I do not believe the technology exists to do this without causing environmental damage. If it does, mining companies would be using it. They are not, as far as I know. Could you provide us with examples of where this so-called technology is being used successfully in other sulfide mining operations around the world. How much will it cost to treat the water for upwards of 500 years, and who will pay for it. We all understand that as soon as the mining companies are finished extracting - they are gone. Bankrupt in some cases, as we've seen in the paSt Layer upon layer of shell companies, leaving taxpayers to foot the bill. All one needs to do is look to the western United States. It's my sincerest belief that, contrary to you and the mining companies, these mining operations will produce acid rock drainage. Start reading on page 5-99- From a stockpile duration how long is temporary. Research shows that within 3 months - acid mine drainage starts to occur. Might be 30 years in a test tube, but in the wild - it can start in 30 days. If I'm not mistaken, the first failed EIS draft said that the sulphur content was 4%. And at the time, they tried to tell us that 4% was considered low. It is not, and now the concentrations seemed to have changed. Can you explain. Please read this: http://pub.epsilon.slu.se/1874/1/Kappan_Avhandling_nr_08-88-pdf Long story short, until mining companies can produce real results showing no environmental damage from current operations, I am not for sulfide mining in Minnesota. Regards, Gregory A. Solberg 1645 Millwood Ave W. Roseville, Mn. 55113

The SDEIS for the Poly Met Mining Project is flawed and does not guarantee that sulfide mining can be done in Minnesota without seriously harming water and habitat. This project should not go forwaRd We need to move slowly and carefully on this effort. While a boost to our economy is always tempting, any long term adverse environment impacts will certainly vastly overshadow any short term economic benefits. Our healthy natural environment is our legacy to our successors, not our bankbooks. Thank you, Greg Swanson 651-459-5455

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely greg tofte 152 sawbill trail tofte, MN 55615 2186637829

I OPPOSE PolyMet Mining. PolyMet should be required to make a cash deposit to the state in the amount necessary to pay for any environmental problems they create, this deposit may be refunded when all risks to the environment have passed (I believe this is estimated to be in 200 to 500 years). As a shareholder of Minnesota Power (Allete) I thank them for providing this card to express my opinion to you. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Gregg Wiitala

9289

Dear Ms Fay: Please reject the PolyMet NorthMet SDEIS as inadequate and as there is considerable evidence that this approach is not environmental sound. The area that is proposed for the PolyMet open-pit sulfide mine is located in one of the most pristine areas of Minnesota and enjoyed by so many people. Potential negative environmental damage to surface and ground water quality is something hard to rectify and often not possible to rectify. I'm also sending a copy of my email to the US Environmental Protection Agency. The PolyMet SDEIS and the PolyMet sulfide mine plan both should be rejected as many of the assumptions used were not realistic. Recent news of internal DNR documents showing that base flow at mine site was seriously underestimated. Neither the SDEIS nor the sulfide mine projects are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) is not supported by scientific evidence. This assumption allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. It is unethical to ask future generations to pick up the tab for clean-up that occur in the future when we know what the real risk is. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. There will be improved mining processes in the future that will be better equipped to protect this fragile environment. I think the good folks of Minnesota would rather wait for a safer mining operation rather than move forward with a risky project now. Sincerely yours, Gregg Wiitala 131 Needham Rd, Grand Marais, MN

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Greggory Jennings, Wildlife Biologist PO Box 912 Ashland, WI 54806

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. If approved, the mine will pollute Lake Superior, threaten our clean water and wild lands, and endanger public health for generations to come. A decision in favor of PolyMet's proposal would open a floodgate for more sulfide mining in a large area near Lake Superior and surrounding the Boundary Waters Wilderness - considered by some as one of the most beautiful wilderness areas in the world. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Gregory B. Gregory 1321 N 21st St Milwaukee, WI 53205-2406 (414) 933-9167

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Granting Polymet permission for Sulfide mining is like letting the proverbial camel stick his nose into the tent. If one sulfide mining operation is allowed, then all others will demand equal treatment under the law. If each company digs for twenty years and then leaves behind a source of pollution that will have to be monitored and managed well into the future, pretty soon mining scars and environmental watch areas will sprout all over Northeastern MN. There is no sure way to manage the results once the Pandora of sulfide mining is let loose. Please count my vote as being against this proposal. Gregory Garmer, Duluth, MN The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Gregory Johnson 17713

Attached are my comments about the proposed PolyMet mine in Northern Minnesota. Gregory L. Johnson

Gregory M Anderson 54556

The risks are too great to the environment. I fear the clean up operations will offset any profits. This is not good for Minnesota.

Gregory N Rautell 57208

Only thing this is going to benefit is the politician's pocket books. This mining is going to pollute the land and waters so my grandkids will not enjoy what I have. And when they are done making their millions of dollars they will pull out and leave the taxpayers to clean their mess up. Just like Duluth's steel plant cleanup and cement plant cleanup. Gregory N. Rautell 5557 N. Cloquet Rd Duluth, MN 55810

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Greta Bergstrom 46344

Thanks for offering public input in this critical process. I am writing to request that you revise the draft EIS to address Minnesota Rules 6132-3200, clarifying to the public how the post-closure activities described in the mine plan are consistent with the mandate that the mine site be "maintenance free" upon its closing. It is my understanding that existing data in the water management plan supporting the SDEIS show that sulfates and metals will dramatically exceed water quality standards for hundreds of years after closure. As we know, releasing sulfuric acid into our water supply will taint it. The reverse osmosis water treatment that will be required for hundreds of years appears (to me) to be in conflict with Minnesota Rules requiring that mines be "maintenance free" at closure, bringing the project truly to a close without harm to our environment or excessive costs to state taxpayers. Please show how exactly PolyMet's North Met mining project would meet applicable water quality standards upon completion/closure given these Rules. We cannot cut corners on crucial questions required to accurately evaluate this project including making sure our water stays clean and safe (throughout as well as beyond project completion); taxpayers are protected; and we have strong safeguards in place for when things go awry which has always been the case in every other sulfide mining project that has been undertaken. Thank you. Greta Bergstrom St Paul

Greta Fay 57974

Please don't mine in the BWCAW. I grew up there and don't want it to change. Please don't dig. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Gretchen 45407

One has to look at the taconite mines past to realize the horrendous impact a copper mine would have on our state jewel-the boundary waters. The mining companies quickly disappear when the profits are gone and leave the ravaged environment for the taxpayers to clean up. Sent from my iPhone

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Gretchen Zell 14250 Jonquil Ln N Dayton, MN 55327-9656 (763) 323-7884

Griffin Henjum

To whom it may concern, I am concerned with the long term safety of the water. I do not believe all contingencies can be anticipated and that the state will ultimately come out poorly. There needs to be very long term, perhaps indefinite, water protection. The BWCA should be protected at all costs. Once damaged or altered, it can never be replaced. The mines will eventually come and go. Steven Fisker 590 Palmer Drive Pine River, MN, 56474 (218) 587-3156

Gwen Myers 58129

This project must not be permitted. The SDEIS is inadequate and inaccurate and confusing. How can it be that all their science cannot predict how long water treatment would be required? How can PolyMet say they will be able to answer the question after they've begun mining? Incredible!

Gwen S Myers 18887

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Please increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Gwen S Myers 12009 Hilloway Rd W 12009 Hilloway Rd W Minnetonka, MN 55305 952-545-8686

Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I strongly urge you to reject the proposed PolyMet mine. I am well aware of how mining companies strip an area of minerals or metals, and then ignore responsibilities for the mine sites and environmental damage, based on what I have seen in Arizona, where I own a seasonal home. The sites are just abandoned, and the state is left to clean up the site at the expense of the state and the taxpayers. Too often, the mining companies go bankrupt and/or just walk away from the mine and the state has no recourse for restitution. The financial responsibility for the clean up is borne by the state and taxpayers, and in the case of Arizona, the state has not had the financial resources to restore the area that was mined. What financial guarantees does Minnesota have so this does not happen to the state of Minnesota and our taxpayers. I am greatly concerned about this for Minnesota. The Polymet project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. It is clear that the main concern of PolyMet is the profits that can be obtained, and the Range wants jobs, even though the jobs are relatively short term. Lake Superior and the Boundary Waters area should not be irreversibly compromised and sustain long term damage to satisfy corporate profits. The high risk of irreversible and long term (500 year) damage to our beautiful wilderness areas cannot be sacrificed or justified for short term jobs and corporate profits. What real financial protection does the State of Minnesota have for all of the clean up that will be required. Also, since PolyMet is a Canadian company, how easily can any obligations be enforced. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I strongly urge you to reject the PolyMet mine. Sincerely, Ms Hallie Finucane 2447 Chatsworth St N Roseville, MN 55113-3315

Hello, I am a young citizen of Minnesota and am concerned about the issue of the insertion of a mining site. I do not support the decision to go forward with this movement. I live in a suburb of the Twin Cities, and traveling to the fresh air and beauties of northern Minnesota is a treasure. Having the mining site located outside of the boundary waters creates a strong case for the degradation inside the reserve. Run-off of chemicals is expected to occur. For me, the natural resources and quality of air, land, and water in one of the purest places in Minnesota are most important. The pride I have to live in this beautiful state is founded by the natural aesthetics and fresh air accessible to all. People travel from far across Minnesota and other states to visit and breath the fresh, not as polluted air. Being disrupted by this mining site will change the opinions of many negatively. Hanna Hindt

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, hanna poulsen Tigaiga Pt. de la Cruz, ot 38400 ES

Hannah

44577

My name is Hannah Hinh and I am a senior at Prior Lake High School. As a young person living in Minnesota, I do not agree with allowing polynet to mine. Although it will provide few jobs, the ecological damage will affect the natural habitats of Minnesota and the Boundary Waters to a great extent. I don't want to go to the Boundary Waters expecting to see a beautiful lake surrounded by lush forests and find mining residue polluting the area around it. I also don't believe the company when they say that they will clean up the mess and pay for ecological damage. Most of the companies that "claim" they will clean up usually file bankruptcy and leaves the next generation to clean up their mess. I don't agree with the plan to mine due to the guarantee of ecological damage.

Hannah Jents

54342

Dear Ms. Lisa Fay, EIS Project Manager, I am an eighth grade student attending South West Junior High School. I think that PolyMet Mining has a good plan in place. I think that this copper-sulfate mining process will benefit Minnesota. Some of the advantages that there will be are more jobs open for people for mining and mechanics. It could bring more businesses over, opportunities and industries too. There are some disadvantages though. Water and air pollution could be a problem if they are not treated right. Also some of the chemicals could harm the environment around the area too. It could affect cultural resources by stunting the growth of the wild rice if not treated properly, same with the runoff water and rivers. I do agree with the Land Exchange offers. I don't think that this will affect me right now, but it might in the future. Though, it could affect people now who are looking in to mining and mechanics or live by that area. Sincerely, Hannah Jents

Hannah Maertz

43835

My name is Hannah Maertz and I live at 2006 east 1st street, Duluth, MN 55812 I am incredibly concerned for the well-being of future generations if the PolyMet mine proposal succeeds. Even the company acknowledges the large amount of water pollution that will occur for hundreds of years after the mining takes place. As a Minnesotan, I am proud of our state's abundant water supply and our ability to ensure it's quality. I believe this mine would greatly jeopardize that. Thank you for your time and consideration. Please do not let this mine become a reality.

57265

Human life as we know it is incredibly-nay, ENTIRELY-dependent on water. The proposed mine plan does not keep Minnesota's water safe and clean. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. Is short term, unsustainable, monetary gain worth centuries of damage to a vital resource? Please support MN and earth friendly energy plans – not this mine! Hannah Maertz 2006 East 1st Street Duluth, MN 55812

HYPERLINK "<mailto:hansolsen44@yahoo-com>"hansolsen44@yahoo-com Lisa Fay, et al EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Copies: Wide Distribution Dear Ms Fay: This is a response to the request for public comment on the PolyMet SDEIS for the NorthMet project. I am a local citizen who supports this mining and is actively engaged in ensuring that it is done right, what I like to call Minnesota right. Offered in this spirit, here are some substantive suggestions that are intended to improve the NorthMet project plan and the associated SDEIS going into the permitting process. Please seriously consider these ideas. There is a summary followed by supporting detail, beginning with this overview: Cumulative effects: Herein there is disagreement with the decision to exclude certain cumulative factors and a suggestion for one major addition to be considered. This involves an important open decision by regulating agencies that is avoided in the current SDEIS. It must be decided whether to concentrate copper / nickel ore processing in one river drainage or disburse it across all three. Long term pollution mitigation: There is also disagreement with the decision not to consider certain catastrophic failures and a suggestion for public funding of long term secondary mitigation measures on a fairly grand scale. Water use: There are specific suggestions relative to Colby Lake and the Whitewater Reservoir. Solar panel arrays: There is a suggested alternative supplemental cover system to cap stockpiles and tailings basins. Wild Rice: There is a specific plan for compensatory mitigation that affects certain lakes and rivers that currently hold wild rice but are impaired. Infrastructure improvements. There are two suggested new public roads plus certain floodplain proposals. Maps: There are suggested improvements for maps in the SDEIS. Among other things maps need to more clearly show the Laurentian Divide. Summary: The SDEIS section on Cumulative Effects must include some high level analysis of the impact of multiple copper / nickel mines processing their ores in this immediate vicinity, and of PolyMet processing larger volumes for longer periods. There needs to be some conceptual analysis of the impact on these headwaters of multiple copper / nickel mines operating there for a hundred years. It is simply not acceptable to affirmatively permit this one mine for only 20 years without considering the more global impact that surely will follow. In fact, if this were to be the only copper / nickel mining project ever undertaken in the Duluth Complex, it should be turned down. We are not evaluating a new mine here, we are evaluating a new industry. For the same reason a specific analysis needs to be done of Twin Metals processing their ores using excess processing capacity at this same site. That possibility is too real and too imminent to be excluded from your analysis. At a bare minimum this EIS needs to identify one backup site for an additional tailings basin and needs to update the impact on the local hydrology assuming a doubling of the projected volume of ores processed in this same time frame. That analysis needs to consider refilling the West Pit at twice the forecast rate. The assessment of cumulative effects should not be limited to known specific pl

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Harlan

43962

The proposed PolyMet mining project is too risky. The SDEIS tells us that water pollution and other environmental harms can be prevented or contained for 20 years of mining operations and hundreds of years thereafter . . . if the reverse osmosis water treatment and other systems work as they are designed to work, if nothing goes wrong, if extreme weather events or other natural or human-caused catastrophes do not occur, if the containment barriers are not punctured or overwhelmed, etc But unforeseen things do happen; in the real world, unexpected events should be expected; and hundreds of years is a very long time. The likelihood of a breakdown in PolyMet's proposed operations is great, and the consequences to the environment would be disastrous, especially in this fragile and water-rich part of the Lake Superior watershed. The short-term economic benefits of the mine would not be worth the price of the potential long-term harm. Harlan Cavert 100 2nd St SE, #1002 Minneapolis, MN 55414 (612) 378-2919 [HYPERLINK "mailto:hmcavert@msn-com" hmcavert@msn-com](mailto:hmcavert@msn-com)

Dear Comment Reviewer: I find the NorthMet SDEIS to provide a very strong basis supporting that the project move forward and I encourage the appropriate authorities to do so. There is confusion in the public media about the impacts related to the potential for ground water or surface water contamination or a potential need for an extended, undefined term of mechanical treatment. It is my understanding that extensive lab leaching tests and related modelling have been conducted that address and resolve these issues, but I do not believe this has been made adequately clear to the public, since this remains a commonly cited objection and most people cannot reasonably understand a 2300 page technical document. I recommend in your approval of the project that you provide some better summary of this collection of issues. Harold J Noyes P. O. Box 1186 Golden, CO 80402

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Harold Kapaun Jr 2207 Reaney Ave E Saint Paul, MN 55119-3949

To: Lisa Fay, EIS Project Manager MN-DNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 From: Harold Nordin 5310 Oakley Street Duluth, Minnesota 55804 In my opinion the NorthMet SDEIS falls short of providing the quality of information required to ensure the appropriate environmental safeguards are implemented before, during, and after the projected 20-year life of the project. For the following reasons I feel the current NorthMet (PolyMet) SDEIS should be rejected and a revised document required: 1- The current SDEIS does not address the use of alternative methods for mining sulfide bearing ores that would reduce the impact on the environment—eg underground or subsurface mining operations which could significantly reduce adverse impact on the ecologically sensitive surface area and reduce the likelihood of water contaminants in the watershed. 2- The current SDEIS does not adequately address the issue of water quality relative to the reproduction of wild rice in waters adjacent to mining operations. Current guidelines for water quality should be enforced as currently written and allowances for seasonal variations should not be allowed. 3- The current SDEIS does not address the consequences of long terms exposure to water borne and airborne contaminants for individuals living and working within area which will be impacted by open-pit mining operations including consequences likely to occur long after mining operations have ceased. 4- The current SDEIS does not adequately address the issue of water quality relative to the reproduction of wild rice in waters adjacent to mining operations. Seasonal variances should not be granted until research is available to support such action. 5- The current SDEI does not adequately address the ability of the parent company (PolyMet) to provide the necessary financial assurances that site remediation issue can be addressed long-term notable after mining operations have ceased.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Feb 12, 2014 Ms Lisa Fay MN Dear Ms Fay, Let's keep mining out of Minnesota. Let the other states take the risk. Keep Minnesota wild and beautiful. It's our investment for the future. It makes economic sense to not burden our children with 500 years of pollution. Let's be known for our unpolluted natural resources. There are no "guarantees" worth the risk. Say No to mining. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. We live on a planet overcrowded with people. Evolution tells us that any species that gets out of control ultimately dies off. We need to treat our environment as precious. Everything that is not eco-friendly must not be done. This mine isn't environmentally friendly. We don't need it. Minnesota is known for its natural resources. Let's not risk our future. It's not worth it. Tell them to develop a solution that doesn't pollute. That's what makes economic sense. Clean technology is real, and there are companies that can bring it about. Let's do the right thing. Say No to this mine in its present form. Harriet M Liedtke 15151 Greenhaven Dr #124 Burnsville, MN 55306

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Harriet McCleary 2440 Stevens Ave S. #2 Minneapolis, MN 55404

Harry Melander 18140

My name is Keith Hanson, H-A-N-S-O-N. And I'm ceding my time to Harry Melander.: Harry Melander, H-A-R-R-Y, M-E-L-A-N-D-E-R. Mahtomedi, Minnesota. Thanks for the chance to comment on the Supplemental Draft EIS for the purpose of the NorthMet copper-nickel mining opportunity for our state. As indicated, my name is Harry and I work for the Minnesota Building and Construction Trades Council. This council represents over 55,000 skilled construction workers throughout our state. Tonight we are here as a group to comment on this document, and we will only do that. We believe that the applicant has provided to our state and our national agencies all that has been asked for and more. We believe that the agencies, the DNR, are state agencies and others that we all support and trust addressed all that Minnesota wants, which is a safe and clean mining process for minerals that everyone in this room depends upon. We believe that the applicant was required and provided concerns brought forward by the state and federal agencies. And those issues are addressed in this document. Minnesotans, today we come together as a state to discuss a process that was required and followed. We are here commenting on what can be the future of clean copper-nickel mining not only in our state but our nation. We know that there are no individuals in this room that want to do damage to our pristine Northwestern Minnesota landscape. Our organization supports and believes that. We do see the benefit of clean and safe copper-nickel mining and what it will do for our state. Let's not blow a chance to establish globally what good, clean copper mining looks like. Minnesota, we have an opportunity to produce safe and clean copper-nickel mining. And to say that it needs to and it's okay to be somewhere else is globally irresponsible. In closing, this document has all and more than what was asked for. We cannot look in the mirror and say anything different. Mining in Minnesota has been a tradition for over 100 years. Our members benefit from it, the region benefits from it, and everyone in this room depends upon it. Clean, safe protected policy is what this document is about and provides. We ask our state and federal agencies to make sure that happens. And this time it does just that. We asked them, they delivered it, and now let's move on. Jobs in the traditional of mining clean, safe, and greatly regulated. Thank you.

Harvey Hyatt 54551

Please reject the polymet mine. I heard just today, Jan 22 2014, that the model is based on a drought year. This severely underestimates the amount of sulfides that will enter the environment.

To whom this may concern; I am a former resident of Ely, and I am STRONGLY AGAINST the new proposed copper-nickel mines. I have worked several jobs there, in the outdoor tourism industry, retail and food. My husband and I married and had our first child in Ely. I have many friends who live there still, and we still live in Ely during the summer for our jobs. I feel that 500 years of potential pollution to our lakes and rivers is too much of a risk to take. For the outdoor tourism industry we do have, and for the health and lives of the people who live and work in the surrounding area. We need sustainable industry up there- not the slash and burn, boom town industry that mining has always been. There is not one copper-nickel mine in the world that has operated safely without serious pollution and harm to people who live around it. I don't want to live near a Superfund site which we just let happen in some of the most scenic and pure places in the world. Who will be paying for the perpetual clean up of these mines and tailing basins. While the mining companies say they will, 500 years of pollution is longer than we can expect those companies to stay in business, or stockpile enough money to take care of their mess. Polymet has yet to detail how they will financially pay for perpetual cleanup. Without that information it would be foolish for us to even consider letting the mining begin. In reality cleanup will fall on the backs of our children, and our children's children for many generations. Who gives us the right to do that. We should not pollute the water we all drink and play in. What about the heritage we leave to our children. I want them to have the same opportunities to fish clean waters and collect wild rice that we hAve I do not want them to live in fear of what the pollution is doing to their bodies and minds because they live up north. Is this the legacy we want to leave our children. This and other mining proposals are some of the reasons I hesitate to move my young family back to Ely, despite the fact that we love it there. Lack of jobs doesn't keep me away, I know I can create my own living there. The resulting boom town and pollution which will ruin many lives does keep us away. Thank you for listening. Heather Friedli-Ratzlaff 37135 Shady Lane Trail Cannon Falls, MN 55009

Heather Hartfiel

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Miss Heather Hartfiel 122 W Fletcher St Apt 5 Crookston, MN 56716-1944

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. Cumulative Effects- Arsenic and Cancer *Arsenic is rated by the US Environmental Protection Agency as a Class A carcinogen. That means it causes cancer in human beings. Colby Lake provides drinking water for the city of Hoyt Lakes. It already has high arsenic levels. *The SDEIS says that the PolyMet sulfide mine project will increase arsenic in Colby Lake by 38-5% (SDEIS, p. 5-145) *The EPA has adopted rules calculating how much arsenic in water unacceptably increases the risk of cancer. (40 C.F.R. 131-36) PolyMet's increase in arsenic for Hoyt Lakes drinking water is above both the threshold set by the EPA and the cancer risk level in Minnesota. *In addition to arsenic in their drinking water, people in Hoyt Lakes would ingest arsenic by eating local fish or wild rice. Low income people who fish and rice for food would have the most cumulative risk. The Food and Drug Administration recently tested rice for arsenic and found Minnesota wild rice has 6 micrograms per liter of arsenic. *The SDEIS must be redone to make a cumulative assessment of arsenic exposure and cancer risks for people in Hoyt Lakes, including formula fed infants and people who rely on fish and wild rice for food. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, The proposed mining is a death knell.. Why would we create a by product that will pollute environment for 100s of years. Yes- they say they have safety standards and rules and laws in place to prevent pollution. That is no guarantee. Why can't we learn from our mistakes. A mistake will happen. Humans make mistakes. Then part of our world will be gone forever. All for money. Money and greed. They dangle before us that jobs will be created by this mining. Why would we want jobs that don;t even last as long as the pollution this mining will create. What are people thinking to allow this to happen to one of the world's pristine places. There WILL be pollution from this mining that will negatively impact this unique and precious environment. AND it will create a by product that will be toxic for hundreds of years. Are we insane that we would undertake this venture for short term goal and long term pollution and destruction This action is not in the interest of the many but of the interest of the few. Those that will make the most money want this. Money. The language of destruction. Why doesn't ethics , values and the beauty of nature ever trump profit. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Heather Macdonald 75 Vermillion St Carlton, MN 55718-9705 (218) 390-1929

Dear Ms Fay, Thank you for taking the time to hear comments and understand my position strongly opposing the proposed MN Sulfide Mine. I'm shocked and saddened that Sulfide Mining in one of our national treasures, the Lake Superior Basin, is even being considered. I am not fundamentally against mining; however, I am strongly against Sulfide Mining and this Proposal. Therefore, I respectfully urge you to reject this proposal and to not grant permits. With great power comes great responsibility. Don't allow the destruction of the Lake Superior Basin's environment and existing economy. The scientific facts are clear + Sulfide mining's current state and history are consistent and clear: This type of mining is destructive to the environment. There is nothing in this proposal to prove otherwise. It is both naïve and dangerous to think Sulfide Mining will just "fit right in" to Northern Minnesota and create jobs with no negative consequences to the environment and existing economy. I'm in favor of job creation but not at the expense of everything else (eg water, and existing jobs). Everything comes with a cost, and the true cost of sulfide mining is far too high. Don't allow Northern MN to be another failed sulfide mining "experiment". My strong opposition to this proposal has many bases~ · Environmental · Economic · Personal Environmental Impact: Have we really come to the point in the American Economy that we need to choose between clean water and jobs. This proposal risks our water, air, and the overall environmental health of the region. This is not equivalent to mining Iron Ore (which is a tradition of the region). The impact difference between Sulfide and Iron Ore mining is drastic, but this is not being discussed enough. There are many of us who are not fundamentally against mining, but have researched this, and are very against sulfide mining. However, I'm concerned most Minnesotans believe this is just the same as the Iron Ore mining done in Northern MN for generations. It is up to you, as leaders, to know the difference, stand strong, and protect this region. Iron ore mining doesn't trigger acid mine drainage and pollute the surrounding environment. There is mining and then there is MINING . Facts: · When Sulfide ore comes in to contact with air and water (keep in mind, these mines are almost always below the water line), sulfuric acid is generated. · This acidic run off mixes with other heavy metals and thus creates acid mine drainage. This leaches in to ground water, lakes, streams etc + pollutes the air.. This is dangerous for people (as well as wildlife). · The mine craters fill with water (rain + ground water) and mix with the mines acid drainage creating Acid Lakes-This kills the wildlife that unwittingly land in, or drink from, these "acid drainage lakes". · To date, no sulfide mine has been able to operate without causing pollution in the surrounding environment. o Many companies point to the Flambeau Mine as a model case; however, a 2012 federal ruling showed multiple violations of the Clean Water Act at the Flambeau site. · As a result of the Flambeau site, Wisconsin has issued a moratorium requiring sulfide mining companies to prove that sulfide mining has successfully been done elsewhere, without causing water pollution, before the allowance of mines there. There is no real life evidence PolyMet's plan will work. Their proposal is not fact based, but rather theory and speculation. We need real, practical application PROOF this has been done (in a similar climate and scale) without destruction. Not "theories on paper" or "controlled tests or models". Let's not just believe the Mining Companies (that have a long history of poor stewardship, integrity and accountability). No matter what measures they claim will be put in place, there will be issues/"events". Thinking we can "control" the spread of the acid mine drainage is supremely arrogant and obviously wrong. No matter how many pages the proposal is, we all know

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Heather Phillips Eden Prairie, Minnesota

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Because I currently live in an area code far removed from the proposed PolyMet mine, you may want to discount my concerns. But your decision will have a far-reaching effect on the rest of the country-whether democratic forces will have any effect in mine locations anywhere, including our own Cascade and Olympic mountain ranges. I grew up in West Virginia as well as Wisconsin, and I have seen the type of society that accompanies resource extraction economies: severe local poverty, extreme corruption in government, brutal ignorance and its militant defense. The time had come for a different vision, just to survive. Others see it and are willing to defend the land if you are not. We need water to live. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Heidi Jindrich 4159 47th Ave SW Seattle, WA 98116-4001

Heidi Lynn Ahlstrand

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Heidi Lynn Ahlstrand 1580 State Ave NW Owatonna, MN 55060-5688

Heidi Takala

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I grew up on the shores of Lake Superior and in the surrounding wooded areas. I still live in those areas. How dare you even think about setting forth with this business of such contamination process. I am very sure that you are able to find other area that are adequate for your needs. Please do so. This area is the very pure and should remain so. It is the one and only unpolluted natural waters left. What are you thinking. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. People in these areas rely on the natural wildlife and natural resources in this area, I am sure that do not want to see their lives and their childrens' lives threatened by the destruction that would impact the area. PLEASE DON'T DO THIS. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Heidi Takala 1232 4th Ave SW Apt 13 Rochester, MN 55902-3815 (507) 358-0290

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

3/13/14 I have reviewed the SDEIS for the Polymet Project, and fully approve of the proposed processes and mitigation systems as well as the science used in designing them, and ultimately constructing them. I also believe from an economic standpoint, that expediting the current processes so Polymet could begin construction immediately would bring a desperately needed, immediate economic boost to the Iron Range, not to mention the added benefit of more public lands, through the land exchange. I fully support the SDEIS in its entirety. Heidi VanGuilder 7955 Waris Road Embarrass, Minnesota 55732

Heinecke

Helen Forsythe 3115

To whom it may concern, As a young person who has treasured the natural landscape on and around Lake Superior on many occasions, I am entirely disappointed that such a beautiful place in our state would be considered for the destructive and toxic process of mining. In addition, people living around this region would be detrimentally affected by any sulfuric acid released into watersheds as a byproduct of the proposed Polymet mine. To endanger the health of this sacred ecosystem for the benefit of corporate interests is to devalue the health of the people and other creatures that inhabit this region. To put corporate profits before this health is entirely immoral. I recognize that this mine will create over 300 jobs for 20 years, which is a social benefit of the mines that I do not want to discredit. However, a job can only get you so far if the water coming out of your sink is contaminated by sulfuric acid or other mining byproducts. For these reasons, I am in favor of the rejection of the proposed Polymet mine. I hope the DNR will take into account the health of the people and the land when making this decision. Thank you for your time. Helen Forsythe

57188

In the interest of protecting human and environmental health, I am in opposition of the proposed Polymet mine project. I believe the perceived economic benefits of these mines will be short-lived and will benefit only a few people so the dangers posed by these mines are entirely more significant than the benefits. Helen Forsyth 25361
County 7 Blvd Welch, MN 55089

58096

I am in opposition of the proposed Polimet mine. I understand the significant economic opportunities offered by these new sulfide mining operations, but I believe the consequences to be for too dangerous for the economic argument to be valid. The potential water, soil, and air pollution effects from these mines pose major threats to the health of people in Minnesota. Our citizen's health will be compromised by this mine, and even those who receive the economic benefits will either be living away from the wastes created, or they will be experiencing the toxic qualities of mining for the period of time that they are employed in the mines. The use of the products received from those mines are not worth compromising our health in the form of our water, soil, air, co2 levels, etc. It is simply not a logical tradeoff, and the proposed Polymet mine should not be approved.

Feb 15, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for- information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, helen frigo 9650 S Ocean Dr Jensen Beach, FL 34957-2354

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr Helen Gilbert 3540 Edmund Blvd Minneapolis, MN 55406-2943

HELEN J SPRY

We are property owners on the White Iron Chain of lakes. We are GRAVELY concerned about the potential water quality damage that could result from the proposed mining efforts in the area. We do not believe the mining company premise that this process is "safe". All mines of this type in the US and outside have water issues. There are other locations that have these minerals, why do this next to Watersheds critical to MN and US. Why would or should the state risk this next to one of the most pristine and valuable water sheds in the state: BWCA and Lake Superior. I encourage the deciders to consider the risk of doing this to the future generations Can it really ever be repaired if a problem occurs. If mining is allowed, and if correction is needed it should be funded as a HUGE (multiple BILLIONS) bond or escrow. When your document shows mitigation needs to allow 500 years on the Mining companies, make sure it's the mining pocket books NOT the MN or US taxpayers on the hook. Thank You Helen Spry 2639 Humboldt Ave So MPLS, MN 55408 612 747 0640 Sent from my iPad

Helen Johnson

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Helen Matekunas 1570 West 96th Street Indianapolis, IN 46260 US

I do not support the Polymet mine project because it goes against the things I value most about my state. I've grown up spending time in our beautiful, pristine natural areas like the waters threatened by this project. I also believe in a Minnesota that shows respect toward the Native Americans living here, whose wild rice resources would be threatened. Helen Mercer-Taylor 2231 Folwell Ave. St. Paul, MN 55108

To all that it may concern Having heard a representative from PolyMet speak earlier in the year, I thought perhaps this might be an ethical company. Attending the public meeting in St Paul convinced me otherwise. One of the first things I observed was what appeared to be bus loads of unprofessional people arriving in overalls and hard hats, apparently representing the miners. One had to wonder if they thought the ceiling was going to fall down, thus the hard hats. Then, there was the activity of “stuffing” the barrel with names of people who then “ceded” to people who had interests that would bring themselves monetary rewards. Why didn’t the people who put their names in speak for themselves. Any company that stoops to those tactics is not likely to care about what damages they do while extracting what will probably be great monetary profits for the company, PolyMet. I left the meeting being even more concerned about the damage that will be done to the environment than when I came. Not only are many valuable resources such as forests, wetlands, bogs, lakes and rivers be physically and permanently damaged but the seepages of toxic chemicals such as mercury and all of the sulfides into the watershed will cause big problems for generations to come. There already is significant damage from previous mining activities. This will only exacerbate the problems. My concerns were increased through a conversation with a representative of PolyMet situated at their booth during the meeting. When I asked what the company was going to do about the metals that would inevitably escape their reclamation system, he indicated none would because the whole purpose was to acquire those metals to sell. Clearly he did not understand, or perhaps acknowledge not only the known pollutant, mercury, is a metal but more importantly some of the copper and nickel would inevitably escape and that these elements were toxic to plant and animal life alike, even in very low concentrations. One could also add, once in the environment these metals could be converted to organometallic compounds which are extremely toxic at even lower concentrations than the inorganic form, the sulfides for example. Methylation of such compounds, which can occur in natural environments, increases their capacity to cross the blood/brain barrier causing all types of neurological problems as well as genetic anomalies. Take for example the methylation of mercury by sulfate-reducing and iron-reducing bacteria (<http://www.intechopen.com/books/methylation-from-dna-rna-and-histones-to-diseases-and-treatment/the-methylation-of-metals-and-metalloids-in-aquatic-systems>). An acute example of the health hazards brought on by methyl mercury is occurring right now in the Grassy Narrows in Ontario, Canada (http://en.wikipedia.org/wiki/Ontario_Minamata_disease). If PolyMet is truly concerned about the environment and what problems they leave behind, I wonder what is they willing to do in order to obtain the right to mine the copper, nickel and other valuable metals located at the proposed mining site. Are they willing to pay a “carbon tax” on all of the carbon dioxide it releases. Are they willing to put a cap on their profits and invest the rest into the community from which they are taking the minerals. Are they willing to invest a significant portion of the monetary gains towards researching methods of preventing and/or reversing the effects of the pollution caused by their mining techniques. I asked a PolyMet representative at the public meeting if they would install solar cells on the roofs of the buildings only to find an unwillingness to even entertain the idea. Photovoltaic cells could also be installed over the tailing ponds. Oregon has what they refer to as solar highways ([HYPERLINK "http://www.oregonsolarhighway-com/"www.oregonsolarhighway-com](http://www.oregonsolarhighway-com/)). Would PolyMet be willing to install solar power or wind power along the roads to the mining site. Would th

Dear Ms Fay, Thank you for letting me comment on the proposed leaching mine in Northern Minnesota. I am a retired PhD in Chemistry who has worked for many years for Henkel/Henkel Corporation, a company involved in providing chemicals to the mining business in the US and worldwide. This company has developed the LIX (liquid ion exchange) process to remove valuable metals from ore. As part of my employment, I have learned much about the opportunities and challenges in mining low grade ores. As you are certainly aware, the leaching technologies used to extract metals from low grade ore use a number of very dangerous and/or toxic chemicals, like cyanides or sulfuric acid, depending on the metals that are extracted. In all cases, protecting the water below and around the leaching fields is a major technical challenge that continues long after the leaching operations are discontinued. While it is technically feasible to do this, the long duration of all protective measures have generally exceeded the commitment or financial resources of the operating companies and the clean-up of problems falls onto the public sector. While this may not have resulted in major disasters (yet) in North America, the very large operations in Africa that used leaching processes, are an example of the environmental disasters that can result in the aftermath of abandoned leaching operations. Unless PolyMet is forced to fully finance the long-term clean-up of the proposed leaching sites while they operate the mine, the long-term protection of the ground water and environmental water sources will eventually fall to the public sector, either through bankruptcy or off-shoring of the operating company. In any case, major negative environmental impact of the mine after the leaching operation ends is, in my opinion, a certainty, due to the long clean-up process. I am strongly opposed to the PolyMet proposal and urge the DNR not to approve it. Best regards, Helmut Maier 1201 Yale Place Apt. 702 Minneapolis, MN 55403 maierhk@outlook-com

Dear Ms Fay, I am writing to you regarding the planned Polymet Mine in Northern Minnesota. After reading that Glencore is a 25% owner of the intended mine and a likely operator, I was concerned about ethical issues reported about Glencore in the news and on the internet (see quotes from Wikipedia below). My big concern is the protection of the environment in the area around the proposed mine. Considering the heavy metals as well as sulfur containing ores in the tailings of the mine, water and air contamination are serious concerns. To assure that any contamination is caught in real time rather than upon inspection by the authorities after the fact, effluent and off-gases should be controlled in real time with data sent immediately on-line and automatically to a government authority as soon as the allowed discharge limits are exceeded. The technology for such real time tests as well as on-line reporting is readily available and would protect the environment much better than cleaning-up after a spill has been discovered. As you are well aware, cleaning up a heavy metal spill is very difficult, time consuming and costly and does major damage to the environment. Prevention is the only option here. Finally, considering the information listed below, the PolyMet mine has to fund verifiably ongoing insurance that will pay for any longterm clean-up of water from the mine operation. It has to be assured that the owner or operator of the mine cannot declare bankruptcy or go off-shore and walk away from their long-term obligations without leaving enough funding/insurance behind for the long-term operation of the clean-up and monitoring operation. The tax payer should not have to pay for any of the long-term consequences of this mine operation. Best regards, Helmut Maier 1201 Yale Place, 702 MPLS, MN 55403

Controversies[HYPERLINK "http://en.wikipedia-org/w/index.php.title=Glencore_Xstrataandaction=editandsection=11"edit] Financial and accounting manipulations[HYPERLINK "http://en.wikipedia-org/w/index.php.title=Glencore_Xstrataandaction=editandsection=12"edit] Five non-government organisations have filed a complaint to the HYPERLINK "http://en.wikipedia-org/wiki/Organisation_for_Economic_Co-operation_and_Development"OECD against a subsidiary of Glencore over allegations that a mine it owns in HYPERLINK "http://en.wikipedia-org/wiki/Zambia"Zambia may not be paying enough tax on its profits. The cause for the complaint lies in the financial and accounting manipulations performed by the two companies' subsidiary, Mopani Copper Mines Plc (MCM), in order to evade taxation in Zambia.HYPERLINK "http://en.wikipedia-org/wiki/Glencore_Xstrata#cite_note-corporatejustice-org-41"[41]HYPERLINK "http://en.wikipedia-org/wiki/Glencore_Xstrata#cite_note-guardian-42"[42] In 2011, HYPERLINK "http://en.wikipedia-org/wiki/Grant_Thornton_International"Grant Thornton found that tax avoidance by Glencore in Zambia cost the Zambian Government hundreds of millions of dollars in lost revenue. The avoidance was facilitated through mechanisms such as HYPERLINK "http://en.wikipedia-org/wiki/Transfer_pricing"transfer pricing and inflating costs at Glencore's HYPERLINK "http://en.wikipedia-org/wiki/Mopani_Copper_Mine"Mopani Copper Mine. Concern about control of discharge from mine. It is not sufficient to control discharge level of pollutants on an infrequent basis. Instead, there has to be real fine control for metals and pollutant gases to assure no inadvertent pollution happens due to mechanical failures or human error. The technology for this exists. It is essential to prevent such pollution accidents since cleanup of spills in this sensitive environment is very difficult or impossible and, for sure, expensive.

Dear Ms Fay, The proposed PolyMet mine for northeastern Minnesota is a disaster on a number of fronts just waiting to happen. Reading the SDEISI am opposed to the mine for several reasons. First, it will destroy nearly 1000 acres of wetlands and probably nearly 8,000 additional acres, all in violation the EPA which requires that a project that destroys wetlands not be approved if pollution would violate the Clean Water Act. This applies to the "Section 404 Permit" as well as the SDEIS. Poly-Met admits water pollution at the site. How does Poly-Met respond to this concern, and will the EPA rule be enforced. Second, will Minnesota's own Department of Health regulations regarding limits for manganese be upheld. The current limit set by Poly-Met of 1506 micrograms per liter for manganese is fifteen times higher than the health limit set by the Health Department. Why. How will this be corrected since it induces brain damage in humans of all ages. Third, what will be the effect of the toxicity of the plant on the workers. Will Poly- Met cover their health liabilities or leave it to Minnesota and the federal government to cover the long term costs. Why is nothing regarding worker health liabilities addressed in the SDEIS statement. Why is this glaring omission allowed. Fourth, why is a project potentially allowed which will pollute the agricultural, fishing, wildlife, and drinking water for thousands of people in the northeastern Minnesota area and in the Lake Superior basin into perpetuity. If clean drinkable water is one of the absolute necessities of life why is it being considered for toxic pollution for the next 500 years or longer. What happens when the systems designed to stop the seepage, drainage, and discharge fail to operate as described in the SDEIS. How is Poly-Met (or whoever might buy them out during the 20 year mining period) going to be held responsible. How will the water seepage from rock fractured by blasting into underground sources which will eventually reach the wetlands, rivers, streams and lakes be prevented. I live in the Lake Superior region, have a cabin on Island Lake and love the beauty of the land, the woods and the forests. I moved here from Chicago about 25 years ago so that our daughters might learn to love this beautiful place also. I do not fish, hunt, or ride snowmobiles but I respect the rights of those who do and the vendors who service their pursuits. Why should a most valuable tourist and vacation land for much of the Midwest be sacrificed for a few short lived high-tech jobs, a valuable product to be shipped overseas, and profits be provided to corporations located elsewhere around. Respectfully, Henry O Moore Henry Moore 502 Madison Abve Duluth, MN 55811 218-727-5319

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, To whom it may concern: I understand the desire for jobs in Minnesota's iron range and the desire to develop the vast deposits of copper and other valuable metals lying beneath the Earth's surface in NE Minnesota. However, I am aghast that those charged with the protection of Minnesota's environment, especially Lake Superior, would accept a "reclamation" plan from PolyMet that would require treatment of mining-contaminated water for hundreds of years post mine closure - perhaps in perpetuity. We the people will be paying for the extracted copper long after PolyMet's CEO and other top executives have built their trophy homes and purchased their yachts and the workers from the area have purchased their new pickup trucks, snowmobiles and camper trailers. I would hope that the officials in command of this permit application would stand firm that mining should leave no legacy environmental problems with which to deal post closure. Those wishing to profit from the mining operations undoubtedly claim that such a guarantee cannot be made - that such a remediation plan cannot be set in place. I would vehemently disagree. I am an environmental engineer (holding a PhD) and strongly believe that such a design surely can be devised. It may be expensive, but in order to partake in Minnesota's subsurface mineral natural resources, PolyMet (or any other mining company wishing to do so) must be prepared to shoulder the true cost of extracting the minerals from the Earth. Do not say "NO" to mining itself; say "NO" to mining when associated reclamation plans will leave legacy environmental problems Please don't concentrate on the amount of the bond that PolyMet will set forth - whatever is decided, it will not be sufficient. Rather, concentrate on a requirement that the mining operations will leave no new legacy environmental problems Sincerely, Henry V Mott, PE, PhD Sincerely, Henry Mott 1489 Clarmar Ln Saint Paul, MN 55113-1652 (605) 484-8140

Mar 13, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. March 13, 2014 To the Minnesota Department of Natural Resources: Re:Supplemental Draft Environmental Impact Statement NorthMet Mining Project I have reviewed the Supplemental Draft Environmental Impact Statement (SDEIS) for the proposed NorthMet Mining Project and Land Exchange, with specific focus upon the proposed reclamation plan. I find this reclamation plan to provide grossly inadequate assurance of long-term protection of critical ecosystems and surface waters. The proposed necessity to maintain monitoring and treatment systems for seepage from the tailings basin and category 1 waste rock storage pile for 200 to 500 years post mine closure is preposterous. Further, the proposed necessity, in perpetuity, to maintain the vegetative covers to prevent growth of trees and woody plants on the tailings basin, hydrometallurgical pit and category 1 waste rock pile caps is unthinkable. The proposed plan would simply allow the West Pit to fill without measures to isolate the reactive walls from oxygen. The pit would subsequently overflow requiring treatment (perhaps in perpetuity) of emanating water. This portion of the plan is unconscionable. Hereinafter, I offer some specific comments relative to proposed plans for tailings, hydrometallurgical pit, category 1 waste rock, category 2-4 waste rock, and East/Central and West mine pit reclamation. 1-0Tailings basin: PolyMet proposes to cap the unlined tailings basin with bentonite layers. This action is intended to limit the entry of oxygen into the materials contained therein. The inevitable oxidation of sulfide to sulfate would merely be delayed beyond the time frame of mining operations. Then, post-closure, over time the sulfide to sulfate reaction would occur, creating acid seepage containing leached metals. Then, the acidic seepage water from the un-lined basin would necessarily be collected and treated well after active mining operations cease, until the entire quantity of sulfide contained in the tailings would be converted to sulfate. PolyMet's predictions suggest a period of up to 500 years during which mechanical treatment of tailings seepage would likely be necessary. PolyMet would not be around to perform this treatment, which if discontinued for any reason, would put sensitive ecosystems and water resources at significant risk. Generations well beyond ours would bear the ultimate brunt of these un-reclaimed tailings as would the ecosystems which undoubtedly would be adversely affected by this activity. This portion of the reclamation plan should be rejected as it provides wholly insufficient protection of water resources and the environment. It would seem prudent to devise a methodology, alternate to PolyMet's proposed "mining business as usual" approach for the tailings basin. PolyMet should be directed to devise a means to accelerate the sulfide to sulfate reaction of the tailings during active mining and a short, well-defined, period thereafter, thus eliminating the reactivity of the tailings and providing the potential for alternative uses. A large body of existing scientific literature addresses the characteristics and behavior of sulfide-oxidizing bacteria. Means to contact tailings with oxygen and other reactants in the presence of sulfide oxidizing bacteria to produce the acid and release metals prior to placement in the tailings pile should be devised. Bench- and pilot-scale testing should be initiated if the literature does not yield sufficient information for system design. Since acids will inevitably be created and metals thereby leached from tailings, the best time for this to occur is during active mining when human and plant resources to deal with this side stream are present and abundant. Additionally, the tailings already existing in the tailings basin, if reactive, co

Dear Minnesota DNR, I'm writing out of concern for the possible development of a new Sulfide Mining industry in northern Minnesota, in particular the PolyMet mine currently under consideration. I am worried that the environmental impacts of such a mine are far too great and risky to be worth permitting the mine - in particular, the mine has great potential to seriously pollute the water in the Lake Superior watershed, especially in the long term, which has downstream effects on countless other states, provinces, and ultimately the Atlantic ocean. In addition, development of such a mine sets a dangerous precedent that could open the doors to other mines that could further pollute both the Lake Superior watershed as well as the Boundary Waters Canoe Area Wilderness. The DNR should take a hippocratic oath to "FIRST, DO NO HARM" when managing Minnesota's natural resources, the most valuable of which are our clean air and water. I URGE YOU to protect our water and DO NOT ALLOW THE DEVELOPMENT OF A SULFIDE MINING INDUSTRY in Minnesota. Sincerely, Henry Reich Creator of the Youtube Channels MinutePhysics and MinuteEarth with 2-7 million subscribers PO Box 145 Marine on St Croix, MN 55047

My name is Herb Smith. I'm from Red Lake, Minnesota. It's great to be here. And what I have to say is I'm not really for mining because I've seen what it's done to other lands and other bands. And they don't really clean up their site. They have never really cleaned up their sites. Take a look at the southwest corner of our United States. Take a look at Oakland. There's radioactive (inaudible) all over. Our water -- we got the greatest waters here in Minnesota, and we want to let somebody pollute it for a few minor jobs. Your kids and grandkids and your great-grandkids are going to drink that water. Are you going to stay in that area and drink that water? I don't think so. You guys will be buying water. But that water eventually reaches us. All the water in the land -- take a look at water -- I was told we live on a big sponge. You take a look at your own body. You prick it here, that blood is going around. I saw some of your pictures out there. It says it just runs away. It does not run away. It runs all over the earth. If you consider us a like the earth. So when you contaminate the water over here, you contaminate my water in Red Lake. I'm not for this. Few jobs. You know, you guys want to pollute the water -- these guys that want to use these chemicals, drink a gallon of that water in front of us and see how safe it is. Is it that safe? Are you guaranteeing that water is safe once they mix it in with that other water? It doesn't run one way. This is the greatest watershed in the whole world. A couple weeks ago on the news they said we've got the greatest watershed, and we're going to let somebody pollute our water. Water gives life. It sustains us. I appreciate the time for letting me speak. Appreciate it.

Dec 20, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Heyward Nash 2625 Park Ave Minneapolis, MN 55407-1016

Hillary Peterson

18318

I'm Hillary Peterson. I am from Sturgeon Lake. The proposed PolyMet mine is not a good deal for Minnesota. Trading 500 years' worth of water pollution for 20 years' worth of jobs is irresponsible. Water from open mines and processing plants will be contaminated with heavy levels of sulfide. PolyMet initially stated they would capture all the contaminated water on site and treat it before it was released. However, their own plan now shows that millions of gallons of polluted water will seep off the site before any treatment can be done. Minnesota law requires that sulfide mines be maintenance free at closure. This means a mine site cannot be ongoing with pollution when it is closed. The wastewater generated by sulfide mining is the source of dangerous pollution that by at least one mining company's own acknowledgement will be toxic for thousands of years. Pollution at sulfide mines will certainly require some sort of maintenance into perpetuity. The SDEIS is insufficient. There are still far too many unanswered crucial questions. We should not be willing to gamble the future of Northern Minnesota and condemn ourselves to 500 years of water pollution for 20 years' worth of jobs. I ask that the DNR reject the SDEIS and protect the future of Northern Minnesota.

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The proposed PolyMet mine project is not a good deal for Minnesota. Trading 500 years of water pollution and immeasurable damage to the pristine environment of Northeastern Minnesota for a mere 20 years of mediocre jobs is desperately irresponsible. There are far, far too many unanswered questions about this project that need solid, scientifically based answers before this project is considered any further. We cannot continue to pretend this project is somehow special or different from all the other sulfide mining projects. PolyMet has absolutely no motivation to protect our environment. They are a company in a capitalist society. Therefore, their solitary goal is to make the largest profit possible, regardless of the cost to people or the environment. Many who support this project have often said our society needs these minerals if we want to sustain our highly technical way of life; so we should mine them here, in Minnesota, where we have strict environmental laws. I am not doubting the high demand for these minerals or saying that I do not utilize gadgets that are made from these minerals. However, I do have many objections to these statements. First, Minnesota does not have a perfect track record, by any means, for regulating now existing taconite mines. Many of these mines have been granted variances from environmental laws and have paid thousands and thousands of dollars in fines for violations. Sulfide mining poses far more opportunities for environmental harm than taconite mining. If we are not able to fully regulate lower risk taconite mining, why should Minnesotans believe our governing agencies will be able to regular sulfide mining any more effectively. I am not accusing the governing agencies of not trying to regulate the mining indust

Holly Check 44596

Good Morning, After hearing that the treatment and clean-up efforts could and most likely will last up to 500 years, I am too worried about our environmental future as it is to condone this decision. Despite PolyMet's claim that they'll be around in that time to continuously fund the treatment, if we're being honest, how many companies alive and well 500 years ago are still here today. I can't think of a single one. This leads me to believe that PolyMet will not stay true to their promise and our environment (one that has been protected for good reason) will be left in worse shape and without much hope for effective treatment. Thank you for your time. Holly Check Senior at Prior Lake High School

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Holly Jenkins 1130 Tiffany Pt Eagan, MN 55123-1876

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, holly marcotte spring lake park, Minnesota

Holly Nelson

58030

The proposal is short sighted and will put the natural resources of our state at undue risk of harm. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Holly Villa

40328

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Holly Villa 729 McPherson Dr Nashville, TN 37221 US

Hope C'Dealva-Lenik 22805

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, It is my understanding that sulfide mining has never been done in Minnesota, and that in all other places where it has been allowed, acid mine drainage and heavy metal contamination have polluted nearby rivers, lakes, streams, groundwaters, etc In addition to risks concerning water quality, there would also be danger for local wildlife such as declining moose populations and the threatened lynx, not to mention the obvious health risks to the local human population due all forms of pollution from the mine. I ask you, who would benefit from the mine, other than the mine owners themselves. Are the risks to human and animal health, plus the egregious despoiling of one of the most beautiful wilderness areas in the world worth it. These are National Forest lands: public lands that are set aside for ALL American citizens. Sincerely, Hope C'Dealva-Lenik 7462 Sale Ave West Hills, CA 91307-1640

Hope Flanagan 18160

(Spoke foreign language). What I'm saying in Ojibwe is, "Hello, relatives. My name is Little Wind Woman." I'm a teacher. I don't have money to hire a whole van of people to cede my time to. It is about our children and the health of our children. Our prophecies talk about seven generations. We got to think about every action that we take affects seven generations of our actions right now. And I wanted to speak as a native woman. Native women we have known -- it was part of our prophecies that we would have to watch out over the water, because we carry our children in sacks of water. All of you women out there, this is our job. We got to make sure our kids aren't sick. The water is the health. When I say "we're relatives," we're relatives to those plants. We're relatives to the food that we eat. I also work in Dream a Lot Health. We're looking at the food sources. We got to have clean water, clean food, clean places to go to get ourselves clean or we're going to have sickness. And I think we've seen that in birth defects and challenges in our children. So let's start thinking about our children. It's not worth a little bit of money. The fellow talked about a risk walking across the street. Well, if nobody ever successfully walked across the street, don't walk across the street. No one has ever successfully had one of these mines. And I would suggest, like the last fellow did, go to a copper mine, see what it looks like. Nothing grows there. It's like a moonscape. I remember when they were trying to grow little plants there. It's so sad. For me, I get people asking me to gather medicines. Right there at Babbitt this year I went fishing, I went gathering plants that they asked me to go for healing. We can get healings from those places, spiritual; the healing from those plants, we don't know all those gifts that those plants have yet. And I know that's part of our ways. Look through those healings. There is different ways of looking for growth. This doesn't have to be a way that pollutes us for infinity. As the rest of the world is looking for freshwater and we're ready to throw ours away. Don't throw this precious, precious gift away. As human beings you'll see in my community we've had women walking from the four directions, from the Arctic Circle, from the Gulf of Mexico, from the two coasts to say "Water is precious. We are running out of freshwater." So please support this clean water movement. Remember, that's what we are, we are water. We are walking skin with water.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Howard Lambert 35495 Riverwood Ct Unit 1623 Crosslake, MN 56442-4069 (218) 692-5521

Howard Markus

18367

Good evening. My name is Howard Markus, H-O-W-A-R-D, M-A-R-K-U-S. I am a volunteer with Audubon Minnesota. I just retired after working over 22 years for the Minnesota Department of (inaudible) in the area of water quality. And I have a few points to make. Many points have been made on all sides. So I appreciate the fullness of that. But I do have a few things to talk about from my own experience. Taconite mining does not use sulfuric acid. This mine will. So everybody's experience up here I appreciate how good taconite mining has been to everybody. You have no idea how ugly acid mine drainage is. I was a grad student at Iowa State. I saw acid mine drainage in abandoned coal mines in Oskaloosa, southeast of Des Moines. It is not pretty. It is not something you want up here. It sounds great now and there won't be any of this, there won't be any of that. It is ugly. It kills things. It is not what you want up here. It is going to seriously degrade the water resources up here. I read so far about two-thirds of the 2,200 pages. So I'll probably have more comments at another time once I have read the rest of it. But what I have so far is I was looking at the land trade. Right now the land proposed to be traded comes with the surface rights but not mineral rights. This is going to happen all over again. The EIS says all of these things are invaluable. Well, they're not valuable until they become valuable. I believe the Forest Service should reject the land trade and do it right by demanding both the surface rights and the mineral rights for all the lands traded or we're going to be in this circle where we have to go through all this again. So the land trade to me does not work until everything is traded, both surface and mineral. Really soon after the mine starts there is going to be discharges to impaired waters. It is going to be a mess for the agencies. It is going to be a mess for the mine. This is going to be in ecosystems forever. It's going start out with no drainage and no pollution, and really soon there's going to be pollution, there's going permanent problems. There's going to be all sorts of problems with this. It is – you just have no idea of the mess that's going to be in courts from this forever once this thing starts going into waters. These waters are too good. There is just not enough limestone. It's all taconite. My last point is that we are trading upland valuable forest land and they are going to be traded for shrub forest wetlands. Not a fair trade.

Dear Sir/Madam: I wish to convey my wholehearted support for the Polymet Mining effort to establish a copper/nickel precious metal mine in Minnesota. This project will provide thousands of well-paid jobs and will help to provide North America with an inexpensive supply of copper and nickel plus ancillary precious metals. Polymet management will ensure that the mine is operated in an environmentally sound fashion. They will leave the area in at least as good a condition as it is now. Thank you for considering my comments in your deliberations. Howard Miller 12 Colgate Dr Camp Hill, PA 17011 (717) 982-0263 email address: HYPERLINK "mailto:html@aol-com"html@aol-com

I'm against the mine because mining will destroy the wilderness. There will be water pollution. The sulfuric acid will reduce the pH level and kill all the fishes. We won't get to fish in the river anymore. Even though we need copper and gold, we want to save the environment. The economy and environment will have to live through the pollution for 20 years. That's a long time to have to live through those loud machines. The river is a sanctuary for all lands of animals and for some people. Please don't destroy our peace and an environment.

Hugh Curtler III 17605

Feb 15, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. There are serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for -- information that is necessary for you to make a fully informed decision. I urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining threatens to result in hundreds of years of water pollution to sensitive wildlife and habitat. This trade-off is not worth the risk. Thank you for your time and consideration of this important matter. Sincerely, Mr Hugh Curtler III 4516 89th Cres N Brooklyn Park, MN 55443-3936 (763) 315-8749

30110

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose populations, and cumulative impacts from mining. In short, I feel that the federal land exchange of protected Superior National Forest land to facilitate a destructive open-pit sulfide mine is not in the public interest. Thank you for your time and consideration of this matter. Sincerely, Hugh Curtler III 4516 89th Cres N Brooklyn Park, MN 55443-3936 (612) 111-1111

Humphrey Kearns 3703

Dec 20, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Until it can be demonstrated that no contaminated water can leave the site, either in run-off or under ground, I can't support this type of mining in an area like the Arrowhead. Once you mess up a place it is pretty much messed up forever. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Humphrey Kearns 6282 State 26 La Crescent, MN 55947-8763 (507) 894-1000

51784

Dec 20, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Also because there are ecosystems, and this mining could endanger them. Or possibly destroy them for good. Imagine if you were a animal in the Boundary Waters, you wouldn't like it if one day miner just came near your Waters and polluted your water that you live in. You'd probably die from it. So please, SAVE OUR ANIMALS. And one of our National Treasures. Sincerely, Mr Hunter Maughan 2123 Ivy Ave E Saint Paul, MN 55119-3222

i care

40267

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, i care manila manila, ot 1000 PH

First of all, thank you for holding this hearing and taking the time and effort to listen to people's concern. Very much appreciate all the work that has gone into that. I want to invite our friends from Northeastern Minnesota, particularly the Iron Range, to overwhelm our friends from Duluth here tonight and eat at those establishments. Those bartenders will love their tips at the end of the night. My first request, respectful request, of the co-lead agencies is that at over 2100 pages this document is an overwhelming conglomeration of information. And a lot of it is very difficult for a layperson or even many experts to understand. I first of all respect your request that we extend it from 90 days to 180 days for people to take in that information and review and provide comments. Second of all, I would like to see a more complete delineation of how we are going to pay for the water treatment facility that will be required to run perpetually in order to make sure that the water discharged from the site is not polluting our Northern Minnesota rivers, lakes, groundwater included. As it has been explained to me often, the financial assurances all happens during the permitting stage. However, just because we've done something wrong before doesn't mean we should continue to do it. So I respectfully request that we have the financial assurance piece, how we're going to pay for the long-term water treatment at the facility, included in the SDEIS process so that the public can participate, see how it's going to be paid for and come away with a reasonable assurance that if we are going to do this project that at some point the taxpayers are not going to liable for hundreds of years of water treatment. Additionally, there is some confusion in the SDEIS over the tax numbers. As it is right now there doesn't appear to be any analysis behind the tax figures that are presented. In the original draft it was something in the neighborhood of 1.5 million. It is now 16 million. And as far as I understand it, the DNR did not do a tax analysis of the project. And I would like to see the State of Minnesota -- having gone throughout the pull-tab debacle -- understand a little bit more of what we are going to be seeing for actual tax occurrence from this site. Because if we are going to pay for it, I want to see what's coming in. Finally, there seemed to be some current conditions that are in the EIS that do not match what the actual monitoring stations read. And I would like to see that resolved. Because as we were looking at the future modeling, the models have never been accurate; however, they are good guidances and some of the current conditions anticipated by the model conflict with what we see at actual monitoring stations in the field. Thank you so much.

47155

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Dear Lead Agencies, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (*Lynx canadensis*). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. The cumulative effects analysis section of the NorthMet SDEIS fails to adequately account for a number of reasonably foreseeable projects. Specifically, the Twin Metals and Teck American projects are listed as "speculative" in Section 6-2-2-1-21 and are not analyzed for their cumulative effects. No evidence or rationale for excluding these projects from the cumulative effects analysis is offered. In Section 6-2-3-6-4, the Gray Wolf is the only "Special Status Species" for which even limited analysis of cumulative effects is conducted, despite the Canada Lynx's status as a federally threatened species. Please take the following actions: 1) Include the Twin Metals and Teck American projects as reasonably foreseeable projects in the cumulative effects analysis in section 6-2-2, since the disposition of the NorthMet SDEIS and subsequent permitting decisions could make these projects more likely to be built. 2) Include the Canada Lynx as a "Special Status Species" in Section 6-2-3-6-4 and conduct a cumulative effects analysis of the impact on Canada Lynx. 3) Analyze and include mitigations such as tunnels and fencing to limit the possibility of incidental take of Canada Lynx by increased road traffic associated with the NorthMet proposed action. 4) Remove contradictory language in SDEIS about Canada Lynx utilization of roads as travel corridors. For example, on p. 5-628 the SDEIS states "Lynx utilize snow packed trails and roads as travel corridors," while on p. 5-366 it says "this species does not rely on roads for travel." 5) Analyze and include mitigation such as accelerated re-vegetation of the mine site after closure to decrease the amount of time the mine site would be inhospitable to Canada Lynx. Dear Lead Agencies, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (*Lynx canadensis*). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Dear Lead Agencies, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Dear Lead Agencies, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Dear Lead Agencies, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Dear Lead Agencies, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Dear Lead Agencies, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Dear Lead Agencies, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Ian Kimmer 4102 Gilliat St Duluth, MN 55804-2140 (218) 750-0784

47190

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Dear Lead Agencies, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Dear Lead Agencies, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Dear Lead Agencies, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. My name is Ian Wunder, my spelling I-A-N, W-U-N-D-E-R, address 3515 Columbus Avenue South, Minneapolis, Minnesota 55407. The claim in the SDEIS is that PolyMet will decrease mercury and sulfate pollution in nearby waterways and will do this by operating water treatment systems that have not been detailed. The treatment plant designs have not been outlined in detail in this document, and this industry has a zero percent success record at containing waste toxins. Because of this detail, the SDEIS is insufficient and should not be approved. It does not provide this important information.

19515

My name is Ian Wunder, I-A-N, W-U-N-D-E-R, 3515 Columbus Avenue South, Minneapolis, Minnesota 55407. Five centuries of water treatment will need to be paid for either by the mining company or by Minnesota taxpayers. These individuals in either case will be the future generations of Minnesotans and US citizens. They will be left with a legacy of pollution and wastewater that will need to be cleaned continually for more than half a millennium. The mining industry as a whole is responsible for the largest and most costly environmental cleanups in our nation, and a large percentage of Superfund sites are the legacy of sulfide ore mining specifically. We do not need this legacy added to our Minnesota tax burden for so many future generations.

19516

My name is Ian Wunder, I-A-N, W-U-N-D-E-R, 3515 Columbus Avenue South, Minneapolis, Minnesota 55407. The SDEIS is insufficient and should not be approved based on missing information. The economic consideration for developing an underground mine to access the mineral ore beneath the US Forest Service land has not been sufficiently explored. Many tribal governments in the State of Minnesota have brought concerns forward through the SDEIS and other avenues that the economic possibility of extracting the ore in an underground mine has not been fully explored and that the SDEIS should not be approved based on the fact that this method of mitigating and avoiding environmental degradation has not been explored.

19517

My name is Ian Wunder, I-A-N, W-U-N-D-E-R, 3515 Columbus Avenue South, Minneapolis, Minnesota 55407. Based on the following information, the SDEIS is insufficient and should not be approved. The entire 3,014-acre mine site is classified as high biodiversity significance and houses endangered, threatened and special-concern plant species, as well as used habitat by many rare and important bird species, as well as other rare and important Minnesota wildlife. There is not sufficient action outlined in the SDEIS to mitigate the disturbance of this specific, very important ecosystem habitat.

19518

My name is Ian Wunder, I-A-N, W-U-N-D-E-R, 3515 Columbus Avenue South, Minneapolis, Minnesota 55407. The SDEIS is insufficient and should not be approved on the basis that the proposed wetland mitigation will only cover 912 and a half acres of wetland impact by the PolyMet operation. Ten additional square miles or more of wetlands as well as surrounding area are projected to be indirectly impacted by drainage, decrease in water level and the addition of toxic materials in the form of blown dust. There is absolutely no monitoring plan that will be able to mitigate damage immediately. Additionally, any damage that does occur will be occurring on bogs and coniferous swamps that are extremely difficult to restore and are ecologically sensitive and very important.

Iana Studelska

57272

Absolutely against the licensing and pursuit of this project and similar projects. I am unwilling to trade 20 years of "jobs" for a future of sulfide pollution and the compromise of the Lake Superior Basin. This project does not have the science, nor crystal ball to meet its stated goals. No sulfide Mining. Iana Studelska 2318 Roslyn Ave Duluth, MN 55803

DNR The PolyMet project is an Important part of northeastern Minnesota's economic future. As an Iron Ranger I am confident that this project will provide us with long term jobs. That is good paying jobs not minimum wage jobs. The environmental review process has been lengthy and thorough. The supplemental draft EIS addresses the potential environmental impacts and how to mitigate them. I trust the DNR to do their job to protect us and the environment. I also think that by letting PolyMet mine with the controls that have been put in place will clean up a brown area the old LTV mining site. This will make the site cleaner than it is today. After all these are metals that we use every day. We can control the pollution here but we have no control in other countries. So if we don't mine here, there will just be more uncontrolled pollution in other parts of the world which still affects us here. We should be using our resources and controlling the environment. Thank You Greg Topel IBEW LU 294 503 E 16th street Hibbing, Mn 55746 [HYPERLINK "mailto:busmgr294@mchsi-com"](mailto:busmgr294@mchsi-com) busmgr294@mchsi-com 218-363-6895

To Whom It May Concern: As a resort owner in Cook County, I have been keeping informed on the mining debate. I am completely against this mining project - or any other that poses such a risk to the environment in general, and the Boundary Waters in particular. No mining has been proven to be safe, all mining destroys at least some part of the environment, and water is a resource we can't waste. The risk to human health is too high. The jobs claim is a false one, and the cost associated with any cleanup is unacceptable. In fact I question the estimate, because I don't believe it takes everything into consideration, particularly when it will be us, the taxpayers of Minnesota footing the bill for the cleanup, and trying to live with the destruction of not only our business but the loss of a pristine national public area for at least 500 years. We've seen too much to believe any corporation - the oil spills in Alaska are still not cleaned up even decades later. The small fines payed by companies responsible for the oil spill in the Gulf is criminal. Corporations get away with far too much in this age of greed when a handful of people own half of the globe's wealth - trust in our system of checks and balances is gone, and there seems to be a deep lack of fairness and simple honesty in the race to the bottom to achieve profit at any coSt This cost is too high. Far too many of the disasters we've seen over the years have been due to human failure and disregard for others, but mostly the motive of profit. Until more regulation and stricter controls and rules are put in place, and until we are guaranteed a criminal conviction and jail time for any and all persons responsible for damage, including the death of the corporation itself, I say NO. to sulfide or other destructive mining in Minnesota or anywhere in this country. We need to look more to the sun for our sources of energy, and the challenge of coming up with new materials for manufacturing that are not harmful is one many are waiting on. Thank you, Ida DeLisi 13732 Wellington Crescent Burnsville, MN 55337

17220

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Ida DeLisi 13732 Wellington Cres Burnsville, MN 55337

40807

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

The NorthMet/PolyMet mining project should be REJECTED. This project is not worth the potential environmental impacts and risks. I love this earth and this is not the way to treat it. Our environment should be protected and respected for generations to come. If you pass this sulfide mine you will not only not be protecting the environment but you will be inadvertently destroying it. This mine will poison our drinking water, negatively affect wildlife and raise greenhouse gases as well as ruin our beautiful boundary waters. What we decide, what you decide will affect your children, my children and our grandchildren. Reject the proposed PolyMet/NorthMet sulfide mine.

In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles.
- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Ilse Mortensen 1425 w. 28th street # T 10 Minneapolis, MN 55408

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

40662

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ingrid Baudler 700 College Dr Decorah, IA 52101-1041

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Iraida Capaccio 337 Hudson Rd Sudbury, MA 01776 US

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Iris Sinai 36 W 47th St New York, NY 10036-8601

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Iris Young St Paul, Minnesota

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, To my knowledge sulfide mining has never been done without polluting the environment. Doing it in an area that could contaminate Lake Superior and the famed Boundary Waters Canoe Area seems to be the height of folly. Risking Superiors waters, the recreational economy of the area, public health, and the environment in general is not worth the profits to the company that proposes this disaster. Clearly the Federal land exchange of Superior NF land to help Poylmet's polluting open pit mine is not in the public intereSt Sincerely, Irv Berlin 16385 Frels Rd Cable, WI 54821-4525 (715) 798-4646

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Irv Smith 3141 Dean Ct Minneapolis, MN 55416-5507

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Ivan Snajdar Kralja Zvonimira 27 Crikvenica, ot 51260 HR

Ivan Zenker 11271

Gentlemen: I grew up in the UP of Michigan and understand the desire of rural folks to develop potential jobs. However, as a child I also saw the bleak desolate terrain surrounding Sudbury, Ontario Canada. It was a site that I will never forget. It looked like eastern Wyoming or maybe even the moon. There was little live vegetation. Now I know that was caused by the very polluted water run off. I just don't feel some jobs in the short run justify the danger to the watershed areas that surround the site. And I believe that asking for a company to promise stewardship many, many years into the future to treat the water long after the profits are gone is just not something we should count on. Ivan Zenker 5698 King Arthur Road NW Rochester, MN 55901

Ivy Wright 54555

There is nothing more important to every person in our world than clean air and water. Sulfide mining has been shown to be toxic to the environment. Financial gain for foreign or American companies is a shameful reason to destroy our world.

J Brophy 39412

Dear DNR, I am writing to express my opposition to the PolyMet mining project in MN. Jobs v. Environment Risk The supposed short term gain via jobs would be a small scale, short term boost at best And the jobs would be grossly outweighed by the risk of water pollution and contamination that will continue for centuries after the mining is completed. This is a short-sighted project that endangers our natural resources needlessly. Financial Assurances of Clean Up: PolyMet may sign on to promise clean up, but companies go bankrupt all the time, so what financial guarantees will there be to make sure the clean ups actually occur. For that matter, insurance companies go bankrupt, as do major financial institutions. We can't be left holding the clean up bag if PolyMet's finances evaporate. Thank you for your consideration, J. Brophy Victoria, MN

J Cherveney 16517

To Whom It May Concern: I am writing to share my concerns with you about the proposed Poly-Met copper-nickel mining project. I live in Duluth, and we draw our drinking water from the beautiful Lake Superior. In fact, our water was voted the best-tasting in the state. It is one of the largest fresh water bodies in the world, and many people would love to have our water. Just ask the folks in California and Nevada, among other places. Fresh, clean water is a very precious commodity. The people in West Virginia who live on the Elk River can vouch for that. Yet people in our state are willing to risk our fresh water for a generation of jobs with the promise of a clean up if the inevitable contamination occurs. I can hardly believe that anyone would want to risk our precious clean water for any job or promise of money. You can't drink money. Please deny the permits they are requesting. It's not just for me that I am asking this. It's for my children and grandchildren as well. They deserve the same clean water that we have enjoyed and have a right to--yes, a right to. This is my world, my state, my community, my water, and I don't want it polluted by Poly-Met or anyone else. Thanks for "listening." Judith Cherveney Duluth, MN

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, J Gravenson 1820 Ivan Way St Paul, MN 55116

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

J Patrick Kegley

18171

Good evening, I'm Patrick Kegley from Minneapolis. K-E-G-L-E-Y. And I have lived in Minnesota all my life. I've been up to the Boundary Waters Canoe Area many years ago with Jim Klobuchar. And I am also on behalf a member of Ecology Democracy Network with Ken Pentel. And I think the spirit of Pete Seeger is here tonight. We have to protect the land, the water. The ecology must come first. We cannot restore the ecology. You cannot restore things once they're damaged. Native Americans have known this for years, centuries. We must also consider that. Yes, we need copper. Yes, we do need precious metals. But much of the metal is already here. We can reclaim and reuse copper. 24 percent of the copper of the world comes from reclaiming it. We don't have to continually mine it and rip apart the earth to do it. I wish there were a way to do it safely and responsibly, but I don't trust that there is. I've never seen it done in any way. From all I've heard about copper mines, it's destructive and it pollutes the environments. I don't know any way around that. I am hoping everyone here will consider making comments and strongly speaking for generations yet to come that we need to have the ecology and all of the environment protected as our first priority, not something as an afterthought later. That's all I have to say. Peace.

J Van Dyne

58162

Wonderful discourse. We, the public, needs more study and comment timePolymet has not or needs to respond to concerns brought up tonight.We need to think about the 7th generation and what we may be leaving behind. As a society, we tend to be shortsighted. Jobs for 20 years! Sure they worth the travesty, wrecked on our environment which will impact us economically, physical – both health wise and topographically.I have seen the devastation in Utah, and various places in AZ, IT it not pretty – nothing is growing.H2O is in shortage. We need to keep it clean.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Feb 15, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. This will ruin the entire St Louis River Watershed, which is home and habitat to many birds, animals and people. Birds that depend on fish and other aquatic organisms for food will be affected, including Bald Eagles, Ospreys, Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons, Mallard Ducks and other ducks. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. Animals that live and depend on the St Louis River include River Otters (which live in/on the banks of the river or nearby), Fox, Coyote, Timber Wolves, Black Bears, River Otters (who make their home in or near the banks of the St Louis River), Deer, Moose, many small mammals and birds. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. The St Louis River is a beautiful and scenic river and from the source until it gets to and drains into Lake Superior, most all of it is a river that travels in quiet beauty through wild/wildernesslike lands. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds, animals, people and habitats. This trade-off is not worth the risk. Please do not allow this harmful mine to ever happen. Every company who has undertaken sulfide mining has promised to clean it up but they never do. They always have said that it would be okay for the environment but it has devastated the environment. Unlike the iron mining that has happened in Minnesota, this sulfide mine would be much more damaging to the environment and not just the local environment where it is located but much of Northeastern Minnesota where the St Louis River watershed and the Lake Superior watershed exists. So, please do everything in your power to stop this mine from ever starting or existing. Our lands, wildlife, human life, water that we drink are more important to most all of us than any gold, silver, copper, platinum, etc that we are told exists where Polymet wants to mine. Thank you for all your help and all that you will do to protect us and a beautiful and wild area of Minnesota. Sincerely, Ms J. K. Fort-Strietzel 10332 Bachelor Square Rd Meadowlands, MN 55765-8103 (218) 206-1788

Jace Carlson

57139

Sulfide mining in other states has been extremely detrimental to the water around the mines and in an area like the Superior National Forest with valuable peatlands, this kind of pollution would be unacceptable. The fact that there are no safeguards for when things go wrong makes this plan even scarier. Risking our valuable environment for this reckless mine is unacceptable. I urge you to stop this plan before Minnesota is seriously damaged by it. Jace Carlson 4238 LaVaque Rd Hermantown, MN 55811

Jaci Christenson

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Jaci Christenson 12309 Fiona Ave N White Bear Lake, MN 55110-1147 (651) 343-6340

Lisa Fay MDNR Division of Ecological and Water Resources Tim Dabney US Forest Service Douglas Bruner US Army Corps of Engineers Dear Ms Fay, Mr Dabney, and Mr Bruner I am writing to ask you to reject the PolyMet sulfide mine project, Supplemental Draft Environmental Impact Statement (SDEIS) and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes and does not take into account the true cost of the project. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all lands in the exchange have split mineral rights and no legal barrier to future surface mining. The Land Exchange results in an unacceptable net loss of 6,026 acres of area with high biodiversity; 2,030 acres of mature forest-replaced by 2,000 acres of immature forest and 1,400 acres of floodplains. Secondly, PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swampland and the Partridge River headwaters for its open-pit sulfide mine. This would result in the single largest wetlands loss ever proposed in Minnesota. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres in total due to air and water pollution, mine dewatering and water from wetlands. These comments are made from both the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit. In addition, the PolyMet sulfide mine would negatively impact 2 out of 13 remaining corridors for wildlife, including resident and migratory species, to travel across the Arrowhead region. The PolyMet mine plan would destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which has dropped precipitously by 35% from 2012 to 2013- Eleven endangered or threatened species, including lynx, would be further impacted. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants including wild rice. PolyMet and the SDEIS do not acknowledge the true cost of the proposed PolyMet sulfide mine. PolyMet is a lean deposit of copper-nickel, therefore, 99% of what is dug out of the ground will be waste. For that 1% gain in metal, the true cost will be unfathomable. The toxic extraction process will be energy and water intensive (releasing 200,000 metric tons of carbon dioxide). Even more water and energy (generating 707,000 metric tons of carbon dioxide each year) will be used in processing; leaving us with even more waste that will need to be managed for 500 years. This is in direct opposition to Minnesota's goal of reducing greenhouse gas emission by 30% by 2025- Lastly, it can no longer be ignored that fresh water is a precious resource and must be treated as such. By rejecting PolyMet's SDEIS and sulfide mining plan, you have the opportunity to pass on to future generations of humans and nature alike, the gift of irreplaceable wetlands, mature forests and fresh water resources of the Lake Superior Basin. You have the responsibility to do what is right and lead the way to a future that faces the fact that we live on a finite earth with finite natural resources. I respectfully ask you to reject the PolyMet sulfide mine project. Sincerely, Jaci Christenson 12309 Fiona Ave N White Bear Lake MN 55110 [HYPERLINK "mailto:jacichristenson@gmail-com"jacichristenson@gmail-com](mailto:jacichristenson@gmail-com)

Jack and Rhoda Liebo

I am a life long Minnesotan. My wife and I are both physicians, as are 2 of my three children. We adore this state, and mostly because this has been a state that cares more about health and family, and less about money than many of the other 50- I was shocked to hear about the exploration for minerals near the BWCA and the Superior National forest watershed, several years ago. I understand how blighted the region has been economically, since the iron mines have ceased. But the decision to move forward past this ridiculous review shows a sense of panic on the part of the officials in government to produce(in the short term), good economic growth. They have a blind eye to the real issues here. Externalizing toxic water soluble poisons, which are currently well insulated from doing us harm, into this glorious region of Minnesota, shows a complete absence of understanding. The multinational corporations that promise economic prosperity and jobs for Minnesotans are nothing more than rapists, telling us all the while that we will like it, and that it is for 'our' good. In fact, they will extract our wealth, freeing deadly polluting poisons that will contaminate our environment, kill the fish and the precious watershed, leaving us, some time within the next 500 years to cover the cost of cleanup. They will kill land values, resources, and the budding conservationists tourist industry. Just look at the hard rock sulfide mining track track recoRd No matter what the industry suggests, there are no big breakthroughs that will suddenly make this type of mining safe for the local watershed. Say no to these 'carpetbaggers'. Read their EIS for what it truly is, a fairy tale, told to eager and receptive ears. Do the right thing, deny these mines. Protect the state from evil during your watch. Have patience, and do not succumb to the financial enticements. Jack and Rhoda Liebo 5729 Kemrich Drive Mpls., MN 55439

Jack Brunell 15964

Dear Lisa, I am in favor of letting Polymet mine in Northern Minnesota. In the past mining companies could do whatever they wanted with almost no regulation. That is not true today. I feel the current State regulations adequately safeguard the Northern Minnesota environment. I was raised in Northern Michigan in a copper mining area. I have seen the problems unregulated mining can cause. I also see that nature is very good at correcting mistakes that man has made. Thanks You, Jack F. Brunell 2133 10th ST NW New Brighton, MN 55112

Jack Carrick 15815

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, jack carrick 2525 2nd ave E North St Paul, MN 55109

Superior National Forest Service 8901 Grand Ave Place Duluth, MN 55808 Dear Tim Dabney, I am writing to ask you to not approve or even consider the PoliMet open pit mine. I attended the meeting last week and saw how important jobs are to the miners and the tax base of the area but please, think of the future. Please keep in mind that there has never been a sulfide type mining operation that has not polluted. PoliMet spent years and a ton of money on trying to get EPA approval and can't even get it correct on paper?! How in the world would they be able to do it for real? And take care of the upkeep? Some of the obvious possible failures of even a good plan are: 1. a 100 year weather event and the whole area overflows. 2. the area is mostly rock but there could be crevasses where contaminated water can slowly leach. 3. heavy equipment throws up dust, in the summer the wind is usually out of the south blowing toxins directly into the BWCA (the fish already have high mercury levels from coal plant dust hundreds of miles away). 4. a tornado hits and blows the waste all over the place. 5. a dam fails. 6. a containment membrane fails. 7. a reverse osmoses filter fails. 8. a pipe breaks. 9. a rail car or truck derails. 10. engineering miscalculation. 11. bankruptcy and bond to cover bankruptcy fails (500 years is a long time). 12. worker error. There are many others of course but I have to go to work. As you know most of these things have already happened in the past in other types of projects and I am sadly confident will happen with PoliMet site more than once over the years. Please do what is right. We're already limited to how much fish (probably the healthiest food known to man) we can eat from Minnesota lakes. Help clean the lakes and drinking water, don't make things worse. Jack Carrick 2525 2nd Ave E St Paul, MN 55109 651-704-0123

jack dunham 40393

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, jack dunham 3343 wilawana Rd sayre, PA 18840 UM

Polymet is a Canadian mine development company that wants to start copper mining in Hoyt Lakes, Minnesota. They want to build a mine in northern Minnesota in order to attain an abundance of metals and open up hundreds of jobs for unemployed Minnesotans. It is being launched by an unproven company, Polymet, and it could desecrate the beauty of northern Minnesota, but I think they should go for it. The reward far outweighs the risk. It would open up hundreds of new jobs and it would provide us with metals that we need in our everyday life. There are many reasons why Polymet should start copper mining. For one, based on an unbiased article I read, the estimated amount of ore underneath the northern regions of Minnesota totals out at well over one trillion dollars. That would really benefit the state financially. Another reason they should go forward with mining is because it would open up a multitude of new jobs for the unemployed residents of Minnesota, mainly those that live in northern Minnesota, where jobs are scarce. The third reason we should open this mine is because we need to take a leap of faith. Where would we be today if we had hesitated on opening mines in the past? We wouldn't have nearly as many of the materials needed to survive. Sometimes we need to take a chance. It could go horribly wrong, but it could also predominantly be right. Either way, we won't know until we try. There are, however, unignorable issues. Polymet is new to the scene and has no past experience with mining. The open pit mine they are hoping to construct would most likely pollute the area's watershed, which is all of the water under the ground, which in turn, could end up reaching the Boundary Waters. Once these toxins reach the lakes in the region the fish are sure to die. If this happens, this pristine national treasure will be destroyed forever. The company also hasn't assured us that they will leave the area in good condition when they are done. There are a lot of risks, but if the company can address these environmental issues before they were to begin mining I believe they will be able to pull it off. In conclusion, I support opening the copper mine in northern Minnesota. We need the resources and we need to open new jobs for Minnesotans struggling to get by. Sometimes you have to take a risk, and maybe, just maybe, that risk will pay off for Minnesota.

Jack Huhta

18081

I'm Jack. I'm Jack Huhta from Gilbert. My background is I've got about 32 years with the FAA, and about nine years with the St. Louis County Planning and Zoning. I was chair of the planning commission for three years, and I was involved a lot -- or we were involved a lot with the clean water and sewer systems and we were very concerned about it, but having said that, I'm still just a layman like you people are in the audience here. We have to depend on the Corps of Engineers, the DNR and the US Forest Service for our information. We're paying them. They're all experts and they did all the research on this -- for this EIS and we have to depend on the information that they're providing us. Opinions are fine. We heard a lot of opinions in Duluth the other night and we're going to hear opinions here tonight. Opinions are fine as long as they're based on facts, but a lot of times you have opinions that are based on emotions and they are not valid in the cases that are confronting us tonight with this EIS and the mining in -- up at the -- at PolyMet. World War II probably would have turned out a lot different had we not had the mining here on the range for the iron ore. As we all know, a lot of the iron ore for fighting World War II was provided by the Iron Range. Who would have ever thought that we would have been finding trout, probably the most sensitive species of fish in the Iron -- in the pits where we had extracted all the iron ore. Who knows what's going to happen; what we can do? Who knows what they can do with the -- with the -- with the area that has been extracted -- that PolyMet's going to do. We put PolyMet through a lot of hoops. We've made them -- we put them through a lot more than the average corporation would ever think of going through. The cost, the frustrations and the delays are unbelievable. I can't imagine nine years what they've gone through trying to get this process forward. Our schools, our streets, our roads, we need something. We need a tax base so we can provide an education for our kids. How are we going to provide an education for our kids with schools if we're going to depend on the canoeists in the boundary waters, picking rice and shooting ducks. It isn't going to happen. We have to have a tax base, and that's money. We can't build schools with money that we get from rice and canoeing. So I just wanted to tell you people that -- listen to the facts. Forget about the opinions and let's move forward. I'm a full supporter of PolyMet's project.

Jack Hwinta

58109

The Polymet Project will not only benefit northern Minnesota. It will provide resources and raw materials for manufacturing which will benefit the entire state of Minnesota made in USA sounds a lot better made in China or Beijing.

<http://www.icmm-com/members/member-companies> Good morning Lori: Will you please bring this organization to the attention of your mining people. It is important. They control your future. In London they now acknowledge the fact that nations with mineral resources are beginning to resist offshore pirates and would-be colonists. In our neck of the woods it is they who seek out the decision-makers and adopt them for as long as they are useful. It is they who decide whether we should be bought, not with beads today, but with t-shirts and baseball hats with corporate logos. It is they who will decide when to pull out with maximum loot, leaving second-tier mining companies to deal with the left overs and perhaps the cleanups. Please remember Kennecott/Rio Tinto Flambeau and Eagle and Pebble projects more clearly than we "Remember Pearl Harbor.". So soon we forget the wasted millions. You will probably recognize some of the corporate logos already. Keep in mind their multi-billion dollar reasons for being and trust them as far as you can throw them. Check their social and environmental records. Begin by demanding all the facts concerning the mineral resources they seek - NOT only those items they choose to divulge to serve their reason for being. Demand too financial assurance that all damage will be remediated. If, for example, they cannot give us absolute assurance that Lake Superior will not be harmed - then there should be no mining. For an antidote to ICMM go to "London Mining Network" an honorable non-profit organization in London keeping tabs on big miners. Thank you Lori, Sincerely, Jack Parker, Mining Engineer/Geologist, Baltic.MI 49963, 3/7/2014

One more comment please - to support my earlier comments concerning the integrity of the PolyMet principals, if any. They are not dumb. They have led the opposition up paths where they have little to worry about, and they withhold most of the information which they would rather not bring to light. For that reason we must insist on seeing all of the basic information, not what they want the public to see. Fail to do that and we give them freedom to do whatever they want to do, regardless. Example 1- Remediation. Show the terrain as it is now, summer and winter. Show it again when the mining is finished.. Show it again after remediation. All photographs and "artist's concepts" clear enough for viewing on a large screen, i.e not thumbnails. eg 2- Provide all the geological information needed for an independent evaluation of underground mining. Thank you, Jack Parker, Mining Engineer/Geologist, Baltic MI 49963, March 6th 2014 On Thu, Mar 6, 2014 at 12:30 PM, *NorthMetSDEIS (DNR) wrote: Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. Hello MDNR. Lyman being out of office until 3-17-14 I figure I should fwd this directly to you for prompt action - please. It is vitally urgent Thank you, Jack Parker --- Forwarded message --- From: Jack Parker Date: Thu, Mar 6, 2014 at 11:24 AM Subject: THE MID-MARCH HEARINGS RE POLYMET To: "HYPERLINK "mailto:lwelch@greatlakes-org"lwelch@greatlakes-org" , Lori Andresen , jack parker Am not a chemist but find your comments OK, except that Superior is the biggest by surface area but not by volume. Baikal is. Time is short and my octog. fingers not supple so I must be brief. A resume is available on ne. 1- You do not know your opponent. He is not a benign businessman. I have been working, unpaid, on the Kennecott/Rio Tinto/ Lundin Eagle project since 2006, not giving up because very soon after receiving the application for permits we recommended that it be rejected - the document was indeed unacceptable. The basic design data had been faked. When corrected the design approach indicated that the factor of safety was lower than one - UNSTABLE. There were many other mistakes and mis-statements, lies. In short they got away with it because they were in cahoots with MDEQ and the courts. I took the case all the way up the ladder from local cops to US Atty Gen and all declined to prosecute because "jurisdiction over mining matters had been delegated by the Feds to Michigan DEQ." \$4,700,000,000 can do that. Michigan Mining Law, Part 632 recognizes their approach as felonious and prescribes stiff penalties for principals, including jail time. 2- So what is that to you in Minnesota. Hear this: The prime movers at PolyMet, Messrs Cherry, Foth and now Ware, were at the helm of the Eagle project. The truth is not in them. With another potential bonanza in the Duluth gabbro they can be expected to lie and to cheat and to hand out t-shirts to get the money. Foth boasts that he knows how to get permits. You might learn something about tactics by Googling "The Silver Fox Fable" at the "Woods Person" site. You'd better believe it. You will recognize the progression. 3- Am not familiar with the machinations in Minnesota but know this: That the big miners do not follow established rules and politicians look the other way. In days of yore, for example, the miner seeking a permit would have to submit all basic data = diamond drill cores and logs and assays and evaluations in detail. How else can the project be evaluated. I was not surprised, for example, when Eagle "discovered" recently that there is uranium in the system. I saw it in the very first core logs, but they quit testing for it and declared it absent. 4- I suspect that the MN ore could be mined selectively underground, so ameliorating many problems with the environment, but I see that PolyMet dismisses the possibility, essentially "Because I say so". We cannot correct them because they will not disclose details of geology. Part of their plan. 5- I submit that we, the people, cannot and should not accept PolyMet statements unless we can confirm them via original data. 6- As a demonstration of good faith how about them submitting all known facts about the "orebody" (which it is NOT until factors including environment are satisfied) to a worthy mining group for evaluation. There they have you by the scrotum. The Big Miners already have their Club, the ICMM in London. QV. Hanging on eagerly to their coat tails are most of the international mining consultants - as we saw at the Eagle. Their experts too lied freely under oath - with one notable exception - David Sainsbury of your Itasca group. He was quickly shipped off to Australia. We knew about his promotion before he did. Not many old-timers are left. Maybe some associated with universities. Maybe Ralph Marsden is still kicking in Duluth, he's a good man. You might look up Wilson Blake - his reputation is good. 7- Divide and Conquer is a good weapon for them. If you put on blinders to concentrate on chemistry and get no support from tree hug

I am voicing my concern for the destruction of 913 acres of irreplaceable wetlands along with another 7,350 acres in the St. Louis River watershed that would be affected (SDEIS, p 5-224). This mine and its water if allowed to proceed, will effect all living things "down stream" in the Lake Superior basin. This area of northern Minnesota that is so very water rich could very quickly be polluted. All ecosystems are interconnected. Mining harm to this area will effect the whole environment, such as the nuclear meltdown in Japan iif effecting all of the Pacific Ocean basins. I ask that you please reject the Polymet SDEIS as inadequate. I ask that you reject the proposed Polymet mining - it is a grand experiment - that will leave northern Minnesota with pollution; the money (billions) going to Canada's Glencore Xstrata Corp. The company and its chair, Tony Hayward, now famous for his part in the BP deepwater oil spill have a notorious record for environmental and labor abuses. Thank you. Jack S. Sneve PO Box 3501 Duluth, MN 55803

The precautionary principle “states that if an action (PolyMet Mine (My View J.S.S.)) or policy has a suspected risk of causing harm to the public or the environment” and that when “extensive scientific knowledge on the matter is lacking” (Polymet’s recent (MY view J.S.S.) science must be re-examined because it is based on computer modeled simulations and prediction. They must do the numbers on red field evidence!) or scientific evidence is insufficient to prove that such harm will not occur, the prudent thing to do is to say NO. I am saying NO and I ask you to say NO to granting the permit to mine until evidence can prove otherwise. The principle implies that there is a social responsibility to protect the public and the environment from exposure to harm when scientific investigation has been found to have plausible risk. Source: Wikipedia) [ILLEGIBLE] every sulfide mine has had a 100% failure rate. Untreated seepage forever for all living beings. Jack S. Sneve PO Box 3501 Duluth, MN 55803

Jack Sikora 39364

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Jack Sikora 1600 N Jefferson St New Ulm, MN 56073-1417

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jack Van meter Hugo, Minnesota

16 South 25th Avenue East Duluth, MN 55812-2227 Lisa Fay, Public comment Manager, DNR DNR Ecological and Water Resources 500 Lafayette Rd Suite 25 St Paul, MN 55155-4032 Dear Ms Fay: I have lived all of my adult life in Minnesota. I love its beautiful natural resources and have raised three children to do likewise. As a citizen and taxpayer, I write to express my opposition to the reported conclusions in the SDEIS draft for the PolyMet proposed for Northern Minnesota. (To be frank, the document is too complex and lengthy for me to make an informed analysis based on my own knowledge.) As it has been repeatedly pointed out, correctly, any jobs for Minnesotans are temporary, the bulk of the profits will flow out of the local economy, and the “toxic legacy of damaged waterways” will remain permanently here in Minnesota. To date, “Mining without harm” and “environmentally safe mining” have been promised, but there is zero evidence to back up the claim that sulfide mining can be done without causing devastating watershed pollution. In fact, mining of sulfide-metal ore has never been accomplished without causing eventual acid-metal leachate pollution of ground and surface waters. As a result, Wisconsin wisely placed a moratorium on sulfide mining operations in 1997, until it could be demonstrated that such a mine would not pollute the water. The construction of a mine such as the one PolyMet proposes violates the Precautionary Principle: “if an action or policy has a suspected risk of causing harm to the public or to the environment, in the absence of scientific consensus that the action or policy is harmful, the burden of proof that it is not harmful falls on those taking an action.” Only if and until, the mining industry has a demonstrated track record that it has the means and the willingness to invest the effort and the capital necessary to mitigate all present and future environmental costs, the benefits of the mine cannot possibly outweigh the damages to Minnesota’s water resources, resources that may require treatment for more years into the future than can be accurately predicted. Thank you for your attention to my concern. Jackie Falk

_____ "I go down to the shore" I go down to the shore in the morning and depending on the hour the waves are rolling in or moving out, and I say, oh, I am miserable, what shall what should I do. And the sea says in its lovely voice: Excuse me, I have work to do. - - Mary Oliver Jacqueline H. Falk 16 South 25th Ave East Duluth, MN 55812-2227 ground line: (218) 724-7407

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I am very much against the mining issue. I am a land owner near Babbitt and I cannot tell you how fearful I am that this will ruin this land. I am also infuriated that these companies have eventual mineral rights underneath my land (State owns this and can sell it to the companies). Stop these products. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dmiinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Minnesota DNR: My name is Jacob CrawfoRd I am not a Minnesota resident yet, but I will be in a few months. I'm distressed to hear about the potential for Polymet Mining's proposed Copper-Nickel mine to become reality. I may not live in your state yet, but I've been doing a lot of research on all the great things Minnesota has to offer for outdoor enthusiasts such as myself - not least among them being the Boundary Waters Wilderness, which this mine will almost undoubtedly affect adversely. Long has this been a dream destination for me. Speaking as an out-of-stater, I can say that it holds a somewhat mythical status among Americans across the nation and even to foreigners abroad. To think of what damage this mine could reap upon such a place (such as the leaching of acid drainage and harmful heavy metals into the surrounding environment) makes me very sad for the future we're leaving for future generations. My brother and his wife are Minnesota residents and this April they'll be bringing into the world their first son (my first nephew). I want places like the Boundary Waters to be untouched by industrial havoc for his generation to enjoy, explore and be proud of. Beyond my sentimental attitude and selfish hopes as future Boundary Waters visitor, I believe this mine can not be practically considered. I'm told the previous EIS on the project received an "F" from the EPA for all its many dangers, which is not something that should be brushed aside lightly. Approving such a project would put wildlife and human health at risk as well as the good reputation of the state of Minnesota. Thank you for your time, Jacob Crawford 2208 E. 17th Ave #2 Denver, CO 80206

Jacob E Davis

I am commenting today due to my concerns of the geological analysis of the mine site. The environmental impact survey is based on the iron range and its geology, where as the actual mine site is entering into the Duluth Complex. This misrepresentation of the geological implications of the proposed mining site is misleading to the public. Further, it is flawed science. Give the people truth. Stop squandering what could be a lifelong resource (our waters) for 20 years of jobs. Stop letting corporations extract wealth from our lands only to leave us with pools of toxic waters for 500 years. Recreation is far more important to northeastern Minnesota than mining. Jacob Davis, MLS (ASCP)

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: The PolyMet project is not just risky, it is all but guaranteed that this project would decimate Minnesota's fresh water for hundreds of years. Also, how many companies do you know that are till around for cleanup after even 100 years, let alone 50, 25 or 10- If it'll be cheaper for them to go bust, then that's what they'll do and you know it. They'll take their short-term money and run leaving us with a long term costly, disastrous, mess. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Jacob Kjome 10761 100th Ave N Maple Grove, MN 55369

I believe the mine that is desired to be built is not a good idea. Building this mine will pollute the beautiful waters and put people in danger. Sure it may create jobs, but the negative impacts such as waste and pollution will weight those out.

Jake H 11362

Dear DNR, I am worried about the perpetual clean-up costs associated with the North Met project. It is my opinion that Glencore, the European company that is backing Polymet, is trying to reap the economic benefits of our natural resources while avoiding liability for environmental impacts. I'd imagine that Glencore would own the North Met project outright, if it were not for the aforementioned perpetual costs. I believe that the responsibility for such costs should rest entirely on the company- a responsibility which cannot be realized given the indefinite nature of the environmental impact. In June 2012, the region I live in (Duluth area) experienced a historic flood, the likes of which I had not thought possible. The St Louis river saw peak flows of 56,000 cubic feet per second, 40% higher than the previous record. What would the consequences be if such an extreme precipitation event (10 in+) were to occur in the region of the proposed site, either during or after mining operations. Would the tailings basin overflow and contaminate flood waters. How would a situation like that be managed if the power went out, as would likely to be the case in such a scenario. Would the waste water pump and treatment facility still be operational. Also, I believe the increased demand for Coal-generated electricity, as a result of new mining operations such as this, would be a step backwards in the direction our state should be heading. We should instead be looking for ways to reduce our energy needs and diversifying our energy sources away from coal. Burning Coal and Mining Copper what year are we in, 1880- I'm sure President Ulysses Grant would approve of all this nonferrous nonsense, God rest his soul. Thank you for your consideration, Jake Hartley 418 Kelly Cir Duluth, MN 55811

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. So much of our wilderness has already been ruined by development, drilling, pollution, and logging. Enough is enough. The wilderness is supposed to be a place of peace and quiet for us, and the wildlife which live in it. The animals are running out of places to live and be safe. Our wildlife are under threat from so many angles. They desperately need to be protected, mainly from humans. Life is hard enough for people, let alone the animals. Can't we please offer them some much needed help.. PLEASE save the wilderness for all future generations before it is permanently ruined. Some damage cannot be undone. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Jake Hodie 145 Starwood Aspen, CO 81611

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Jake Jacobi 861 19th Av SE Mpls, MN 55414 612 378 3954

Lisa Fay MDNR Division of Ecological and Water Resources Douglas Bruner US Army Corps of Engineers Tim Dabney US Forest Service March 13, 2014 Dear Ms Fay, Mr Bruner, and Mr Dabney, I write today to ask you to please reject the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) as inadequate. You must not allow the PolyMet project to proceed for the following reasons: 1- The extensive environmental devastation at the core of the PolyMet project that will negatively impact our economy, 2- The severe lack of integrity and neutrality among the authors of the SDEIS when choosing what information and outcomes to include in the SDEIS and what information and outcomes to obfuscate or hide, and 3- The negligence of the authors of the SDEIS in their failure to include a cost/benefit analysis of the PolyMet mine with specific provisions regarding amounts and sources of financial assurance. The only appropriate decision is to select the No-Action Alternative in the SDEIS. I am very familiar with the economic and environmental issues concerning the citizens of the Minnesota Arrowhead region. I have lived in the Arrowhead most of my life; I grew up in Grand Rapids and now live in Grand Marais. My brother is part of the Iron Workers Union and frequently works for the mining companies along the Iron Range. I work in the kindergarten classroom of a Grand Marais public school and at the Angry Trout Café during the summer. I understand that a responsible, clean mining operation could be a boon for this area. The SDEIS, despite its many attempts to hide or distort the truth, shows that PolyMet's proposed project will be environmentally and economically devastating for our area. The issues directly concerning the local people, the people who live in the Arrowhead, are strongly interconnected. What happens on the Iron Range does not stay on the Iron Range; the environmental and economic reverberations can be felt from Grand Rapids to Grand Marais. The health of our regional economy depends upon its diversity. What threatens our environment also threatens our economy. We, the people who live in the Arrowhead, greatly value the natural beauty of our wilderness. It is in our interest to preserve the attractiveness of our wilderness and parks not only for our own enjoyment, but also for the enjoyment of visitors to our area. Tourists as well as locals seek out our area as a haven a multitude of outdoor activities, including, (but not limited to), hunting, camping, canoeing, and fishing. Our robust and constantly expanding tourist economy depends upon these nature visitors to thrive, and survive. If the natural beauty of our region were compromised by bad land management practices, as would be the case if the PolyMet project was allowed to proceed, these visitors would lose interest in returning to our area. Then, the outdoor outfitters, hotels, state parks, restaurants, gas stations, and everything in between would suffer a significant loss of income. The economic impacts of losing the robust recreation and tourism industry we have so carefully constructed would be catastrophic. In this way, we depend upon the natural beauty healthy environment of the Arrowhead region for our jobs. Dependable jobs, (notably those supported by our tourism industry that have lasted and will continue to last for several generations), are of great concern for the Arrowhead's local people. It is not logical to jeopardize over 18,000 jobs in our recreation and tourism industry in order to provide a few hundred people jobs in a destructive sulfide mine that will only turn a profit for 30 years, and, PolyMet admits, will require cleanup of the pollution by sulfuric acid and heavy metals it causes to our water for over 500 years. According to Minnesota Rules 6132-3200, at the time of its closure the mine site must be maintenance-free. The PolyMet plan for 500 years of cleanup not only br

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. Those of us who love the boundary waters and the many species of wildlife and especially birds fear that proposals such as this will bring long term losses that cannot be justified by short term profits. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr James A Ahrens 529 Park St Grinnell, IA 50112-2421 (641) 236-4665

I wish to register my objection to the proposed PolyMet copper mine and processing center near Hoyt Lakes. Copper mining is very different from traditional taconite mining. It carries increased risks to the environment which in my opinion have not been adequately addressed. The waterways of northern Minnesota are a priceless asset. They have enriched our lives for countless generations and should be passed on unspoiled to future generations. A comparative handful of jobs for a few decades do not justify the immense risk involved. As a retired physicist and a concerned citizen I urge you to please take into account the serious danger to our environment posed by this project. James J. Amato, Phd 4004 London Rd, Apt. 1111 Duluth, MN 55804

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. My wife and I have recently bought property on the North Shore. From our point of view, the danger is so catastrophic that there is no way we would want this area's unique beauty to be risked for generations, much less for our generation. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr James Amundsen 3540 Edmund Blvd Minneapolis, MN 55406-2943 (612) 721-3282

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. The BWCA is particularly sensitive, and, its natural beauty aside, is a major contributor to the economy of northeast Minnesota and particularly Ely. We moved to Minnesota 35 years ago, drawn by the quality of life and the unspoiled woods, lakes and rivers, and the legacy of environmental stewardship. We want to see those qualities preserved for our children and grandchildren and future generations. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. We have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, James And Deborah Nicholson 7508 Hyde Park Dr Edina, MN 55439-1743 (952) 942-9639

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, james barnett 515 E WilsonSt ELY, MN 55731

Dear Sir, I am an avid canoeist, CC skier and general all around outdoorsy 64 year old. I was born in Ely and moved back here +30 years ago. I 100% support responsible mining in this area. I want to see healthy young families grow and prosper here like I did. Tourism never did and especially with the creation of "Disney Woods" never will provide livable wage jobs. Like my Buddy Rick said " Jobs. There are plenty of jobs in Ely. Why my girlfriend moved here and within a week had 3 jobs. Of course their total pay barely covered her living expenses-but hey, she's living in Ely" We need to move forward with the mine project. James F. Beaty 921 E. Pattison St Ely MN. 55731

James Beaumont 57461

I believe the PolyMet Mining project should proceed. The PolyMet Mining water quality study, the Superior National Forests bio. assessment and evaluation as well as the United States Army Corp of Engineers have done an extensive review of the proposed project and long-term effects. Please help to see this project passes. Thank you for your help. James Beaumont 3290 68th Court East Inver Grove Heights, MN 55076

James Beckstrom 31231

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, The trend to pollute must be reversed - when is blatant greed going to be taken off its pedestal. Sincerely, James Beckstrom PO Box 436 Oscoda, MI 48750-0436

James Borden 3601

December 20, 2013 No Polymet Project Please. I am e-mailing you as part of the window of public response given to residents of Minnesota to say I do not feel that Polymet's proposed mining of Sulfide Ore is good for Minnesota from any way it is viewed. It will only go for 20 years, with a minimum of jobs, especially compared to the jobs we get from sustainable tourism in Ely area, and produce sulfuric acid in all the waters it drains to including Lake Superior, the largest supply of fresh water in the US. Thanks, James Borden 1963 Fairmount Ave St Paul, MN 55105 651-699-8957

9311

January 30, 2014 I am writing because I am against PolyMet or any other company mining for metals in sulfide bearing ore. The issue is very simple to me; the danger of harmful byproducts, such as sulfuric acid and mercury is too great in an environment like this. The mining for these copper and Nickel need to talk place in dry environments like Arizona, Utah and New Mexico, which are already the leading states for copper mining, not in a wet environment like Superior National Forest No this can't happen, here, especially not near the boundary waters, a protected as a National Wilderness Preservation System. With two major watersheds that could potentially spreading sulfuric acid into Lake Superior and the Hudson Bay. This mining deal doesn't really present viable, sustainable jobs and may only last 20 years whereas the potential for pollution may be up to 500 years. It would be a foolish trade-off for all involved. Thanks for letting me speak my mind. James Borden

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, James Bradley 18448 Belle Alliance Prairieville, LA 70769 US

James Bussa 6316

Say no to mining in the BWCA. A handful of jobs is not worth 100's of years of pollution. Jim Bussa Shakopee

James Cunningham 33549

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. So, there's no need to start. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. This mining activity will pollute one of our nation's largest bodies of fresh water. Not a good idea unless you want to poison Americans. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest in any way, shape, or form. We cannot allow corporate profits to trump public health. Please put a stop to this incredibly bad idea. Sincerely, James Cunningham 205 W Reindeer Dr Powell, OH 43065-5073 (614) 326-0730

James David Cole 57232

Too many decisions in the quest for greed ignore the consequences. When the land is destroyed, where will we live? The costs to clean up the problems left behind far exceed the profits taken! James David Cole 24553 Evergreen Drive Nevis, MN 56467

James Denman 43645

There needs to be more push back on the Polymet Proposal. The BWCA is so close and it is a treasure that we should not risk. 1- Polymet will emit 46 lbs of mercury/ year that will cause harm to visitors to the BWCA and local residents. 2- It will destroy Moose and lynx habitats 3- The risk of Sulfide pollution is high. 4- The project will affect over 1000 acres of valuable wet lands. The project does not seem to benefit the local residents nor the citizens of Minnesota. The risk to the area is high compared to the benefit of the project is low for Minnesota overall.

Feb 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr James Hall 1820 E 1st St Duluth, MN 55812-1721

James Hansen 57378

I think it's great idea to develop the area and create jobs for the iron range. Jim Hansen Sent from AOL Mobile Mail

James Hanske 11272

Hello, It was unclear on your website where you are receiving comments for the Northmet SDEIS. I will submit mine here. I feel that my rights as a Minnesota citizen would be violated by having the Northmet mine approved. This is Minnesota superior national forest land and it should be up to the people to decide its use and up to the DNR to protect this land and ensure its preservation. This mine would significantly degrade the water quality of the boundary waters lakes and lakes in the surrounding area. It is our job as Minnesotan citizens to protect arguably the most precious natural resource in Minnesota which is our lakes and more specifically the boundary waters. It would be an outright greed driven crime for SNF lands to be exchanged to a mining company. The way we regulate mining companies to make sure they follow environmental regulations is not enough. Furthermore surface mining is extraordinarily harmful to the environment. It would be the biggest betrayal of the people for the DNR, the very people who are supposed to preserve this land, to not only allow but knowingly aid in the permanent destruction of our beloved lake country. If this is approved and a mine is built I will have lost all faith in my representatives ability to listen to their citizens and the DNR's ability to protect our states wildlife and wilderness areas. I will no longer vote to approve any funding for DNR sponsored programs because of my lack of faith in their morality and ability to do their job. I urge you to please make the decision that will protect our nations fading wildlife and not allow this or any other mine in this area. Thank you, James Hanske

JAMES HENDERSON 38574

Dear DNR, I oppose the proposed PolyMet mine in northern Minnesota. It will pollute the land and water with little economy compensation to justify such a degradation of our precious environment. Thank you, James C. Henderson 104 Windsor Court New Brighton, MN 55112-3309 651-633-2297

By way of background, I have BS & MS degrees in Mining and Metallurgical Engineering from the University of Wisconsin, Madison. I have worked at the U.S. Bureau of Mines, ALCOA, and other mining related industries. Over the years I have read many EIS documents and Conditional Use Permit applications; there is a common thread through all of them. That thread is that the mining companies are using them for hype and propaganda. Poly-Met hopes that by overdramatizing a few positives, namely jobs and the economy, the many flaws and omissions in this document will be missed by the many review boards. Let me briefly recount the history of the Flambeau Mine in Rusk County near Ladysmith, WI., a location similar to that which Poly-Met has chosen, but with far fewer complications. Flambeau said that they would be there for at least 20 years, supply 160 jobs to the locals, reclaim, and restore everything so that you could hardly tell that they had been there. In the end, Flambeau shut the mine down in less than 6 years, and exported an estimated \$750,000,000 of metal out of this country. From the few records that Flambeau made available it seems that less than half of the jobs went to locals and they were the low paying ones; Rusk County's jobless rate and economy made no improvements. Worst of all there was very significant pollution. Below is the website where this information can be found. <http://flambeaumineexposed.files.wordpress.com/2013/01/buzzards19.pdf> History Flambeau mine This project will deeply and adversely impact the lands of several Native American bands in the area. I thought that we as a nation and state had grown out of the phase in history where it was okay to cheat the Native Americans because someone wanted to make money with Their Land. They want the land that was returned to them by treaty, because it is sacred to them. This land is their "green grass of home", and yet this company wants to destroy it forevermore by polluting it with toxic waste water. When will we as a Nation and a State be honorable enough to keep our agreements? This document has been studied and been found to be misleading, missing information, and fails to speak to many issues including health. It is not an acceptable document on which to base public trust for the future of Minnesota's people, especially the unborn. I ask you to reject this facade of due diligence.

James Kayfes

77

Let's get this done. We need the jobs in that part of the State. These people know what they are doing when it comes to mining, give them the opportunity. If we fail to support this part of the State I will no longer commit any more resources/donations, etc. to the State of Minnesota. Everything is for the Twin Cities, I am fed up with this. Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr james koenig 1584 Whitaker St White Bear Lake, MN 55110-3768 (651) 261-1798

James Korthals

57348

My name is James Korthals. K-O-R-T-H-A-L-S. I am a partner with Krecho Jard & Associates (phonetic), an engineering firm based in Duluth, Minnesota. I am here to talk for and in support of PolyMet and the project that they have going right now. K-R-E-C-H-O J-A-R-D. We are thoroughly convinced that through the collaborative efforts of all of the agencies and PolyMet that the EIS has brought forth everything that will be of benefit and/or detriment to the environment. And we firmly believe that PolyMet is a responsible mining company and they will be taking care of the environment for a very long time to come. My background, I am a mining engineer. I have been involved in the mining industry for the last 30 years. And I personally know a large number of people that work at PolyMet, and I am convinced that their ethical behavior is above reproach and the way they undertake business is also above reproach. So, therefore, we fully support the NorthMet project.

Lisa Fay, SDEIS Project Manager, MN DNR Kenneth Westlake, US Environmental Protection Agency Region 5 Douglas Bruner, US Army Corps of Engineers Michael Jimenez, US Forest Service-Superior National Forest March 13, 2014 Re: Public Comment submittal: Supplemental Draft Environmental Impact Statement, PolyMet Mining, Inc.- NorthMet Mining Project and Land Exchange E-mail directed to: [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us) [HYPERLINK "mailto:Westlake.Kenneth@epa.gov"](mailto:Westlake.Kenneth@epa.gov) [HYPERLINK "mailto:Douglas.W.Bruner@usace.army.mil"](mailto:Douglas.W.Bruner@usace.army.mil) [HYPERLINK "mailto:Mjimenez@fs.fed.us"](mailto:Mjimenez@fs.fed.us)
From: James Koschak 1329 East Harvey Street. Ely, Minnesota 55731 Dear Ms Fay, Mr Westlake, Mr Bruner, Mr Jimenez, Thank you for the opportunity to comment on this proposed NorthMetSDEIS mining and land exchange project. My Home is located in Ely and my two tourism recreational businesses are located at 12007 River Point Road in Stony River Township on Birch Lake and the South Kawishiwi River. I am a 3rd generation owner. I have reviewed the SDEIS and have interest in providing comments for the MN DNR, the US Army Corps of Engineers, and the US Forest Service. Comments have also been sent to the EPA. General Comments: The PolyMet North Met Mine proposal SDEIS is filled with flawed data, inaccurate information, omissions of pertinent information and is overwhelming complex by design. It is inappropriately long at 2,169 pages, confusing to read, with many leading and unsubstantiated statements. Details of models used to project pollutant estimates are often lacking and the basic assumptions and data inputs for models inadequate. Lack of evidence-based explanations for key conclusions is problematic. One example is that there are no reasons given why other alternatives that could reduce pollution and impacts on wetlands were not analyzed. Why is that. Taking Our Lake Country and Minnesota's Most Valuable Wetland and Turning It into a Mining District: If approved the PolyMet NorthMet sulfide mine would be the first of many such mines looking to secure a permit in northeastern Minnesota. If permitted, PolyMet NorthMet Mine, along with Twin Metals Minnesota and other such toxic sulfide mines "waiting in the wings" would effectively turn our lakes recreational district into a mining district devoid of a beautiful wilderness landscape, solitude, wildlife, including the iconic moose, clean water, clean air, and peace and quiet. PolyMet's proposed mine is not on the Iron Range. PolyMet's SDEIS states: "The NorthMet Project area, including the Mine Site, Plant Site, and connecting infrastructure, would be in St Louis County, Minnesota, and situated at the eastern end of the Mesabi Iron Range." "That statement is false. The NorthMet Mine Pit would not be on the Iron Range. It would be on the Superior National Forest land approximately six miles from the Plant Site. It would be in the Duluth Complex, where the predominant mineral sulfide is copper-nickel, not iron. PolyMet's Mine Plant (LTV's old taconite plant) is on the Iron Range. The Iron Range is not the Duluth Complex." (Community Voices, February 26, 2014). Other misrepresentations, besides the Minnesota Department of Natural Resources SDEIS, as to where the NorthMet Mine Pit would be located were made in other instances, including the opening statements by DNR Director of Lands and Minerals, Jess Richards, at the February 11, 2014 Minnesota House Environmental, Natural Resources, and Agriculture Finance Committee hearing (financial assurances and PolyMet), and the investment firm, Edison, secured by PolyMet, put the Project on the Iron Range. Again, this is not correct. It is quite evident as to why the NorthMet Mine site has been resoundingly misrepresented as being on the Iron Range, instead on in the Superior National Forest in the dissemina

My husband and I want to express our concern about the poly met operation being planned for northern Mn. Perhaps we should be leaving the minerals in the ground until a safer way of getting it out of the ground. Contaminating our ground water is a high price to pay for a relatively few local jobs. Also, we tax payers should not be the ones to pay for cleanup. thank you for consideration of our concerns. Jane Dietl and Jim Lynskey McGregor, Mn.

Dear Reviewers: The EIS should state how the mine's production will be transported to customers. Whether by rail, ship, truck, or pipeline, the method and route of shipment is important as shipping corridors may be greatly impacted by an increase and concentration of shipping traffic along the corridors to be used. Thank you. James M. Hagen 3817 47th Avenue South Minneapolis, Minnesota 55406 jamesmhagen@yahoo-com

I understand the implications of a project like the new mining project. I live in Bigfork Minnesota and have for years. The DNR is not a very good steward of our natural resources and systematically is destroying our forests with logging and power sport trails, wildlife with the wolf hunt and now destruction of the ground itself with this purposed mining project. I guess giving the reigns to a entity that needs money from natural resources to grow and survive was our fault, but you have to live with it. I vote no on any new "management" of our natural resources. You should protect, not destroy. Jim McCluskey 55107 Owen lake road Bigfork, MN 56628 218 743 6720

19979

I want to go on record as opposing the mine operations as a citizen of this state. I will not go into detail, but as a Minnesotan and a person who loves our public lands, I think we should protect them at all costs and stop the progress of this mine. Think of our kids. lets not destroy another piece of this great land. Jim McCluskey 55107 Owen lake road Bigfork, MN 56628

James P. Bremer 36682

To who it may concern: With respect to the PolMet project, as a citizen of Minnesota, I personally believe this project should be allowed to leave absolutely no pollution. Whatever is used in the process and whatever is a result of this process should leave no effect on the environment. Therefore to insure that this happens, if the project is approved, a fund should be created as the mining is done to reverse any harm to the environment. JPB James P. Bremer 16015 46th Ave N Plymouth, MN 55446 Phone: 612-750-2370 jim.jpbv@comcast.net Confidentiality Notice This e-mail document and any documents accompanying this transmission contain CONFIDENTIAL INFORMATION belonging to the sender, which is legally privileged, and only for the use of the intended recipient. James Poole 57241

I believe that any mining company that is moved to Minnesota [ILLEGIBLE] should be faced to escrow any and all cleanup costs paying forward/or 500 years. This should be done in the forms of a 100 million dollar fund that advances by 10% each year starting with the first day of production. If they don’t need to do any damage, then after 500 years the company gets the money. This should be a sure thing for them if it really is as clean as they say. James Poole 10641 Hwy 37 Hibbing, MN 55746

James R Bester 57203

If this mine pollutes Birch Lake and the Kawishiwi River it flows right into the BWCA and up through Canada. If it pollutes the Cloquet and St. Louis River it flows into Lake Superior. Has anyone thought to ask the citizens of Canada and the Great Lakes states what they think of this acid mining? Let’s hear what their thoughts are. James R. Bester 6413 Petre St Duluth, MN 55807

James Rodriguez 44302

To the Department of Natural Resources, Please oppose the Polymet mining proposal. Sulfide mining produces toxic waste that could irreversibly damage Minnesota's fragile lakes, rivers and natural resources. This is not our grandparents' iron mining — sulfide mining has never been done in Minnesota. While iron mines have significant environmental challenges of their own, the sulfuric acid that is produced with sulfide mining makes it particularly difficult to avoid polluting nearby lakes, streams and ground water. Thank you, James Rodriguez 1919 5th St NE #1 Minneapolis, MN 55418

James Rolfe 57150

Thank you for the opportunity to comment. I strongly oppose sulfide mining in Northeastern Minnesota. In my opinion, the long term consequences and the potential for irreversible damage far outweigh any short-term gain. It's an enormous risk to this area, the country and the planet. James Rolfe 6252 Heritage Road Duluth, MN 55804

James Russell 39698

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr James Russell 805 Hidden Ln Excelsior, MN 55331-1916 (952) 474-9052

James Schulzetenberg 36539

Dear Ms Fay, Dear Miss Fay, Federal and State Agency Leaders: Please reject the PolyMet SDEIS and deny the section 404 permits that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. The SDEIS admits that PolyMet's sulfide mine will directly destroy over 900 acres of wetlands by blasting pits, and creating huge mounds of waste rock, along with other wetland destruction. The SDEIS also states that an additional 7,350 acres or more of wetlands could be destroyed because of air and water pollution resulting from taking water from the mine site to the tailings pile and changing the water patterns at the existing old LTV tailings site. However, according to the SDEIS, PolyMet will only have to replace about 27 acres, not the full amount of 7,350 acres. Given the history of the indirect effects of mining on wetlands, PolyMet should be required to come up with wetlands replacement in advance for all likely wetlands losses. Again, please reject the PolyMet SDEIS and deny the section 404 permits that would allow this open-pit sulfide mine to harm Minnesota's fresh water. Thank you. Sincerely, James Schulzetenberg 4117 W 8th Street Duluth MN 55807 James Schulzetenberg 4117 West 8th Street Duluth, MN 55807

James Stout

43053

Feb.4, 2014 Dear Mr. Dabney, My name is James Stout. I am a recently retired professor of Earth Sciences at the University of Minnesota, Twin Cities campus. In addition to teaching both undergraduate and graduate courses for over 41 years, several of my PhD students have gone on to work in the mining industry. One of them, Drummond Earley (PhD 1991) is a specialist in sulfide mining remediation and now is employed as a regional hydrogeochemist with Barrack Gold Corporation. I have maintained close contact with him over the years, and along with input from dozens of colleagues elsewhere in the profession, I believe I have a well-informed opinion regarding both sides of the Polymet sulfide mining debate in northern Minnesota. First and foremost sulfide mining is a dirty activity. It's just inherent to the business. In every operation I am aware of, there is or has been significant environmental pollution. The negative impacts of sulfide mining on the quality of water, air, soil and plant life are exceptionally well documented in the literature. All 14 of the currently active sulfide mines in the U.S. have suffered some level of environmental damage with remediation costs in some cases amounting to many millions of dollars (Gestring, B., 2012, www.earthworksaction.org/files/publications/Porphyry_Copper_Mines_Track-Record.pdf). Last Wednesday evening I attended the third Public Hearing in St. Paul on the Polymet proposal. Speaker after speaker on the pro-mining side spoke about how clean the proposed mining operation will be. That promise flies in the face of a very large body of data that shows otherwise. It is noteworthy that all of the currently operating sulfide mines in the U.S. went through an EIS process where "promises" of no pollution were made. All have failed to some degree. In my view, it not a matter of "if" we are going to see environmental pollution in the proposed Polymet operation, but rather "when" it will be. The second and final point I would like to make has to do with a parallel debate concerning the Pebble Mine proposal in Alaska. If developed, the Pebble Mine will easily become the largest open-pit sulfide mine in North America. At risk is the inevitable negative impact the mine and its auxiliary components will have on the native salmon fishery that is so unique to the area and so vital to commercial and sport fishing. The parallel risk in Minnesota will be to the flourishing recreation industry centered on the BWCA and Superior National Forest. The economic benefits of this use of our resource is guaranteed in perpetuity in contrast to proposed mining operations in that area. I believe strongly that mining is not the best use of our resources in N. Minnesota. Thank you for your attention James H. Stout

James Thompson

52440

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, James Thompson 8905 Little Horse Ave Las Vegas, NV 89143

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Why do you want to do sulfide mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, James Vental 13 Spring Farm Ln Saint Paul, MN 55127-2145 (612) 916-1654

The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, James Vental 13 Spring Farm Ln Saint Paul, MN 55127-2145 (612) 916-1654

James Vigliotti 38983

Hello. I would like to comment that a federal-level review should be done of the proposed PolyMet mine's SDEIS particularly regarding the incorrect maps as seen on <http://www.bwcasulfideminig-org/mine-site-drainage-to-bwca/> . My name is James Robert Vigliotti. My mailing address is 999 Smith Ave S. Apartment 1 West Saint Paul, MN 55118

James Voita 58186

My name is James D. Voita, V-O-I-T-A, Afton, Minnesota and Finland, Minnesota. We use the North Shore for cabin, recreation and fishing, swimming and we're very concerned about the long-term water quality and the fact that this process has never been done anywhere in the world, successfully, and that there's still visible damage from copper mines that King Solomon used centuries ago. We're also on the Sierra -- Sierra Club board.

James W Larson 54867

James Watson 18113

My name is James Watson. First off, I would like to thank everybody for showing up here. I'm just a grunt who worked at the mines like so many other people here. Friends that I worked with, friends that I haven't worked with. And I've seen firsthand some of the work that PolyMet does. Maybe not firsthand but second, third, fourth hand. They're pretty diligent in their research. Rightfully so, because I suppose they're told they have to do it that way. But they seem sincere in the way they go about it. I would also like to thank the whole team of PolyMet for taking part in this, giving us the opportunity to push it along. Also at the same time I would like to thank all the people here taking a part of this to make sure that it is done right. And it sure looks to me like it's done right. There's no reason in my opinion as why we can't get along with all our environmentalists. We have seen tonight so far the wild rice thing. Sort of a homemade expert on wild rice. Doesn't sound like it's a big problem. (Inaudible) something bad shows up for wild rice, it's going to show up quick. All the experimentation that PolyMet has done in the last eight, nine, ten years you have to see it to believe it is actually done. It is a good thing we have some investors that are willing to take a chance on a venture like this. I am 100 percent for PolyMet in that we need jobs. We have so many of our young people that have left the area. Young families have left because there's no livelihood for them here. There's no one with family that I can think of that is capable of supporting a family on \$10-an-hour wage. It looks like PolyMet is going to be one good payer of good wages and benefits. They already have a facility that is pretty much already built. There's modifications to do, of course. But that is all laying out already what they're going to do if this is approved. So I think PolyMet needs to go forward so we don't wind up with a whole bunch of ghost towns on the Iron Range.

Jami Halder 57352

My concern is the pollution spreading much farther than the localized area and, you know, affecting more people than it is saying it is going to. With the quality of water and its going down the seeded area, the watershed, the St. Louis watershed, my concern is that we will all be affected and that watershed will come down and affect my gardening, and all of that stuff. So, I don't know. That's my comment. That's my concern. It is the polluted water spreading further than they are saying it is going to. That is my concern. Thank you so much.

Jamie Bartzen 38038

DNR representatives This a NO vote for the PolyMet mining proposed for northern Minnesota. Please do not give approval to them, too much is 'unknown'. Our resources must be protected at all costs. Thank you Jamie Bartzen Sent from my iPhone

Jamie Fillmore 40278

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Jamie Fillmore 18770 SW Lisa Court Beaverton, OR 97006 US

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. To whom it may concern: I raise several concerns with the proposed project, but most of the concerns have been raised at public hearings. One concern that has not been addressed is the adequacy of Minnesota law to protect landowners that could potentially have their land polluted by sulfide mines. The Minnesota Environmental Rights Act exempts permitted projects like the Northmet project from private causes of action from landowners whose groundwater or surface water may become contaminated. Will causes of action under public/private nuisance laws give landowners adequate recourse if their property is damaged. Will causes of action couched in theories of negligence or trespass give landowners adequate recourse if their property is damaged.? If we do not know, then what do we tell landowners whose property is contaminated. What recourse will they have against a multinational company that is profiting off the destruction of a private landowner in Minnesota. What if that land is a resort or business and the owner loses business. What recourse will they have. These are all issues that must be considered. Respectfully, Jamison Jamison Tessneer Student | William Mitchell College of Law jamison.tessneer@wmitchell-edu 218-831-4118

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Jan and Jim Porter 26334 Indigo Dr n/a Park Rapids, MN 56470

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Fay, Dear Lisa Fay I'm writing in regards to the PolyMet SDEIS. It appears that the study is flawed. It does not make any sense to allow a mine that will only be open for 20 years that will require 500 years of clean up. PolyMet is only a shell company and will file bankruptcy as soon as the minerals are extracted, then it will be up to the tax payer to pay for the clean up costs. They say reverse osmosis is their plan to clean up the waste, they estimate it will cost 6 million dollars per year: If the clean up lasts 500 years we are looking at 3 billion and that is not including inflation, PolyMet must agree to put up 3 billion dollars + inflation up front to protect us the tax payers. I also do not agree with the wetland swaps the current wetland, draining wetland in one part of the state and digging a pothole in another does not replace a wetland and it's value to a watershed and the wildlife that depends on it. And speaking of wildlife our moose population has been stressed and been in decline in the last decade, we can ill afford to remove any more habitat from it's range. There is no way I can see that they can totally seal off the waste in our water rich environment when sulfide based mining in the drier western states have all ended up being environment disasters requiring us the tax payer to clean up the mess. The potential cost to Minnesota tax payers and the natural environment is just too high and the SDEIS doesn't address the problems adequately. From what I understand the Minnesota rule 6132-3200 requires all mines to be maintenance free upon closure, and PolyMet doesn't even come close to meeting that rule. Every thing I see PolyMet has a long way to go before we even consider this type of mining in Minnesota and should be turned down. Thankyou for considering my comments. Sincerely Jan Kaeter 28585 Co Rd 2 St Joseph MN 56374 Jan Kaeter 28585 Co Rd 2 St Joseph, MN 56374

20031

Hello, I have a number of concerns that lead me to question the wisdom of granting Polymet a permit to mine in northern Minnesota. The length of time Polymet itself says the toxic waste will have to be monitored - 200-500 years, violates current Minnesota law requiring such waste to be permanently disposed of before an operation closes. It is simply impossible for Polymet to meet the letter of this law. Is making an exception a wise precedent. Second, the logic of the safety of monitoring for such an unheard of long time eludes me. Mining companies simply do not last that long; most companies do not last that long. Who will monitor the toxic waste when Polymet no longer exists. The State of Minnesota at taxpayer expense. Furthermore, how could Polymet possibly give financial assurance for such a long-term operation. The duration of the toxic waste is an amazingly difficult environmental threat. I hope that you will deny the permit and protect our waters, one of Minnesota's greatest treasures. Thank you for considering my concerns. Jan Karon 218-722-7200

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Jan Myers

41838

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jan Myers Saint Paul, Minnesota

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Jan Myslajek 14665 -78th Ave N. Maple Grove, MN 55311 (763) 420-7339

7057

Dear Friends, Years ago, I was touring the Peloponnese area of Greece, a mountainous region where it was still possible to experience the sound of silence. But one vast scar cut away an entire section of one mountain, and the tour guide explained that it was caused by an American company mining bauxite for aluminum production. When I returned to the states, everyone was drinking sodas from aluminum cans and throwing the cans away. Very little recycling was happening. If we recycled, there would be no need to tear up pristine landscapes any longer. Recycling is cheaper, brings us more jobs, and logically should be a true conservative's first choice. We really have very little need now for copper and nickel, especially since those metals are available through recycling. What we need is not more mining of copper and nickel, but more clean water preservation. Every life form requires water. There is no life form that requires copper or nickel mining. We also need more natural land preservation. As Mark Twain observed, they're not making land any more. Once a mountain is destroyed, once a great lake is contaminated, once a river is toxic, it is difficult if not impossible to bring it back. Sincerely, Jan Saecker W2771 Circle Drive Markesan WI 53946

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. We have seen these promises from mining companies before. There is no way they can avoid damage to our pristine environment in the Lake Superior basin. Period. We ask for our rights, as citizens, to reject these mining proposals. It has no foresight for down the road pollution of the entire basin. Having copper/mineral mining in this area is absolutely ridiculous Sincerely Jan Swart Jan Swart 214 1st Ave Two Harbors, MN 55616 218-834-4051

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: We are proud of our land and water quality in MN and want to keep it great. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I’m also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet’s own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won’t end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won’t allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, jan Weber 1878 ROBLYN AVE ST PAUL, MN 55104

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Janarose Savit 148A Daly Road East Northport, NY 11731 US

I do NOT agree with the above statement. Enough!! Do no more harm. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Jane Ament 18281

Jane Ament. My name is Jane Ament, A-M-E-N-T. I live in the Two Harbors/Silver Creek area of Lake County. My home and property is located in the Lake Superior watershed district. This is approximately 45 miles southeast of the proposed PolyMet mining site. As a home and property owner from this area, I have serious concerns about both water and air quality should this mining proceed. Each summer I feed approximately 250 hummingbirds who nest in and around my property. I arrived at this population estimate because they consume 60 ounces of nectar daily from mid-August to early September in preparation for migration. I equate these little birds to the canaries sent into mines in days of yore. They are environmental barometers. If they die from bad drinking water, so will we. It would translate into the loss of many species. My interpretation of this open-pit mining process is that sulfuric acid will then be introduced into the air. These airborne toxins will then travel whichever way the wind blows. Not only will it blow my way, it will also blow to a huge portion, if not all, of the Superior hiking trail. This will poison our air, our earth (topography) and our surface water. This will pose tremendously hazardous health risks to all inhabitants and visitors to the Arrowhead region. It should be noted here that the Arrowhead already suffers from high levels of acid air and rain from industries, both past and present. In summary, I ask two questions. No. 1, can the DNR/PolyMet unequivocally promise me that our drinking water (from underground aquifers) will remain completely safe? No. 2, that our air quality (which also impacts our topography and surface water) will remain safe and not deteriorate if this mining goes forward?

19086

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, JANE AMENT 3000 East Alger Grade Two Harbors, MN 55616 218 834-6055

Jane Amundson 18292

My name is Jane Amundson, A-M-U-N-D-S-O-N. I am from Northfield, Minnesota. I believe that the mining company needs to prove that this process of cleanup will be safe and effective. They need to put the money upfront for the cleanup, so that we are not expecting that they can have the money for 500 years. So, I just want to say, "Prove it first, that it is safe." That's all.

Jane Armstrong 45105

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I am a concerned citizen, a regular visitor to the BWCA, and the Community Board Chair of one of the YMCA Camps in the Ely area. I am a Professor at the University of Minnesota and regularly read grant proposals and feasibility studies. I have major concerns about the PolyMet NorthMet SDEIS Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I have particular concerns about the unsubstantiated assumptions like the percent of seepage collection at the tailings basin. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science and there has been insufficient time for adequate independent evaluation. One has to look no farther than West Virginia to see the results of industry assurances of "safety". The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. I am very concerned about the potential impact of these threats on the BWCA. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. A number of critical failures have been pointed out in letters from WaterLegacy. I share these concerns. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jane Armstrong 11550 Irish Ave N Stillwater, MN 55082

Please do not approve PolyMet's mining project. The gains are temporary; the damage is forever. -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. -Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -Annually, 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated. -The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site.

Jane C 39896

March 8, 2014 Dear Minnesota Department of Natural Resources, I have attended two of the meetings regarding the NorthMet copper-nickel-precious metals mining project, and I am deeply concerned about the possibility of a permit to mine being granted to PolyMet. Our only guarantee in this project is that our water will be polluted. There are many questions yet to be answered about this project, and it is unwise to move forward when some extremely important questions and concerns remained unanswered. Some of these are: It is not known what path the toxic seepage will take. Who and what will it affect. Holes in the models. Many of the questions asked of the MDNR at the hearing on February 11, 2014 received a response of "We don't know" or "The model doesn't account for that". It is not enough to only require PolyMet to answer questions that they pose. The MDNR must think through this project and demand answers to every eventuality. Samples of some of these questions are: "What financial assurance has been guaranteed for industrial accidents, such as a waste water line break, rail car derailment and waste spill" It is not possible to make a realistic financial guarantee reaching out 500 years. We know the pollution will last 500 years, but we don't know that PolyMet or any of the financial agents will exist in 500 years. It is easy to promise to do something, and easy to not follow through. Do you think they would take the deal if the terms were "You put the money down now, and we promise that in 500 years, PolyMet will be granted a permit to mine". Is there a safer way to mine. The hurry here is of financial nature only. There will likely be a demand for those metals in future years. If we wait for a safer mining practice to be developed, we could have our cake and eat it too - by getting the metals, and keeping clean water. Remember we may want the metals, but we need clean water. Since the only benefit of this project for Minnesotans is jobs - is there a better way to create 350 jobs that will last 20 years (or how about 350 jobs that will last many more years, or, perhaps 14 jobs that will last 500 years), rather than accept this project that has extremely limited gains for enormous risks. Is this the company you want to go into business with. PolyMet seems disingenuous. One example of this attitude is from the financial assurance hearing on February 11, 2014- PolyMet sent Brad Moore, Executive Vice President to speak for the company at the financial assurance hearing. When asked simple questions about the company's financial statement, Mr Moore claimed he didn't know about the financial statement, but would be happy to bring the committee's questions back to the company and get back to them. This was his response to nearly every question from the committee. He also elected not to read his prepared statement for the committee. Mr Moore's refusal to answer the committee's questions made a mockery of the committee and the proceedings. He offered no answers, and no statement from PolyMet. PolyMet hid from the questions, and offered no answers or assurances of their own. There is no guarantee on how many years the mine will operate. All the benefit analysis for jobs is based on a 20 year operation of the mine, but that is the maximum number of years of operation. There is nothing to say that the mine won't shut down earlier. Would you be considering this proposal at all if the projected jobs were only for 5, 10 or 15 years. We are guaranteed, however, of at least 500 years of pollution from the first day of mining. Wetlands cannot be created to be the same diversity of conditions or organisms of the original wetland. A land swap is ill-advised, as the precious wetland cannot be recreated. The water models are flawed and in dispute. They need to be redone. Much of the information I heard at the meetings was alarming, and if the copper/nickel mining project is allowed, our precious natural re

Jane Christensen 43068

My name is Jane Christensen and I live at 1876 Eleanor Ave, St Paul, MN 55116 I disagree with how the current (Supplemental) Draft EIS disregards the concerns of the Fond du Lac and Grand Portage Tribal Governments, the 1854 Treaty Authority, and the Great Lakes Indian Fish and Wildlife Commission (the four formal representatives of tribal interests) relegating those concerns to Appendix C and responding to each concern as a MDO "Major Difference of Opinion." I also ask that the map/ boundaries of the One Hundred Mile Swamp be clarified. Thank you. Jane Christensen

Jane Clements 40994

I am writing to express my concern over the North Met DEIS, particularly the lack of information concerning the monitoring of the effluent. Minnesota water is going to be more valuable than gold, copper and nickel. We have no assurance that this mining operation will contain their run off in safe and long term, non polluting ways. What a terrible legacy you will leave to your community and the state should this be approved.

Jane Eloise Whitledge 57151

PolyMet should not be allowed to get their mine just because they've already spent millions of dollars, any more than a robber should be allowed to ransack your house because he's spent time and money casing the property, and seeing the best way into it. Jane Eloise Whitledge 1801 E. Superior St, Apt 1 Duluth, MN 55812

57156

Someday there is going to be commodity worth more than all the gold on earth: clean water. PolyMet's - and the public's - short-sighted vision on profits overlook our long-term needs. Life cannot survive without water. We can live without gold, copper, nickel. We must look to recycling for our metal needs. Jane Eloise Whitledge 1801 E. Superior St, Apt 1 Duluth, MN 55812

57157

With clean water sources dwindling the world over, it is very foolish to destroy one of the last remaining large areas of unpolluted water. Scientists predict future wars will be fought over drinking water. Do we really want to destroy a commodity that will be - and I believe really is now - more valuable than gold. Jane Eloise Whitledge 1801 E. Superior St, Apt 1 Duluth, MN 55812

57158

We can't afford to sell tomorrow for today. We have no right to sell our children's future. PolyMet is about to commit a crime against nature and humanity. They have admitted their mine will leave contaminated water for 500 years! Jane Eloise Whitledge 1801 E. Superior St., Apt 1 Duluth, MN 55812

57159

If an individual caused our water supply to have to be treated for 200 years, polluting it willfully, we would call him a terrorist and imprison him. PolyMet will be doing exactly the same, and yet will be rewarded with enormous gain, at the public's expense and detriment to health. Jane Eloise Whitledge 1801 E. Superior St., Apt 1 Duluth, MN 55812

57160

If this mine - God forbid - should be approved, it should not come without a strict "damage deposit" required of PolyMet, to insure that taxpayers will not be burdened with the (very likely - the admitted) clean-up, which will cost in the millions and millions of dollars over centuries!

57161

PolyMet has not clearly stated how they would great our waters to ensure drinkability, safety for fish, wild rice, etc. Or how they will keep treatment facilities in place for 200 years or more, or how they will for them. Jane Eloise Whitledge 1801 E. Superior St., Apt 1 Duluth, MN 55812

57162

This mine is unconstitutional. Minnesota law clearly states that a mine must be left maintenance-free when closed. PolyMet, meanwhile, says the water, after mining, will have to be treated for at least 200 years! How could anything be less "maintenance-free"? Jane Eloise Whitledge 1801 E Superior St, apt 1 Duluth, MN 55812

57167

Before the state approves any mining project – such as this sulfide mine proposed by PolyMet – it should be able to point to a mine somewhere in the world where its safety and maintenance-free closure are an example. It cannot.Jane Eloise Whitledge1801 E. Superior St., Apt 1Duluth, MN 55812

Jane Gilbert-Howard 9615

Dear People at the DNR, US Army Corp, and the US Forest Service. Thank you for taking my comments. I do NOT believe the EIS addresses the long-term environment effects of this proposed copper/nickel mine. I have spent time at Killarney, a Canadian provincial park. I have seen first-hand the damage the mine and smelter at Sudbury has done to the environment. The lakes at Killarney are sterile—nothing grows, no fish, the land looks like you are on a planet—only white rocks with no vegetation. This is an area that should look just like Duluth—lots of healthy trees, wonderful lakes full of fish, and lots of vegetation. Sudbury isn't very far away from Lake Superior and Lake Huron—it should look like northern Canada and it doesn't. What a tragedy for PolyMet to put a mining operation so close to the BWCAW—the only remaining wilderness of its type on the planet—especially when the forecast for “handling contaminated water” is estimated to be 200-500 years—OMG how can the permitting agencies even consider such an insult to the environment. I have much faith and trust in the DNR, the US Army Corp and the US Forest Service to make the right decisions to protect our environment for generations to come—by not accepting the EIS and not allowing PolyMet to build this mine. Thank you, Jane C. Gilbert-Howard 8717 Congdon Blvd. Duluth, MN 55804 This St Lukes communication is intended for the use of the person or entity to whom it is addressed and may contain information that is privileged and confidential, the disclosure of which is governed by applicable law. To whom it may concern: As a resident of Tofte,MN I want to express my grave concern over the possibility of Polymet mining. I do not believe that they will ever be able to prove that there will not be pollution of the waters that are so important to this area. In our current time of climate change, clean water is at a premium and must be preserved at all costs. Jobs are important but cannot take precedence over preserving our clean water resources. There are so many endangered species in this area. So many times in the past we have allowed industry to take priority over preservation. This time lets make a different decision - lets learn from the paSt PLEASE DO NOT APPROVE POLYMETS APPLICATION TO MINE IN THIS AREA.. Jane Johnson PO Box 2303 Tofte,MN 55615

PolyMet's NorthMet project plan is harmful to the Arrowhead, the Superior National Forest, and the Lake Superior Watershed. The SDEIS is inadequate.

There are numerous fallacies in this plan. One being that mining would totally occur on the Iron Range where typically iron and taconite mining have occurred. However, the copper and nickel deposits, which are proposed to be mined, are located within the Duluth Complex, which is not on the Iron Range. Only PolyMet's plant is on The Range, not its proposed NorthMet Mine. The proposed mine site is in the Superior National Forest.

Birch Lake is part of the Duluth Complex Areas and is located in the Superior National forest. Birch Lake would be negatively impacted by this mine plan.

My home and my resort and canoe outfitting businesses that I have owned for 38 years, and which have been in my family since 1944, are located on the north end of Birch Lake, which is a multi-use recreational 20-mile Long Lake. There are resorts, house boat businesses, campgrounds, cabins and homes dotting the shoreline of Birch Lake. There are vast areas of forest, wildlife habitat, treaty-protected resources within the 1854 ceded territory and cultural sites, one being an archeological cultural site of the Laurel people located on my property dating to 500 years before Christ.

Noise and air pollution. Most, if not all, will be impacted and permanently degraded by noise pollution and air pollution from the proposed sulfide mine. I have 1500 plus resort guests each season. And when they boat, fish, canoe, kayak, picnic, and swim on Birch Lake, they do so with the expectation of listening to the loons and watching eagles, fishing in peaceful coves, and picnicking on islands studded with pine trees and a canopy of clean air. Instead with this plan my guests and most who live and recreate on Birch Lake will be receptors for mine noise and air pollution. This is unacceptable.

Why should my businesses and my way of life and the lives and homes of others on Birch Lake be impacted negatively by this sulfide mine plan?

Perception of noise, air, water pollution and degradation of the wilderness land in the minds of the travelers will negatively impact their decision to recreate in the Arrowhead region of Minnesota; therefore, economic loss for tourism.

Figure 5.2-8.2 of the SDEIS illustrates air blast contours from the blasting at the mine site. This documentation is flawed and inaccurate. It does not take into account impacts to residents that do live on Birch Lake near the proposed mine site, to recreational sites to the Birch Lake pine forest just outside of Babbitt with biking and hiking trails, and to the 14 federal camp sites on Birch Lake.

Furthermore there is no mention of the privately owned recreational tourism businesses based on Birch Lake for decades.

There are three resorts, a canoe outfitter, two houseboat businesses, and one campground that will be sound and air receptors of the proposed NorthMet Mine. It only mentions the federal camp area.

It is important to remember that noise and air pollution have no barriers no matter how many charts and tables may be drawn up to state otherwise. Why was documentation related to the aforementioned items not included in the SDEIS?

Wind blown dust particles containing sulfite compounds that are emitted from mining and beneficiation activities could contaminate wetlands, lakes, and streams near the project site and could cause harm to the species of concern that have been found in this area and to animals that depend on these foods or these plants for foods. This comes from the Tribal Cooperating Agency Supporting Intertribal Agency. These wind blown dust particles could be hazardous to human health of those living in the region of the proposed NorthMet. How is the SDEIS going to address this concern?

Alphabetical by sender's first name

Minnesota Environmental Rights Act. The Minnesota Environmental Rights Act 116B.01 says, "The legislature finds and declares that each person is entitled by right to the protection, preservation, and enhancement of air, water, land, and other natural resources located within the state, and that each person has the responsibility to contribute to the protection, preservation, and enhancement thereof."

This environmental rights act gives its citizens to right to protection of our land, our water, our air, and our natural resources.

The SDEIS states that it will not pollute our environment. How can this proposed mine plan move forward when it will degrade and destroy air, water, land, and other resources that are natural resources within our state.

Open-pit mining, heavy metal leaching, and human health. Under the Weeks Act, open-pit mining is not allowed on federal land. But instead of rejecting this proposed mine the United States Forest Service is proposing a land exchange so that their consideration of the surface land is eliminated. These lands and these waters that are proposed to be exchanged to PolyMet by the USFS belong to all the citizens of this country. This is wrong. This is our land, our wetlands, our water. This should not be allowed. Why is the Weeks Act not being enforced?

In return for this possible land exchange with the federal government, PolyMet's proposal would take a portion of our Arrowhead Lake District and the Superior National Forest and turn them into a mining district with the tradeoff of destroying the forested land that belongs to us, perpetual water pollution, and increased human health risks, including increased neurological damage to our children from mercury pollution.

Heavy metal leaching is one of the greatest environmental liabilities associated with mining, especially in pristine environments like the project mine site that have economically and ecologically available natural resources. And that comes from Reclamation Research Group Bozeman, Montana, for USFWS, Anchorage, Alaska. The article is "Acid Mine Drainage and Effects on Fish Health and Ecology," a review 2004.EX.G. how is the SDEIS going to address this environmental liability?

Metal, such as manganese, at the tailings pile will have 15 times more manganese per liter than the limit set by the Minnesota Department of Health to prevent brain damage in infants, children, and adults. There will be an increase of arsenic at the tailings pile by up to 417 percent. An increase in arsenic in Colby Lake drinking water by 38.5 percent, which would increase the risk of cancer for Hoyt Lake residents above the level of concern in Minnesota's cancer risk rule.

How is the SDEIS going to prevent this dire situation to our waters from occurring to preventing human health risks of cancer and other diseases and ailments?

There are no hard-rock surface mines that exist today that can demonstrate that heavy metal leaching can be stopped once it occurs on a large scale. And that documentation comes from EARTHWORKS fact sheet, "Hard Rock Mining Acid Mine Drainage," which is available online at www.earthworksaction.org/PUBS/FS_underscoreAMD.PDF.

Mining cannot be permitted if it causes destruction of our natural resources. PolyMet's proposed sulfide mine not only Minnesota's clean water but it threatens public health.

Minnesota Environmental Policy Act. Under the Minnesota Environmental Policy Act 116D.04 subdivision 6. "No state action significantly affecting the quality of the environment shall be allowed nor shall any permit and natural resources management and development be granted where such action or permit has caused or is likely to cause pollution, impairment, or destruction of the air, water, land or other natural resources located within the state so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public health, safety, and welfare, and the state's paramount concern for the protection of its air, water, land, and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify this conduct."

The proposed PolyMet plan would seriously degrade the quality of our environment. How will the SDEIS address this?

Perpetual treatment. Minnesota rule 6132.3200 does not allow perpetual treatment. "To receive a permit to mine the permittee must be able to close the mine in such a way

Alphabetical by sender's first name

that is stable, free of hazards, minimizes hydrologic impact and release of substances, and is maintenance free."

A, the PolyMet SDEIS states that long-term -- meaning greater than 500 years at plant site and greater than 200 years at the mine site -- treatment of wastewater is needed, which means the site will not be maintenance free at closure.

B, 526 acres of lands covered by more than 167 million tons of waste rock would be covered by a plastic sheet and surrounded by a system that would supposedly collect contaminated seepage. All would require monitoring and maintenance constantly for hundreds of years to fix leaks, repair perforations, and remove deep rooted plants.

C, a mining pit lake would require pumping to prevent the toxic brew of acid and heavy metals from spilling into the nearby Partridge River and the tailings basin pond would require pumping to prevent spillage into the tributary of the Embarrass River.

And finally D, the polluted water collection system, which includes miles of pipes, would require monitoring and maintenance for centuries. This proposed sulfide mine project features requiring perpetual maintenance and monitoring, which is in violation of Minnesota rule 6132.3200 is absurd and unachievable as it requires this to go on for centuries. It should not be allowed. How will the SDEIS attempt to counteract this?

This SDEIS proposal is not in the public's best interest. It is inadequate, contains falsehoods, and omissions related to moose, mercury, and other concerns. The word "moose" does not appear at all in the SDEIS cumulative effects analysis. What is the reason that important concerns related to moose and their habitat and mercury as related to aquatic species and human health were not fully addressed in the SDEIS?

Lastly, nothing in this SDEIS demonstrates that we need the copper or the jobs, which are the big reasons it is being pushed for by the mining boosters. This is totally a bad plan for Minnesota. Therefore, I endorse the no action alternative.

Mar 13, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining is a toxic threat to Minnesota's Lake District. This type of mining has never been done anywhere in the US without horrific water pollution results. The EPA calls hard rock mining the most toxic polluter. Where is the common sense in thinking that this type of destructive mining could be done in the water-rich environment of northeastern Minnesota. 1- Permanent Water Pollution. Not only will there be 500 years, or basically into perpetuity, of water pollution from sulfuric acid and heavy metals, as indicated by PMet's own DEIS, but in addition, not all of the polluted water will be captured for treatment. This is what PolyMet calls "minimizing the water pollution" in their marketing rhetoric. Some 11 million gallons, annually, of polluted seepage from the tailings basin will enter our groundwater without treatment. And, further some 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated. Think of it this way .Flush your toilet 9 times, and the waste goes where it is supposed to, but for the 10th flush, the polluted and toxic waste flows directly into the ground by your home, or into the water in a nearby lake, or into your neighbor's yaRd What would be the long-term effects of the release of this untreated water to your health, your neighbor's health, and the health of the land and nearby lake. What kind of plan is this. PolyMet's computer model may actually understate the actual pollution impacts, because it has been shown to be inaccurate in representing current conditions for water quality by the mine site. Irresponsible and inadequate. 2- No Plan for Accidents and Failures. PolyMet's water treatment system provides no details for what happens in the event of catastrophic accidents or failure of the system to operate over the 500+ years during which polluted water is being discharged. Daily operations are planned to treat some 6-2 million gallons of polluted water daily. Broken pipes, tailings basins failures, human error causing accidents, and more are inevitable. Just look at the recent news for West Virginia, for North Dakota. There is always some type of accident whereby pollutants run off into the ground and waters. This mine plan is designed for a 100 year storm and given climate change this design is lacking, at beSt Scientific studies suggest that this facility must be designed for the 500-year storm, because the 1980's 500-year storm is now occurring almost as often as the 100-year storm. The SDEIS provides no assurance or details on the impacts to water quality, wildlife or human health if the treatment system fails or if there is a breakdown, which is inevitable. Irresponsible and inadequate. 3- Lack of information regarding mercury contamination of fish and ultimately methymercury in humans. This area, home to 6 operating taconite mines, already has an alarming concentration of mercury and other pollutants far exceeding the regulatory standards. Every one of our taconite plants is presently operating under variances with basically a "permit to pollute." Minntac's, which is operating on a wastewater discharge permit that was issued in 1987, despite the Clean Water Act requirement that permits be reviewed and renewed with updates every five years. Minntac's pollution of nearby water with sulfate concentrations are up to 60 times higher than state limits, are linked to mercury contamination and are toxic in fish and wild rice. In the 2011 MN Dept of Health's study, 10% of our newborns tested in the Lake Superior Basin had toxic levels of mercury in their blood, from pregnant mother's eating mercury-laden fish. The answer: eat less fish, rather than enforcement of standards for mercury, sulfates, and water hardness. I have no level of confidence that our so-called st

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, PolyMet would also destroy thousands of acres of very high-quality, irreplaceable wetlands, (the largest destruction of wetlands in the state of Minnesota). To create the Mine Site, our public lands within the Superior National Forest of Minnesota would be traded by the US Forest Service for lands in Cook, St Louis, and Lake County that are non-contiguous with a fraction of the value of the lands we, the people, would be virtually giving away to PolyMet Corporation for their Mine Site. These wetlands are in an area identified by Minnesota as having "high biodiversity significance," the highest state ranking. The US Environmental Protection Agency agrees, calling these wetlands, "aquatic resources of national importance." These are large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of waste water. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for multiple sulfide mining companies, "waiting in the wings", that would endanger the Boundary Waters Canoe Area Wilderness (BWCAW). My family and I have lived on Birch Lake and the South Kawishiwi River for the past 38 years, adjacent to the the BWCAW. We have two tourism recreational businesses (resort and canoe outfitting). We are threatened by the advent of turning our Lake District into a Mining District .from turning a vibrant Wilderness area into a dead and barren Minefield of toxic destruction, not only to the landscape, but to our most valuable resource .our WATER. For all these reasons, and many others, I urge you to reject the PolyMet SDEIS. It is inadequate and is harmful to the Arrowhead Region, the Superior National Forest, and the Lake Superior Watershed. It is not in the Public Interest to allow this plan to proceed. The No Action Alternative should be used. Sincerely, Mrs Jane Koschak PO Box 397 Ely, MN 55731-0397

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Forty six doctors, nurses, and other health-care professionals sent a letter on March 11, 2014, asking the MN DNR to declare that the environmental review of the proposed PolyMet sulfide mine as inadequate, and justly so. There simply is not enough information about possible human health effects of air and water pollution, particularly sulfate, manganese and mercury. Methyl mercury is linked to mental-health problems, lowered intelligence, behavior and memory problems Ten percent of babies born in the Lake Superior Basin are born with mercury in their bloodstreams, according to the MN Department of Health report of 2012- (Analysis of PloyMet impacts is inadequate, letter to DNR says, By Stephanie Hemphill, MinnPost, March 11, 2014-) Pregnant mothers eating fish is linked to the high levels of mercury in newborns. After the alarming MDH study, did our agencies hold any Minnesota industry in any way accountable for contaminating our waters. Did any industry scramble to fix its toxic releases to help protect Minnesota's children. No. Industry claims it is not "economically feasible" or "cost effective." Women are told they should make better decisions about the fish they eat, ironically told they can "choose." I presented this same information, along with other facts related to health issues and mining, as outlined in the paragraph below, to the St Louis County Board in the fall of 2012- Not only was the Board present, but so were Representative Dill and Rukavina. Health concerns released by the MDH in 2012, and reported in the Hometown Focus: According to the MDH, compared to all rural regions of the state, northeastern Minnesota has the highest rate for "asthma hospitalization and emergency department visits, the highest Alzheimer's rate over age 65, the highest mortality rates for cancer, heart disease, and diabetes; and the highest overall mortality rate." The fact that there are six operating taconite mines on Minnesota's Iron Range surely has something to do with these serious health risks for those of us who live here. But, the pro-mining St Louis County Board and the Representatives, who only wanted to postulate upon jobs that the new era of sulfide mining would provide, and promote their agenda regarding the school trust fund had no comments regarding workers or public health on the Range. In 2007, the mayor of Hoyt Lakes reportedly testified at a hearing, "We're used to mercury here." Really. Acceptance of whatever a corporation does to our children, just the cost of doing business. Unacceptable. Since 2004 all modern taconite mines have violations and fines, not adherence. The long closed Dunka Mine on Birch Lake may have qualified as a Superfund site. Instead it was given variances allowing it to be non-compliant for decades; releasing high levels of sulfates and heavy metals particularly nickel, to our waters. Nickel is a genotoxin, carcin

Members of my church's Caring for Creation Committee at Macalester-Plymouth United Church have discussed the proposal for a large scale copper-nickel sulfide mine near the BWCA, to be conducted by PolyMet. We have shared our concerns about the long-term and destructive impacts on this special area of Minnesota. We are concerned about: 1. The major loss of wetlands, primarily bogs, that cannot be replaced. The SEIS already makes it clear that wetland "restorations" will not take place in the Lake Superior watershed and are highly unlikely to replace bogs. The wetlands at the site have been rated as "having high wetland quality." How can they possibly be "replaced?" 2. Predictions of chemical pollution, not just from sulfate and its acceleration of toxic mercury conversions, but also heavy metals like nickel and aluminum, that kills fish. 3. The long term need to clean up water from pollutants, possibly for 200 years. How can that be assured, especially with more mines ready to ask for permits in that area? 4. The questionable suggestion that a company, that plans to mine the proposed site for 20 years, could possibly provide "financial assurance" to cover the expensive costs of water treatment for 200 years or more into the future. And can such treatment truly control all the sorts of pollutants that will come from the mine site? The SEIS predicts the company will excavate 307 million tons of bedrock in 20 years, at 70,000 tons per day. 5. We are concerned that a lot of the proposed PolyMet site area has been designated by MN DNR as "Sites of High Biodiversity Significance" and support eleven state-listed species of plants. Destruction of such an area cannot be rectified, nor justified. We urge our government officials to take courage and SAY NO to this mine and to others waiting in the cue for permits. There are other ways to secure jobs in this fragile and unique area of Minnesota than this. One suggestion is to create metal recycling facilities and hire people to work on recovering the metals we need. Please reject the PolyMet mine. It's a short term venture with long term harm to MN.

Jane Maltby

41960

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jane Maltby Chanhassen, Minnesota

Jane Norling

39883

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Jane Norling 5450 Ridgewood Cv Mound, MN 55364-8238 (952) 472-7155

Mar 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Jane Norman 54162

Shame on you, representing our water resources and siding with themining companies. Its time you be visionary and care about everyone's future. Water is fast becoming our most important resource. Soon it will be more important than oil or anything else--yes even money. Don't sell your soul! [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

jane piegras 47417

To Whom it mayconcern: We are property owners near Ely,Mnnesota and enjoy the beautiful waters and serene environs year round at our home there. We write to express out concern regarding the PolyMet Sulfide mine near Babbitt and urge that this project as outlined in the SDEIS not be allowed to proceed. We have read the proposal carefully yet are left with the genuine concern that long term environmental protection expecially for the area waters, can not be assured. Our fears are substantiated by the fact that there is no existing sulfide mine, even the most contemporary such as Flambeau in Wisconsin, which have not ultimately caused leakage of toxic metals and sulfuric acid into the water table and surrounding earth. Northeastern Minnesota's precious natural resources must not be jeopardized for future generations by approval of mining which is based on unproven technology, false premises and self serving promises from an industry with such a terrible track record worldwide. Sinderely, Jane and David G. Piegras

Good Day, Please do not let this project move forwaRd The long lasting impact on our beautiful state's environment is NOT worth 300 jobs. Rather, lets create jobs by putting those folks to work on our infrastructure roads; bridges etc I think it is highly unfair for our children to allow this project any ground what so ever. I heard a Woman from WI speak about how just the testing for that site ruined their crops of Wild Rice. I do not trust that they will be able to keep the percentages of sulfite low enough to be dismissed. These are people's lives we are talking about destroying, along with our ground water, if this project is allowed to continue. Hoping you all will make the intelligent decision to tell Poly Met "NO" Yours in solidarity with Clean Water Action. Jane Whiteledge, Duluth. W-H-I-T-L-E-D-G-E. All we need to know about this mining proposal is what PolyMet itself has said, that once the mining is done the water will have to be treated for at least 200 years. The lack of common sense and the stupidity of it all is breathtaking that we even consider following our own water forever. Thank you.

Janet Anderson 35147

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I have serious and real concerns about the PolyMet Mining Corp. NorthMet mining project Supplemental DEIS. PolyMet's destructive and polluting open pit sulfide mine is NOT good for the public health - also there is loss of wetlands, risks to water quality, harm to wildlife, and cumulative NEGATIVE IMPACTS FROM MINING. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Janet Anderson 2130 N 85th St Wauwatosa, WI 53226-2848 (414) 258-5624

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Janet Bennett 201-w Park Row #207 St Peter, MN 56082 US

Janet Brown 38837

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, As an avid user of the BWCA and the beautiful natural areas of Northern Minnesota, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. I do not believe that PolyMet has proven that they will not contaminate this area forever. Only that they have a lot of money to spend on PR. Too often we see they companies claim that they have taken every precaution, only to find out later that they have cut every corner and we are left with millions or billions in clean up efforts that not only become the burden of the taxpayer, but leave us with a destroyed ecosystem. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Janet Brown 5100 Portland Ave Minneapolis, MN 55417-1748 (612) 750-7210

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Janet Frigstad 111 Riveness rd Duluth, MN 55811

Janet Jacobson 15789

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Janet Johnson 44768

I may not be as eloquent as some writers, but I have attended hearings, read much of the Polymet Report and would like to say, 500+ years of treating polluted water, Damages wild rice, Damage deposit details, Water Data errors, Mercury pollution, Destroys lynx habitat, Tony Hayward and Glencore, Destruction of wetlands, Dirty Energy, No health impact study, Failed to consider alternatives, Tax discrepancies. The first reason alone should be enough to open our eyes and say no. Water is our most precious resource and in a world where potable water is scarce and disappearing why are we endangering one of our last great supplies of clean water (this watershed goes into Lake Superior) for mining that has not proven to be safe and has never before been done in such a wet environment as Northern Minnesota. Sincerely, Janet Eileen Johnson 1823 15th Avenue S Minneapolis, MN 55404

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Janet Neihart 6751 Geneva Ave S Cottage Grove, MN 55016-1019 (651) 261-3579

Dec 20, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The health and beauty of our Earth are a priceless legacy that belongs not only to us but to all generations to come. It is our responsibility to see that it is protected. This means practicing the "precautionary principle" when making decisions that can irrevocably damage our planet. It must be proven beyond a shadow of a doubt that sulfide mining will not degrade the environment or tip the ecological balance. It must be proven absolutely safe before any permits are release. Consider it through the eyes of our descendants. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Janet Neville 11742 Mount Curve Rd Eden Prairie, MN 55347-2927 (952) 903-9682

Dear Ms Fay: I understand the appeal of the mining jobs - that would last for only 20 years (.) - but i am very concerned about the effects of the sulfide runoff into the watershed. Northern Minnesota and the BWCA are VERY watery environments. The reverse osmosis water filtration seems pretty cool, but it has not been tested on this scale. What happens when (not if) there is a 10 inch rain on the site. Who will be maintaining the reverse osmosis system in 500 years - 480 years after the mine shuts down. A giant barrier is needed, down to bedrock, to keep the untreated, polluted water from flowing down stream. In 500 years, who will be maintaining this barrier. For that manner, who will be maintaining and funding the barrier in 50 years, or 100- Why not require an underground mine, which would present fewer risks to water resources. What happens when the former LTV Steel.s tailings basin, which was developed in the 1950's, fails after sulfide-bearing tailings are dumped on top of it. The company says that copper prices are not high enough to make underground mining pay. However, I think it is worth it to wait to mine until it can be done right. The copper will still be there. I have seen places polluted with mine tailings. I don't want northern minnesota to go that route. Clean water is essential for life. I oppose the Polymet mine as currently proposed. Sincerely, Janet Petri 209 Manitou St Northfield, MN 55057

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Janet Spring 1676 Olive St, #6 Bloomington, IN 47401

Here we have a chance to stop an accident before it happens. Installing a copper-nickel mine near Hoyt Lakes and Babbitt in northeastern Minnesota will result in environmental damage to the clean water in the area. If it doesn't happen in our lifetimes, it will eventually. There are no assurances that it won't. In fact, the people trying to convince us to put the mine in Minnesota are already including in their proposal the funds for a clean up. If that isn't an indictment of the situation, I don't know what is. We have to stop treating this planet that we live on as if we can use it up and move on to the next one. We already know that we have changed the climate with our actions. It's time to be the adults that our ages say we are, buckle down, make the hard decisions and save this planet we call home. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Janice Beske Minneapolis, Minnesota

Janice Conklin

I am writing to state my strong opposition to proposed sulfide mining. I can't even comprehend that we are considering sulfide mining in this state of 10,000 lakes when the risk of polluting the environment is inevitable. No one has ever done sulfide mining "right". The technology to do so doesn't exist. Nowhere on the planet has copper-nickle mining been done without destroying water resources. As we all know mining companies tell untruths to get what they want. Do we actually believe that the mining company has detailed plans for clean up when pollution occurs. And do we actually believe that effective mitigation measures will remain in place for 200 to 500 years. OF COURSE NOT. Sincerely, Janice Conklin Mt Iron, mn

Feb 12, 2014 Ms Lisa Fay MN Dear Ms Fay, The current Supplemental Draft Environmental Impact Statement (SDEIS) is missing some fundamental information - what will be the long-term damage to our water resources and who would pay for this damage The Superior National Forest was established for the purposeful protection of our fabulous Minnesota natural resources. We need to respect this visionary purpose and REJECT the PolyMet sulfide mine proposal. Sincerely, Ms Janice Greenfield Rome Ave St Paul, MN 55116 (651) 698-2400

I came to this meeting because I am concerned that copper and sulfide nickel mining in MN will cause: 1. Polluted water 2. Loss of wetlands 3. Imports on wildlife 4. Climate change – more global warming 5. Legacy to our grandchildren will be overlooked 6. Loss of clean [ILLEGIBLE] in Boundary Waters Let us: 6 Spend our time and work on alternative energy like solar and wind 7 Give construction workers jobs in environmentally friendly job 8 Respect and protect the earth – not take everything we can from the earth.

Janice Peterson

Recently there was a piece in the news about Minnesota water (GOOD water) shortages in the near future. (Not to mention the water disasters sure to occur in the not-too-distant future in the western and southwestern states.) We should not even have a discussion about messing around with the polymet mining proposals: a stable water future is not a sure thing. It is a mistake to think that mining should trump our Minnesota jewels: clear and pure water. LeRoy and Janice Peterson Slayton MN 55172

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Janis Gerkenmeyer 72 Gull Lake Lane Grand Marais, MN 55604

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, janna piper po box 15072 portland, OR 97293 US

Hello my name is Jacky. I'm writing this letter because I am AGINSST about the mining. It is really dangerous for the environment, economic and for the world. It has been in the history our history in MN I really love the wilderness that has not been destroyed by mankind. It will pollute our water were gonna have sulfuric acid are PH will go down and kill the animals and insect that actually help the envirement. The world don't need more that's why they invented recycling for we can' do no more harm in the world I gess people just don't get that we have to protect what grows in the world for that we can still be living there so many other places were you can get copper, metal and other minerals pleas don't destroy our home the land of 10 thousand lakes we need our lakes and we need animals. I am AGINSST of WHAT YOUR DOING.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Jared Gertzen 1742 171st Ave NE Ham Lake, MN 55304-4917

As the father of two young boys who love Minnesota's lakes, rivers, and woods, I encourage the MN DNR to carefully balance the short term benefits and localized economic impact of this mine against its potential long term harm to our state's citizens and brand. I believe that our most valuable natural resources are those that are internalized in our spirits and memories rather than extracted from the land. Thank you for your consideration. Jason Carr 301 Monroe Ave S. Edina, MN 55343

Jason Etten 10295

To Whom It May Concern, I am opposed to the proposed mine development near Babbitt, MN by PolyMet. I have read most of the executive summaries of the most recent study and find them to be smooth and glossy but they carry little serious consideration of the hundreds of years of future care the site will require. Most summary documents mention in a sentence or two about long term care and monitoring. Do we really have a concept of the length of time and the cost involved in this cleanup effort. This could be two to three times longer than this state has been in existence. I hope that there will be more serious consideration of the tremendous potential long-term negative impacts and not count on promises from a company that not only has polluted in other areas but has every reason to sell the State of Minnesota on the untested technologies they propose to corral pollution in our future. Humans have shown little ability to control nature over time. There is no reason to think that PolyMet has figured out how to conquer nature in Northern Minnesota. My grandmother and her family grew up in Tower, MN. I have spent significant time in northern Minnesota and visited several mine sites. I am not opposed to mining as much as mining that destroys the earth where the materials are removed and leaves potential environmental disaster for countless generations after mining ends. Those who argue about the positives this will bring to the economy are looking only at the short term. Twenty years of mine work doesn't even provide jobs for a career for a miner. That would be half a career and then we would be back to start with an environmental disaster waiting to happen. This is not a sustainable or wise way to provide jobs and a future for those living in the Iron Range. Please do not allow this mining project to proceed. Thank you, Jason Etten 2054 Cohansey Blvd Roseville, MN 55113

Jason Finley 5925

Jason Finley. 6670 Vernon Ave S. Unit 111- Edina, MN 55436- Clean water is the most valuable resource we can leave for future generations. Mining creates the possibility to poison a Minnesota water supply. Therefore, mining permits should not be issued. Sent from my iPad

Jason Fisher 7617

After reviewing the information provided by Minnesota's DNR and hearing the comments at the public hearing in Duluth on Thursday January 16th, I am convinced that PolyMet's NorthMet project can be done in an environmentally friendly manner. The SDEIS is a detailed, independent review; federal, state and tribal agencies shaped the development of the draft EIS, which was written by an independent, third party. I believe this is a sound process. The environmental review process has been lengthy and thorough; the supplemental draft EIS addresses potential environmental impacts and how to mitigate them. The public can be confident that the draft EIS offers regulators the information they need to issue permits so that PolyMet can operate in a way that protects natural resources. Since the closure of LTV the East Range is in need of livable wage jobs. Most people would love to have their children establish careers close to home and currently those opportunities are not available. I support PolyMet and ask for your support on this important economic development opportunity for the people of the Iron Range and all of our great State of Minnesota. Thank you for your consideration, Jason Jason Fisher 4165 Kerr Location Hibbing, Minnesota 55746 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

My name is Dustin Loosbrock. Just so everyone knows, I'm not being paid to be here either. And I'm ceding my time to Jason George. Good evening. My name is Jason George. J-A-S-O-N, G-E-O-R-G-E. I work for the Operating Engineers Local 49. We represent 13,000 heavy-equipment operators in the state of Minnesota, North Dakota, and South Dakota. I'm going to talk for a second about the EIS, which I think we're supposed to kind of direct our comments to. Although I don't hear much of that going on. We support the process that is going on right now with the DNR. We feel like they're doing an excellent job of vetting this project. This public comment period is excellent. It's fantastic to see so many people here passionately advocating one way or the other for this issue. And just really believe in the process. And I think that the process needs to be followed. And when we come to the end of the process and there's a decision, we need to respect that. These folks know what they're doing. The people at the agencies know what they're doing. And I for one trust them to get this right. And I believe that we can get this right. And I believe that we can have these jobs and protect the environment. I know that because my members do that every day. Every day they're working on highway, pipeline. Any kind of industry that we work in these guys over here that build America do it the right way. They know what they're doing. That's right. It's hard for me to believe some of the people that come up here and talk about how there's no way we can do this. It can't be done. I mean I've never heard so much negativity. This is America. We can do anything. Right. We can protect the environment. So I want to dig deeper on jobs. I commented on the process. I think it's a good one. I think we need to dig deeper on jobs. I keep hearing about 300 jobs. Nobody is talking about 2 million construction hours, which is what it's going to take to build this project. That's the same amount of hours by the way that it took to build Target Field. So we're talking about a stadium-sized project in Northern Minnesota that is desperate for jobs. I want to talk about North Dakota. I want to talk about when I go to North Dakota, having union meetings in North Dakota, and everybody I ask to raise their hand who lives in Minnesota. The whole room raises their hand. There's 3,000 49'ers Minnesotans that live here, their family lives here, and they are working in North Dakota right now. My message to you and everybody in this room is: Let's bring them home. Thanks.

To whom it may concern: I fully support the PolyMet project. They have sufficiently addressed the environmental concerns and will provide much needed jobs to the area. Copper and nickel will only grow in demand with the increase in alternative fuel sources. I would rather have these minerals mined in Minnesota where it will be done with oversight than in a third world country with little to no oversight. Jason Loos Jason T. Loos Erik R. Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. This proposed mine threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. It is simply not worth the risk. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. We need to be thinking about recycling, re-using, and reclaiming metals - not sulfide mining The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest This is the people's National Forest and we want to keep it that way. Sincerely, Jason Rabuck W3080 Hay Lake Rd Springbrook, WI 54875-7509 (715) 766-8220

Dear DNR Colleagues, Minnesota is an outstanding state for many reasons; the foremost being engaged and involved citizens. Minnesotans have a strong tradition of balancing and ultimately meeting the needs/wants of its diverse citizenry. We have a strong economy, outstanding parks both national and state, many institutions of higher learning and great health care. All of these factors make Minnesota stronger from an economic and environmental standpoint. Minnesota is thriving and there are many reasons why: educational opportunities, employment, quality of life, clean air, clean water and natural beauty. I have spent time time camping and fishing in northern Minnesota every year of my life. I moved to Duluth from Chicago over 10 years ago for graduate school and I have been here ever since. My family has been visiting Lake Vermilion for three generations now. Bottom line, this is a great state, how do we improve from here . Enough of a prologue; I want to express my strong opposition to the copper/nickel mine in Minnesota. My reasons are listed below. 1-) Economics: yes jobs will be created but sustainability will be loSt The preservation of clean water and wilderness will provide a greater economic stimulus to the state and local areas than mining. Mining companies have projected jobs and tax revenue on many occasions only to bow out when the market changes. People will always be drawn to wilderness and Minnesota is a prime example of that draw. Amidst the coldest winter in 139 years tourism in northern Minnesota is thriving because of snowmobile trails, ice fishing, nordic skiing, and the human desire to get outside. A prime example is the The Apostle Islands National Lakeshore sea caves. There has been over 10 million dollars spent by visitors in the darkest days of winter to come see an area that is clean and beautiful. Sustainable development is what will keep minnesota strong and healthy. With respect to health, Minnesota is one of the healthiest and most active states in the union. We are in the top 5- To keep us healthy we need clean air and water, sulfide mining does not meet that goal. Minneapolis and St Paul are vibrant prosperous places to live as compared to other large US metro areas. It is not a coincidence that they are also the most bike friendly urban area in the country and provide plenty of parks and green space to keep there citizens active and living (spending money) in the city versus commuting from a bedroom community like many other urban areas. My town of Duluth is another example; historically mining, timber and shipping put Duluth on the map but higher education, healthcare and tourism will sustain a prosperous Duluth. Duluth is lucky to have trails and is building even more; people come to Duluth both summer and winter to ski, run and mountain bike our trails and it is a rare summer day when our Lakewalk is not crowded with tourists enjoying a cool lake breeze. 2-) Recycle the copper already in our country: We need raw materials to keep our economy strong. There is no question that if we do not supply copper someone else will. My worry is that if we dig a large, likely toxic, hole in our Minnesota backyard and a large multinational firm quickly opens a new copper mine in Chile or Mexico and provides copper at a fraction of the price; our mine is shuttered until the next perceived demand and then what. Once again the sustainability just is not there; we simply cannot out mine other countries with looser environmental laws such as Mexico, Chile and the remote parts of Canada nor would we want to. Our focus should be on reusing and recycling the vast amounts of copper and nickel that are currently in our possession. A robust scrap copper market could be made more mainstream and we would benefit our environment as well. 3-) Accountability: large corporations, especially multinational corporations like Polymet, are often poorly accountable for lingering environmental impacts. St Louis Bay at the western

____ From: jdregni@hotmail-com To: dnr@state.mn.us Subject: Copper Nickel Mining Date: Thu, 27 Feb 2014 17:48:25 -0600 To Lisa Fay, EIS Project Manager Dear Lisa Fay, I am writing once again to highlight the gravity of the decision on copper and nickel mining in Minnesota. I can only imagine our children and grandchildren Saying to us something like the following; “what were you thinking in 2014 when you approved nickel and copper mining in Minnesota. Were you thinking at all of the future, our future.” Considering the weight of the information and evidence to date, I do not think mining for copper and nickel should go forwaRd Actually the water in our state is truly our treasure - the land of sky blue water. Regards, John Carleton Dregni 921 Bayless Place St Paul, MN 55114 Phone 651 644 2786

20016

Dear Lisa Fay, I am not in favor of copper nickel mining in Minnesota at this time due to lack of environmentally successful mining of this sort, plus the years it might take to rectify the water pollution and environment of our state. If however some level of mining is permitted, the following ideas and conditions must be considered: A. A trust fund with at least two parts; first, a multimillion dollar initial contribution (non refundable), and second an annual addition to the trust fund equal to ten percent of some measure such as revenue, tons of copper/nickel removed, etc B. Sixty percent of the jobs at all levels to be held by Minnesotans, and 90% by US citizens. C. Vertical integration of the mining process and subsequent industrial processes to be conducted in the state of Minnesota. This activity to be considered as an add on only if safe environmental conditions can be put in place. D. Operations management and their families to live in the area. E. No special tax breaks to be provided. Thank you for coordinating this written comment response program. Courage, honesty, foresight and transparency can provide for a good outcome, John Carleton Dregni 921 Bayless Avenue St Paul, MN 55114 Phone 651 644 2786

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. This issue seriously concerns me and my family's future use of the Arrowhead region for recreation; I can't imagine what effect this will have on people that actually live there and have to literally drink the water. My wife and I were seriously considering purchasing land close to the mine site, we will not invest in a future in this area if short-sighted proposals like this threaten the water quality and the environment. Seriously this is the only draw to the northshore and we as Minnesotans should feverishly protect our remaining natural resources. There is no history of sulfide mining in Minnesota, for good reason we should reject proposals like this that threaten our natural resources for little gain for the people of Minnesota. Hundreds of jobs you say, this pales in comparison to the number of jobs that BWCA, Lake superior and its tributaries provide in the form of recreation. Poison the water and poison the future investment in the region. Who will clean up the mess. When Polymet closes their doors, files for bankruptcy and leaves their tailing ponds and rock piles Minnes

Dear Ms Fay, Mr Bruner and Mr Dabney, Please reject the PolyMet NorthMet SDEIS as an insufficient plan and find the project likely to pollute beyond acceptable levels. Evidence that the plan misrepresents the boundary of wetlands and tributaries flowing into the BWCA and other protected lands needs to be investigated. The plan should include analysis of underlying bedrock and it's ability to protect groundwater from pollution. The Land Exchange proposal is not an equal or fair tradeoff. Potential conflict with the 1854 Treaty with the Chippewa regarding pollution of reservation lands needs to be investigated. Long term pollution mitigation and financial accountability plans are not sufficient. Conflict with the Clean Water Act seems likely. Polymet's actions are deplorable - instead of guaranteeing a clean operation they are engaging in public relations tactics to convince people we should support their operation. They're running ads, hiring "real people" to tell us we need the jobs, we need the copper for wind turbines and platinum rings. We use copper to build nuclear bombs and bullets too, but they're not talking about that. This is not about the products made from minerals. Polymet doesn't care about what their ore is used to manufacture unless it's a convenient story. It is about money and it's about risk. Their tactics and refusal to guarantee a safe operation are enough to tell me we shouldn't move forwaRd At the Saint Paul public forum I sat next to Polymet CEO Jon Cherry and listened to him laugh and scoff while citizens gave testimony on the verge of tears. He and his group looked like foxes in the hen house. It made me sick - first of all I can't believe they were so careless to act that way and second I can't believe these are the people we are doing business with. If they can't even mind their own image in public, how can they mind a mine. If there was a video of how they acted and what they said, this project would be over for good right now. My dad, grandfather and great grandfather were miners along with many other relatives. Many of them died early and some even on-the-job due to unsafe conditions and exposure. Through history, only recently have mining companies been held accountable to acceptable standards even for the safety of their employees. We know that maximum profits and safety are in conflict. The fact that they can't produce an acceptable plan is proof they're already cutting corners. The stakes are higher than they have been in other Minnesota mining projects because technology has increased our ability to damage the environment beyond repair, and the proposal is to mine unsafely in an exceptionally sensitive area. Proponents of this project invoke "The American Way" of progress and industry and say we should charge ahead. If anything, we've learned this old American Way was wrong and so we learned to be more careful with our natural resources. Please delay the permitting process until we are sure that environmental impact within acceptable limits is guaranteed. Jay Haapala 1560 Grand Avenue Saint Paul, MN 55105

Jay Lehman

18099

This is a special treat for me. I am Jay Lehman. I am from Aurora. I am part of a small family business that has been on the range for 30 years. Thank you to the DNR and the federal agencies that are here allowing us to talk about this. Reading through the Supplemental Draft Environmental Impact Study, it is a very complicated and extensive document. I am convinced it takes an experienced environmental engineer versed in permitting to fully understand and appreciate it. I will admit that I'm not one of those people. With that being said, I believe we have to put our trust in the experienced scientists and engineers of the lead agencies to determine if this mining project can be done safely. If this project can meet the environmental and financial requirements, then we must allow PolyMet to move forward with this project. Not doing so would be an injustice to the people in Minnesota, especially here on the Iron Range, as we have one of the world's largest deposits of strategic metals. I believe we have the technology and experience to move forward with this project. Copper-nickel mining has been going on for hundreds of years. We know what the dangers are and we know how to avoid them. Our regulatory agencies are staffed with experienced, competent professionals who are some of the best and brightest that our country has to offer. We need to put our trust in them. We keep hearing that in Minnesota we are going to be trading 20 years' of jobs for 500 years of waste water treatment, or even a thousand years. I would like to ask the DNR to make an official statement as to whether or not this claim of 500 years of required waste water treatment post-closure in the SDEIS is in the SDEIS or is it not? I feel many people aren't sure about this issue. This issue needs to be put to rest in the SDEIS of properly informing the public. The financial risk of moving forward with this project does not lay on the taxpayers' shoulders, it lays on PolyMet's. PolyMet, before mining begins, funds must be set aside to cover the entire cost of the closure and the reclamation. The Minnesota DNR determines the amount to be set aside and the company does not get the funds back until all closure and reclamation is complete. I don't know anybody on the Iron Range who does not care about this project being done right and safe. We care not only for the jobs this project will provide, but we care about protecting the environment as well. This is our backyard. We don't want to damage it. Those saying we need to choose between jobs and environment are presenting a false choice. We can have both. Thanks.

My name is Jay Newcomb. I'm from Duluth. N-E-W-C-O-M-B. Seems pretty clear to me listening tonight that we would all like to have more jobs on the Iron Range, especially good paying ones. And we also absolutely want to protect our environment. So the real question becomes: Who can make this call? Who can make this decision? Obviously PolyMet is supposed to be the expert in mining. But who can really tell us about the environment and how we need to treat it and live sustainably on it? And even though PolyMet now is using the term "NorthMet," and it sort of sounds like they are from here, they really aren't. The people who can tell us how to live on this plant are the Ojibwe. And they have brought up three bands, the Net Lake, Grand Portage, and Fond du Lac band have drawn up a list of 18 disputes that they have with the EIS. They range from not looking at the possibility of underground mining rather than surface mining, the differences in how wild rice would be affected, groundwater, and the hydraulics. And what I would suggest is that before this mine is considered further or goes forward we need to listen to the people who know how to treat this land the right way and sustainably and resolve all these 18 issues. Thank you.

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, By now you have heard it all: economic arguments for and environmental arguments against the PolyMet mine. The very fact that thousands of people have commented on the SDEIS shows how inadequate it is. We fear for our environment and for the future of our clean water. PolyMet spent its money sponsoring the state high school hockey tournament in a public relations campaign rather than dealing with these real issues. Their job is to make money. Your job is to protect our environment. Jay Newcomb 1230 E 8th St Apt/Suite Duluth, MN 55805 2187246141

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Jay Strachota

39959

I believe the mine should not be built. I do not believe that PolyMet can safeguard Minnesota's ground water and protect it for 500 years. Further more I believe it should be a requirement that when a mining company finishes mining that the site should be cleaned up and left maintenance free. That's the only possible way taxpayers can be protected and even then PolyMet could default before the end of the mining. We can not strap this clean up burden on future generations who will gain nothing from the efforts after the site is mined. It is beyond basic common sense that any amount of damage deposit is adequate to offset 500 years of water treatment and then depending on a corporation to back it. Corporations by definition are only beholden to their shareholders, not the environment or taxpayers. It is further more beyond belief that people exist who think they can calculate the environmental and financial risks and requirements for possibly 500 years, and others who think they can market the calculations, and still others who want to believe it. Jay Strachota 712 6th Ave S Hopkins, MN 55343

JAY STROHMAIER

11982

I'm writing to voice my feelings about the potential copper-nickel mine proposed by PolyMet near Hoyt Lakes MN. I live in Minneapolis but spend a tremendous amount of time on the Iron Range. My wife's family grew up on the range, and for the past 60 years have been careful stewards of lake property they've owned near Biwabik since the late 1950's. When I first moved here from Washington State in 1982, my first trip "up north" was to this area. Since then, that is what "up north" has come to mean to me. It is a beautiful and treasured part of our state in fact, a treasured part of our country. We were so entranced with this part of the Iron Range that we purchased our own second home in the area a few years ago, as well. We now spend even more time at our home near Biwabik, and plan to move there when we retire in a few years. The beautiful lakes, bike trails, natural forest, nearby boundary waters, and wonderful people; it is truly a gem - it can't be taken for granted. While I understand and appreciate the economic challenges facing the Iron Range and many other communities around the country, where job growth has been scarce amid an evolving service-centric economy, it seems to me, as an economist by training and an investment manager by profession, that the proposed PolyMet mine represents a grossly sub-optimal trade-off from a risk/return perspective. I understand it could create 350-400 jobs for perhaps a 20 year period; maybe a few more jobs, possibly a few less; maybe a few more years, but perhaps a few less. Commodity prices are volatile and the economic and regulatory environment associated with mining profitability can change quickly and unexpectedly. Even in the best case scenario, we need to carefully consider what we'll be facing 20-25 years from now when the mines close and the cleanup begins. More importantly, what may our grandchildren and great, great grandchildren (and beyond) potentially be facing 100 or 200 or 500 years from now, when the lakes have been contaminated with sulfuric acid and no one even knows what a Walleye is because our lakes don't support any aquatic life anymore. When well water could be tainted and unsafe for drinking. And when the costs associated with the clean-up could overwhelm the ability of local communities (or even the state) to bear the financial burden. For 350 jobs for 20 years. For tax revenue for the state that could pale in comparison to the costs that could be incurred to repair the damage - if that's even possible. I've reviewed much of the research on the efficacy of responsible copper-nickel mining. Reasonable people have argued that there are some cases where it has been conducted and remediated fairly effectively. But there are many more cases, way many more, where both reasonable and unreasonable analysts alike concur that this type of mining has been an unmitigated economic and ecological disaster. Is that a risk we want to take. Is it a risk we need to take. I believe that as a state, we would be better served by creating an economic development program that provides state-of-the-art training to residents of the Iron Range to create long term skills for the economy of the future jobs in technology, medicine, science and the like, with longevities into the next century not just the next 20 years. And the cost of such a program would likely be a fraction, a small fraction, of the present value of the potential liability that the state, and its taxpayers, may ultimately face if the PolyMet project moves forward. Finally, I realize that regulators and legislators are working in earnest to ensure that adequate financial assurances can be provided by PolyMet to ensure that potential clean-up expenses will be fully covered. I applaud them for this foresight. But I would also challenge them to ask themselves, "How many companies have been around for 200, 300 or 500 years, with the wherewithal to pay off debts incurred from their business activities centuries earlier." The l

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Jay Thacker 4060 Crestview Ln Shoreview, MN 55126-2332 (651) 490-1178

To whom it may concern; I believe that Ploymet is going to be a valuable asset to the surrounding communities. I for one would love to be employed close to home. I live in Gilbert, MN and have a difficult time finding employment close to home. I find that I have no choice but to work up words of 60 miles from home. Currently I work in Le Sueur, MN 4 hours or 250 miles from my wife and five kids. I make it home for 1-2 days every other week. To relocate is not an option. Northern MN is in need of growth, and income. People living on the range take pride in living in a beautiful area, but most people struggle with income and limited options for employment. There are many educated, hardworking people who are just waiting for an opportunity to shine. I understand that not everyone whom applies will be give an opportunity to work for Ployment, but the construction of the facility and other local business will have more work, and be able to employ qualified workers. I would like to see my State and DNR working with Ploymet to overcome the issues and concerns. We have an opportunity for greatness. Ploymet is working hard to overcome every road block that is and has been in the way. I think it's time to join forces, and use the resources we have to make this dream a reality. Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, The citizens of Minnesota are justifiably concerned with protecting our clean water and therefore have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota. I believe that the Supplemental Draft Environmental Impact Statement is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high-quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest, the largest designated Important Bird Area in Minnesota. In addition to direct destruction of habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need likely will lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk, and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. A mere twenty years of mining threatens to result in hundreds of years of water pollution and damage to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jean Beyer 7413 W 110th St Bloomington, MN 55438-2375 (952) 941-6541

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jean Brozic jean brozic 1227 e. skyline pkwy. duluth, MN 55805

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Jean Brozic jean brozic 1227 e. skyline pkwy. duluth, MN 55805

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Jean Christopherson 6013 Dublin Cir Edina, MN 55439

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Jean Evens 3192 Town Road 207 International Falls, MN 56649-9022 (218) 283-4667

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Jean Greenwood

Dear DNR personnel, I wish to speak in opposition to the proposed copper-nickel mines in northern Minnesota. I believe that the risks to our environment and our health are too great to warrant our proceeding with this mining venture. Let us not be held hostage by our need and desire to create jobs, so that we resort to short-term thinking, heedless of the long-term consequences. I understand treatment will be required at the mine for 200 years and at the plant site for 500 years. All this for a mine that lasts 20 years, creates few jobs, and puts our land, water, air, health at risk. Please do not grant permission for the PolyMet mining to proceed. Thank you, Jean Greenwood 4515 Garfield Ave Minneapolis, MN 55419

Jean Johnson

57174

Minnesota has clean water and beautiful clean lakes. Why would we permit a company to ruin all our water. They say it will bring more jobs. We need more jobs, but we need clean water to survive. Any mining that will harm our water is not wanted in Minnesota. Jean Johnson 3392 Strand Rd Duluth, MN 55803

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Jean Ross 3624 Bryant Ave S Minneapolis, MN 55409-1018 (612) 824-2080

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please vote to protect out environment. Jean Waldt Sincerely, Ms Jean Waldt 1992 Hyacinth Ave E Saint Paul, MN 55119-3251

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jean Watson Red Wing, Minnesota _____ There are now 53 signatures on this petition. Jeanette Curphy

19893

From Jack and Jeanette Curphy (please count as two responses-we only have one computer.. We oppose the Polymet project in Hoyt Lakes. There has not been a "safe" way to mine copper/nickel. It bothers us that Polymet is not an American Company but a Canadian company. Do they really care about our environment. The history of copper/nickel mining companies is that they do their mining, file bankruptsy, and leave the citizens to pay for the clean up, and their is no known way to clean up sulphur material in the water. The Poly Met project is located, at the beginning of three (3) watersheds; namely the St Louis River and Great Lakes watershed, the Mississippi River watershed, and Hudson Bay watershed. For the few hundred jobs offered for this project, that would last approximately 20 years, the damage appears to outweigh the benefits. I would hope the legacy of the DNR and governing bodies would not be the irreversible environmental damage they allowed. Thank you. Jeanette and Jack Curphy

Jeanette Trushess

18247

My name is Jeanette Trushess. The last name is spelled T-R-U-C-H-S-E-S-S. I wish to register my opposition to copper/nickel mining in Northern Minnesota. We call the assurances -- we recall the assurances that taconite mining would not pollute the watersheds and the attempt of the mining company to deny their actions as a source of asbestos pollution to Lake Superior. Even with the best technology and state-of-the-art methods for capturing sulfide, eventually, perhaps several generations from now, those chemicals will leach into the watershed and Lake Superior. The mining company is not going to take responsibility, even if it still exists as an entity 100 years from now. And even if it were to take responsibility, it would not be possible to reverse the damage. No amount of money would compensate the people relying on Lake Superior for their potable water. Fresh water is going to be a necessary condition for quality of life in Minnesota, long after the miners and the minerals have come and gone. I happen to also be a psychologist that works and specializes in fertility, and I'm concerned about environmental causes of infertility. That's it. Thank you.

Begin forwarded message: From: Jeanine Allen <HYPERLINK "mailto:jmk.allen@hotmail-com"jmk.allen@hotmail-com> Subject: Opposition to PolyMet Mining Date: March 13, 2014 1:19:51 PM CDT To: HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us Cc: Jeanine Allen <HYPERLINK "mailto:jmk.allen@hotmail-com"jmk.allen@hotmail-com> March 14, 2014 MN Department of Natural Resources Dear Sirs: I am writing to express my opposition to the PolyMet copper mine, and any other such mining, in northern Minnesota. My reasons for doing so are due to the negative environmental impact such mining will have on our most precious and endangered resource, namely clean water. It has been noted in news articles that copper mining will expose and release into the environment sulfate, mercury, possibly asbestos-like particles, and other toxic metals into the water, and possible the air. These releases have the potential to destroy wild rice growing areas, wetlands, increase mercury levels in fish and other aquatic species, along with the potential to add more asbestos-like particles to the drinking water of people and possible airborne particles to areas around the mine. To prevent such pollution from happening, we are told that extraordinary pollution control prevention measures must be implemented, and sustained, for a period of at least 500 years. This is absolutely mind-boggling to me that we would even consider approving a project that gives us 20 years of mining and jobs, in return for more than 500 years of State oversight and maintenance of the mine site. Minnesota has only been a State for 156 years, and to commit future generations to this amount of supervision, and resultant costs, is absolutely irresponsible. In addition, I have yet to find any such pollution control measures that actually work in the real world. Minnesota is known world wide for our Minnesota grown wild rice. Native Americans have been harvesting wild rice for centuries, and will probably continue to do so, "if" we don't ruin the environment which is necessary for its continued survival. As far as I can tell, we have not fully determined the "safe" level sulfides in the water which will allow for the sustainability of our wild rice crop. I feel we should not endanger wild rice production in our State in return for 20 years of copper mining; it just doesn't make sense. We've been trying to reduce mercury levels in Minnesota waters for years. Every summer I hear reports that people should limit their fish intake to so many fish per week due to mercury contamination. And now, we're to consider increasing adding more mercury to Minnesota waters, in return for 20 years of copper mining. Once again, this doesn't make sense. I am also concerned with the asbestos-like fiber getting into the water supply. I lived in Duluth from 1969 to 1975, in the early 70's the City of Duluth informed residents that asbestos fibers were discovered in the water supply, caused by taconite mining. We were told that to prevent aerosolizing the fibers, and risk breathing the fibers in, we shouldn't cook with the water, we should stop taking showers, and wash our clothes in cold water etc, until the City could install filters to remove the fibers from the water supply. I imagine people in Duluth and many other communities and individuals up and down the North Shore who obtained their water from Lake Superior had been subjected to this contamination for years before it was discovered. I also imagine it will be years before the direct negative impact on public health this pollution has, and will, cause. For years I have wondered what will be the eventual impact this will have on my family. People should not have to worry about problems like this. Our government's, including the DNR, primary objective should be protecting Minnesotans and our environment, not catering to foreign corporations. If this in not a concern of the DNR, it should be. Last

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Regarding the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement, I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Lake Superior's waters were seriously contaminated by the taconite tailings that mining companies dumped into it. This pollution was a threat to both marine and human life until an international effort stopped the dumping. So why would we even consider authorizing a new and similarly dangerous threat to the Lake Superior and the beloved Boundary Waters Wilderness. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest It's time we stopped protecting corporate pocketbooks and started protecting the health of the earth in earnest Sincerely, Jeanine Center 618 Northside Ave Ann Arbor, MI 48105-1133

Minnesota's clean waters and wilderness areas have provided our state with ample economic benefits for decades, and they form the backbone of our healthful way of life that attracts people from around the world. These assets of ours will continue to serve us if we don't ruin them for short-term gain. Sulfide mining carries too many proven risks; chances are very high that Minnesota, in the long run, will pay more than it will gain if we move ahead with the sulfide mining. Jeanne M. Wesley 2421 Kelly Paulson Rd Carlton, MN 55718

Jeanne Piehl 38971

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Jeanne Piehl 24246 Highway 15 N Hutchinson, MN 55350-5401

Jeanne Thoreson 39535

I think it is absurd to embark on a mining operation that gives a few hundred workers 20 years of employment and saddles the state with centuries of cleanup. It is also absurd to risk the health of the Boundary Waters, which is Minnesota's greatest gem. Lastly, it is absurd to allow an out-of-state company to rape our land and carry the profits away. People who think this is a good idea need a sanity check. Thank you. Jeanne Thoreson 504 21st St NE Rochester, MN

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Jeanne Wright 221 County Road 44 Grand Marais, MN 55604-2229

Jeannie Rustad

Comment: I am strongly against allowing PolyMet or any sulfide mining in Minnesota because: I believe the toxic waste caused by this type of mining will cause irreparable harm to our environment. The history of this type of mining being able to reclaim the land to it's original state is extremely poor. There is never enough money to pay for the future problems, if it can be fixed at all. I also believe that by allowing sulfide mining to start up in order to provide mining jobs, we will ultimately destroy out tourist industry jobs in Northern Minnesota because of the damage caused by mining for copper. Polymet is at best a short sighted, short term fix for our state. Please do not allow sulfide mining in our state Jeannie Rustad

As a Geology Student in the Northern Minnesota area we learn how to tell the difference between different minerals, we learn how minerals are formed. We also learn things like how ore deposits form, the differences between various forms of ore deposits, how acid mine drainage actually works, and how the chemistry of the surroundings effect the pollution potential in a region. I have been watching the debate over PolyMet for quite some time, and for obvious reasons I have a bias in the direction of it going forwaRd However, I also know the difference between reality and fantasy and can use that to make my own opinions on this matter. PolyMet looks to be proceeding with this project in a manner that is safe, open, and responsible and should be allowed to proceed. This is going to be a huge boon to the area, and the state, with the additional jobs and tax revenues. The project will not pollute the boundary waters (not even the right watershed) and even the watersheds that it does lead to, are also safe because mining can be done safely. Minnesota has some of the toughest mine pollution laws in the country, and this is an area that has been mined for well over 100 years without it turning into a wasteland. Previous mining projects were not mining for copper-nickel, but many of them ended up abutting the copper-nickel deposits due to their geography. Let PolyMet proceed with this project, it is the best for the region and it is the best for Minnesota. Jeff Harrison BS candidate, Geology, University of Minnesota, Duluth 7801 E. Superior St Duluth, Minnesota 55804

JEFF ANDERSON 43336

I would like to submit the following comments: As a fourth generation Iron Ranger, resident of northeastern Minnesota and former elected official, I would like to voice my support for the PolyMet project. The mining of these strategic and precious metals will generate significant economic activity, creating hundreds of jobs that can support families and sustain communities. What does this project mean for northeastern Minnesota: 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state and the Iron Range desperately need. We need the good-paying jobs that copper-nickel mining will provide. We cannot afford to miss the opportunity for 360 full-time jobs with hundreds of additional jobs in other industries. Having grown up on the Iron Range, I know all too well that we need jobs for young people and copper-nickel mining will provide our young people with multiple opportunities for challenging and exciting careers. I am an environmentalist I want to make sure we protect our clean air and water. I hunt and fish and appreciate this beautiful place we live. I trust the multiple State and Federal Agencies involved in preparing the document. Minnesotans trust the DNR to study copper-nickel mining and keep our communities safe. The environmental review process has been lengthy and thorough; the supplemental draft EIS addresses potential environmental impacts and how to mitigate them. It's time to put people to work. The time is now. Enough is enough; let's get on with permitting this mine. We want and we need jobs. Jeff Anderson Former Duluth City Council President and Duluth Economic Development Authority President P.O. Greetings - I am writing to provide comment on the NorthMet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement (SDEIS). My concerns with the SDEIS include: I feel strongly there is a lack of detail regarding the risk analysis in the document that would allow me to fully understand the consequences of the proposed action. While I understand that further detailed risk analysis may be called for at a later stage of permitting, I would urge the agencies to conduct a more thorough, detailed, and complete risk analysis to be included in the EIS. I do not feel the question of financial assurance has been adequately addressed for post-closure, especially given the high likelihood that perpetual treatment is needed. There is absolutely no historical examples of mining in MN that suggests PolyMet will be able to provide the necessary monitoring and funding to make certain that millions of gallons of untreated water don't pollute groundwater and nearby rivers. PolyMet's mine plan doesn't provide details about how to calculate an adequate damage deposit to protect taxpayers from the cost of 500 years of cleanup and maintenance. The plan includes inadequate contingencies for disaster events like pipeline breakages and extreme weather events. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. I am extremely opposed to the proposed Polymet mine. It is absurd to jeopardize the safety of drinking water for 500+ years in order to get, at best, 20 years of jobs. Why destroy the future just to get something today that will be gone soon. What copper mine hasn't polluted the environment. And who will pay for the cleanup if Polymet doesn't have the money to do so, as has happened so many times in the past with other mines. Why should we believe that Polymet can do it this time when nobody has before. And why rush the project until the full environmental study is done. Are the minerals going anywhere. If the demand is going to decrease, that is just another reason to not do to the project. Please do what is best for Minnesota in the long run, not the short run - please stop the Polymet mine. -Jeff Conrod 426 Cherokee Avenue Saint Paul, MN 55107

37895

The wrong question is being asked. We shouldn't be asking, "Can the Polymet Mine be built, operated and decommissioned without damaging the environment." People who are against the mine can easily point to previous mines that were responsible for environmental disasters. Supporters of the mine can point to changes within the industry made to prevent similar disasters from ever happening again. Neither side can say with any certainty of what will happen in the future. Instead, we should be asking, "Are we willing to sacrifice our environment over the long-term in order to receive the short-term benefits from the mine." This is similar to the parent who considers the pros and cons of allowing their child to go on a long-term, unsupervised camping trip in the Northern Minnesota woods with a convicted pedophile. The child might have a wonderful trip with this person who "learned from their mistakes" (as the mining industry claims to have done) and won't repeat the same "mistakes" they made in the past. Or the child might be scarred for life and may go on to become an adult who makes the same "mistakes" which results in decades of pain and suffering for many many people. Clearly a responsible adult would not allow their child to take this trip. The parent's job is to protect their child since they aren't always able to protect themselves. Just as clearly, a responsible state agency, whose charge is to protect the environment (which can't protect itself) MUST not allow this mine to operate. Yes, it is POSSIBLE that it can be built, operated and decommissioned without damaging the environment, just like it is POSSIBLE that a participant in the Minnesota Sex Offender's Program might go through their program and never commit another crime again. But there is a reason why only one person has ever been discharged from the program - the risk is too great. The mission of the DNR is to conserve our natural resources and allow them to be used in a way that creates a sustainable quality of life. Putting the area around the proposed mine at such a high risk of being destroyed for 25 generations is irresponsible and reckless, just as allowing a child to be unsupervised with a pedophile in the woods is. Please protect our environment the same way that the Department of Human Services protects our children. Please don't allow the Polymet mine to be built. Jeff Conrod 426 Cherokee Avenue Saint Paul, MN 55107

My name is Jeff Evans, I live at 1692 Princeton Ave, St Paul 55105- I also own a cabin near Ely and have been taken over thirty canoe trips to the BWCAW. I owned and docked a sailboat on Lake Superior for five years. I am opposed to the plan to mine copper nickel in Northeastern Minnesota for these reasons: 1- The lack of transparency on the financial assurance calculations. Not providing the assumptions or contingencies is short sighted. I realize this by law is to be part of the permitting process but the DNR and other agencies should've realize the lack of faith citizens would have in this process and provided that information. To not make those calculations is akin to saying we are going to Mars next year but not provide the details as to how to get there. 2- The lack of a mercury/sulfate standard for wild rice. How can the state make a wise decision if the rules for sulfate standards haven't been decided on yet or updated. 3- What are the health risks from this type of mining. Has it been studied. 4- How much of the technology has been tested in the field rather in the laboratory. Reverse osmosis operates differently in a controlled environment of the lab. 5- What is the cost to the state and local communities on the infrastructure. Crime will increase so will heavy loads on highways. Is this considered. How this project will be taxed has not been determined. Let's solve that problem firSt 6- What are the costs of 200 to 500 years of pollution compared to twenty years of a few jobs. 7- Modeling should be revised. The new information on water flows indicate that the models are incorrect and need to be substantially revised. The state should make an informed decision with the best information possible, not a hurried political one. I was impressed by the professionalism and patience displayed by state agency personnel at the public hearings. I hope that same professionalism and patience is displayed when they consider the adequacy of the SDEIS.

16933

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Jeff Hanson

44301

Dear Sirs, My name is Jeffrey Hanson. I grew up in Babbitt, MN where we built the family home on Finn Bay of Birch Lake. After high school in Babbitt I attended Vermilion State Junior College in Ely and the University of Minnesota for Mechanical and Environmental Engineering. We still have and use our family home at 8457 Spring Ridge Road, Babbitt, MN 55706- Since we first cleared the land and built our home overlooking Birch Lake we have considered ourselves avid environmentalists and diligent stewards of the natural environment we love so dearly. Based on these convictions, I have been concerned about the eventual impacts of copper-nickel mining ever since its was first discussed in the mid 1960's and found along Spruce Road near to Birch Lake. No one is more passionate about protecting our waters then I am. At the same time I recognize the essential nature of mining and that it does cause impacts on the natural environment. We moved to Babbitt in 1958 due to taconite mining and the new high school it built where my Father was the industrial arts teacher. My first job after high school was working at Reserve Mining where I saw first hand the real impacts of mining. Over the years I have followed from a distance the development of mining above the shores of Birch Lake at the Dunka Pit of Erie LTV Mining. This mine pit is a prime example of the sulfate and acid mine drainage problems that can result from any type of mining where sulfide ores such as copper sulfide or iron sulfide (pyrite) are present. This pit was dug to extract taconite in an area where both copper sulfide and iron sulfide are present. Problems arose and the pit was later closed. To this day seepage from this site is treated before being discharged into Birch Lake, and it still exceeds some contaminate limits. Now PolyMet Mining is hoping to develop copper-nickel mining with a pit behind the Northshore Mining taconite mining pit with processing on the brownfield site of the deactivated LTV/Erie taconite mine and processing facilities. This site is not virgin territory and already has the legacy environmental impacts from times when mining operations were not required to evaluate these impacts prior to initiating operations. Today we do have a rigorous EIS review process to attempt to foresee these impacts and address ways to minimize or eliminate these impacts. I am extremely well impressed by the level of concern and the depth of the review that has been conducted by the PolyMet SDEIS process. This is exactly the type of review that is needed to rationally anticipate and mitigate the environmental impacts that could happen. One of the best aspects of this project and SDEIS review process is that it is on a brownfield site. This is an area where we must address both the potential impacts of copper-nickel mining, as well as the legacy of the taconite mining that has been in the area for 65 years. This is a unique opportunity to take all precautions and learn how to mitigate the impacts of both types of mining. After all, both copper-nickel and iron/taconite mining have impacts on the environment that need to be evaluated. I am further impressed and pleased that the MPCA through their water permits and the SDEIS process have required that PolyMet and Erie evaluate methods for the reduction of sulfates, sulfides and dissolved metals in mining impacted water discharges. I am a strong proponent of biological reduction technologies that can remove 1,000 mg/l, or more, of sulfates from mine pit waters that have high sulfate levels and convert it into pyrite before being discharge downstream. This technology uses nature's normal processes to address the problem of sulfates and their potential transformation to hydrogen sulfide, which is topic to wild rice and humans alike. We are currently conducting field tests that have demonstrated that this can be done on the industrial scale needed to handle the industrial scale problem we have from the legacy of high sulfat

Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. The moose habitat is being destroyed by climate change, this has nothing to do with Polymet, it has more to do with the interruption of natural fire cycles and the resulting parasite populations. It seems that there is a population who will make any stretch to try to blame the destruction of the planet on a mining project. The reality is far more complex, but mining a few acres of Minnesota, or even a few tens of thousands of acres of Minnesota is not going to do nearly as much damage as human presence in the form of hunting, fishing, camping, sightseeing, travel, commercial transport, and the like. As a result unless we are willing to completely let the entirety of Northern Minnesota go feral by moving every person out and never allowing anyone back in the moose are going to go through their natural cycles regardless of what Polymet does. Sincerely, Mr Jeff Harrison 7801 E Superior St Duluth, MN 55804-3109

Jeff Heikkinen

38105

The risk reward just isn't worth it for the Polymet proposal. A few hundred jobs and 20 years of work compared to 500 years of possible ecological impact doesn't make sense Thanks Jeff Heikkinen

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr jeff hopkins 69 Amber Ct Lindenhurst, IL 60046-7912

Jeff Iisakka

18333

Good evening. My name is Jeff Iisakka. And I live in Esko, Minnesota. I'm a shy Finish kid. I grew up in Virginia, Minnesota. And as you know Virginia is surrounded by open-pit mines. In fact, in my backyard on Fifth Avenue North in Virginia was the Oliver Iron Mining Company. We had a very good quality of life in Virginia back 30 some years ago. And I'm sure that 50 to 75 years ago the environmental regulations were very minimal if none; and our quality of life was very good. I'm very confident that with today's high technology, strict environmental regulations that the PolyMet mining facility will be highly successful and we'll be enjoying the fruits of their labor for many years. Thank you.

Jeff Kopp

18137

My name is Jeff Kopp. It's spelled J-E-F-F, K-O-P-P. And I grew up in Aurora, Minnesota. And I now reside in Saint Michael, Minnesota. There was this young boy who lived across the street from this beautiful A-frame Lutheran church that was perched up on this hill. Just below this hill was this beautiful park that had two outdoor hockey rinks in it. He used to wear his skates to ski down that hill to that hockey rink. His mom used to ring the dinner bell and he would hear it and he would race way up this hill as fast as he could to see how far he could get up that hill for dinner time. After prayers and dinner, he would skate back down that hill and play hockey until they turned the lights out. All this happened because my mother was a schoolteacher from Gilbert, Minnesota; and my father was a miner from Erie Mining Company. Yes, the same place and the same buildings that PolyMet is going to bring back to life. Let's get to PolyMet and breakdown who they hire. Two companies come to mind. Barr Engineering, who has won world accolades for their engineering abilities; and GE and their reverse osmosis systems. And let's not forget Mr. Jon Cherry, whose 25 years in the mining industry, who has a bachelor of science degree in environmental engineering. This is a miner that has a bachelor degree in environmental engineering. This 2,160 page SDEIS is a summation of thousands of engineered documents created -- to create the most expensive and comprehensive mine plan yet on this planet that I know of. The iron mining industry paid billions and billions of dollars of taxes to the school systems and the universities to educate our youth. The copper, nickel, PGMs that are on the brink of being mined and allows the chance to continue the billions of dollars the state so needs. I know PolyMet, Minnesotans, and the DNR are going to set world-class standards with this mine plan. I would like to thank all the miners in this room. And especially those that I've known have given their lives for me to be free to be standing right here. I know where I can buy copper, gold, nickle, platinum plating, cobalt. Saved a guy's life back here, that cobalt. If it's not grown, it's mined. But no one can tell me where I can buy sulfide. Whoever created this phrase "sulfide mining," you need to go back and get a new education. I know you're in this room somewhere. Because it didn't work. There is no definition in Webster's Dictionary for "sulfide mining." This is hard work mining. Leave the mining to the miners and allow the children of the Iron Range to have the opportunity to skate both ways to that hockey rink.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the economic gain, and environmentally friendly procedures, mining in Minnesota should stay. There is huge demand in the world for mining, and if we don't do it here, it will be done elsewhere, like China. China doesn't care about the environment like we do. So let us keep those good paying jobs here in Minnesota. There have been plenty of health impact study's done on the poor, and their not as healthy when compared to the wealthy. Wealth is the only thing we can invest in the technology that make these procedures more environmentally friendly. Sincerely, Mr Jeff Lentsch 42085 County 14 Blvd Kenyon, MN 55946-3209 (651) 494-2132

Dear Minnesota Department of Natural Resource: The discussion regarding the proposed Polymet mine has resulted in a great deal of rhetoric. Quantifying the comments is difficult. Some things we know: The world needs copper. Copper mining would result in many jobs in NE Minnesota. If the Polymet mine is permitted, many more mines will likely follow in NE Minnesota. Polymet says that they can mine copper safely. Copper deposits and mines exist in parts of the world where conditions are so arid that water supplies are not placed at risk. Sulfide mining is inherently toxic to aquatic ecosystems and has never been done without causing environmental damage. Environmental damage poses risk to the tourism business in northeastern Minnesota. Copper mining would have a negative impact on real estate values in NE Minnesota. The SDEIS indicates that it may take as long as 500 years to completely treat the water that would be polluted by Polymet in the normal course of operating their proposed mine for twenty years. The SDEIS is based on the assumption that nothing goes wrong. No accidents occur. No strange weather events cause any damage. No pumps fail. No liners leak. The water treatment system works perfectly every day for 520 years. NE Minnesota has abundant fresh water. Parts of the US are experiencing water shortages. White Bear Lake water levels are extremely low because of excessive use of the Prairie du Chien-Jordan aquifer. It is important to protect our abundant supply of fresh water. If this were just about economic benefits, it would be difficult to argue against permitting Polymet's proposed mine. The fact that this process has never been done safely along with the need to treat the polluted water for 500 years, should make any thoughtful person skeptical. The fact that the SDEIS assumes that nothing will go wrong is not defensible. The risk to the abundant water in the area makes this project a poor choice for our State. Sincerely, J.Jeffrey Mogush 1230 West Minnehaha Parkway Minneapolis, MN 55419-1163

Jeff Pearson

45063

This is a terrible, terrible idea. How can you PLAN to pollute a pristine area like this with 500 years of pollution. What company will be around in 500 years. Our children will hopefully be alive to live with a horrible decision, should this be approved. Turn it down. Don't do this to the BWCA and Minnesota and the people of Minnesota. You know it is wrong

Jeff Peterson

39462

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Jeff Peterson PO Box 177 Marine ON Saint Croix, MN 55047-0177 (651) 433-2653

DNR, I am against this mining project because waste water (acidic) must be treated on a continuous basis as rain water and ground water make contact with sulfur containing waste rock. I did attend the Saint Cloud Polymet sponsored meeting where no mention was even made about sulfur containing rock and how it would be handled.. Until I asked, and then they stated that the sulfur containing waste rock would eventually be placed into the depleted mine site and then allowed to naturally fill with water- Polymet's stated the reason being, "sulfur containing waste rock surrounded by water isn't exposed to oxygen so won't produce sulfuric acid contaminated water".. So therefore very little water treatment is required after mine closure.. First of all I don't think that simple premise holds true in the natural environment. I think it's possible for algae, plants and bacteria to produce oxygen underwater as a result of natural metabolism especially if exposed to sunlight. Second if this premise isn't true and the waste water from the mine will require continuous treatment as it flows away from the mine site-how can a company and the DNR be certain waste water won't find hidden cracks and fissures at the mine site and percolate to unexpected areas contaminating lakes or groundwater in unforeseen locations, making water treatment very difficult. Also, during the mining process and after how would they handle water treatment if for example they had another very intense prolonged rain event with record setting amounts of rain in short period of time like what occurred last summer.. Lastly, I want to mention that not all mining results in an economic boost for the surrounding communities. I had recently driven through the town of Miami in Arizona and counted over 7 different mines operating in the surrounding hills and this town looked like a ghost town most of the businesses were boarded up and the streets and parks were in extreme need of repairs. It was a very empty looking, depressing town to drive through and just goes to show most economic benefits occur mainly in the early stages of mine construction- not as much during mine operation.. I am afraid if this type of mining is allowed here, it will open the door for the next mine planned just south of Ely Minnesota - even bigger mistake.. Thank you.

Jeff Scharlau

46027

Nothing that comes out of that mine is as important as fresh water and the unspoiled beauty of the Superior National Forest. Cancel plans for the mine. Jeff Scharlau 2629 W. 43rd St #309 Minneapolis, MN 55410

Jeff Schuller

Jeff Soderstrom

45165

My name is Jeff Soderstrom 2055 Salem Court Orono, MN 55356 Thank you for accepting my comments on the Polymet NorthMet EIS. Copper mining involves a much greater environmental threat than iron mining. I am a grateful supporter of the legacy of mostly successful iron mining in Minnesota. However, the proposed mining is an entirely different ballgame and the EIS does not sufficiently address many serious concerns. Perhaps foremost among concerns, while the EIS makes clear that treatment of contaminated water will be perpetual (arbitrarily defined as 200 or 500 years), no decrease in contamination is seen in the graphs projected through these very long time periods. Given this long and indefinite time period, the EIS should state how the treatment mechanisms will be maintained for hundreds of years. It does not state how long geomembrane covers and liners will last, how they will be replaced and what replacement will coSt It doesn't state how long the equipment doing the treatment is projected to last and how it will be replaced when it fails. It doesn't state how Polymet will maintain the physical plant after operations. In general, it doesn't provide adequate information for the public, voters and regulating agencies to evaluate whether Polymet will be able to treat contaminated water as projected. Given that Polymet has clearly stated in public disclosures (including 2013 Annual Report) that is has no experience with mining or treating contaminated water, the EIS should be required to inform the public in more detail how they will maintain water treatment for 500 or more years. Additionally, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. Mitigation plans for these seepages must be accounted for. On the point of Polymet having no mining experience, no present financial capacity to develop and maintain a copper mine and because it is clear to any business person that control of their decisions and ultimate operations would fall to the established mining entities that would ultimately fund the operations, why is Minnesota not requiring the controlling company or companies from making the commitments required of such a massive mining operation. I fully understand why Glencore and other mining giants set up their quasi-affiliates as they do, but I don't believe that should prevent the DNR from requiring clear accountabilities from named funding entities. It is irresponsible to do otherwise. Glencore will be among the primary beneficiaries of permits granted and as such should be the applicant and be subject to legal recourse by the state of MN for any failures to comply with the permits or other violations of law. As an executive of a fortune 300 firm in Minnesota, I would not consent to do business with a shell firm such as Polymet given the significant potential liability of operations and potential damage to the economic and intrinsic value of the region. I accept and understand that not all potential consequences can or should be anticipated. Some problems cannot be anticipated and must be left to address when they arise. However, in these circumstances with technology and processes largely untested on this scale, considerably more contingency planning is warranted. For an entity with no mining experience, asking for the immense responsibility of protecting the water rich environment they seek to mine requires greater and more confident planning and demonstrated ability to address inevitable, unexpected breaches in the mitigation mechanisms outlined in the EIS. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, fai

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Remember Reserve Mining. They dumped millions of tons (literally) of iron tailings into Lake Superior. When called out on it, they arrogantly made it clear they will dump whatever they want into the lake. It wasn't until a college professor noticed that that tailings look like asbestos fibers that action was taken. It was the EPA that sued Reserve and stopped the dumping. Remember the EPA. They used to protect the environment. In West Virginia and Kentucky mining companies are blowing up mountains to extract coal. They have blown up 500 mountains so far. They extract the valuable resource and ship it to India, and the residents of West Virginia are left with a pile of toxic rubble, as well as high rates of cancer and birth defects. Last weekend the state of Oklahoma experienced 103 earthquakes as a result of fracking. We are stupid if we believe the "science" and promises of mining companies. We've managed to keep the Arrowhead pristine up till now. Why even take a chance of destroying it. If you want to create jobs, start extracting valuable materials from our waste stream. People throw old appliances into the trash, and they go into a landfill. To make their new appliances, we go mine more copper, iron, nickel, chrome, etc This is clearly unsustainable, expensive, and ruinous to our environment. Time to do things differently. Best regards, -Jeff Wilson resident of Minnesota and regular visitor to the Arrowhead Jeff Wilson 3145 Harbor Lane N Apt 1313 Plymouth, MN 55447

Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage COME ON. you can't see the issue. I own land 20 miles East of the mine. I bought this land to wipe my carbon foot print. How can you allow the this project to go forwaRd This will be the biggest screw up in MN history and your names will be part of it. If the two paragraphs below don't show proof enough then what will. read it again and stop looking through bought glasses, see it for what its worth to are kids and their kids. COME ON. Minnesota history. PolyMet would dig up nearly 1,000 acres of high value peat bogs, part of the 100 Mile Swamp, a critical habitat for many plants and animals. This wetland is designated an Area of High Biodiversity Significance by the Minnesota Biological Survey. In addition, over 6,000 acres of wetlands could be damaged or destroyed by PolyMet changing the water flow. When you dig a deep hole in the ground, it fills with water. That water would come from surrounding wetlands, and could dry out and destroy them. PolyMet is required to replace lost wetlands, but they understate the area of wetlands they would affect, they fail to replace the unique habitat offered by peat bogs, and they propose replacements that are far from the mine site. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Jeffery Kane 2136 Ford Pkwy # 187 Saint Paul, MN 55116-1863 (651) 307-4805

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental No cumulative effects analysis of reasonable foreseeable mining, including uranium mining near Lake Superior. Wisconsin's new mining law is inconsistent with federal law. Wisconsin is about to approve mining activities that will violate federal law. Michigan has already permitted hard rock mining in a manner that's inconsistent with federal law. Meanwhile - EPA Region 5 has been sitting around like last year's Christmas tree making dozens of video presentations by which EPA managers and staff sing parodies that make light of oil spills and the Asian carp debacle. Videos of ballet performances, karate demonstrations, singing and dancing and other inappropriate workplace activities. Then - they placed them in the public domain on YouTube. Disgusting and just plain wrong. Sincerely, Jeffery Loman PO Box 142 Lanse, MI 49946-0142 (907) 720-8680

Dear DNR Professionals, While I am a business professional and would like to see economic growth in Minnesota, I can not support the Polymet and other copper-nickel mining projects being considered for our state and hope that you will stop these project before they ever get started. The proposed economic and employment benefits are small (if they truly exist at all) in comparison to the economic cost and the high probability of damage to the environment in the region. The state's taxpayers are likely to bear the burden of mitigating the negative environmental impact of the Polymet project for generations to come. This is an unfair burden to be placed upon our children and grandchildren and their children and grandchildren. The negative economic impact on property values and tourism could far outweigh any economic benefits. Clearly these negative impacts are not a certainty, but even a small assumed probability (and I believe they are actually quite high) when multiplied by the very large negative economic impact, should lead our shepherds of our natural resources to say no. I urge you to make it very clear that Northern Minnesota, where the land is a wonderfully dynamic, porous mix of rock and water, is not a place where this type of project should be developed. Thank you for the due diligence that is being exercised and the opportunity for the public to make itself heard Jeffrey Brown jdbrown1@gmail-com

Jeffrey Bryan

14491

Dear Sirs, I am writing regarding the mining proposed by Polymet in northern Minnesota. I do not think that this can be done without contaminating and changing the ecosystems surrounding the mining operation. The attempt to contain and treat the waste rock during and after the mining operations for several hundred years after is ludicrous. There will be plenty of problems that will cause heavy metals and other wastes sulfides/sulfuric acid etc to get into either surface or underground sources of water. I think the damage will be substantial and impossible to mitigate. Flooding such as happened to Duluth recently or seismic activity could easily cause the containment to fail. The superfund that cleans up hazardous waste sites have plenty of mining sites that it is working with and this could be a future site. The money that the mining company puts up for clean up would quickly be expended. The brief economic gain for the area is far outweighed by the cost of clean up and the time that this site will have to be cared for into the future. I am against the proposal and want you to reject the applications on these grounds. Sincerely, Jeffrey W. Bryan

Attn: Lisa Fay, EIS Project Manager The Draft Supplemental Environmental Impact Statement (SDEIS) for the NorthMet mining project addresses a variety of potential environmental hazards presented by this project from the perspective of current scientific understanding of climatological factors that have bearing on estimations of risk. One such climatological factor of particular relevance to risk modeling for this project is precipitation, particularly storm water runoff. This specific issue is the topic of my comments and concerns. The water quality implications of this project are, appropriately, an important focus of the SDEIS and mitigation efforts on the part of the proponents of the project. The potential adverse effects on water quality are clearly recognized; acidification and heavy metal contamination are particularly important in this regard. The estimations of risk and P90 thresholds related to storm water runoff presumably have been calculated on the basis of climatological factors as we understand them today. However, the modeling (MODFLOW, XP-SWMM, GoldSim) used to predict the hydrologic and water quality effects of the mining for the next 200 – 500 years cannot, with an acceptable degree of accuracy, incorporate the effects of climate change on precipitation in the arrowhead region of northern Minnesota. The data to do this are not available at present nor will they be in the foreseeable future. Substantially increased amounts of annual precipitation in this geographic region in the decades/centuries ahead have a significant but unquantifiable potential to overwhelm the water containment and water treatment methods described in the SDEIS. Thus the statement that the "water quality model predicts that the NorthMet Project Proposed Action would not cause or increase the magnitude of an exceedance of the groundwater and surface water evaluation criteria at the P90 level " [ES-35] is inaccurate and untenable. Because the proponents of the project accept and plan for risks to water quality and the need for mitigation for 200-500 years they have placed this unattainable burden of proof on themselves. One needs only to look at recent history to develop an appreciation of the hazards of storm water runoff from the proposed mining project and the potential for widespread and long-lasting effects on water quality in the region. The deluge in the Duluth area of June 19/20, 2012, was unprecedented and exceeded the capacities of both natural and man-made systems for managing it. A storm water runoff event of similar or greater magnitude at the mine site creates an unacceptable risk of environmental contamination in a large surrounding area. Climate change appears all but inevitable, and with it significant alterations in patterns of precipitation, including the distinct possibility of increased frequency and intensity of storms. In this context, the NorthMet Project, which necessitates mitigation efforts for centuries to come, presents a risk of water quality degradation that is too high for the project to meet applicable environmental protection standards.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I am a resident of Finland Minnesota and am highly concerned about the ramrodded mining venture that the State and the mining industry is trying to blow past the scrutiny of Minnesota citizens. I perform NEPA reviews for FEMA and fully understand the kind of detail that goes into an EIS. What you are attempting to pull off, under this limited public response period, intentionally targeted over the busiest holiday period of the year, with this exceptionally lengthy document, is in my opinion despicable and possibly bordering on illegal. The time period afforded the mining industry to respond to their first initial dismal failure of the first EIS has been a number of years now. They have had a lot of time to examine the errors of their ways. Now that they have had several years to improve their argument, can not the opposition have similar latitude. I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, jeffrey dickson p.o

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jeffrey Domingues Northfield, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: The investment in Minnesota and the small 10-year projection of jobs/mining is insufficient compared to the unknown costs to the environment. What other industry would create such short term employment opportunity when a better fit would be creating perhaps 300 jobs for 60 years. Planning for the short term needs to be discarded in favor of a sustainable long term approach. If the mining were to exhausted the deposits after ten years, where would the city of Ely look like with another shut down industry. A bad fit and short sighted in my estimation. Sincerely, Jeffrey Grosscup Minneapolis,, Minnesota Jeffrey Grosscup 4801 Portland Ave S Minneapolis, MN 55417

Jeffrey Hanson

18219

Hello. My name is Jeffrey Hanson. I think everybody can spell Hanson and Jeffrey. I am from Babbitt. I grew up there. I moved there when my father was hired as the industrial arts teacher, built a high school there. We lived in town for a couple of years, and then we cleared the woods on the edge of Birch Lake and built a house. I grew up looking out my bedroom window over Birch Lake. Not specifically related to the PolyMet project, but copper-nickel, Birch Lake is ground zero. The deposits are under my lake. They're by the shores of my lake, and I have been passionately concerned about that since they first discovered copper-nickel back in 1964. Ever since then, I've known sometime they're going to mine around my lake. I moved there because of mining. I live there because of mining. I know it's important. But we cannot exchange the environment for mining. It's not an either/or. It's how can we do it right. Reserve mining was built there before we had EIS statements. They had problems. They were shut down. They corrected the problems, and they opened again. The Dunka Pit of Erie Mining you can see from Birch Lake. It has drained acid into the lake and they've worked on cleaning it up. I have dedicated about the last six years of my life to saying what can we do to mine safer. I've been working on sulfide-reduction projects to clean up taconite mining in bear waters. PolyMet is on an old taconite mine site. They are helping support even my project to clean up taconite mining-impaired waters and yes, it can be done. I'm proud we're in a state, we're in a country where we go through this process of an EIS to try our level best to analyze the problems and do what can be done about it. I support the PolyMet project because they are seriously looking at those things. They are helping me research sulfide-reduction projects and how to minimize the impacts in the future through passive biological treatment. We can't do that if we don't have the industry supporting us. We have a lot at stake. There are many other projects that have happened in the taconite industry that we need to clean up, and we have to do the future of copper-nickel mining right, and I believe we can and we're really working seriously on it, and passionately. Nobody is a stronger environmentalist than I am and my lake in Babbitt.

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Since childhood I have spent summers and winters in the Ely area as one of hundreds of thousands of annual visitors who pour millions of dollars into the area's outdoor tourism economy-clearly among the most dominant sectors of the regional economy. I continue to fish today with my father in the White Iron Lake system, which would be directly impacted by any pollution from the proposed Franconia Mine. It literally breaks my heart to realize that if this project is approved, it is likely that I will not be able to teach my son to fish in these same beautiful lakes, because as we know, past sulfide mining elsewhere has resulted in acid mine drainage causing extensive and expensive damage to water quality and the environment. Given the rarity of protected forest and lake country in America, and the undeniable preciousness of Minnesota's Superior National Forest and the nearby BWCA, I cannot understand why we would risk potentially catastrophic pollution in exchange for the short-term profits that could be earned from exploiting these lands for their limited mineral resources. I am strongly against this project, and I fear greatly that it will be approved in the end. I ask that every revision possible be made to this project to limit as much as possible the environmental damage I believe to be unavoidable, and attain every possible assurance that Polynet will pay for the cleanup necessary, and for the economic losses the region's outdoor tourism industry will suffer. Thank you for the opportunity to provide input on the PolyMet SDEIS. Sincerely, Jeffrey Iverson 2172 Stanford Avenue Saint Paul, MN 55105 Sincerely, Mr Jeffrey Iverson 2172 Stanford Ave Saint Paul, MN 55105-1221

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Jeffrey Kolnick

40018

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. It's not worth it. The answer is conservation and investment in a sustainable economy. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Jeffrey Kolnick 568 State St Apt B Saint Paul, MN 55107-3094 (651) 308-7241

Just a comment after looking over the EIS. I feel this is an extremely thorough document. No stone was left unturned. The amount of time, money, and effort put into this is incredible. I firmly support the project and believe that it can, and will, be done in the safest way to the surrounding lands, air, and water. As a life-long Iron Ranger and an employee in the mining industry my whole career, I see the importance of making sure things are done right (and I've seen the consequences when they are not done right). The 10+ years of study on this proposed project has given me the undoubted comfort of knowing that the Polymet project is safe. I would never voice my support if I thought otherwise, as I fish, hunt, and enjoy the beautiful areas around this project site year round. So let's finally move forward and issue the permits. What an exciting time for our area and our communities.. Jeffrey L. Cerar 7674 Woodlawn Drive Eveleth, MN 55734 218-744-1840

Mar 12, 2014 Ms Lisa Fay MN Dear Ms Fay, I am writing to urge you to reject PolyMet's proposal to build a sulfide mine in northeastern Minnesota. As a resident of Duluth, I do not look forward to having our watershed contaminated mine run-off. The history of these mines is problematic, as they often leave behind a legacy of pollution once the mine is closed down. This is not to say that at some point, with better and cleaner technology, the metals could not be pulled out of those veins without the risk we face now with current technology. The metals will be there for the taking, and there is no rush to bring them to market at this time. Many of us who live in the Arrowhead region choose to do so because of the pristine ecosystems and natural beauty. The PolyMet mine proposal threatens to upset what ecological balance we have remaining here in the north part of the state. Clearly, more jobs are needed in the region. But extractive industries do not make for long-term economic health in small communities, which has been shown over and over again in case studies. Please do not allow construction of this mine. Sincerely, Dr Jeffrey Lyon 1125 W Victoria St Duluth, MN 55811-1694 (218) 249-0887

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Jeffrey Masco 2720 40 Ave S. 2720 40th Ave S. Minneapolis, MN 55406

Jeffrey R Jukich

To whom it may concern, I want to voice my support for this project. I have faith in all the agencies involved to ensure the environment is protected. I live on Bass lake(57-16) in the St Louis river watershed so water quality is of utmost importance to me. I am also a former LTV steelworker who understands the concepts of open pit mining. I think this is an appropriate use of this land and I believe the economic impact is greatly needed in this area of St Louis County. Sincerely, Jeff Jukich 4621 Bass Lake Road Gilbert, MN 55741

Jen Olson

44615

To Whom It May Concern, I am writing to express my strong opposition to the proposed mining activity in Northern Minnesota's pristine National Forests. As you know, sulfide mining produces incredibly toxic and dangerous byproducts which have the potential to contaminate our public trust resources. The EPA classifies hardrock mining as one of the nation's top polluters, and sulfide mining in particular has a terrible track record. The EPA called Polymet's environmental review "inadequate and unacceptable" in 2010- If Polymet can't prepare adequate environmental documents, how will they treat our public lands. The Boundary Waters Canoe Area Wilderness is the crown jewel of Minnesota-there are few other places like it anywhere in the world. I lived in Minnesota for the first 25 years of my life-I grew up and went to college in Duluth, just a few hours south of the proposed mining locations. My mom and I camped and hunted for ruffed grouse in some of the forests where Polymet is proposing to mine. All of my family still lives in MN, and it's heartbreaking to think that areas which continue to provide so much recreation, enjoyment, and food and clean water for my family and other Minnesotans could be irreparably damaged by an industry that knows and cares little about the area it may destroy. Please preserve these places in the name of wilderness, public health, and the environment. Thank you for your time and consideration. Sincerely, Jennifer Olson Current address: 2699 Pleasant Avenue Eureka CA 95503 Phone: 707-502-2372

I believe the mine is not beneficial to us in the long run. While the increase in resources will help the economy in the short run, the value I place on the environment is much [ILLEGIBLE] Please consider the children in your business endeavor.

Jen Y 6

This copper mine sounds like a terrible idea. Minnesota has too many times been taken advantage of by corporations that don't live up to their word (delta comes to mind) I would not trust a company to say they would do this maintenance (or pay for it) for the duration. Please do not allow this to start happening. It's bad for the environment and bad for Minnesota. The few jobs are not worth the environmental impact. Thank you. Jennifer kingsbury- yungers Sent from my iPad

Jena Ketchum 39090

---Original Message--- From: marcusandjena@gmail-com [mailto:marcusandjena@gmail-com] Sent: Monday, March 10, 2014 6:04 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Jena Ketchum 6740 97th St NE Monticello, MN 55362-2914

Jenn Pontinen 6069

Hello Ms Fay and the EIS Project Team, Attached is my letter regarding the PolyMet project. Thank you. Jennifer Pontinen

Jenn Young 54902

The earth doesn't belong to 360 people who could potentially benefit from jobs with PolyMet. It belongs to us all! What is being done by this mining will have ramifications, maybe not for our Earth now but the Earth of our descendants decades & centuries from now everywhere! Pollution doesn't care where it goes & what it destroys.

Jenna Grove. I am the grassroots project manager at Clean Water Action and I am here to voice my concern about allowing PolyMet to open the copper-nickel mine here in Minnesota. I am worried that on top of the negative environmental impact, the impact on the economy and the potential burden to taxpayers, that if approved, there will be an opening of the floodgates for more sulfide mining across northern Minnesota. We know that sulfide mining has a significant impact on our environment and with such a water intensive area, that waste rock, when it is exposed to air and water, yields that sulfuric acid, which will produce that harmful pollution. And according to PolyMet's own reports, this pollution will last a minimum of 200 years at the mine site and 500 at the plant site. And it just really doesn't seem responsible, especially with only 20 years of mining. And I do understand the appeal of the creation of new jobs and economic stimulation. And in a perfect world, there would be no environmental degradation and PolyMet would offer all of its employment opportunities to members of local communities and the resources that they planned to mine would be endless, but that is obviously not realistic and we know what implications this will have on our environment. The mining companies will typically import employees from elsewhere and only half of those jobs will go to members of local communities. The metals that will be extracted are most likely going to be exported, putting profits in shareholders' pockets rather than in the pockets of Minnesotans. The resources are not limitless and eventually will become depleted, and ultimately these mining companies will pack up, absolve themselves of their responsibility left behind and move on to the next profitable opportunity, leaving our once pristine environment both polluted and destructed for the next few hundred years. Those jobs will be lost and remind us of the dramatic collapse of the 1980s and could possibly become vulnerable to the boom and bust cycle of mining again. In a report prepared by Thomas Michael Power of the economics department at the University of Montana, it states that, "Environmental quality is not just a matter of prettiness or aesthetic preference, it is an essential part of any region's economic base and potential for economic vitality. He also adds that the question here is whether the public benefits and costs justify approving the proposal. When total costs exceed the benefits, economic rationality would call for the mining project to be rejected. That's all.

Feb 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Jennie Manar 13001 Pennock Ave Trlr 95 Apple Valley, MN 55124-8598

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jennifer Adams 1200 27th Ave NE Minneapolis, MN 55418

To Whom it May Concern, First off, thank you for taking the time to read my comment. I'm sure the average demographic responses the DNR is receiving is from middle-aged people with strong personal ties to the BWCA. I am a 23 year old woman and want to say what happens and doesn't happen in northern Minnesota in the coming years matters to my generation too. A few summers ago, I worked up north in Ely a resort where I was first exposed to the idea of mining for precious metal. The resort I worked at was on the Kawishiwi River, near the BWCA. That same summer, there was some exploratory mining going on around the Kawishiwi and Birch Lake. We could hear that mining that was happening 3/4 of a mile or more away. Talk about ruining the aesthetic appeal of the Northwoods. As I learned more about Polymet's plans to mine in the area, I became more and more concerned. The waters in that area are all connected. I think it's a huge gamble to take mining in such an environment where a mistake is not only colossal and can potentially harm waters that go into Lake Superior and also into Canada, but any mistake would also be very expensive. In the event that the water becomes contaminated, I highly doubt Polymet is going to see the treatment of the water through for the next 500 years. Inevitably, the burden will fall on the tax payers or possibly even go without being treated. That risk alone, I think should caution people when they consider mining in northern Minnesota. 500 years of water treatment, potentially ruined the lynx and moose habitat, and wild rice patties – is this worth 15 or 20 years of jobs. I'm not convinced. I might be more inclined to the idea of mining in such a sensitive area if Polymet instead considered underground mining, but it sounds like the plan is to use open pit mining, in which case run-off water is harmful to the environment, yet guaranteed. Given what is at stake, I find mining for precious metals dangerous to the environment, to the aesthetic appeal of the BWCA, and to our tax payers. Instead of looking at the big picture: what are we going to leave behind on this earth for our children, mining in the area is a way to make money and a short-term solution. I am lucky enough to have experienced the BWCA myself and readily enjoy a good hiking and fishing trip in the Northwoods. My experiences have taught me an important lesson that most people would benefit from, and that is to walk more gently upon our earth. Dear DNR: My family has enjoyed wilderness camping in the BWCA Wilderness Area nearly every year for over 30 years. The area is one of the treasures of the State of Minnesota and the nation. The pristine waters are essential to the appeal of the area for the vital tourist industry that supports visitors like me. The long-term risk to water quality from the proposed PolyMet mining is enormous and the potential benefit is very small. The few mining-related jobs that would go to Minnesotans would be quickly offset by the devastation in the tourist industry that would result from long-term contamination of the watershed. Only small errors in the water-flow models could lead to the destruction of the wilderness. The potential gain is small and the risk is enormous. Residents in West Virginia know, all too well, that contaminated drinking water destroys jobs and basic livability of a community. Minnesota is better than that. Please do not approve this or other mines in or near the wilderness area or watersheds. Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Jennifer Lasch 11213 President Dr NE Blaine, MN 55434-1774

Jennifer Lund 14922

Good morning. The PolyMet project, NorthMet, will create a positive addition to the area and the state of Minnesota as a whole. The estimated \$10 billion in estimated impact over the twenty years of the project (study by UMD) will help the region to flourish. This growth and sustainability will help families create a stable base for a successful and happy life in our state. When it comes to mining, the concern always comes up about the environmental effects of the project. However, PolyMet has openly addressed and alleviated my concerns. With the federal regulations being strictly regulated and the increase in the technology behind the mining process, preserving the environment appears to be top of mind. Keeping the outdoors as beautiful as they are now is extremely important, and I feel that Poly Met Mining, a Minnesota Corporation, understands that as well. With all of the precautions being taken and the jobs that will be created by the project, we cannot afford to say no. PolyMet has my full support. Thank you for your time. Jenny Lund Payroll Administrator Industrial Lubricant Company P.O. Box 70 Grand Rapids, MN 55744 (218) 328-0263 tel | (218) 328-0259 fax

Jennifer Lynch 57222

The resources we have in NE Minnesota are far too valuable to risk with introducing sulfide mining. The “technology” to prevent polluting our waters are not new and have not proven to be safe. We have the largest source of fresh water in our hands to protect for our children and grandchildren – please do not risk contaminating it. Jennifer Lynch 2650 NE McKinley St Minneapolis, MN 55418

Good Afternoon, This area desperately needs the jobs that PolyMet can provide, and all the research and preparation has shown this operation will be a responsible and profitable venture for everyone involved. Please support the people of the Iron Range and allow PolyMet to begin mining. Thank you, Jennifer Osufsen Aurora, MN

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, jennifer p 640 st paul, MN 55101

Dec 31, 2013 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

To whom it may concern, As the mother of two young children, I care deeply about environmental issues. I am dedicated to protecting and preserving our environment for my sons and all Minnesotans. There is no substitute for clean water. As an economist, the issue of pollution has special resonance as well. Pollution is a way that businesses and others pass part of the cost of operation off to other people, especially current and future taxpayers. For the public to make an informed decision and to protect our environment many things need to happen. There are more than twenty sites in the Duluth Complex that are designated as potential mining operations. Any review of the environmental impact of mining should require assessment of the impact of all of the projects together, not piecemeal analysis of one project at a time. No project should start before this analysis is performed. There should be no change to our allowable limits for water quality. These limits are the result of unbiased application of the best scientific information. To allow them to be significantly altered - by as much as 28 times more allowable pollution - in response to political and financial pressure is not acceptable. It is my understanding that the techniques planned for water purification are incapable of reaching required water standards today, much less complying to those standards for hundreds of years in the future. The project should be stopped if it cannot meet our existing, scientifically established, standards. Allowing our regulatory agencies to issue variances to pollute is not acceptable. In addition to the water quality issues being addressed, rational assessment requires evaluation of pollution by many other potential contaminants that are being ignored. This includes not only mercury, arsenic, and other chemical pollutants, but also both air and water pollution with small mineral fibers. These have been shown to cause cancers. We should not be threatening our lives and our children's and grandchildren's lives for short-term gains. Financial guarantees should require indemnification not just for the estimated minimum \$450 million cost for closing the project, but for potential costs of chronic or catastrophic failures of safety systems. The legislature should pass laws to ensure this, requiring bonding guarantees in the billions of dollars. Mining companies should be held responsible or not be allowed to operate. These costs should not fall on taxpayers, as they have so often elsewhere. Good quality on-going monitoring and assessment of environmental impact and pollution will be critical from day one until hundreds of years in the future, in order to assure public safety. To provide for this, we will need to hire many trained technicians and invest in scientific instruments to perform continuous monitoring on an independent basis. Funds to pay for this should come from taxes on the mining operations themselves, and should not be passed off to general taxpayers. These new taxes should be passed by the legislature to pay for independent monitoring now and for centuries to come. Finally, any intelligent approach to developing extensive new mining should include a comprehensive, unbiased economic cost-benefit analysis. Benefits of new jobs created and new taxes generated must be weighed against the costs of pollution and costs to existing businesses and residents, including the impact on the recreation and tourism industry. Increased costs of public infrastructure, of monitoring and of possible abatement of environmental impact must be included in these calculations. Unless this type of analysis is made before starting operations, we have no way of knowing if this project is a benefit or a detriment to society's welfare. Development should stop until this analysis is complete. Potential guarantees based on supposed adequate performance in mining operations elsewhere are not sufficient. The history of industrial catastrophes

Jennifer Seeger

41916

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jennifer Seeger Minneapolis, Minnesota

Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jennifer Stokes Saint Paul, Minnesota

Jennifer Tudor 40044

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Jennifer Tudor 3960 Jackson St NE Columbia Heights, MN 55421-3943 (612) 267-2612

Please stop destroying our beautiful planet Sent from my iPad

Jenny Kedward 58115

I understand and appreciate the work put into the SDEIS. Based on the EIS, I cannot support a mining operation that would leave the state or federal government liable for actions of one business. Water quality is evolving constantly. This EIS does not address new concerns or proposed limits of water treatment. And even with the best WWTPs, pollution is still possible. Lead pollution is stated as inevitability with this plan. We know for certain the health and environmental risks associated with lead and mercury. China is the main consumer of copper – more that all other countries put together. I do not feel we need to destroy our land, air, and water to feed Asian growth. We have also not exhausted our recycling efforts for copper. As a recycling educator, I see firsthand what precious metals we send to the landfill.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Jenny McDermott 4055 Meadowbrook Ln Saint Louis Park, MN 55426-4608 (952) 935-7509

Jenny Putnam

39101

DNR I urge you not to accept the SEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan
Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model
In conclusion it is my opinion that the few hundred jobs and monetary gain for a corpor

DNR I urge you not to accept the SEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan
Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model
In conclusion it is my opinion that the few hundred jobs and monetary gain for a corporati

I am writing to express my opposition to the proposed PolyMet sulfide mining project in Minnesota, and my serious concerns with the flawed SDEIS. This project should not go forward As a 35-year Minnesotan, I consider the BWCA and Superior National Forest to be a state and national treasure, and a place that I personally enjoy and support financially several times every year. It is a place of spiritual renewal, and truly one of the best things about living in Minnesota. When I go the DNR website, I see drop-down menus for “recreation”, “destinations”, “nature”, “education/safety”, and “licenses/permits/regs.” I do not see “mining” anywhere. My hope is that the DNR will continue to protect our natural resources for the use of all Minnesota citizens, rather than allowing the environment to be destroyed for the benefit of a Canadian corporation and a few hundred jobs. I sympathize with the workers in NE Minnesota who need jobs, but I don’t think their employment in a boom-and-bust industry like mining is worth the cost to the other 5 million Minnesotans and the entire country, for generations to come. Past history shows that it is not a question of “if”, but “how bad” the environmental impact of sulfide mining will be, and in this regard, I think the SDEIS is seriously flawed in its water flow models, estimates of habitat destruction, and cost/risk models for environmental clean-up. There is no reason to believe data or performance that has not been previously demonstrated. I urge you to think of the greater good of all Minnesotans, our precious natural resources, and generations to come, and not give in to short term economic interests. My ultimate hope is that sulfide mining will never occur in northeast Minnesota, but at a minimum, I expect the DNR to demand an EIS that is accurate and comprehensive. The current SDEIS does not meet the standards I expect for Minnesota. Thank you, Ronald Jensen 9704 Oxborough Road, Bloomington, MN 55437

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Jere Wilkerson 1680 Linden Ct. Cambria, CA 93428 US

Jeremiah Boe

16739

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jeremiah Boe 529 Henry Lane Lino Lakes, MN 55014

I have many concerns regarding the Polymet mine. The key ones are: 500 year cleanup - Who is going to be maintaining this cleanup operation, especially when Polymet or Glencore are no longer in business. Flawed Water Study - The water modeling was done using water flow data from a time with historically low water levels. I feel more representative data should be used to assess the full impact. Contaminant breach - We've had several 1,000 year floods in the last few years. What happens in the event that the containment basin is overflows or is otherwise breached. Our water resources in NE Minnesota are far more valuable than the mineral resources. This proposed project is far too risky to Lake Superior and the surrounding watershed. NO to Polymet and their proposed mine. Jeremy Beck 415 University Ave NE Minneapolis, MN 55413

"You've all heard that northern Minnesota is home to one of largest copper deposits in the world. It's not. It doesn't even come close. At peak production, this mine would produce 72 million pounds per year. The largest copper mine in the United States, which doesn't even make the list of the top 10 mines in the world, is the Morenci mine in Arizona, which produces 1 billion pounds a year. People ask, can we trust PolyMet. It's not PolyMet we need to trust. It is Glencore Xstrata, the primary owner of PolyMet, which [reportedly] will buy the rest of PolyMet once all the permits are in place. So, who is Glencore Xstrata. Glencore Xstrata is a Swiss-based firm known for its ruthlessness. It is the fourth-largest mining company in the world. It controls 50 percent of the world's copper through its ownership of more than 100 mines around the world, and its commodities trading operations. Glencore Xstrata has run up a long list of labor and environmental abuses, including 58 mining fatalities between 2008 and 2010, over twice the number reported by any other mining company over that period. Just in 2012, their environmental and labor record includes dumping raw acid in waterways in the Congo, failure to provide a vapor barrier to keep an acid mist from descending on 3,000 people in Zambia, utilizing child labor as young as 10 years old in mines in Congo, and causing environmental damage at its McArthur River mine in Australia. Can we trust these people to do it right' in Minnesota. I think not." - Ron Sternal of St Louis Park, a retired Wall Street executive speaking at a public forum on the PolyMet mining project in Northern Minnesota - Jeremy Reichenberger University of Minnesota [HYPERLINK "mailto:vicke034@umn.edu"](mailto:vicke034@umn.edu) reich298@umn.edu Confidentiality Notice: This message, together with any attachments, is intended only for the use of the individual or entity to which it is addressed and may contain confidential or privileged information. Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. These are sad times we live in when corporations and government care less about the real people that have to live here and only about the bottom line. My wife and I are already researching other states to move to that value natural resources and human life and wildlife more than money. We'll be prepared to move when and if these mines are approved, it will be disheartening, but we literally and physically and mentally cannot support such disdain for the wildlife and nature of this state and country. We've seen programs where PolyMet 'claims' they're environmentally safe and have cleaned up their act. They say they'll implement cleaning acts to help with ground water contamination [a clear admission of fault in and of itself] once their new mining facilities are opened. If they really cared about the environment, why wait for mines to open, clean up the water now, show the people they care. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Jeremy Swanson PO Box 140 Mora, MN 55051-0140

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Jerome Comeau 3316 Emerson Ave S 3316 Emerson Ave S Minneapolis, MN 55408 612-825-4049

I live approximately one mile north of the Clay County, MN Landfill. This was sited in the 1970's with permission from the State. It was placed on a water recharge area with only a clay liner. The site leaked VOC's into the shallow water table. Follow-up has been to transfer waste and relining most of the original site. The liner is heavy tough plastic. The local governments and the State have learned some tough lessons. The state has been improving and regulating the site. If the local and State-Federal governments allow the Poly-Met mining project the investors and the employees will benefit. Use of this resource will be needed. The land exchange sounds to be a reasonable action. Extreme environmental groups and a few local "Not in My Back Yard Groups" can best be used to lobby for the best science to protect the area and extract the resources. The Laws must be used to make the best and safe use of the resource. I see nothing from this project but knowledge of how to use the resource with safety and provide jobs in an area where Iron has been removed in some of the area. This is an environment that has been used. Some of the Iron sites will have a use and be cleaned up in the future. Allow this project. Thank You Jerome Ekre 18059 17th Ave South Hawley, MN 56549 218-937-5504

I think this is a terrible plan. I think it will lead to pollution that no one will want to pay to clean up. Please do not allow this to proceed. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Jerritt Johnston

44701

To whom it may concern: The PolyMet SDEIS is deeply flawed and should not be accepted. There are numerous, significant problems throughout the document, but four stand out to me. 1- The models used to predict water flow are inaccurate and do not match actual rate of water flowing from the site. This means that all the amount of pollution and impact on the Partridge River and subsequent waterways are underestimated. After this many years of study, if PolyMet cannot accurately measure water flow, they are not competent enough to operate a mine in this area. 2- Minnesota state law requires that closed mines be maintenance free. Two hundred years of water treatment at one location and 500 years of treatment at the other do not meet that requirement. PolyMet fails that test Even those numbers are suspect, as the model used ends at those years because there is no longer a change in the level of pollution. It does not stop because the pollution has been eliminated. Also, no amount of financial assurance that a company will be willing to pay will cover the costs of maintaining this site in perpetuity. 3- There is not enough attention paid to cumulative effects of this project in relation with past iron and taconite mining in the area. More importantly, cumulative effects need to be addressed in relation to other copper-nickel mining projects moving forward in this region of the state. 4- As with work supporting much of this document, the socio-economic impact section is lacking. It was prepared using an IMPLAN model, which has been shown to overestimate the impact of new economic activity. Even with those biases, the document states that employment will only be increased by about one percent in the region. This is not a compelling reason to move forward with a project that will cause this much damage. As a resident of Ely, and someone who cares greatly about the economic and environmental viability of this region, I have no confidence in PolyMet's ability to safely operate a copper-nickel mine. The Superior National Forest and the woods in northeastern Minnesota are among our greatest assets. To destroy these assets to mine for possibly 20 years is failing the DNR's mission to manage our resources and is in direct conflict with the Forest Service's responsibility to manage the forest for multiple uses. Sincerely, Jerritt Johnston 737 5th Ave S Ely, MN 55731

Jerrold Gershone 41938

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Dear Ms Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Please reject the proposed mine. Future generations will thank us for our foresight in protecting this environmentally sensitive area. Thank you, Jerrold Gershone Sincerely, Mr Jerrold Gershone 13111 April Ln Minnetonka, MN 55305-2735

To whom it may concern: Please accept and consider my comments regarding the above mining SDEIS by PolyMet Inc. Although a lay person (me) is ill-prepared to technically review any document of this magnitude and formally prepare comments that are “informed, specific and relevant” to the SDEIS as prescribed by the agencies, still, I have attempted to be specific and relevant to those items I have addressed. My concern is about all the types of environmental degradation that usually always occur with large land transformations. True natural areas are becoming less and less and what often replaces them are the scars and contaminations left on the land for future generations to deal with. PURPOSE AND NEED FOR MINING - Alternative for the “need” to mine and JOBS It is stated that the purpose and need for this mining project is to meet the “rising global demand” for these products to domestic and world markets. Just how great is this “demand” at this time. It seems that there could be a possible ALTERNATIVE to mining at this time also. Before we mine our deposits here in Minnesota with an unproven method of copper sulfide mining, we should consider and make an honest attempt to recycle these same metals from the electronics that we as Americans so readily discaRd This trash waste stream is also a rich resource in and of itself and certainly provides more sustainability than does depleting the raw resources in the earth. (Personally, I think it’s more about someone being able to make \$\$\$ from a perhaps ‘easier’ method than the ‘dirty’ process of recycling.) JOBS Certainly there is a need for jobs--and there will always will be a need for jobs as the population grows, but the 300-400 permanent jobs that this mining project provides for only 20 years is a small number in the long-term scheme of things, and likewise for the spin-off jobs---a short-term fix if you can call it that. And after the mine closes, where will the next set of jobs for the area come from. It really is not worth the uncertainty and cost of possible consequences to the waters and land in that area at this time. AFFECTED ENVIRONMENT - WATER Waters are perhaps the most important and major concern of mine. Surface and groundwaters are unequivocally one of and perhaps the most important “element” of our natural commons. (Right.) Any project that poses or threatens harm and degradation to water should not be allowed to go forward until such time that it can be shown/proven that the project actually works as described in the mining process and operations description. Why would you risk Minnesota’s waters and lands. We should be at least as cautionary as Wisconsin who evidently has a prove-it-first policy or standaRd Michigan’s situation remains to be seen. The fact that evidently no where on earth has copper sulfide mining been benign to the environment should not go unheeded. So the process of reverse osmosis has not “stood the test of time” and is only part of the total operation. 1- I am concerned that this process of chemical extraction in order to separate copper and other metals from the sulfide rock material requires vast amounts of water that have the potential of polluting or contaminating surface and ground water quality. To even (having to) refer to water treatment after (only) 20 years of mining, for 200 or to 500 years after the mining has shut down is unthinkable; it is human hubris to the nth degree. NO ONE can assure any of us, the citizens of Minnesota, that treatment would be feasible into the future for hundreds of years and who can tell what the real cost would be. Citizens in places like some of Montana’s mining are paying millions annually for clean-up from mining companies who walked away after filing bankruptcy. In addition, natural calamities happen all the time; WHO can guarantee that something will not occur to

If this project is approved, Minnesota will be exposed to enormous environmental and financial risks. If we get this wrong, we risk ruining the environment in one of the most pristine areas of the state, and incurring enormous financial costs for generations to come. Should that occur, the value of the jobs and other economic benefits created by this project will pale in comparison to the damage done. Therefore, I urge each and every regulator on this project to gather your courage, remind yourself of what's at stake, and do your utmost to protect Minnesota's environment and minimize its financial exposure. You should approve this project if, AND ONLY IF, stringent environmental protections and financial assurances are firmly in place. Minnesotans now and for generations to come are depending on you (regulators) to make the right call. Set the bar high, and do not not compromise your standards or judgment in the face of pressures from Polymet, unions, or local leaders who understandably are motivated more by short term economic interests than by the long term well-being of our state. We're counting on you to get this right, and so are millions of future Minnesotans.

Jerry Fryberger

18191

My name is Connie Smallman, C-O-N-N-I-E, S-M-A-L-L-M-A-N. I've been a 25-year member of Local 49 Operating Engineers. I mostly run backhoe and that big yellow, heavy equipment. The one lady who spoke earlier was wondering if a union job was a good-paying job. I'm a single mother of two. I raise my kids all by myself with good pay, good health benefits, and I look forward to a good pension in the future. I yield the rest of my time to Jerry Fryberger. Thank you. Thank you. I am honored to be here. My name is Jerry Fryberger, F-R-Y-B-E-R-G-E-R. I'm a lifelong resident for my 76 years and counting in Duluth, Minnesota. I work for the same company, Hallett Companies, in Duluth for 50 years and counting. One of the companies we have is Hallett Dock Company in Duluth. We are in the business of handling, storing and shipping bulk commodities from our three facilities in the Duluth-Superior harbor. We ship by truck, by rail and by vessel. We ship to folks in Minnesota, Wisconsin, throughout the Great Lakes, Eastern Canada, Europe and South America. And I have, like so many of you here, have read parts of the Supplemental Environmental Impact Statement for the PolyMet project. I questioned the three co-lead agencies; namely, the US Corps of Engineers, the Department of Natural Resources, and the US Forest Service to get a better understanding. You see, I lived here for a long time. I started paddling with my family when I was nine years old in 1946, and I've been going ever since in the Boundary Waters Canoe Area and adjacent Quetico Provincial Park. And I love the clean water, I love the clean air. I like to be able to paddle and sit around the campfire and look at the constellations in clear skies, and that's an environmentalist right to the core. And I am embracing the PolyMet project in my backyard simply because of the superlative job that the H. Cody Agencies (ph) have done. They have done their due diligence. They rolled up their sleeves, rolled up their socks, and made sure that we're going to have a continuation of clean water, clean air and clean skies. I want to particularly honor and thank the leadership provided from these agencies; namely John Stein, who's Commissioner for the Minnesota Pollution Control Agency, Cam Foss, who is Commissioner -- or Director of Mining, Tom Landwehr for the Department of Natural Resources, Tamara Cameron for the US Corps of Engineers and Brenda Halter. I thank you very much.

Jerry Groeneveld 943 Wales Rd Two Harbors, MN 55616 218-834-9552 n0Mrjerry@gmail-com I'm a retired chemical engineer that worked for a major Minnesota company for 35 years. I contributed to many EIS reports for projects where I did research and development, plant design, and startup. I want this and other northern Minnesota noble metal mining projects to succeed because of the value to the area and our country. However, I must also be respectful to my many friends that oppose these projects. I've read a good deal of the report but must apologize up front if I missed sections that describe process and chemistry that I need to form an opinion. I believe these type mining operations can be run in an environmentally friendly manner but I was surprised to see what I believe to be a lot of details missing from the report. Details that I need are the entire physical and chemical process throughout the operation. Again, sorry if I missed this in the report. I read of the physical mining and crushing operation, some sketchy words on a dual flotation operation, a few words on a heat treatment and a large discussion of the disposal of waste. There is mention of RO (reverse osmosis) purification of water. I believe missing is the chemistry, material balance, energy balance and control strategy throughout the entire operation. There may be some trade secrets in parts of the operation but these can be handled in an open manner and with generic chemicals. Each part of the entire operation should have a detailed material balance of all inputs and outputs including physical and energy inputs and outputs. Process control should be included to show the process is well understood to avoid upsets. An additional value of a detailed process overview is that there might be waste streams that can be a valuable byproduct of these operations. Byproducts can be additional revenue and eliminate the possibility of these products being slowly leached into the water or vented to the air. More details can lead to increased yield of the desired minerals and even discovery of other valuable products. Details of an energy balance can show unusually large energy usages that can be reduced. Another item that could be valuable is a comparison to ferrous mining that has been done successfully for many years. How do the waste streams compare, how are they handled and what have been the problems Thank you for giving me the opportunity to comment on this report. If more process details are forthcoming I would appreciate the opportunity to read.

Dec 23, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The known - and unknown - hazards of sulfide mining demand that any permit granted for mining in Minnesota be conditioned on a posted bond sufficient to cover the costs of mitigating any and all of those hazards. Beyond that, the state must first be assured by all competent authorities that this project will not damage Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations. The state must recognize that the mining of precious metals beneath our surface may first require the development of new mining technologies. In this regard, would-be miners should be encouraged to contribute funding for research by the University of Minnesota and work with the University to develop those safe mining practices. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Jerry Kahlert 900 Robert St S Apt 110 Saint Paul, MN 55118-1484 (612) 839-0725

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Jerry Witcher 416 Rail Overlook Adairsville, GA 30103 US

Jerry Witte 7707

The current ferrous mining has old mine and current mines tailings that produce acid runoff into ground water, streams and rivers. The level of this runoff is at or beyond the level that nature can naturally clean it up. From what I read in the EIS is that the Polymet mine will also allow a degree of acid seepage into a water system that is already at or beyond its pollution max. Reverse osmosis water treatment is Polymet's solution to the bulk of there process to minimize the pollution. I propose a moratorium on the Polymet mining process until a working reverse osmosis water treatment can be installed at the worst polluting ferrous tailing pit or mine. This will prove the technology works, the cost of the technology, and the cost of the hundreds of years of filtering that will be needed. If the watershed shows improvement, then the cleaner waterways will be able to accommodate the add planned runoff of the Polymet mine. Jerry Witte Duluth MN

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Jess Walczak 1680 Westminster St Saint Paul, MN 55130-3039

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Respect the good earth, our only home while we're physically alive. Sincerely, Mr Jesse Dermody 8484 Arkola Rd Kelsey, MN 55724-8032

Jesse Peterson

18133

Hi. I'm Jesse Peterson and I'm from Duluth. I want to talk a little bit about some of the job creation that has gone on with the PolyMet mine. One of the jobs created was a wonderful job for a poor fellow who's been pining to have his life put back together ever since the BP oil spill. His name is Tony Hayward and he's got a job with Glencore, which is the lead investor in PolyMet. He doesn't have such a great record, and I'd like to just speak to Glencore a little bit. I think it's highly inappropriate to do business with a company that's manufactured famines as a way of doing speculative trading to inflate the price of food and they've also been implemented sitting on ore to inflate the value. And so they're a criminal organization. They're invested in PolyMet and I think it's highly inappropriate to be working with them and that it behoove us that if this is inevitably done it eventually can be done right, that we do not do business with people who have been implemented in exploiting child labor, killing organizers and union members in other mining projects around the world. And now, I'd like to speak to some stuff that has been done properly in the SDEIS. The PolyMet SDEIS artificially limited cumulative-effects discussion of water quality to just the Partridge and Embarrass Rivers. The St. Louis River was left out completely. This cuts out anyone who be fishes or eats fish caught downstream in the St. Louis River and Lake Superior and ignores the impacts on the Fond du Lac Tribal Waters. It is not good science. The PolyMet Project would increase mercury in the Embarrass River and could increase mercury methylation near the mine site, as well. Increases in mercury or sulfates at PolyMet could increase mercury in the fish in the St. Louis River. Both existing LTV tailing seeps and the other mine discharges flowing into the St. Louis River also carry high levels of specific conductance which the EPA has found can be toxic to fish. Tribal research shows that specific conductance is the water chemistry signature for mining discharge that can take more than 100 miles to dissipate. Cumulative analysis of water quality impacts in the SDEIS must include the St. Louis River and must specifically analyze impacts on mercury contamination of fish and impacts of specific conductance levels on fish. So I feel it would be very important for these things be done and that this is an inadequate document done, so far. It looks like I have more time to say that Glencore is really evil and I hope you people could Google them. I do believe something like this could be done, maybe 50 years in the future. I think that people should consider nationalizing the resource and keeping all the money in the United States, guaranteeing that the jobs pay well and guaranteeing that the ore stays in the United States, in Minnesota, before they do business with anyone. I don't think it behooves anybody to rush into this project. You should investigate all the players and think about all the possible ways that this stuff could be mined and the money could be kept in our region. Thank you.

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jessic Marshall Maple Grove, Minnesota

"Topic: Cumulative Effects, Arsenic and Cancer." (Reading.) Okay. "Arsenic is rated by the USEPA as a Class A carcinogen. That means it causes cancer in human beings. Colby Lake provides drinking water for the City of Hoyt Lakes. It already has high arsenic levels. The EIS states that the PolyMet sulfide mine project will increase arsenic in Colby Lake by 38.5 percent. EIS Page 5-145. The EPA has adopted rules calculating how much arsenic in water unacceptably increases the risk of cancer. 40CFR 131.36. PolyMet's increase in arsenic in Hoyt Lakes' drinking water is above both the threshold set by the EPA and in the cancer risk level in Minnesota. In addition to arsenic in their drinking water, people in Hoyt Lakes would ingest arsenic by eating local fish and wild rice. Low income people who fish and use rice for food would have the most cumulative risk. The FDA recently tested rice for arsenic and found wild rice had six milligrams per liter of arsenic." (Reading.) The EIS should be redone to make a cumulative assessment of arsenic exposure and cancer risks for people in Hoyt Lakes, including formula fed infants and people who rely on fish and wild rice for food.

Jessica Gardner 57980

I am worried about the impacts this project will have on moose, lynx, & other animals. This project should be cancelled. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jessica Hacker 1805 250th ave canby, MN 56220

Jessica Hemmer

For the past five summers I have worked and enjoyed our great woods and waters at a canoe outfitter located just outside of the Boundary Waters. My love for this unique place compels me to be very nervous about the sulfide mining already taking place in parts of our arrowhead, and especially cautious when considering this large scale proposal that is now in question. I feel the boom then bust that would be created by this mining proposal is not worth the harm it would ultimately cause to some our unique plants and animals. Can we really believe that these big mining companies will be around for hundreds of years to continue to clean up the mess they promise to make. I just don't think it is a risk we should be taking. Thank you for considering my comments, Jessica Hemmer 4510 60th Ave SE St Cloud, MN 56304

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Thank you so much for giving the public an opportunity to voice their thoughts. I am going to tell you the same thing that I tell my six year old: accidents happen. Plain and simple. Accidents happen. There is no end to the list of environmental disasters. Even in the past few months, the news is flooded with these stories. You have the opportunity to just say no. No, we won't even tempt fate and invite accidents to happen here. Minnesota is smarter than this. We value our environment too much. We know that it is simply too risky to do this particular type of mining here. The ecosystem is connected in all directions with water. That is just too risky. Why would we invite something like that to take place at the headwaters of 20% of the world's freshwater. There are stories all over the news about the shortage of clean water. It is more precious than copper. All of this for little more than 300, short term jobs. I hear that there's a Wal-Mart opening in Northern Minnesota that will employ about the same number of people as the PolyMet mine. I guarantee that Wal-Mart will have a far greater lifespan than the PolyMet mine. It is not worth it. We know that all of the big profits will go overseas. Is Minnesota going to allow itself to be used like this by international corporations. It seems that we should be smarter than this by now .we KNOW that accidents happen. Do the people of Minnesota not have a right to have an opinion about what happens in our state. This type of pollution is permanent, irreversible and devastating. It doesn't matter what is written in a 2,167 page document. It doesn't even matter if PolyMet were to put all of the millions and millions of dollars aside in case of an accident. That money can't bring back clean water, habitat lost, wildlife lost, the countless opportunities for people for whom a chance to experience wilderness enhances, even saves their lives. No apologies or "we couldn't have predicted this" can bring that back. I am a single mother, whose opportunity to work at a camp at the edge of the Boundary Waters every summer with my son has literally changed our lives. We are careful about not even letting our campers use chemical shampoos in our lake. Yet sulfide mining is being considered. I understand that PolyMet says they will capture 90% of the waste water. First of all, anyone who understands wetlands knows that it would be impossible to predict a figure like that, but even if they could realistically promise that, it still allows 10% of the sulfuric-acid laden water to escape into the waterways. That is unacceptable. I just cannot understand why this is even on the table. Haven't we learned any lessons from the multitude of disaster stories. Are we really going to let this happen in Minnesota. Accidents happen. There's no way around it. And by then, it will be too late to say you're sorry. Just say no. Now. Please. March 10, 2014
Lisa Fay, EIS Project Manager
MDNR Division of Ecological and Water Resources
Environmental Review Unit
500 Lafayette Rd, Box 25
St. Paul, MN 55155-4025
Dear Lisa Fay, EIS Project Manager:
I am writing to urge you to deny PolyMet the permit to mine near the BWCA. Minnesota is well known for our natural areas and our lakes. That being said, the BWCA is the only wilderness area our state has to offer, and it has been protected for 35 years. Now is not the time to support a project that will undeniably have effects on this pristine watershed. Sulfide mining carries with it proven environmental impacts. Acid mine drainage will drastically lower the pH of our waters, potentially changing the community of life that resides in our northern lakes and rivers. These changes will reach far and wide in a watershed with little buffering capacity. Erosion accompanies the deforestation that will be unavoidable. This increases the turbidity of nearby waters, reducing photosynthesis and oxygen levels, also detrimental to life in our aquatic ecosystems. Air pollution from the equipment used in mining and processing ore is also guaranteed. In a part of our state that receives a large part of its revenue from ecotourism, 20 years of mining and the temporary jobs it will bring is not worth lifetimes of water pollution and destruction of natural environments. The cost of this project certainly outweighs its benefits. Outfitters, camps and lodges are just a few businesses that benefit from this area staying pristine. The copper and nickel this mine would produce is such a low grade that they need to remove an incredible amount of rock to make it worth it. This will scar the land beyond recognition, in the most beautiful part of our state. The stored tailings can contaminate the groundwater, and communities would have nowhere else to turn for their water. Mining companies have demonstrated time and time again that they do not stick around to clean up their mess. This is another reason the financials do not make sense. I urge you to deny PolyMet the right to scar our land, destroy our wilderness, all for minimal community benefit and corporate profit. It is not worth it. Enclosed are numerous letters from high school students who chose to speak their mind about this mine. They are the reason you should oppose this project. They should have the opportunity to bring their children to the BWCA and other natural areas up north. If we keep rubber-stamping mines and other devastating projects like these they won't have anywhere to go in our country to see true wilderness. Sincerely, Jessica Ley 603 7 Clinton Ave Minneapolis, MN 5541

Jessica Martinez

41763

Hello, My name is Jessica Martinez. I live in a small town in Southern Minnesota and I have recently heard about the possible mining project that is going to be voted on in Ely. I want you to know that I oppose this completely. It is going to destroy more liveliness than will be created and it is a solution that corporations and companies are using just to create a simple solution for the NOW, not for the future. Anything that happens now is going to be left for cleanup by the next generation and that is not fair. We are putting more value in making money and objects for consumers with these minerals, but no value in educating the children about what mining would do to their future and how much work they are going to do to minimize their suffering. It really seems like the "older" generation doesn't even care about the young people because if they did, they wouldn't put us through making decisions that won't affect them 20 years from now seeing as they'll probably be gone. Don't accept this mining proposal. Respectfully,
Jessica Martinez

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jessica Rocheleau 9470 Ranchview Ln. Maple Grove, MN 55369

To Whom It May Concern, I was born in Duluth and now in my 50s travel to N. Minnesota to visit the Boundary Waters Canoe Area every summer I can. This wilderness region is vitally important to me, to the Minnesota region and the nation as a whole as a place of respite, recreation, wilderness and clean water. It is absolutely unacceptable for the state of Minnesota to approve the PolyMet mining plan for 500 years of treatment of polluted water to be left behind from 20 years of mining. There is absolutely no economic good worth poisoning this beautiful, essential and priceless resource for so many generations to come. Sincerely, - Jessie Jessica Stein Diamond 610 Yale Road Bala Cynwyd PA 19004 610-667-1449

Jessica Straczowski

44819

As a resident of Michigan's Upper Peninsula I have always opposed sulfide mining for many reasons. However, the main reason I am opposing this kind of mining is the dangers it poses to our clean water. Sulfide mining in Minnesota or Michigan or anywhere else in the world affects our future for hundreds of years. Who are the ones who will make sure that clean-up is done appropriately in a hundred years. Why would anyone knowingly risk our water quality - our meaning it affects all of us and our future generations. Please deny Poly Med the permit to operate a mine that risks all of our future. Thank you, Jessica Straczowski Marquette, Michigan

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Rudy's Bar and Grill Aurora Mn Tim and Jessie Kruchowski We support Polymet 100%. We bought Rudy's in March of 2003- We have been through some rough times and everyday we hang on in hopes that Polymet will open and one day we will have a prosperous business. When we opened in 2003 we anticipated Polymet was right around the corner, 11 years later we are still waiting. Right now we employ 16 employees. If Polymet opens their doors we anticipate we will employ anywhere from 20-30 employees, that is 20-30 families right here in our community that will be supported by just one small business. So please let's get the doors open so we can continue to do what we do best and make our community happy. Thank you, Tim and Jessie Kruchowski Owners Rudy's Bar and Grill

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jessie Thompson Minneapolis, Minnesota

16 South 25th Avenue East Duluth, MN 55812-2227 Lisa Fay, Public comment Manager, DNR DNR Ecological and Water Resources 500 Lafayette Rd Suite 25 St Paul, MN 55155-4032 Dear Ms Fay: I have lived all of my adult life in Minnesota. I love its beautiful natural resources and have raised three children to do likewise. As a citizen and taxpayer, I write to express my opposition to the reported conclusions in the SDEIS draft for the PolyMet proposed for Northern Minnesota. (To be frank, the document is too complex and lengthy for me to make an informed analysis based on my own knowledge.) As it has been repeatedly pointed out, correctly, any jobs for Minnesotans are temporary, the bulk of the profits will flow out of the local economy, and the "toxic legacy of damaged waterways" will remain permanently here in Minnesota. To date, "Mining without harm" and "environmentally safe mining" have been promised, but there is zero evidence to back up the claim that sulfide mining can be done without causing devastating watershed pollution. In fact, mining of sulfide-metal ore has never been accomplished without causing eventual acid-metal leachate pollution of ground and surface waters. As a result, Wisconsin wisely placed a moratorium on sulfide mining operations in 1997, until it could be demonstrated that such a mine would not pollute the water. The construction of a mine such as the one PolyMet proposes violates the Precautionary Principle: "if an action or policy has a suspected risk of causing harm to the public or to the environment, in the absence of scientific consensus that the action or policy is harmful, the burden of proof that it is not harmful falls on those taking an action." Only if and until, the mining industry has a demonstrated track record that it has the means and the willingness to invest the effort and the capital necessary to mitigate all present and future environmental costs, the benefits of the mine cannot possibly outweigh the damages to Minnesota's water resources, resources that may require treatment for more years into the future than can be accurately predicted. Thank you for your attention to my concern. Jackie Falk

"I go down to the shore" I go down to the shore in the morning and depending on the hour the waves are rolling in or moving out, and I say, oh, I am miserable, what shall what should I do. And the sea says in its lovely voice: Excuse me, I have work to do. - - Mary Oliver Jacqueline H. Falk 16 South 25th Ave East Duluth, MN 55812-2227 ground line: (218) 724-7407

The iron ore mines won't last forever -let's get something new going on up here. Sent from my iPhone

Jill Alisa Holmen 57262

How wretched it would be to witness the demise of our precious BWCA and subsequent lakes and waterways. It's the thing we hold most dear and brad the most about as Minnesotans. The proposed mining is a massive invasion to the landscape and wildlife, not to mention a permanent damage for very short-term gain. Please use your hearts in making this decision. Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuri

Mar 10, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I'm concerned about the major impacts to water and wetlands this project will have in northern Minnesota, especially given Polymet's own study that says water from the mine site would need 500 (500, not a typo) years (YEARS, also not a typo) of treatment. Sulfide mining should not be given an ounce of consideration, since it a) has not been done in Minnesota, b) is not allowed in Wisconsin (which shares much of the same topography), c) is run by a multinational corporation that has no stake in this location, and d) is not clear who would pay for 500 years of water monitoring and treatment. There is absolutely no way to guarantee Polymet will be around that long to pay for it. And if we leave a trail of toxins in our lakes and waterways, in our wetlands, in our beloved Boundary Waters Canoe Area Wilderness, well I guess we won't be around to care. Have we not learned anything from our mistakes. That toxic spills are terrible for our health, our wildlife, and our public lands, and they take FOREVER to clean up. We have an incredible array of wildlife here in Minnesota - bear, bald eagles, loons, lynx, moose - including the largest population of wolves in the lower 48- And we want to tamper with their drinking water. Please, if we're going to take a 500-year view of these areas, make it be the one where we're doing more to clean up the water, doing more to ensure these wildlife populations are stable, doing more to ensure diversity of plant and animal species, doing more to preserve the landscape. I understand much of the proposed project would use public lands - these are OUR public lands. And the understanding is the government is supposed to protect them for current and future generations. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Jill Boogren 2925 E Minnehaha Pkwy Minneapolis, MN 55417-1315 (612) 722-2391

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Jill Eisenberg

18264

My name is Jill Eisenberg. I want to speak on behalf of the future of Minnesota and the generations of Minnesotans to come. Water is one of our most precious resources. So important, in fact, that we even note it on every license plate, the "Land of 10,000 Lakes." I am a union worker and I'm in support of some mining. The hard rock mining of taconite is something that I can live with in this state. But the proposed copper-nickel mining is wholly different from taconite mining. 43 years ago I got a D in chemistry, but even I know that when you mine for copper sulfide, it mixes with the oxygenation in the air to turn to sulfate, which in turn mixes with water, and you get sulfuric acid. This is acid rain. In fact, a minus 3.6 pH is what is listed in the Environmental Impact Statement. And when the water evaporates from the tailings ponds, it will be even more concentrated. I know there is a need for jobs in Minnesota, but 500 years of jobs cleaning up the environment are not what we need. As other states are dealing with severe droughts and the lack of water, and we read about the impact that this has on the entire country, I implore you not to play Russian Roulette with our aquatic future. Thank you.

Jill F Blooston

44516

Please investigate the disaster that is starting to show up in North Dakota brought on by the drilling companies who said they would protect the environment. Sounds like the hollow claims now being made by PolyMet, policing and regulating of mining and drilling companies has always turned out to be a failure, once they have the go ahead they never look back and couldn't care less about the environment. Please think of the next generations, they do not need any more super sights to clean up, find another way for people to be employed.

jill faulknr

16960

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, jill faulknr 7619 gleason rd Edina, MN 55439

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Governor Dayton and DNR, I think you know in your hearts that a decision to allow Polymet to engage in mining here in northeastern Minnesota will prove catastrophic in many ways. Don't be the ones responsible for the destruction of our waterways, our groundwater, and the BWCA, all of which are what make Minnesota the destination and pride that it is. People travel here from across the globe to take in one of the last places of pristine, unspoiled wilderness. The mining proposal and EIS simply do not account for all the unexpected and prolonged issues that will occur, and will subsidiSt If its jobs we seek, let's consider jobs in greener energy and tourism, the true reasons why people proudly call Minnesota home and why visitors keep coming back. I implore you to stop this wasteful project and show your Minnesota citizens you have our future and best interests in mind. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Thank you, Jill Holmen Sincerely, Ms Jill Holmen 731 N 3rd Ave E Duluth, MN 55805-1201 (218) 624-8903

50509

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jill Holmen 731 North 3rd Avenue East Duluth, MN 55805

Jill Lyman 47258

Dear Sir/Ms: I am extremely concerned about the proposed PolyMet copper-nickel mining project. No matter what regulations are in place or how much money is set aside, the inevitable byproducts of sulfide mining promise to include sulfur-dioxide emissions, acid rain, millions of tons of solid toxic waste, and the slow leaching of chemicals from tailings into surface water and ground water. Glencore, the Swiss mining and commodities trading giant funding PolyMet, has a history of polluting the areas that it operates mines in. They have also been involved in corruption and human rights violations. This is not a company that we want doing business in Minnesota. Please deny PolyMet's permit. Protect the fresh water in the Lake Superior water basin. We need to find jobs for our state that are sustainable and environmentally sound. Thank you. Jill Lyman 3205 Greysolon Road Duluth, MN 55812 218-728-3133 HYPERLINK "mailto:lymans@q-com"lymans@q-com

Jill Murette 43267

Being a public health nurse, focus on being proactive with the pollution. Prevention FirSt Prevent the pollution before it happens, putting money in a fund for clean-up isn't going to solve the problem. Once you have pollution, the environment will never go back to what it was. You have altered it permanently. Don't let them mine until they can prevent the pollution. Jobs are important, I grew up on the Iron Range, but you can never turn back time. Jill Murette

Jill Mooney 39809

This is dangerous and will ruin the NE section of Mn permanently Please don't do this. We totally oppose this Sent from my iPhone

Jill Radman 3386

I'm not sure who this should go to but I'd like to state my avid objection to an opening to a sulfide mine in Northern MN. These mines always have terrible pollution and it lasts up to 500 years. A few extra bucks is not worth acidifying out beautiful land and the harm the pollution will cause. I'm voicing my opinion that I strongly object to the proposal of a sulfide mine in MN. Minnesota resident, Jill Radman Sent from my iPhone

Jill Thomas 42432

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Jill Thomas 12510 43rd Ave N Plymouth, MN 55442-2716 (635) 452-9718

Jim Atkinson

18115

Hi. My name is Jim Atkinson. And I don't consider myself an expert. However, I do consider myself somewhat of an expert on the agencies that are the lead for the environment. I worked in a heavily regulated industry for 28 years and had to get many different permits and have gone through environmental reviews and full-blown EIS's with the DNR and the Army Corps and the Forest Service. And what I know about it is they always without fail have been very cautious and deliberate and really spent the time and energy necessary to make sure that things were the way they were supposed to be. My observations about the Supplemental Draft EIS are, first of all, that it's been a long time in the making. Ten years is enough time for any EIS to be fully developed. And it's based on what I think are very conservative assumptions. I think we're really looking at a worst-case scenario in the predictions that are made. And reality provides a comprehensive and understandable analysis of the issues which it should after 10 years of development. I think PolyMet has demonstrated a commitment to do this right. They've been at it for 10 years as well. They've put in tens of millions of dollars into the environmental studies. And it's also clear that they respect the role and the obligations of the agencies that will have to give them permits. My opinion is that this SDEIS is more than adequate. And it's time to move forward into the permitting stage. Based on everything I've known and all my experiences with the agencies, I think we can all trust them to do just as good of a job in the permitting as they've done in developing this EIS. Thank you.

Jim Baratto

4482

Regarding Polymet I would like to provide my full support and would like to know how an average citizen can help to make this process move forward in an effort to get this mine up and running to provide jobs in Minnesota and boost the overall economy. Efforts to slow the process or even prevent the mine from moving forward in my opinion are self serving to those that continue to try and throw up road blocks. It is time for our leaders to look at the facts and move forward with this project. It is apparent environmentalist groups have a single minded position and that is to stop or delay the progress on this project in the hopes that Polymet will just go away. The questions have been asked and the answers have been provided, let's make this thing happen. Jim Baratto Owner/President Baratto Brothers Construction, Inc. 13872 Shafer Road Crosslake, MN 56422 218-692-1070 office 218-851-4375 cell 218-692-1071 fax HYPERLINK "mailto:jimb@barattobrothers-com"jimb@barattobrothers-com HYPERLINK "http://www.barattobrothers-com/"http://www.barattobrothers-com BC322437

Jim Barott

45596

To: Minnesota DNR From: James A. Barott 1103 E. Washington St Ely, MN 55731 As a professional soil scientist who is intimately familiar with the soils and landforms of northern Minnesota, I believe the shipping of the mine tailings by rail to northwest Minnesota should be thoroughly analyzed for its economic and environmental benefit. The shipping of tailings by rail is nothing new. When I lived in Blackduck, Minnesota, iron ore mine tailings from northeastern Minnesota appeared to have been used for the railroad bed. The benefit of shipping the sulfur laden rock to northwestern Minnesota would be due to the calcareous / higher pH / high cation exchange capacity nature of the soils in that area. The soils in northwestern Minnesota a high buffering capacity, compared to a low buffering capacity / lower pH soil in its current northeastern Minnesota location. The terrain is relatively flat in northwestern Minnesota with relatively few lakes. There are also relatively few people who live in some parts of NW Minnesota. The environmental consequences would be much less in the long run. Thank you for your consideration. James A. Barott

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Jim Bennie 10720 Rockford Rd Plymouth, MN 55442-2865

Jim Ferstle 43373

James Ferstle 539 Lexington Pkwy S St Paul, MN 55116 The saddest part of this debate over permitting for copper/nickel mining in Northern Minnesota is that it is wasting time, money, and resources on a project that doesn't merit this sort of attention. If some company proposed drilling under Lexington Pkwy, for example to bring out some precious metal resource there and tried to justify it based on "creating jobs," or mining the product in the US rather than having some other country grab the profits from this exercise it would be dead on arrival, as they say about doomed legislation in the legislature. And any company promising to pay "costs" of cleanup is something goes wrong is akin to the proverbial huckster joke about selling somebody worthless swampland in South Florida. Please end this charade and rightfully put a stop to this dog and pony show masquerading as a legitimate business deal. Regards, James Ferstle

Jim Fitzpatrick

58094

My Name is Jim Fitzpatrick, I am speaking today as the Board President of the ErnestC. Oberholtzer Foundation, "Ober" as his friends called him was responsible for the protection of the BWCA and Quetco (?) and the first president of the Wilderness Society. He did all of the behind the scenes negotiation on the federal level and got the law written. Ober would be furious about this project. The SDEIS is full of holes. I will talk about only a few but promise a written letter to the DNR and ACE by March 13th. Wetland impacts are unacceptable. 913 acres of direct loss, 7531 acres of indirect impact = 8264 acres of wetland damage. The study of hydrology at the site is inadequate. There is an under estimate of the Partridge ground water base flow. It should be 200 to 300% higher. This is the largest Wetlands destruction project ever proposed in the U.S Army Corps of Engineers Region. The SDEIS says there are no fractures of underground bedrock at the site. I saw a map built by Minnesota History Society that shows the site is riddled with fractures. Not just one or two but many. These fractures will allow onsite pollution to get into the ground water. Putting the tailings on top of an old unlined LTV tailings pile will allow active pollution runoff. This unlined tailings dump from the 50's was built on top of streams to allow drainage of water through the tailings. Surface and ground water seepage at the LTV tailings site ALREADY violate water quality standards in Spring Mine Creek and even Second Creek. The SDEIS does not reveal the levels of contamination that will be placed into the HRF nor does it admit that this highly toxic dump will leak, even if it is lined. It does not analyze the level of acidity, corrosion and toxic metals (or you called it "filtered sludge") that will go into the HRF but it seems very likely that it should be considered and regulated as "hazardous waste landfill" unless PolyMet proves that it isn't. Minnesota statutes and rules require a permit for hazardous waste facilities. They also prevent the siting of hazardous waste dump on wetlands. For these and many many other reasons I can not deal with in 3 minutes I request that the MNDNR At the very least make Poly Met go back and address each of the problems addressed here today by me and others or at the very best reject the SDEIS out right as incomplete. I further request that the USACE deny the section 404 permit request involved in this project.

Jim Foti

43495

Extraction industry megaprojects of relatively brief duration, such as the PolyMet mine, financially benefit only a small portion of a single generation, and yet burden all future generations with a permanently changed landscape. And in this case, hundreds of generations would be left to deal with the pollution impact. One need only be the most casual student of business or history to understand the likelihood of a corporation following through on an environmental responsibility (such as treating the water flowing toward the Great Lakes) for more than a few years after its profits have been made. Unlike the desperately poor areas of the United States and the world that embrace extraction projects, Minnesota is fortunate to have the choice to invest in its future in more economically and environmentally sustainable ways. Let us not conduct this massive science experiment in our beautiful north woods. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Jim Foti 400 Groveland Ave #209 Minneapolis, MN 55403

Jim Hanson

39372

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Jim Hanson 10283 Gilbert Trl Brainerd, MN 56401-6153

Jim Houlihan

18087

My name is Jim Houlihan and I live in Grand Rapids Minnesota, and with my family, I'm a co-owner of Industrial Lubricant Company, a mine company, and a former mayor of Grand Rapids -- 100 years ago former mayor of Grand Rapids. A couple of comments. I offer, first, that we are all here tonight with the very same interests. That is that we are all environmentalists, and we all need to earn a living and strive to feed our families, to provides housing, education for our children and to live in safe and clean communities. Our need to enjoy and to be renewed by being in the outdoors and in the Boundary Waters is not in conflict with our need to earn a living. By taking even better care of our natural resources and by being even better stewards of our environment, we are able to take even better care of our families. I add my urging to you that this review ought to be about "and" thinking, not "or" thinking. Like many of my neighbors, I own a snowmobile and I own a canoe. I'm a stockholder in PolyMet, and I'm a stakeholder in Northern Minnesota. PolyMet's requests and their operation is aligned with our broader community interests. Next opportunity. We constantly read in today's newspaper about the growing disparity of income and wealth; the divide between the haves and the have-nots. The key indicators for the state are staggering compared to Northern Minnesota. On indicators like percent living in poverty, median household income and percent working, ages between 60 and 64, as reported by the Wilder Foundation, are stark. For example, percent living in poverty, statewide, 11 percent; St. Louis County, 15. PolyMet would not be a silver bullet, but would be an opportunity for those of us in Northern Minnesota to strive to earn a living like those in the rest of the state. Based on the mining industry's record of environmental improvement over the years and process changes and all of our aligned interest in both living here and working here, we should move forward with confidence that all members of our community, both industry and environmental communities, will operate and can support PolyMet in a responsible and ever-improving manner. Thank you for your service, and thank you for the opportunity.

--Original Message-- From: jim.howitt@gmail-com [mailto:jim.howitt@gmail-com] Sent: Saturday, March 01, 2014 3:34 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: The PolyMet SDEIS has many flaws which should be rectified, but we do know from it that PolyMet is planning over 500 years of pollution for 20 years of mine operation. This is unacceptable. The mine should not be permitted unless much greater pollution controls are planned for. Sincerely, James Howitt 2639 Aldrich Ave S Apt 101 Minneapolis, MN 55408-1312

Jim Husman

1773

Dear Minnesota Department of Natural Resources, US Forest Service and Army Corp of Engineers: I am writing to express my support for the “proposed connected actions” land exchange between Polymet Mining Inc. at the NorthMet Mining Project and the US Forest Service-Superior National Forest as presented in the Supplemental Draft Environmental Impact Statement. It appears to me that the land offered by PolyMet in exchange is of higher quality than the land they will be acquiring adjacent to the NorthMet property. The exchange does not have any significant negative effects on the Superior National Forest. I believe that the continued wise development of Minnesota’s natural resources is good for Minnesota, the local communities and for the country. Minnesota has a rich mining history and I believe that state and federal support of the NorthMet Project will lead to a resurgent of the economy of northeast Minnesota. Thank you for the opportunity to support this land exchange. Sincerely, James Husman 48 Spruce St Viburnum, MO 65566 _____ This message is intended solely for the designated recipient and may contain confidential, privileged or proprietary information. Rather than use the tailing ponds, which leak, why not use one of the open taconite pits, which are below ground level. This will keep the sulfur below ground level and will not runoff onto surrounding land.

No to PolyMet mining, environment is worth more then the damage caused my mining the minerals in this way. Clean water is like "gold" Sent from my iPhone

Jim Lamppa 21587

The supplemental draft looks great. Get r done. Jim Lamppa 4245 miller trunk road Eveleth,Mn. Sent from my iPad

jim lassi 46627

My Name is Jim Lassi. I live at 35 Fir Circle, Babbitt, MN 55706- I strongly favor granting of all permits to PolyMet for the following reasons. I am a 15 year member of the Babbitt City Council, and as such I have had numerous opportunities to attend information sessions sponsored by PolyMet as well as Twin Metals and Teck. I am convinced that these companies have developed the technology, such as reverse osmosis that will insure a safe operation. I know that the company execs are men of integrity, and will do what it takes to insure that the environment will be protected. If reverse osmosis can clean up an existing disaster like the Kennicott Mine in Utah, it can certainly be used at the onset for the PolyMet mine. I live in the middle of the potential precious mineral development. Base on the SDEIS, I am confident that the impacts to the land, air, and water will be minimal. The economic benefit of such a development far outweigh any potential negative affects. PolyMet can mine these minerals in an environmentally sound manner that creates hundreds of jobs that can support families that will hopefully locate to my community to booster our economy. I have a hard time understanding the opposition to this project by environmentalists who use these precious minerals every day. It seems to me that they will oppose any type of mining even though it is proven to be safe. Lets let the facts speak for themselves. PolyMet can operate safely. Approve the permit. We need to strengthen our economy in our local communities and across the state. Thank you

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jim McWethy 1150 LaSalle St Wayzata, MN 55391

I cannot believe the delay in granting a permit, eight or more years and millions of dollars spent, professional agitators with little or no regard for what the truth is holding a whole section of the state hostage, these people should have to post a bond when coming up with there misguided stories of gloom and doom, we in northern Minnesota need the jobs and tax revenue that this project would provide.

Minnesota Department of Natural Resources Saint Paul, Minnesota February 9, 2014 Dear DNR, My review of the Full SDEIS did not find anything that addresses the issue of enforcement actions for violations of environmental quality standards and criteria. Planning for environmentally safe operations is presented and is necessary and critical but it is also insufficient. A clear plan of actions that will be taken when operations do not go as planned are equally critical to maintaining a focus on safe operations. I did not find any wording in the SDEIS that would trigger the shut down of mining operations in the event that environmental quality standards are violated. It appears that once mining starts, nothing will stop it other than the exhaustion of the deposits of profitably-mined ore. If environmental standards are violated or if environmentally sound practices are not followed even while the environment has not yet been harmed, then mining and mining profits should stop. The fact that some corporate entity might be liable for remediation costs will be cold comfort once damage is done, and those costs may not be sufficient to deter poor oversight of operations. Water quality in the area of the proposed NorthMet mine site is already impaired because of previous iron ore mining activities. Some seem to think that this makes the site a perfect place to continue mining activities. But this logic is not only faulty, it shows a lack of appreciation of the heightened dangers that Minnesota's waters will face if this new form of mining is permitted. This form of copper mining will generate waste that is much more toxic than existing iron mines, and copper-sulfide mining already has a horrible track record of water pollution in areas that have a tiny fraction of the amount of surface waters found in Northeastern Minnesota. I ask that Minnesotans' concerns for our shared environment be taken more seriously than I find them to be in this SDEIS. We already know from the well-publicized poor quality of the initial DEIS that we should be suspicious of any claims of concern for the environment by the leadership of PolyMet Mining Incorporated. If this new kind of mining is permitted, then the consequences of harming the environment need to be clearly stated. For example, 'If the levels of pollutant X exceed level Y at any monitoring station then mining operations shall be halted until the source is identified and the problem is corrected. PolyMet will continue the pay and benefits of all employees during such an interruption in operations ' I understand people's hopes for new jobs that a mine would provide, but the outsized chance of environmental damage from this form of mining during operation and long after mining stops and the subsequent damage to the existing tourism economy almost guarantees that the costs to Minnesotans will outweigh the benefits. I do not support the permitting of copper-sulfide mining in Minnesota. James A. Wolfe Wood 220 Pineridge Lane Stillwater, MN 55082 651-351-7194

I propose that there are at least two major deficiencies in this EIS. 1- The land exchange, per se, is a forfeiture of the public wealth and right. In this document there is no public purpose stated for the land exchanges, per se. Further, while your Executive Summary states a foundation for prohibiting this project as proposed, "allowing private surface mining would be inconsistent with USFS legal mandates for acquiring and managing these lands," there is no guarantee that the exchanged lands will be managed by these same mandates. The US Government relinquishes control to accomplish these mandates. 2- There is no rationale proposed in the EIS that there is an obligation, a priori, on the part of the public, or its government, to yield anything that it holds, in the face of a private mineral rights ownership. There is no rationale in this document for a quid pro quo. The State should hold to a position of NO risk taken on by the citizens and its government. Instead, the document details mitigation of risk, and weak discussions of probability and extenuations, that gives evidence that public risk is assumed. Jim Sulerud, 730 Vogelsberg Trail, Chaska, MN 55318 952-445-4531

I'm against copper / nickel mining in MN done by Polymet or any other company. I think the environmental risks are too great. I'm against it even if Polymet says they will take care of any environmental damage caused for 500 years and is willing to pay money "up-front" to take care of that. Who knows whether they will pay enough to cover the costs of clean-up. No one knows how long it would take or how much it will coSt I don't trust that they won't just mine for 20 years, then shut the operation down and we will be responsible for dealing with the aftermath. Thanks. Jim Suttie 7940 Pequaywan Lk. Rd Duluth, MN

JIM VOYTILLA 43028

Please read and consider the attached comment. I am basically requesting that this SDEIS be redone because of the seriously flawed LTV tailings basin dumpsite alone. Feel free to call me re any questions about this public comment at 651-214-5597- Sincerely, Jim Voytilla

Jim Warzala 26641

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, IF ANY ONE HAS THE LEAST BIT OF COMMON SENSE, WISDOM, INSIGHT AND FORESIGHT IN D.C. - IT'S YOU, SO PLEASE DO NOT ALLOW THE KEYSTONE XL PIPELINE. FRACKING OR ANY OTHER PIPELINE IN THIS COUNTRY. ONE SPILL FROM A TERRORIST ATTACK, EARTHQUAKE OR POORLY CONSTRUCTED PROJECT WOULD MEAN IRREPARABLE AND IRREVERSIBLE DAMAGE TO THE ENVIRONMENT. ALSO SAVE THE LIVES OF ANIMALS and THEIR HABITATS. WE'VE HURT ANIMALS ENOUGH. MAKE FOREIGN AID, AMERICAN AID Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Jim Warzala PO Box 150 Crystal Falls, MI 49920-0150

jim weigle 38952

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks which cannot at this time be accurately projected nor quantified. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr jim weigle 4751 Dona Ln Golden Valley, MN 55422-3536

18063

I was born in 1930. And that was the time of the Dust Bowl. I don't personally remember it because I was pretty little, but that was an environmental crisis and we had to fix it or we would have had all desert in the western part of the United States. So people got together -- and they didn't agree on lots of things -- but they did solve the problem. And so I think you could solve problems of a mine and new jobs if you can get together and work on it. I was born in Alpena, South Dakota, which was in the middle of the Dust Bowl. And my parents were Nellie and William Welch. Nellie, my mom, was born in 1903 and my dad in 1899. And they had some successful crops, and then they had crop failure because the Dust Bowl came in and blew all their crops away. So they were -- basically everybody up there was starving to death. So they all got together and worked and co-oped and raised gardens and hauled water and did all kinds of things to survive. Well, there was pretty much no surviving after 1932 or so. So my dad went down to Minnesota. And he found a farm where he could be a sharecropper, which was you worked the farm and you would get half of the crop and you would give away half of the crop. So that was a way of survival. And I had an older brother and sister. And we were able to survive on what dad would make. And then in 1937, dad had saved enough money -- which wasn't much -- but to save the farm and to put money down on a new farm. So we walked from the old farm to the new farm, which was about 15 miles, and drove the cattle. By that time I was six years old, and I can remember walking most of the way there. And I worked in the fields as my bother did. My brother was four years older. And anyway, they survived by a garden and working out on other jobs. We had an artesian well on the farm, which is kind of an automatic well. It runs. It's like a spring. And my mother and father hauled water to the garden. And they were able to raise some garden crops that way. Well, in 1937 I said dad bought a farm. And then World War II came along, and farmers did quite well. And by 1945 when the war was over, dad had been able to pay for the farm. So we went from being very poor to relatively well off. This all comes down to, I joined the National Guard and went in high school and was called up in '49 for the Korean War. Came back and went into pharmacy, graduated from U of M with honors. Had three girls. At that time we moved to Hoyt Lakes in 1974 and brought six children with us. We left four in the Cities. Since I've been up here, I worked on tourism, Iron Trail, civic board, and I worked on Giant's Ridge. And you might ask what all this means, but also when I worked at Giant's Ridge, I learned about the marsh marigold, which is a very rare flower. It's found in every swamp between here and Duluth or the North Shore. But that was the point where they didn't want to build because of the marsh marigold. Anyway, I learned to look at both sides of every problem or sometimes more than both sides. I also worked on Forest Highway 11 and on the new road to Embarrass and Ely, but that one never came to pass yet anyway. PolyMet has a few people that live in town, and they've been in my store many times. And they're very nice people and they care a lot about the area. And I know that just by the many interactions I've had with them. And I think as long as they live in the area they would be interested in having a safe area. And my opinion is that people ought to look at both sides of all the problems and compromise enough so that we can have some jobs in the area so we can survive. When we moved here there was over 4,000 people here. Now there's probably less than 2,000 people in Hoyt Lakes. And we need people, young people for schools, to keep the area active, to appreciate the area, and being able to go out and fish and do all the things that are fun to do here. We need new jobs to support our community like Hoyt Lakes, Aurora, Embarrass, Ely, Biwabik, Virginia, Mountain Iron, Palo, Gilbert, Markham, Eveleth, and the west range. And I don't know who I forgot. I think the citizens should be able to direct their behavior to support a safe, successful operation so that families that have children will be able to stay together in the area if they choose to. Many of them will choose not to, but it's nice if you can have your children stay with you if they want to. And I think some of the opposition to the mine might also have ideas that would help create a safe mine. I've been retired since 1995. I've been down to Honduras 17 times on mission trips. I work at the store every day as a volunteer. And the reason I volunteer is because my daughter that's the pharmacist has five girls. So it allows her to have a little time with her family and I can still correct and check every prescription that goes.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Jim Wichmann PO Box 385 16424 660th Ave Conger, MN 56020-0385

jim wilson

Please add me to the list supporters of the Polymet Mining project in northern Minnesota. The additional, living wage jobs combined with economic impact to the region can not be replicated in this area. I believe that the Polymet Group has met and surpassed all regulations and guidelines put before them. It is time to move forward with this project and stop looking for a ghost behind every tree. Thanks, Jim Young Industrial Lubricant Co. Cell: 218-259-6367 Direct: 218-328-0274 Fax: 218-328-0259 jyoung@inlube-com

Jim/Janet

44114

From: Jim Woehrl 12793 Wawina E Wawina, MN 55736 Telephone: 218-387-5006 I am requesting that there be no action taken on the SDEIS for the NorthMet (Polymet project) for the following reasons: The long time frame of up to 500 years for the monitoring of the project and the unknowns of the effect of climate change on the hydrology of the region. The fact that sulfide mining is new to Minnesota. There is no good proven technology or long term model to prove that the environmental protection technology will work as described. The fact that the SDEIS grossly underestimates the amount of water that will flow through the 4-5 square mile site that is unlined and where water seepage through the site. The barriers to bedrock can crack and leak. This alone should disqualify the project. The SDEIS contains no credible information about the actual cost of monitoring, maintaining, and replacing the equipment needed to treat polluted water for 500 years or more. It provides no details about the nature or guarantees of a financial assurance scheme that would remain viable for 500 years, yet it does acknowledge, disturbingly, the possibility of events such as "unanticipated liabilities" and "failure or limitations on the ability of third parties to pay." It does not attempt to explain how a corporate entity could realistically be held accountable over such an absurdly long period of time. Finally, even though the SDEIS admits that water pollution will last for a minimum of 500 years, its financial assurance section is an exercise in generalities. The actual cost of water treatment, monitoring, maintenance, repair, and reclamation is completely unknowable. The SDEIS says that PolyMet estimates initial closure costs of up to \$200 million, with post-closure monitoring and maintenance costs of up to \$6 million annually. The Grand Portage Band of Ojibway concluded that PolyMet's numbers are vastly below the actual amounts required. The Grand Portage Band calculates that the minimum amount that should be set aside for financial assurance at the outset, assuming a 3% return on the amount, is \$90-5 billion.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, JinianVictoria Herdina Silver Bay, Minnesota

To whom it may concern, Please do not destroy northern Minnesota with a new mine. The Polymet mine could continue to pollute our waterways long, long, long after any benefit is garnered from the mine. There is NO WAY to guarantee the waterways of Minnesota won't be polluted long after the mine has closed and Polymet no longer exists. It will be left to our multi-great grandchildren to bare this expense. The number of sustainable jobs is minimal as compared to the long term expense. It is very short sighted thinking to allow this mine. Please do not allow new mines in Minnesota. Sincerely, Jane L. Kohnen 5357 Ewing Ave S Minneapolis MN 55410

_____ From: morsejoann@hotmail-com To: northmetsdeis.dnr@state.mn.u Subject: SDEIS - Polymet Mining Project Date: Tue, 11 Mar 2014 19:39:26 -0500 While I am sympathetic to the need for good jobs in Northeastern MN, I think that the risk far outweighs the reward for the Polymet Mining Project. If the state allows the mining companies to potentially ruin the Boundary Waters Canoe Area, one of the major incentives for drawing and keeping an educated work force in Minnesota will be gone. My husband and I are both tech workers who have chosen to relocate to and live in Minnesota because of the wonderful outdoor recreation opportunities in the Arrowhead region. I think that the state of Minnesota will lose people like us if Polymet Mining is allowed to pollute the BWCA and that will ultimately affect the state's ability to attract and keep educated people. Thank you, Jo Ann Morse 1405 29th Ave N.W. New Brighton, MN 55112

Joan and Illegible Mork

58027

We live right near the (truly) Great Lake. There are no benefits greater than its beauty & wholesomeness. Do not let sulfide ore mining compromise this treasure. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Joan Christensen 3292 County Rd 24 Intl Falls, MN 56649

Dear Ms Fay, Mr Bruner and Mr Dabney, I wish to urge you to reject the PolyMet NorthMet SDEIS on the grounds that the project is likely to cause irreparable damage to our cultural and natural resources as well as result in violations to the treaty that the US made with the Chippewa Bands of Ojibwe people. From the Fact Sheet: "The Project area is also located on land that was ceded to the United States by the Bands under the 1854 Treaty. As part of the Treaty, the Bands reserved the right to hunt, fish, and gather on these lands. Some resources — such as fish, plant, and animal species — may be affected by the project, the degree to which in a cultural resource context is unknown. " Additionally, damage may be done to Wild Rice Harvests which would have a detrimental effect on the Ojibwe and many other Minnesotans. While I appreciate the actions PolyMet proposes to mitigate the potential harm that may be done by the project, I do not believe they are substantial enough to truly prevent or account for the damage that could continue for hundreds of years and more after the project closes. There are too many unknowns in this report, and the consequences are too dire for us to proceed with this project. Sincerely Joan Gunderson-Palmer 999 Seminole Ave West St Paul, MN 651-442-6509

Date: March 12, 2014 To: Department of Natural Resources State of Minnesota From: Joan S. Scully 718 27th Avenue South Minneapolis, MN 55454 Re: PolyMet Copper-Nickel Mining Proposal It is my understanding that the DNR is accepting public comments on the proposed open-pit copper-nickel mine and ore processing facility in the Hoyt Lakes area in northern Minnesota. I have deep concerns related to the environment, our health, the survival of our wildlife and their loss of habitat, jobs for Minnesotans, and our economy. There has never been one sulfide mining operation -worldwide - that has not polluted the environment. There are still locations in England where the sulfide mining done by the Romans still pollutes the environment 2500 years later. Our precious wetlands, our rivers and streams, will be adversely affected by mercury, arsenic, and other toxic metals - the 'natural result' of sulfide mining - and it may be necessary for the animals, fish and birds to be instructed on how to keep away from the huge toxic 'ponds' that will require monitoring for the next "500 years" (as far as the company's report would go) or, more likely, forever. The health effects stemming from this mining affects humans, wildlife, and the environment. Tourism would suffer if this mining operation were approved. The number of jobs related to tourism is much higher than are jobs related to mining, and if we continue poisoning our state, how will we attract tourists to see our lovely toxic waste ponds or waste piles. Native populations' tribal rights would be violated if this mining project goes ahead, and their cultural practices and economic livelihoods would be seriously compromised; some would be terminated. As a retired union worker, I have been aware of the historical shortage of good jobs in the northern tier, so I understand the workers' enthusiasm at the promise of good jobs, but many of these jobs will be filled by people they bring in from other operations, and will probably number in the hundreds, a few hundred. A few hundred jobs for 20 years sounds good to Minnesotans who need to support their families, but there are other ways to create better well-paying jobs for the northern part of our state. It would be better to create jobs in manufacturing alternative energy parts, for example, or building solar panels or wind turbines, or growing hemp for clothing, 'concrete', and a myriad of products derived from hemp. Twenty years of jobs resulting in the permanent poisoning of our beautiful state - in its most beautiful part - is just not a good business model. We count on the DNR to protect the state from perpetrators of dangerous money-making schemes that will harm our state. Please listen to our plea: Please Reject PolyMet's proposal to mine for copper and nickel, etc, in northern Minnesota. Thank you for considering this plea. Sincerely, Joan S. Scully

I stand with the research provided by and thoughtful comments and opinions of the organization, Water Legacy. They are as follows - "PolyMet's open-pit sulfide mine plan should not be allowed to directly destroy 913 acres, and indirectly destroy as many as 7,351 acres, of high value wetlands in the Partridge River headwaters and 100 Mile Swamp. Wetlands at the PolyMet mine site bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. More than 2/3 of the replacement wetlands in the "compensation package" are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. The Land Exchange plan does not maintain the value of public assets and comes nowhere near replacing the ecological functions lost in the St Louis River Watershed. PolyMet's Mine Plan doesn't even look at alternatives that would reduce wetlands destruction, restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. Minnesotans need to know every alternative has been explored if the permitting process is to be legitimate in the eyes of the public" I ask that you deny the proposed plan from going through and agree that much more work is need to determine a smarter course of action. Thank you. Sincerely, Joan Sutliff 5325 Fish Lake Dam Road Duluth, MN 55803

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Joan Thom Minneapolis, Minnesota

Joana Cipriano

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Joana Cipriano Beco de St° Cristo, n.° 1 Coimbra, ot 3040-657 PT

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, JoAnn Ailes 575 E 950 N Westville, IN 46391

JoAnn Huss 3454

Dec 21, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Why would you even consider a business venture that has a 100% rate of environmental destruction to the state of MN. Not only would the area surrounding the mine sites be affected, the water sheds far beyond will be adversely damaged for a long time after the mining is done. My family and many other MN families are very worried about the human health risks that you are entertaining. This type of mining will put arsenic, manganese and other contaminants in their drinking water and mercury contamination will happen to the fish in the watershed and most likely far beyond, even into Lake Superior. The research has shown that more than 8,000 acres of irreplaceable wetlands in the St Louis watershed will be impaired or destroyed IF you say yes. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. We have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. PLEASE JUST SAY NO to this lethal project. Thank you. JoAnn Huss 916 North Payne Street New Ulm, MN 56073 United States of America The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs JoAnn Huss 926 N Payne St New Ulm, MN 56073-1474 (507) 354-1644

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Dear DNR, The Polymet debate has been plaguing me for some time now. My worry is only eased knowing the decision lies in your capable hands yet I still feel the need to voice it. The overwhelming point is that the stakes are too high and the sacrifice is too great. You as the DNR have been given the task of being stewards of the land and all its naturalness and as such, it is your duty to protect it without being blind sighted by money. This scenario has been played out too many times before in various places all over the world (the promise of economic success for the "simple" use of resources) but rarely if ever has it come without consequences for the land and all that it had supported. Diminishing the quality of life for the next 500 years for the economical benefit of one lifetime sounds completely ludicrous. Please, you must not allow the pristine beauty and vitality of our land to be robbed by big business because they're lying through their teeth if they think this is ultimately beneficial to we who wish to live here long after those mines close. As a recent graduate from UMD and a citizen of Duluth for the past five years, I have always enjoyed doing projects on the water quality of Lake Superior and after travelling to faraway places, I can still honestly say this is the best water I have ever tasted and I feel safe drinking it. It is for the lake alone that I gave up notions of living elsewhere as I wish to live here now, on a lake so superior to all the reSt But even before I was aware of Polymet, I dreamt of disaster threatening the water. My nightmares held black muck seeping into the water, people ridden with grief over children dying of cancer, illness and disease. This sounds dramatic but there is no other way to voice my concern. Please listen to the people and their cries. Defend this land skin, tooth and bone. It's not worth the gamble. Joanna Schlegelmilch 5356 Greenwood Road Duluth, MN 55804

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining should never take place in the areas around Lake Superior, and in the Arrowhead Region of Minnesota, and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. It is absurd to even think about mining these pristine areas around Lake Superior. We are opposed to all mining around these most precious areas. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Protect our lands and waters. Sincerely, Joanne and Jim Collins 86360 Meyers Olson Rd Bayfield, WI 54814-4510

Joanne Engelking 16193

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, I am not a Minnesota resident but an Illinois resident who is interested in protecting the environment and wildlife. I am very concerned about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Joanne Kalnitz 2920 W Sherwin Ave Chicago, IL 60645-1210 (773) 761-1701

Joanne Luongo 43457

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Joanne Luongo 1636 pingsong creek rd Kettle Falls, WA 99141

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According to the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Many years ago, I drove with my family through Ontario Canada and was shocked to see the devastation to the environment for several miles surrounding one of these mines. At the time we were told that it was 'acid rain.' You know very well that we are looking at this kind of destruction of you approve this mine proposal, and there will be destruction that wouldn't be fixed from at least 500 years. This is too much damage for the few jobs that would be affected during construction and then for the actual mining operation itself. I come from this area. I was raised in Two Harbors along beautiful pristine Lake Superior, and my husband was born on the Range and raised in Babbitt. He, too, knows the negative impact that this would have on our famous clear water sources plus the northern Minnesota woods and habitat. Clearly this should be a NO vote on these issues. Please listen to the conscience of the people on this one. Sincerely, Joanne Smith 697 23rd Ave NW New Brighton, MN 55112-6516 (651) 636-7736

My name is Joanne Smith, and I was born and raised on the shores of Lake Superior near Two Harbors MN. As a young child, we took a trip north along Lake Superior, and in Ontario Canada we came across an area that looked like it had been white-washed. For miles the trees were stripped of vegetation and life, and we gradually found out that this was the effect of acid rain a byproduct of the mining industry in that area. If you have never seen images of this kind of destruction, you would NEVER vote yes on letting these mines in to do their destructive mining techniques. Think what this would effect. Not only would it be destructive to the lives of the people that make this area their home, it would literally decimate the tourism industry along the North Shore and over in the BWCA. Our lakes and rivers would be irreparably harmed, as would Lake Superior itself the source of drinking water for many thousands of people. The jobs that we are talking about do not have that kind of economic impact. Yes, there would be construction jobs but only for a while. As for the miners, as many as want to work, there are jobs already available in the iron mining industry. This is a short term vision for a LONG TERM PROBLEM. Please listen to the conscience of the people on this one. This is not simply a tree-hugger issue. This is the future water quality issue for the State of Minnesota and Wisconsin and also Canada. Thanks for listening to a voice of reason, Joanne Smith 697 23rd Ave NW New Brighton MN 55112 651-636-7736

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, JoAnne Stick 5031 148TH PATH W. CTSTRT APPLE VALLEY, MN 55124

---Original Message--- From: jos1281@gmail-com [mailto:jos1281@gmail-com] Sent: Monday, March 10, 2014 7:54 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Joanne Swanson 1281 Como Blvd W Saint Paul, MN 55103

Jodi Broadwell

Dear DNR, I am against the NorthMet proposal and any other copper/nickel/sulfide mining proposal that comes to Minnesota. Copper/nickel/sulfide mining has a history of leaving devastated wastelands and poisoned waterways behind when the mining is done and the tailings remain. Mining companies have not found a way to keep the tailings contained. There is 1 copper mine, the Mopani Copper Mine in Zambia, Africa where the tailings are contained. The tailings are contained by a Dolomite shelf that surrounds the copper-this shelf occurred naturally within the earth. The Dolomite has made it environmentally safe for copper mining in Zambia. We do not have a Dolomite shelf surrounding our copper here in Minnesota, we have water. I love living in the land of 10,000 lakes and I choose to buy my home here in 2010- I have invested thousands of dollars into my home and I fear that if our waterways become poisoned I will be forced to move and if the proposed mining project turns the Northland into a wasteland and poisons the Minnesota waterways, I imagine no one will want to purchase my home. Please protect our water and our investments from becoming a poisoned wasteland of loss and devastation. Say no to NorthMet. Jodi Broadwell 317 N. 22nd Ave West Duluth, MN 55806

To Whom it May Concern, I strongly believe the PolyMet mining proposal requires more time in order to sift through issues regarding the maps. I have been conflicted about the mine. I realize jobs for Minnesotans are crucial. My husband has been unemployed for several months and we personally feel the strain of a slow economy. However, I am not convinced that this pollution can be contained. The topographic maps are not accurate. The sulfuric acid will most certainly drain into pristine watersheds. I urge the DNR and stakeholders to look more closely at these maps and require more time to investigate their accuracy. We need resources. We need jobs. However, evaluating the risk to the environment needs more time. Thank you, Jodie Prohaska

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Jody Copp 4222 Scott Ter Edina, MN 55416-5036 (952) 926-3740

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Jody Goldstein 2124 Schmidt Ct SE Rochester, MN 55904

Jody Schulman

40313

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Jody Schulman 3305 Coventry Ct. Dr Ellicott City, MD 21042 US

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Areas around and near to the BWCAW need to be protected at all costs. We have seen too many of these areas ruined by indiscriminate development, with the average citizen losing out. It not only costs taxpayer money to try to clean it up, but deprives everyone of recreational opportunities. All the mining company has to do is declare bankruptcy when they have extracted the majority of the minerals from a site, and all future clean up, if it can even be remediated, becomes the responsibility of taxpayers. This is wrong. Minimally, any mining company wanting to mine an area should be forced to put in place an escrow of a minimum of 10% of the value of the deposit in order to have funds available for cleanup. Letting them proceed with a permit, using bad data, is negligence on the part of our public servants. This must be stopped. Sincerely, Joe Adler 3305 E 126th Lane NE Blaine, MN 55449 Sincerely, Mr Joe Adler 3305 126th Ln NE Unit E Blaine, MN 55449-6611 (763) 862-8447

Joe Baltich from Ely, Minnesota. Third generation Slovenian since we're counting. I grew up in Ely and I spent my entire life there and am still there. My family has had a resort in Ely since -- well, it started as a cabin in 1939 and became a licensed resort in 1944 by my dad. And it's operated continuously since 1944 until now. This summer will be our 70th year of operating as resort in the tourism business in Ely, Minnesota. So I know tourism and I know for 30 years prior to the inception of our resort as a licensed facility and to current date mining has occurred in Ely around us for all of these years. And we've lived with it and we've done quite well. The water is clean. The fishing is good. Tourism isn't as good as it is due to competitive forests perhaps, you know, and other things, economic factors and whatnot. But I do know one thing. That Ely won't survive on tourism alone. Tourism is one slice of the pie. Another slice of the pie, from what I see in Ely, is mining. It may be a big slice of the pie, it may not. It depends on how you want to look at it, because all businesses wax and wane. They come and go. Mining will have its peaks and lows. So does tourism. As result I want to see mining on the Iron Range. I want to see the opportunity for the people on the Iron Range to have jobs that aren't just tourism, because tourism comes from Ely next to the Boundary Waters Canoe area where I'm from. It doesn't happened in Virginia, Minnesota, per se. Sorry, Virginia, but it doesn't compare to Ely. And so what I'm trying to stay is you need it all. It's 2014. We've had oh, many, many years now for mining technology to increase over the years and improve. And I believe in the year 2014 that we have the capability to actually function as an ecologically sound mining institution or area or region. One comparison I will make -- and I will try to be brief -- this morning I was reading the news on the Internet and they said China today is having dangerously high outputs toxic air pollution, because China they are all about making money. They don't care what they do. They showed pictures. You couldn't see anything. It was a sea of smog and people walking around with masks. Well, China is one of the biggest places for copper production in the world right now. They're dominating it. And so as a result we've got China doing whatever they want. When they have output of any kind, they dump it out in the sea. They don't care. I will tell you one thing, in Minnesota on the Iron Range we have a lot of fishermen and hunters who like this area. That's why we stuck it out here so long. And as a result we're going to see these people being good shepherds and good stewards to their land. We are not going to see the kind of pollution you're seeing in China. The United States of America, Minnesota, the Iron Range, and Ely should be leading that charge. And that's where I stand.

Joe Begich

18315

My name is Joe Begich and I've resided in Eveleth for the past 84 years. I've been involved in the Minnesota legislature and served on one of the toughest committees in the Minnesota House. The committee of natural resources and environment. We served under a tough chairman. The laws and rules that we are operating under now are the toughest in the USA. Just recently somebody mentioned West Virginia. That plant hasn't been inspected for 20 years. This will be inspected on a daily basis. And there's nothing wrong with mining and providing jobs if we do it the right way. And from what I can follow and what is clear to me, this company is planning to do it the right way. Otherwise I would not support this. I aim to protect the environment like everyone else. But I live in Eveleth in the middle of the mines, of the Eveleth Taconite. 90 feet from my driveway is Eveleth Taconite. I don't have a problem. They live by the good rule. I live by my rule. There is no problem. Why can't we all get together and live the proper way and open that mine and provide long paying jobs for our area, for our youngsters coming up graduating from school.

Joe Cherra

Has anybody researched or even thought to investigat the use of fumerole biotics as a tool for mitigating the sulfur problem associated with sulfide mining. I'm thinking of the deep sea organisms that break down the SO2 and CO3 into oxygen and nutrients to live off of. Minnesota has the 4th largest deposit of Copper and Nickel bearing ore on earth. University of Minnesota - Duluth geology professor, Jim Miller, says that estimates are as much as 4 billion tons, worth more than \$1 trillion, creating thousands of jobs for maybe a century. Polymet proposes to mine this ore near Aurora / Hoyt Lakes with an annual output of 36,000 tons of Cu, 7,700 tons of Ni, 360 tons of Co and 7200 pounds of precious metals. They estimate that this project will provide: Approximately a \$500 million construction project, creating two million hours of construction work. 360 full-time mining jobs 600+ related jobs Estimated \$15 million in annual local and state tax revenue Estimated \$45 million in annual federal tax revenue \$720 million in wages over a 20 year period \$10-3 billion in economic benefit to St Louis County \$300 million in new local and state tax revenues \$900 million in new federal tax revenues. These are Polymets' numbers. What troubles me is: 360 full time mining jobs + 600 related jobs for 20 years is going to create almost 1,000 unemployed 40 and 50 year olds in 20 years in an area that has been hard hit, for years, with scarce job opportunities and higher than the state average unemployment numbers. What happened to the 100 years that Jim Miller forecaSt Even if other mining companies move into the area in the next few years, will they be able to absorb Polymets' unemployed. Will Polymet be paying enough in unemployment compensation taxes to cover these large numbers. Polymet proposes to create 360 full-time mining jobs. They will provide \$720 million in wages and benefits to 360 full time employees over a 20 year period. This looks very promising until you consider that \$500 million of that projection will go to construction. Subtract that from the \$720 million and the number is closer to \$220 million. \$30,000 in wages looks good until you start deducting the benefits they promise. It doesn't take much to make that good looking job a "slightly better than a poverty level" job for a provider of a family of four. Estimates range from 200 - 500 years to treat the water flowing through the site at a cost of \$3-5-6 million dollars per year. No corporation, especially one dealing in a mining project as devastating as this, can guarantee being around that long, even if it's only 200 years. We have to assume that the taxpayers are going to be footing the bill for a clean-up project ranging from \$700 million to \$3 billion. There goes the local, state and federal tax revenues. This figure should be enough to stop the project in its tracks. The EPA estimates the total cleanup cost would exceed \$50 billion. I grew up in Duluth, MINnesota in the shadow of US Steel's Morgan Park plant, a few blocks from the St Louis Bay which the steel plant used as a sewer. My father worked the steel plant from the time he returned from WWII until he was terminated in 1972 when U.S. Steel closed the plant, shipping all of its equipment to Venezuela rather than cleaning up their mess. The grounds of US Steel's Morgan Park operation is now a Federal Super Fund site. The St Louis Bay is still waiting to be cleaned up. US Steel fled rather than fix. I returned from VietNam to find that Duluth's drinking water was contaminated with asbestos dumped into Lake Superior by Reserve Mining Company. Duluth had to build a new water filtration plant to rid the water of the asbestos. Duluth and the federal government paid for this, not Reserve Mining. Reserve Mining closed rather than fix it. The company that took over the Reserve Mining operation lost a tailings pond which dumped mining waste into Lake Superior. LTV closed rather than fix. Polymet has a bad reputation in South Africa and South America. They tend to leave messes behind just like US Steel, Reserve Mining and LTV. Can we trust them to live up to any of their promises. I have learned to be skeptical of any promises made by any corporation that depends on short-term profits ra

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Joe Cunningham 1486 Pleasant Ave Baldwin, WI 54002

To: State of Minnesota From: Susan Hangartner and Joseph Feidt, Beaver Bay, MN Dear State of Minnesota: We own a home in Beaver Bay, MN on the shores of Lake Superior. The house has been in my (Susan's) family since the 1920s. My great grandparents were some of the original settlers in Beaver Bay. I have roots here that go way back. Both of us have hiked and explored this area since we were children. We urge you look beyond the short term gain of jobs to the relatively near future when the mine is closed and the mining company has pulled up stakes. Can you guarantee the pollution from this mine will not reach streams, rivers, and Lake Superior. Do we really want to gamble on our environment once the mine is closed. Superior is the cleanest of the Great Lakes. It is our jewel to protect. Let's keep it that way for generations to follow. Respectfully Submitted, Susan Hangartner and Joseph Feidt

Lisa Fay, EIS Project Manager, MDNR Division of Ecology and Water Resources Environmental Review Unit: I have reviewed NorthMet Mining Project and Land Exchange, Supplemental Draft Environmental Impact Statement documents. I am not a scientist and did not read the entire 2,000+ page document but did read the Executive Summary. In my opinion, the SDEIS provides more than adequate coverage of the NorthMet Mining Project and Land Exchange. Water quality, air quality, cumulative effects, closure, etc are extensively analyzed and studied in the SDEIS beyond the MEPA and NEPA statutes and criteria. The project should be allowed to proceed to the EIS phase. On a personal note I'd like to add that I am from Ely, Minnesota and our town has been dying since our last mine closed on April 1, 1967- We are sitting on one of the largest copper/nickle and precious metals deposits in the world and it would be a shame not to use our natural resources, but import them fro overseas. We need jobs in this area and we also need clean water and air and I believe we can have both. Minnesota has the strictest environmental laws in the nation and we will mine safely. Regards, Joseph R. Folio 546 E. Wilson St Ely, MN 55731 218-365-2474 folio@reagan-com

Joe Knaeble 40871

To: Lisa Fay, EIS Project Manager, or the appropriate person to take public comment on the PolyMet Mining Inc. Proposal. From: Joseph P Knaeble 2533 Colfax Ave South Minneapolis, MN 55405 612 644 9412 HYPERLINK "mailto:joeknaeble@usfamily-net"joeknaeble@usfamily-net I am a Certified Master Water Steward, a contributor to the development of green building standards for the MN GreenStar Program and have been actively involved in the development and operation of several green business over the past 20 years including The ReUse Center, a Project of the Green Institute. I am partial owner of several properties in Itasca County and a property in Lutsen MN. I have several questions regarding the permitting of the proposed PolyMet mine on the Mesabi Iron Range, 6 miles south of Babbitt, MN I also have several comments that I would like to be on the public recoRd Questions regarding the SDEIS Document. First questions are in regards to Section 1-1-1 in which the following figures are given of approximate outputs of the mine. 15 million tons of waste rock annually; 11-3 million tons of tailings from the Beneficiation Plan annually: 313,000 tons of residues from the Hydrometallurgical Plant 131,000 tons of copper concentrate, 18,000 tons of mixed nickel/cobalt hydroxides and 500 tons of PGE precipitate annually 1- Would you please identify the toxicity or danger levels of the 15 million tons of waste rock, the11-3 million tons of tailings and 313,000 tons of residues. What are the time estimates of how long these 3 outputs would need to be monitored in the designed storage ponds, pits or piles before they would not create pollution problems that would exceed environmental standards if they escape from the pits, piles or storage ponds. 2- How would the financial assurances be structured to cover failures that exceed environmental standards while PolyMet is still mining, if they occur decades or centuries after PolyMet has closed the mine or if PolyMet has gone out of business. My next questions relate to the answers given in my first series of questions. In Section1-3-2- subsection 1-3-2-1 Project Purpose and Needs are addressed. The 2nd bullet point states that a purpose and need of PolyMet Inc. is "To extract metals in a safe, environmentally responsible, energy efficient, and economically feasible manner subject to mitigation measures designed to avoid or minimize environmental effects to the extent practicable". 1- Is it possible and even probable that to extract metals in a safe, environmentally responsible manner at some point becomes in contradiction with extracting them in an economically feasible manner. To leave it up to PolyMet to define the extent practicable of balancing what could easily be opposing criteria does not seem to be in the public interest nor does it provide protection for the environment in the Cloquet Watershed and for Lake Superior. 2- Mitigation measures are designed to avoid or minimize environmental effects to the extent practicable. Does the State of MN or any other governmental body have a say in defining the extent practicable. Comments 1- According to my research the past track record for sulfide mining in an environmentally sound way is very poor and mitigation efforts have been inadequate approximately 64% of the time and this includes modern mining operations. An organization called Mining Truth claims that mining companies often either do not have the financial resources to clean up the pollution caused by their mines or have gone out of business while financial assurance have not been adequate to cover the costs of clean up. How is PolyMet's proposal different from past sulfide mining operations that have become a liability to the public and have done damage to the environment. Due too the past track record it seems PolyMet needs to guarantee complete clean up for as long as any failure of waste containment from its operation creates problems that exceed en

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Joe Krenzelok Minneapolis, Minnesota

I strongly disagree with your stance towards sulfide mining. I believe you are just looking for profits at the expense of the environment and peoples lives. Sure this would create jobs, but it would just be temporary and would cause major pollution our lakes and rivers. We do not need my mines in our beautiful state, and if it's not broke don't fix it.

Joe May 6372

Dear Ms Fay, Dear Federal and State Agency Leaders: Who will pay for the clean up when Polymet has exhausted the resource, then files bankruptcy . PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would d Sincerely Joe May 10533 W. River Rd Brooklyn Park, MN 55443 651-334-4199

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. The resources that would be obtained from this mine are necessities, if we don't mine them someone else will. Sure there are negatives to the environment but what about our economy and the jobs that we are giving away. As far as the global environmental impact, most countries have much worse environmental regulations and will cause a larger impact to the environment if they produce these metals. I APPROVE the proposed PolyMet mine Sincerely, Mr Joe Nelson NO shoreview, MN 55126 (612) 581-1154

While I appreciate the fact that Polymet has attempted to work within the guidelines and regulations provided them in their endeavor to begin mining 3 MILES AWAY FROM THE BOUNDARY WATERS, feet away from streams and other waterways that lead into the BWCA and surrounding area, I find it absolutely ridiculous that this proposal has gotten this far. The single point that this is a 500 year agreement along makes it an impossible decision for us to make; there are concerns for the next 20 years as regards water, air and soil quality – how could Polymet possibly believe themselves competent to predict/mitigate effects for the next 500 years? I believe it would be best to let nature function as it has for the past billions of years; obviously the pre-existing system works and the proposed amendments to this system – mining – are iffy at best.

Joe Scherer 18118

My name is Joe Scherer. I am from Embarrass, Minnesota. Thank you guys for your time coming here. I appreciate everything you have done, standing up getting ridiculed by some of these people. I'm not going to do that. You have done a great job. Your employees have done a job. I live in Embarrass, Minnesota. I live six miles away from the gate to this plant. I was born and raised here. I hunt, I fish right in the back of this plant that they are proposing. (Inaudible) nobody has these problems with waters. They're monitoring and taking care of them. We are stewards of our area. I fully believe that our government agencies will make sure this area will remain intact and pure. We can having mining. We can have tourism. So with that being said, again, thank you guys very much. Job well done. Thank you.

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Hello, I am contacting you today in regards to the copper and nickel mining that is being proposed near Hoyt lakes. I am adamantly opposed to opening a mine there. In the past companies that have opened mines like this one have failed to keep the environment adequately during the operation and avoided cleaning up the site after the operation is over. I do not believe current mining techniques can safely remove the copper and nickel without causing great harm to the environment. I have enjoyed the boundry waters many times over the years and with the projected scarcity of water over the next few decades why would we poison our water supply. This mine is irresponsible and the potential benefits are short sited at beSt Joel Bryan Rosemount, MN

March 13, 2014 MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 To Lisa Fay, EIS Project Manager, I am writing to comment on the NorthMet Supplemental Draft Environmental Impact Statement (SDEIS). Based on the NorthMet SDEIS, the proposed project would result in large-scale disruption and degradation of forested wetlands in the headwaters of the St Louis River. The project also represents a serious threat for heavy metal leaching into surrounding ground and possibly surface waters to an area that is already recognized by the state for persistent mercury pollution. These impacts are not adequately addressed in the SDEIS. While the executive summary highlight the direct impact to wetlands (~900 acres), Chapter 4 provides a much more complete picture of the wetland impact. As the SDEIS notes, there will be likely be a much broader affect on wetlands in the region owing to activities associated with the mine pit that would negatively affect wetlands adjacent to the operations (exemplified by the high percent of low quality wetlands adjacent to other facilities in the region) and changes to the underlying water table and hydrology. In the SDEIS, this broader impact is identified in the analysis of Areas 1 and 2 (above and beyond the Northmet project area and Mine Site). The NorthMet Project area includes 177 wetlands (66% rated as moderate or high quality) covering 1,584-9 acres. The Mine Site area includes 87 wetlands covering 1,297-8 acres. According to the SDEIS, these are essentially pristine wetlands: "The vegetation types located at the Mine Site are indicative of pre-settlement conditions and lack hydrologic disturbance." Area 1 encompasses 465 wetlands covering 11,201 acres. Area 2 contains 373 wetlands covering 8,621-9 acres. In essence, the project will severely impact about 6,000 acres and potentially impact about 20,000 acres of wetlands, including pristine wetlands and high-value forested wetlands whose functionality could be severed degraded by changes in hydrology associated with the mining operations. Nevertheless, the mitigation target is far less (<2,000 acres), and would not necessarily restore the lost functionality to headwater streams or to the St Louis River watershed. This is a severe shorting-coming of the NorthMet SDEIS. The resultant changes in hydrology and ecological function of these wetlands represent a significant impact to the watershed, and would add to the cumulative stress placed on the St Louis River. The SDEIS does not adequately address these downstream impacts. The wetland loss is unacceptable at this scale, especially in light of the large expense committed by the federal and state government to restore wetlands in the lower reaches of the St Louis River. As the executive summary notes, mercury pollution in the St Louis River is of particular concern and potentially represents a serious public health threat. There is already a fish consumption advisory (owing to high mercury concentrations in tissue) posted for fish in the region of the proposed NorthMet project. Although the water quality model developed for the project suggests a net decrease in load of mercury to the St Louis River, these models are reliant on two critical assumptions: a lack of groundwater leaching from the pit and tailings basin, and successful water treatment. It seems likely that at least one failure in the applied technologies will occur during the operational period of the mine. This potential is not evaluated in the SDEIS. Moreover, the mine pit will require a large load of electrical power, likely causing an increase in power generation in the region. Presuming the power will come from a coal-fired power plant, this would likely add to the atmospheric mercury loadings to the region. In conclusion, the SDEIS details substantial environmental impact to the region but fails to adequately consider the full effect of t

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Joel Kelly PO Box 181 Montrose, MN 55363-0181 (763) 269-6165

I'm concerned about the mining proposal being put forth. I don't want our state's water sources being polluted for generations to come. Without a plan in place for proper clean-up, I'm concerned of the irreversible damage that will be done to the surrounding ecological systems For the benefit of current and future Minnesota residents, please insist on a more thorough plan for keeping the waters safe and clean. If it isn't possible or feasible to keep the waters clean with this mining project, then it shouldn't be done. Respectfully, - Joel Vlaminck, DC, MS [HYPERLINK "mailto:drvaminck@gmail-com"](mailto:drvaminck@gmail-com) drvaminck@gmail-com

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to much longer. Ninety days are not enough to digest and comment upon the enormous document. Water Legacy, which has looked at the document, states the following reasons for lengthening the comment period. They all look reasonable to me. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Joel Weisberg 105 Winona St Northfield, MN 55057 507-645-9112

45191

Dear Ms Fay, Dear Federal and State Agency Leaders: I am writing to you to urge you to stop the proposed PolyMet sulfide mine because it will violate numerous health and environmental standards. Specifically I am asking you to reject the SDEIS and to deny permits to begin it. It is especially unrealistic to expect that the polluted water flowing from the site will be environmentally monitored and treated "in perpetuity," or even "for 500 years," which would be required according to numerous studies (eg DNR Fish and Wildlife). The SDEIS environmental study suggests a number of practices that would be harmful to the environment, including dumping the enormous amount of wastes into unlined pits that would leach dangerous chemicals into the water, harming streams, wetlands, and fisheries; while containing insufficient detail in other cases to determine whether or not the proposed practices would be harmful. Thank you. Sincerely Joel Weisberg 105 Winona St Northfield, MN 55057 Joel Weisberg 105 Winona St Northfield, MN 55057 507-645-9112

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

9752

Hello, thanks for letting me know if my comments are logged: 1- 500 years of pollution legacy is not worth 20 years of labor 2- Who will foot the bill for the 500y of cleanup when the company folds (because it will, like everything): Minnesotans. 3- No work is worth the pain and suffering that will ensue from people dying from the pollution of our drinking water 4- Nobody would put their glass of water by the urinal. Yet, this project would allow more than just that: the dirty water will go into the biggest reserve of fresh drinking water in the world 5- There is more money and jobs to create by promoting tourism than by polluting. Also, who will want to visit the area if it is polluted, what are going to do the people working off tourism. 6- If Polymet wants some rare minerals, there are in higher concentrations on dump sites: mine there. Sincerely Johann Chemin-Danielson 6039 Beachwood Road Mound, MN 55364

Dear Minnesota Even if I love you a lot, and especially your northern territories are my most loved areas about you, there is something I need to talk with you about. You dear, who do you think you are. What sacrifices are worth trading them for money, short term jobs and resources you can get from recycling processes. Don't you think its time to change our idea of development. Development that creates such amazing things like the selfish capitalism we are living in. The whole thing where I am coming from might be a little bit too big to hang it up just on the polymet story, but if this is goes through its one more big stab to the idea we as human beings, due to our intelligence and power responsible for the worlds health, should treat our environment.. I mean the facts are clear. Everybody who does just minimum research in these mining processes sees the big risks. And everybody who sees clearly understands who the mining will benefit. And everybody who trusts polymet should consider the fact that as fast this company appeared to make that amazing deal, as fast it will disappear if it comes to cleaning up the mess Governments are there to protect people and environment and to regulate institutions and companies. Not the other way around If Minnesota doesn't understand that, who will AGAINST SULFIDE MINING IN NORTHERN MINNESOTA Thank you for listening Minnesota. Your dear friend, Johannes Donaubaauer

John

36772

To paraphrase a well known quote: "Ye canna change the laws of chemistry." Exposing sulfides in a moist environment produces acids, which acids in the water, besides being polluting in and of themselves, also leach heavy metals from the surrounding rock, which poisonous metallic compounds also enter the runoff waters. And the process continues as long as the exposure remains. ie for at least centuries, until all exposed material has been fully extracted. Containment, even for relatively short time spans is difficult and expensive, if not impossible, and over the many years of continued hazard the possibility of continuous containment is merely wishful thinking. All permits for this destructive activity in such a vulnerable environment should be denied. Thank you for your attention. John Kronholm 442 Bear Avenue South Vadnais Heights MN 55127

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. None of us will be around in two or three hundred years but we can make sure that this mining effort does not become like the "taconite tailings" problem for future generations. Let's make sure all the facts are known and the extent of the possible damage is clearly spelled out. Only then can a good and responsible decision be made. Sincerely, John and Carolyn Forney 12913 Jorissen Rd Hopkins, MN 55343-4102

Dear Minnesota State and Federal partner links for the preparation of this DEIS: Unfortunately we were not able to attend the public meetings for various reasons beyond our control, including the weather, and resulting road conditions. So our comments need to be expressed in this email. As residents of the Minnesota Arrowhead country, we certainly hope that these comments are considered. We are full time residents of the Minnesota north country, living at Lutsen for the past 26 years, at 5171 Highway 61, and 103 Caribou trail. The very things that attracted us to this gorgeous country include the beautiful boreal forest, clear streams and inland lakes, and of course the unequaled beauty of Lake Superior during all seasons of the year. We didn't come here enticed by new jobs being offered by any resource gobbling industries. We came here and created our own jobs, offering services that the people living here, or coming to visit needed. We have all lived in various parts of the country, such as south central Missouri, southern Illinois, the mountains of New Mexico, the mountains of Colorado, and the spectacular coast of Alaska, So we have seen other beautiful parts of the country, but none to top the Minnesota Arrowhead, Lake Superior country. The father/grand father of this family, John Woerheide served the US Forest Service for 35 years. Various jobs included preparing proposals for designating Wilderness Areas, lands and minerals management, timber management, silvicultural research, recreation resource management, and public affairs. The whole family has witnessed the results of metals mining for such metals as lead, zinc, copper, gold, silver, and many other metals as well. We lived on various National Forests, mostly in remote back country areas. When we lived in Southern Illinois on the Shawnee National Forest we often visited the fluorspar/lead/zinc mines of that area. such as Minerva Number One, and the Crystal mine. At many of these mines the fluorspar was the retained ore mineral, and the lead, zinc, and other metals often made it into the tailings of these operations. That was back in the late 1950s, and of course the people of the area could only see the benefit of the jobs the mines provided. As a result of the careless surface disposal of metal ores, there is now a great deal of water pollution at and around disposal sites, leading to health alerts for such areas as the Minerva No 1 site (see www.atsDradc.gov. Minerva Mine No1) When we lived on the Santa Fe National Forest at Pecos, New Mexico we used to make many trips up the Pecos River to the site of the old Terrero Min about 12 miles north of Pecos . This was an old deep mine under ground where zinc , copper, lead, gold and silver were mined in the past, There were about a dozen other trace minerals involved as well. Waste rock material was spread out in an area about 20 acres in size at the mine site. Higher grade ore was sent by tramway to the Alamitos Mill at Pecos, New Mexico, where the ore was processed, and waste tailings were fed into tailings ponds. Both of these sites have been discovered to be highly polluted. Unacceptable levels of pollutants present in surface areas, and extreme pollution of ground waters are present all the way as far south as Carlsbad on the Pecos River. Water at camp grounds along the Pecos River has been polluted. A person can not even go near the old mine site, or the mill site. There are chain link fences and keep out signs around the areas. As a reference see - New Mexico Geological Society guidebook, 52nd Field Conference, Geology of the Llano Estacado, 2001 = Long Term monitoring of the Geochemistry Of Surface Water, and Stream-Sediment Samples from the Southern Pecos Wilderness to Brantley Dam North Of Carlsbad. Eastern New Mexico - Year Nine. It is absolutely amazing how long this pollution has held on, and how many parts per million there are of the different metals in the water. At Silver City, New Mexico, we lived in c

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. We in Minnesota take great pride in doing what is right for our state and often lead the nation in many endeavors. If we approve PolyMet to move ahead, we will be condoning a business that could do immeasurable damage to the health of the people, environment and tourism in the northeast region of our state. That will reflect poorly on the leadership of our state who approved such a foolhardy business to operate in such a pristine region. Our wildlands and water is what Minnesota is noted for why would we ever risk it's ruination. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, John Aamodt 35617 County 39 Laporte, MN 56461-4051 (218) 224-3562

Hi Really I just can't imagine this proposed mining project will be allowed .. OK sadly in our misguided way and value system disorder effecting humanity on this earth I can imagine this and it's sad .. Please use logic and shut this insanity down. John Amren 1940 Minnesota Ave Duluth MN 55802 Sent from my iPad

John and Barb Bottger 40658

The facts are clear. This proposition is neither environmentally or financially feasible. It is a huge wake up call to Minnesota to support US companies that are engaged in technology using renewable resources. Let the real work of building a future that we can be proud of passing on to our grandchildren. Barb Bottger 61 Bunn Trail Grand Marais, MN 55604

42277

Dear State Leaders from our Dept. of Natural Resources, our US Forest Service and our US Corps of Engineers, Dear Representative David Dill and Senator Tom Bakk, The PolyMet Supplemental Draft Environmental Impact Statement proves that we are setting ourselves up for one of the most irresponsible decisions for the future of Minnesota's natural resources for this and future generations. Is it still possible to appeal to your basic sense of what is right and wrong. Should I copy and paste the exhaustive lists of holes in the impact statement. Should I appeal to your philosophical, emotional and spiritual selves. What kind of impact statement can I make that will equal the power of PolyMet. It is this: My husband and I live on the Gunflint Trail in Cook County. We work with you to safeguard the water quality of our watershed. You have taught us this truth - "everything that happens on the land, ultimately ends up in the water". We've had to confront you with your own truth more than once when the offer to trade land overrode your understanding of this truth. It was a small scale battle but ironic in that we have to defend the land from the same people who are teaching us to protect it. It would be so easy to throw in the towel and sacrifice it all. But we do not live in a third world country where international goliaths can leave us with no choice but destroy the land for the wealth of a few. Be the leaders you have chosen to be, make a decision based on what is right for the future not on what is best for a few for awhile. The cost is just too great. I do hope you have ears to hear and the wisdom to listen and the heart to protect the land and safeguard those who inhabit it. Sincerely, Barb Bottger 61 Bunn Trail Grand Marais, MN 55604 218-388-0868 [HYPERLINK "mailto:jbottger@boreal-org"jbottger@boreal-org](mailto:jbottger@boreal-org)

John and Barbara Edgar 57276

Please accept these comments on the Poly Met Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose, exchange of federal land within the Superior National Forest, and cumulative impacts from mining. The proposed mine poses unacceptable risks to our waters and communities, and I support the No Action Alternative.

John And Eleanor Lynn 24064

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, RE: PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is NOT in the public interest and the damage CANNOT be reversed. Do not change protection for private economic gain. Sincerely, John And Eleanor Lynn 1215 Crestline Dr Santa Barbara, CA 93105-4604

John and Karen Legenhausen 40804

Please think of our future for our grand children and vote against copper mining in northern MN. Encourage recycling electronics to get the minerals we need for our greedy lifestyle and save our waters. Karen Legenhausen

John Arachikavitz 42005

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, John Arachikavitz Rochester, Minnesota

Feb 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I personally would like to see the issues above resolved and responded to in regards the Impact Statement and how this will be addressed . I thought wetlands can't be destroyed. Digging a pond somewhere else is not the same biodiversity and it's not in the same area. How will the tailing pond protect ducks from landing on it. Hasn't been addressed. What about floods and accidents . There has to be zero tolerance for pollution. I want to see a impact statement on wildlife and moose by a non Polymet third party. The study indicates no nesting eagles but a local person who lives there says there is. Is there endangered plants or animals living there. Need 1-5 million a year for the 500 year time span . IRRRB has to be 100 percent back up to the company's financial assurances. Zero taxpayer liability should be written in. The mining industry must provide like banking and insurance a pooled liability coverage if the company goes out of business. All DNR or MPCA staff who have ever worked for mining needs to exuse themselves from this study and permitting due to conflict of interest . All permit and water violations have to have meaningful fines but also mean immediate shut down until remediated and fines paid. Not gonna see over 300 violations go unenforced like we had with LTV. St Louis River watershed, partridge ,and embarrass rivers can't have any decrease flow from loss of wetlands and their natural ability to clean water. I don't see any plan for tailing pond failure. Needs to be addressed. River flow at the site and down River needs to be redone . It's a big deal . Every model changes with different flow data. Needs re-work. Also put in EIS about planned expansion limits due to existing site limitations and address new mines accumulative effects. Sincerely, Mr John Badger 1341 Valley View Dr Cloquet, MN 55720-2979 (218) 348-3386

Lisa Fay, This may be a great opportunity for PolyMet; it may also be a great opportunity for the Iron Range and Minnesota, however, there are still pitfalls ahead. I've read most of the EIS and attended the meeting of January 28 in St Paul. I talked to someone at every table, learned some new things, and came away with some impressions: the people at the tables knew their material and presented it soundly, without taking a stance on the project itself; the people at PolyMet were less engaging. Going forward, the Partridge River analysis should be redone prior to any permitting process. Without it, that oversight may be indicative of the way the entire project will be managed. While that analysis is being reexamined, I would ask that the following issues be considered and addressed. What is the breakdown of the cost analysis used to arrive at the figure of \$200 million for the 200 to 500 year (perpetuity) water monitoring and treatment cost. The DNR will also need to explain how they are going to manage those funds for "perpetuity". Current climate models indicate a warming climate trend; what criteria will be used to address the remediation of the landscape, not just when the mining project is finished and shutdown in 20 or 25 years, but so the landscape plantings are viable at the 50 year mark and beyond. If severe drought were to affect the region during the time span of the mining project, depleting the available water resources required, what is the secondary resource and how does that affect the existing treatment plan. Conversely, how is excessive groundwater runoff to be managed in the event of two consecutive years of exceptional snowfall with one 500 year rain deluge in between. Since this project is a site renovation, becoming a mining operation, and reverting to a site remediation, why is there no mention of any effort to achieve a LEED certification. Not only would LEED certification demonstrate a commitment to the environment, it would serve as an example of how the mining industry and environmentalists can work together in a non-adversarial relationship. A project of this scope, with a twenty plus year life span, will have a high energy consumption. Why has no effort been made to incorporating solar and/or wind energy produced on site, as well as a minimum requirement for the use of Minnesota produced bio-diesel. If you are going to produce local, then use local. This is not just an opportunity to benefit the Iron Range, but also greater Minnesota. It's disappointing enough when PolyMet misses this opportunity to develop goodwill state wide, but when a state building and construction trades' representative and the Mn Chamber of Commerce ignore it completely, it's not difficult to figure out where the marketing dollars are being spent. In the past few weeks, recent studies on sulfate pollution have come to light regarding the impact of sulfates and hydrogen sulfide on wild rice and the surrounding aquaculture. Since the MPCA announced yesterday, March 12, that further studies and analysis are necessary before new sulfate standards can be applied, it would be in everyone's best interest to delay the permitting process for the PolyMet project until those standards are enacted, so that PolyMet can alter their manufacturing processes accordingly. Until these issues, and others that I may have overlooked, are addressed, I cannot support the permitting process going forward at this time. Sincerely, John Becker
Roseville MN

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, John Brainard 519 3rd Ave SE Apt 205 Minneapolis, MN 55414-1654

My name is John Buschette, that's B-U-S-C-H-E-T-T-E, and I just want to say it makes no sense at all, it's really short-sighted to try to create 50 to 100 jobs or even a couple hundred jobs that will last for 20 years and then destroy the environment to the point where it loses thousands of jobs in the tourism industry, destroying fishing, camping, hunting, other kinds of tourism activities, so that thousands of jobs there will be destroyed for 500 years, and the mining companies have had the same track record everywhere they've been where they set up a subsidiary, give most of the money to their overseas parent companies, and then when they're close to the end of the mine, they spin it off as an independent company, that company declares bankruptcy and the people who live there are stuck with hundreds of years of bills in the billions of dollars trying to pay for the cleanup. So the only one who wins are the fat cats in other countries who come here and pillage our land and leave us with the bill and land that's not safe to live in, fish that are no longer safe to eat and waters that we can't have recreation in. They're laughing all the way to the bank and everybody else is stuck with the bill and stuck living with the consequences. And it's also fitting to remember that the CEO of PolyMet is the same guy who was the CEO of BP when they had their Gulf of Mexico oil spill and his response to the oil spill is, "I just want my life back." Nothing about the people who were affected, nothing about all the harm that was done, nothing about the environment that was damaged and is still damaged. He just wanted his life back. He wanted to just leave everybody else to pay for the consequences of his actions, and he created the environment that when that drilling platform blew up, 11 people died. Nobody's ever had to answer for that. So how many Minnesotans may end up dying in a mine here because of the environment he creates while trying to put profits ahead of everything else? They get rich, we pay the price, and everybody except for a handful of people suffer.

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I am opposed to the proposed PolyMet because of the risks to the lake Superior watershed. The cost of being wrong is too great. Subsequent mines will affect the BWCAW and Quetico watersheds with sulfide mining runoff over many years unless everything works "perfectly." Again the risks are too great. The history of this type of mining is full of environmental damage. Minnesota has a unique resource in those watersheds that is far more important and valuable than the minerals under them. Thank you John Case, 2830 Gale rd, Wayzata, MN 55391 Sincerely, Mr john case 2830 Gale Rd Wayzata, MN 55391-2624

John Clifford

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources RE: NorthMet Supplemental Draft EIS (SDEIS) - Proposed PolyMet Mining, Inc. project (Project) Dear Ms Fay: The SDEIS clearly shows that the Project will impose enormous, long-term financial and environmental risks on the people of Minnesota, while providing only meager, short-term benefits. In exchange for "up to" 360 mining jobs lasting "up to" 20 years at the most, we the people would be burdened with at least 500 years of polluted water (not to mention land and air) in an area whose pristine lakes and rivers are a world-class treasure, and a source of long-term income, pride and enjoyment for all Minnesotans. The concept of "financial assurance" is absurd and meaningless in the context of pollution on the scale expected to be generated by this Project. How can the DNR, or anyone, even begin to guess how much it might cost to carry out 500 years of remediation in the interconnected waterways of Northern Minnesota. Is the DNR aware of any example of financial assurances made in the year 1513 that are still operative and sufficient today. How many private enterprises, governments, nations, and peoples have disappeared from the face of the earth since that time. In effect, we are being asked to accept the permanent destruction of one of the few remaining pristine wilderness areas in the world, in exchange for a few hundred temporary jobs. No deal. The Project should not be allowed to go forward Thank you for giving me the opportunity to comment on the SDEIS. Sincerely, John S. Clifford 1088 Pike Lake Drive New Brighton, MN 55112

Modeling in the SDEIS appears to be of a fatally flawed and discarded tailings basin design, not the currently proposed basin design. The 2014-03-10 Response 4 from ERM re: the Plant Site MODFLOW modeling identified Attachment A of the Water Modeling Data package of March 2013 (SDEIS reference Polymet 2013j) as the documentation of the tailings basin flow modeling for the SDEIS. That response led me to do further research into just what was modeled for the SDEIS. Careful examination of the scant information in the above referenced Attachment A (2011) indicates that the modeling done in 2011 for that attachment was not of the basin as currently proposed. The footprint modeled for attachment A is the footprint of an early basin proposal from 2007 (2007 basin footprint attached) that was supplanted by the basin design developed during the "Mitigation Options" process of 2008- The mitigation basin design was adopted in 2008 (2008 mitigation design footprint attached) and is the current basin footprint assumed in the text of the SDEIS (SDEIS Fig. 3-2-23). In addition to using an old flawed basin design footprint, the modeling in Attachment A also used a crude representation of bedrock that was supplanted by a more refined bedrock representation during the modeling of the 2008 mitigation design (RS13B Draft-01, 2008). The 2007 basin design, that is modeled in Attachment A (2011) of Polymet 2013j, was deemed to be "fatally flawed" by the DNR (Mitigation Table, Arkley email of 2008/12/09) and was replaced by the "mitigation" design developed in 2008- The diagrams and model files supporting Appendix A (2011) further demonstrate that the modeled footprint is of the early flawed basin design (see footprints in layer 1 of 2007 and 2011 models, attached), instead of the mitigation basin design (see footprint in layer 1 of 2008 model, attached). It appears that the SDEIS Goldsim modeling is based on MODFLOW modeling of an old basin design that was deemed fatally flawed and is not modeling of the currently proposed basin design. I am interested in getting feedback on this issue since the complex history of this project makes identification of supporting materials difficult. If I have miss-identified or miss-understood any SDEIS support documents please let me know. ---Original Message--- From: jcramp@comcaStnet [mailto:jcramp@comcaStnet] Sent: Monday, March 10, 2014 5:54 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of carbon pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include an updated 500-year storm analysis of both the mine pits and the tailings basin under increasingly violent weather patterns. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. Repeats of the 1999 Straight Line Windstorm with winds over 90 mph in Northeast Minnesota could also destroy critical wastewater treatment facilities. The constant alteration of drought and flood conditions caused by climate change in Minnesota could put strains on the whole water treatment process which wasn't even taken into account in the SDEIS's water modeling (which didn't even take into account the seasonality of flows in the rivers, streams, wetlands and groundwater) The model which put the flow of the Partridge River at 1/3rd of its actual flow is not fit to be the basis for predicting needs to treat water pollution under climate change scenarios for the next 500 years. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. Make the starting figure \$400,000,000 and keep it out of the hands of the IRRB I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. I camp in North East Minnesota and the Boundary Waters. I fish in the St Louis River and Lake Superior. This SDEIS has serious flaws that need

To: Lisa Fay, MDNR, Douglas Bruner, US Army Corps of Engineers, Tim Dabney, US Forest Service RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Bruner and Mr Dabney: Below are my comments about the PolyMet SDEIS. I am John Crampton of 1401 W. 102nd St, Bloomington, MN, 55431- I am 66 years old and have lived in Minnesota all my life. My wife and I raised our two daughters in Bloomington, and we have spent a great deal of time at the North Shore, Ely, Jay Cooke SP, and Boundary Waters areas camping, fishing, canoeing, hiking, skiing, snowshoeing and bird watching. We value the natural beauty, plants, wildlife, clean air and clean water of Northeast Minnesota. Our oldest daughter went to YMCA Camp Menogyn and to Vermillion Community College where she concentrated in environmental biology and outdoor recreation. Our youngest daughter takes frequent camping trips with her friends to the Boundary Waters and Superior National Forest I am the President of the Bush Lake Chapter- Izaak Walton League of America with over 160 members, the largest chapter in Minnesota. We value the strong longtime connection our league has had with the Boundary Waters Canoe Area Wilderness and Northeastern Minnesota over the past 90 years. The purpose of an environmental impact statement is to clearly communicate the environmental impact of a project and to explore possible alternatives and mitigations to lessen these impacts. I believe the PolyMet SDEIS was written to deliberately mask the many terrible and perpetual environmental impacts of the proposed PolyMet sulfide mining project. The flaws in the PolyMet SDEIS are many and very serious as described below. The PolyMet SDEIS is inadequate because hard rock mining has never been done in an environmentally-acceptable and safe manner in a water-rich environment such as the proposed site near Hoyt Lakes and the tributaries of the St Louis River. Almost all of the examples of technologies that PolyMet provides are from dry climate hard rock mining in Utah, Arizona and Montana. There are no actual real life examples of sulfide mining being done in an environmentally-safe manner in water-rich environments. However, there are many catastrophic examples which serve to show that it as an environmental disaster wherever it is attempted at water-rich sites. The surface water flow calculations for the Partridge River underestimate the baseflow conditions by a factor of 3- This is a fatal flaw since the computer model calculations of water flow are at the heart of hydrological estimates of the flow through the mine, tailings ponds, pipelines, water treatment facilities. Will PolyMet need to make the water treatment facilities bigger. Will they have to treat the water for 1,000 years or 2,000 years or forever. We can't tell because all the calculations are derived from a water flow model based on inaccurate data. The SDEIS should be completely redone or rejected for that reason alone. The PolyMet SDEIS itself foresees the need for perpetual water treatment of 500 years or more requiring continual monitoring, maintenance and high levels of continuous performance by highly complex engineering controls that have never been proven to work in a large scale applications. Think about it 500 years ago Balboa was looking for the Pacific Ocean. Martin Luther was alive and a practicing Catholic. Once hard rock mining is done on a large scale there is no way to stop the heavy metal leaching. PolyMet is proposing to mine for twenty years and then leave to the next 20 generations of Minnesotans the task of keeping its Rube Goldberg collection of technologies running at a high levels of performance (and without any financial assurances) in order to ward off disastrous acid mine pollution dumping into the Partridge, Embarrass, and St Louis Rivers and ultimately Lake Superior, the world's largest body of fresh water. The risk of this is far too high. For this reason alone, the PolyMet project should be

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr John Denk 17456 Parkside Ave Tinley Park, IL 60477-3045 (708) 357-0211

Thank you, Rick. I am John Doberstein. That's J-O-H-N, D-O-B-E-R-S-T-E-I-N. I am from Duluth. I am a volunteer with the Sierra Club. Very happy to be here. And I want thank all the regulatory agencies, all the volunteers, everyone who is working not only long term but short term to make tonight happen. It's pretty exciting. And I want to commend everyone pro, against who has had the courage to come up here and speak this evening. I do feel like this SDEIS is inadequate. And I would please ask that we reevaluate the 500 years of proposed water treatment needs to be addressed. And it is not adequate. It says that it will happen. It does not say how that will be funded, how it will be paid for. And even though we have the minute amount of sulfate in our rock, according to the company, it's a big enough amount to require at least 500 years of treatment according to the modeling. And there is also no contingency plans outlined for expected accidents that occur at all mines of this type. Mishaps such as pipeline spills and accidental releases, failures of water collection, and treatment systems, tailings and basin failure. These are foreseeable events that should have emergency plans developed and articulated to the public so that we have confidence in the company's ability to respond to these crises and potential crises. And I would just ask that we do a little bit better job in the next round. During operations 6.2 million gallons of polluted water a day will be treated. The mining plan does not describe what will happen if the water treatment plants break down. And I would like to see more addressed in that realm. And going back to the financial assurance, I do ask -- I'll reiterate I feel that should be part of this supplemental draft so that the public, the potential entity that will shoulder the responsibility of this cleanup, the public, that we have a chance to comment directly on what the plan is and the cost. How much is this going to cost? What is the dollar amount? How can we do it? I grew up in Two Harbors, Minnesota. I was an Army brat. I moved to Two Harbors at the age of eight from Georgia. And all my family is from Minnesota. I have roots. Even at eight years old I knew that Minnesotans look at the environment different. We don't litter. We protect our environment. We care about it. Everyone in this room here will agree with that statement. I do ask that the regulatory agencies -- I don't envy your position. I know it's really hard. You guys have to protect the environment and distribute the minerals and figure out how to do that. Thank you.

Douglas Bruner US Army Corps of Engineers Dear Mr Bruner, I am a professor of Laboratory Medicine and Pathology at the University of Minnesota in Minneapolis, past chief of staff of the University of Minnesota Medical Centers' hospital, and former Chief of Clinical Chemistry and Toxicology at the VA Medical Center Minneapolis. I also own a home in Isabella, Lake County, MN which is now my permanent legal address. I would strongly recommend that the PolyMet SDEIS be rejected for multiple reasons. In my mind, there is no question that sulfide mining will bring great risks to the water quality and lands in northeast Minnesota. In my mind there will be associated risk to the health of those living in the area and those downstream in the watershed, but I will not dwell on the potential risks. PolyMet's pollution mitigation proposals are vague and very well may not work as planned. The mining industry has a record worldwide of polluting an environment and then leaving it for the local citizens and their governmental to deal with the cleanup. I believe that the only way to assure containment of this potential pollution is to require PolyMet to put funds in escrow or supply bonds for potential cleanup costs. I am not a mining engineer, but from what I've read the annual operating costs for some of the proposed water purification systems (reverse osmosis) might be several million dollars per years and cleanup costs should a containment system malfunction could run in to tens of billions of dollars. Furthermore, I have read that is estimated that protection from leakage of toxic waste metals from tailings might be required for hundreds of years. If PolyMet want to mine in Minnesota, which will clearly put Minnesotans at risk if their containment schemes fail to work as expected, require them to provide concrete financial assurances before they start, not after they pollute the groundwater and watershed and "skip town." Sincerely yours, John H. Eckfeldt 9926 National Forest Lodge Rd Isabella, MN 55607 phone: 651-482-0930 (home/mobile) e-mail: eckfe001@umn.edu

JOHN EDSTROM 38895

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr JOHN EDSTROM 4120 204th Ln NW Oak Grove, MN 55303-8465

John F Miller 47618

From: John F Miller 844 Pioneer Road, Red Wing, Mn 55066 I am in full support of the Polymet Mining project. It will provide a much needed economic impact to the Iron Range communities. My wife and I have many relatives in the region and they have felt the downward spiral of available skilled jobs and the lower pay scales. We also have property in the area and would consider relocating to the Range for our final working years with intent to retire there. Lack of jobs has created dependence of residents on programs, an increased attitude they will never get ahead, increased crime and drug and alcohol use. We have seen the negative changes in the last decade. I am confident the Polymet Corporation will be diligent in following the proper guidelines spelled out to comply with the environmental regulations.

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, John Fahey 8787 Borden Rd Muir, MI 48860

John Fedo

18092

My name is John Fedo, F-E-D-O. For 22 years I've resided on a two-and-a-half-acre lot on Big Sturgeon Lake in Side Lake, Minnesota. I draw my drinking water from a well 30 minutes from the proposed plant site. I'm the former mayor of City of Duluth, former Hibbing City Administrator and a long-time advocate of job creation in Northeastern Minnesota. But more importantly, I am a father of eight and a grandfather of 9, unfortunately, none of whom live on the Iron Range. A mechanical engineer, a biochemical engineer, an attorney, two healthcare professionals, a business degree graduate, a publisher and a law enforcement officer that have been well educated to unfortunately be employed elsewhere. Over 30-plus years, I've participated in many processes such as this. I've heard advocates and critics that site opinions as fact when it suits them. Last week, I attended the previous hearing in Duluth and listened to testimony that I respectfully acknowledge was very long on biased conclusion and very short on science. I heard an individual ascribe stupidity to anyone that wanted to agree with the issuance of a permit to proceed. Not because of the fact that the science was wrong, but because their conclusion was wrong and from her perspective, she did not agree. The point of this EIS procedure, as I've come to understand, is to gather facts and base a permitting decision on the best science and a criteria that does not inhibit the project but, in fact, guides it. I've worked on many job-creation and community-improvement projects in my time, creating many hundreds of jobs in Northeastern Minnesota. A paper plant, a drill plant, hotels, road and freeway projects, apartment buildings, college expansions, commercial projects, tourism projects, bike paths, airport projects, industrial projects, all of those projects involved well-meaning, dedicated community advocates, investors and elected officials. But the most consistent element in those projects was the sense of community improvement and a desire to leave the area better than when we came into it. More jobs, more investment, cleaner water, a better environment, more opportunities and a better life for our children and grandchildren. My whole point tonight is to speak in favor of the moving the PolyMet Project forward and to advocate based on the science and the facts that can make this project viable and not be deterred by well-funded opponents that are ironically funded, in some cases, by the wealth created by the very industry they now claim they oppose. Opponents who, coincidentally, have the very same personal environmental footprint that demands these metals to service their cell phones, clean technology vehicles, et cetera, almost all of which currently comes from third-world providers, with no environmental oversight, and ends up negatively affecting our local environment on a long-distance basis. Terms like financial assurance and 200-year modeling are misstating the true nature of the project and are meant to be a distraction away from the orderly analysis are engaging in. This is not say that those issues will not be addressed, because they will, but as factual resolution as the law prescribes. Finally, we live in the environment that this plant will operate in. We are not going to advocate for a job that will pollute the wells we draw our water from. Thank you.

---Original Message--- From: johnfinazzo@yahoo-com [mailto:johnfinazzo@yahoo-com] Sent: Tuesday, March 11, 2014 9:57 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, John Finazzo 1070 North Shore Drive W, Orono, MN Mound, MN 55364-9726

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr John Finazzo 1070 N Shore Dr W Mound, MN 55364-9726 (612) 382-5772

41937

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr John Finazzo 1070 N Shore Dr W Mound, MN 55364-9726

I have confidence in the DNR and believe the SDEIS process for PolyMet Minings proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMets project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMets plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. John Fitzpatrick 43 Ash Blvd, Babbitt, MN 55706

John Flaten

Ladies and Gentlemen of The MDNR Environmental Review Unit: My comment letter dated February 3, 2014, addressed to Ms Lisa Fay, was also an attachment to an email addressed and transmitted concurrently to you. For readability I now transmit a corrected version of my earlier comment letter which is re-dated today, February 6, 2014, which simply adds the missing caption Future Financing and Joint and Several Securities Law Liability Among Controlling Person Affiliates and moves the two paragraphs pertaining to this subject without other edit to the penultimate section of my comment letter. I'm sorry for any confusion. Thank you, John P. Flaten 1375 Walsh Road Ely, MN 55731-8034 (218) 365-8801

19305

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. A technical paper of over 2,000 pages, regarding our sacred trust environment, documented by over 700 references, will take even the most diligent among us much more than 90 days to absorb and prepare to comment constructively upon. We'll also need a further public meeting to present and discuss those comments at the end of the requested extended comment period. Please don't allow Polymet to co-opt the process before all substantive public issues can be raised and scientifically considered. Thank you. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, John Flaten 1375 Walsh Road Ely, MN 55731 218-365-8801

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr John Gannett 824 Cornwallis Ct Eagan, MN 55123-1961 (612) 239-5250

NorthMet SDEIS Input By John Gappa March 10, 2014 I have had the opportunity to serve as a Chief Financial Officer for 20 years. As CFO, I have reviewed hundreds of millions of dollars of investments creating over 1000 jobs. My role in these investments, some of which were in excess of \$100 million each, was to develop the business case, project costs and revenues over a twenty year period, and evaluate the returns and associated risks. While most of these investments were successful, some were not. Over the years, I have learned the hard way that failed projects all have two problems – overestimated benefits and underestimated costs and risks. As I have reviewed the Polymet plan from a CFO perspective, I have struggled to figure out how the numbers can work with a model that has 20 years of benefits and hundreds of years of costs. My conclusion is that the only way the PolyMet model works is to inflate the benefits, underestimate the costs and shift the risks to someone else. For example, I believe the recent issue over the base flow rates in the Partridge River may be a troubling example of underestimating the costs to the environment in order to make the models work. For my own understanding, I wanted to try to model out what 500 years of remediation costs might look like. I attempted to find inputs for my model from the draft supplemental EIS. While PolyMet provided estimates for closing costs and annual post-closure monitoring and maintenance expenses, there was no further detail or mention of ongoing expenses such as ongoing equipment repair and obsolesce. There was also no mention of ongoing capital expenditures that will be required of an operation of this scale and duration such as equipment and facility replacement. Never the less, I built a 100 year model using assumptions derived from my experience with planning complex, capital intensive processing operations. This model produced upfront funding requirements approaching \$300 million. What I also found is that the financial assurance model is highly sensitive to very small changes in inputs. For example, · A \$1 million increase in annual operating costs results in a \$37 million or 13% increase in the future value of funding required · A one percentage point decrease in the reinvestment or discount rate used results in a \$83 million or 30% increase in the future value of funding required. · A half a percentage point increase in the inflation rate results in a \$71 million increase or a 25% increase in funding required. The point of the matter is that given the significant length of time that remediation will be required, estimating the upfront investment needed to fund the remediation is highly uncertain and very small differences in assumptions have a dramatic impact on the total funding required. Moreover, the detail behind PolyMet's estimates must be disclosed in the final EIS in order for the public to assess the viability of remediation and necessary financial assurance. Another key concern is to ensure that the remediation is fully funded, regardless of when PolyMet stops mining – either after 5, 10 or 20 years. To quote one of the many risk factors that PolyMet included for their investors in a recent filing with the Securities and Exchange Commission: “Because the price of metals fluctuate, if the prices of metals in our ore body decrease below a specified level, it may no longer be profitable to develop our NorthMet Project for those metals and we will cease operations.” The State of Minnesota would be wise to heed this risk factor as well. A key difference between PolyMet and most companies making these sorts of investment decisions is that PolyMet exists solely to develop the NorthMet project. Most companies can choose among an array of investments, acquisitions or returning cash to shareholders. PolyMet's motivation is not to pick the best project possible,

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for[,] information[,] that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the U.[.][S.] Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely,
Mr John Grillo 3 Marsh Ln Apt 21 Orono, ME 04473-5620

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. The proposed PolyMet mine for copper and other so-called precious metals brings up several issues that need to be seriously considered by the State of Minnesota before any new mining permits are considered. The proposed PolyMet mine should not be allowed in my opinion for at minimum the following reasons: 1)the lifetime of the negative environmental impacts for the proposed mine far exceeds the economic viability of the mine; 2)no human or mechanical method exists to guarantee treatment of the mine's pollution for the time beyond the economic viability of the mine. How does one guarantee that people four hundred years in the future will even know how to operate the water treatment systems, let alone will be able to afford to do so. 3)the global mining industry and particularly the global copper mining industry have earned a severely negative reputation for labor, economic, and environmental impacts over the long term. Look to the Upper Peninsula of Michigan to see the continuing pollution that is ongoing, long after the mines have shut down and vanished. The global mining industry should clean up all of their past pollution "mistakes" before new permits are considered. 4)no method exists to control the political climate that governs the mine's operations over the long term. Look simply to Wisconsin where the Walker administration has in a short time gutted environmental regulations that were thoughtfully and scientifically developed over the long term. 5)the majority of the economic benefits of the proposed mine are short term and will flow out of the State, going to entities that have no interest or personal investment in Minnesota's livelihood. 6)If the PolyMet mine is opened, it will set a sad precedent in Minnesota, perhaps leading to the opening of additional mines of questionable character. The cumulative effects of multiple sulfide-producing mines needs to be seriously considered 7)If Minnesota is to have a long term sustainable economy, Minnesota needs to promote and emphasize potentially sustainable businesses like tourism, forestry and forest products, agriculture, renewable energy resources, and valued-added manufacturing rather than the short term extractive mining of low-valued bulk minerals. The viability of sustainable businesses will be negatively affected by the proposed Polymet mine. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr John Gustafson PO Box 62 128 Kendall Road Knife River, MN 55609-0062 (218) 834-3582

John Hadesty

Dear Lisa, with the current war on coal waged by our current administration, projects such as the one PolyMet are proposing need to be approved now. Delaying projects like this could risk the availability of a qualified workforce. As coal mines continue to downsize, qualified miners are retiring or being retrained to take other career positions thus leaving projects like PolyMet to be forced to hire un-qualified, inexperienced miners. Please pass this project. It will create a much needed boom to Minnesota's economy as miner's such as myself flock to your state seeking employment. Miners are the exact type of workforce you want in Minnesota: hardworking, responsible, family oriented, friendly people. Always pulling their own weight and not looking for handouts. Please say yes to creating mining jobs. Remember: If it is not grown, it is mined. Please call with any questions. I am an experienced miner of 24 years and currently responsible for the Health and Safety and training at our 8,000 acre mine here in Northeast Pennsylvania. I would be glad to work with you in some capacity overseeing and regulating this project. My son is in his third year at Penn State University studying Mining Engineering and I'm looking for a new challenge and to re-locate. This project looks very inviting. Have a great week. John J. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Wisconsin experienced similar situations back in the 1990's when at first Exxon Minerals, and then a consortium of multinational mining interests including Rio Tinto (and others) tried to convince the state that a lead/copper mine was in the best interests of the state. When it was revealed that the best plan they (the multinational corporations) could come up with to deal with the MASSIVE amount of liquid waste from the industrial scale extraction of minerals from this ore body, was to pump it all directly into the Wolf River in northern WI near Crandon, the uproar began. Besides all the recreation done on the river, boating, rafting, kayaking, this is one of the regions premier fisheries, and also supports significant First Nations peoples traditional hunting/gathering activities guaranteed in the state's treaties with these peoples dating back to the early to mid 1800's. In addition, the tailings pile was calculated to be many times larger THAN THE PYRAMID OF GIZA IN EGYPT. This tailings pile would rupture its containment device before 100 years elapsed after mining operations ceased, and the company, if still extant, would be long gone and difficult, if not impossible, to get remedies from in a court of law to clean up and remediate the contaminated wells, groundwater, cancer clusters, and human epidemiological nightmare resulting from thousands of tons of tailings and resultant leachate percolating through the aquifer for over a 150 square mile area surrounding the tailings pile. When state law required the mine owners to come up with 3 examples of such a mine, that was successful in its execution and DID NOT cause serious environmental contamination and costly/ineffective clean-up efforts afterwards, they submitted examples which were either 1) completely different in soil type and mineral content/hydrodynamics and completely irrelevant to the task at hand, or 2) were easily shown to be an environmental disaster, with costly clean-up, and serious long-term contamination of the environment, aquifer pollution, human health and drinking water warnings, and negative impacts on the native fauna and recreation activities, for many decades after the mines in the examples cited, were shut down. Suffice it to say, all mine owners pulled out of the Crandon area and have never attempted to initiate the mine permit process in the past 15 years. Most certainly this sulfide mine will present similar, or worse contamination problems which cannot be successfully dealt with either, over the long-term. The last thing the Great Lakes region needs now is another failed attempt at siting a sulfide mine which will only give minimal assist to the local economy, and will certainly damage the regions long term economic stability due to another soil/groundwater polluting, Recreational activity spoiling mine, and the environmental wreckage and ruin which is never remedied in a court of law. Learn from Wisconsin's example and accept that the Federal land exchange of pro

Ms. Fay, Polymet's proposed mining will cost the citizens of Minnesota tremendous financial resources. For 500 years? How long do you think Polymet will pay for 500 years of water treatment? Please re-evaluate the practicality of this plan.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, John Hill 6719 34th Ave N Crystal, MN 55427-2220

John Ingham 7765

My husband, John Ingham and I, wish to register our opposition to copper-nickel mining in Northern MN. We recall the assurances that Taconite Mining would not pollute the watershed and the attempts of the mining company to deny their actions as the source of asbestos pollution to Lake Superior. Even with the best technology and state of the art methods for capturing sulfide. eventually, perhaps several generations from now, those chemicals will leach into the watershed and Lake Superior. The mining company is not going to take responsibility, even if it still exists as an entity, 100 years from now. And, even if it were to take responsibility, it would not be possible reverse the damage. No amount of money would compensate the people relying on Lake Superior for their potable water. Fresh water is going to be a necessary condition for quality of life in MN long after the miners and the minerals have come and gone. Sincerely, Mary Grove

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, John Kennebeck Lake Wilson, Minnesota

I am writing as a "transplant" to Minnesota, having grown up near Boston. I have lived here in the Twin Cities area for 35 years. When our two boys were small, we enjoyed taking them camping "up North" venturing along the shores of Lake Superior and heading inland up the Gunflint Trail. Our travels took us into the region where PolyMet is attempting to persuade Minnesotans to allow a gigantic open pit mine to be put into operation. The idea seems to me to be on a par with suggesting that we should log Yellowstone Park or haul all of the topsoil away from the fertile valleys of California. To allow sulfide mining in the Hoyt Lakes area is a very bad idea for multiple reasons. I will focus on just one reason, which I think is very obvious to me as a newcomer to the state, and that is that it spoils the environment. We stand to lose the beauty of the area, the wildlife, the health of the watershed, the clean air, and the ability of Tribal Nations to carry out their guaranteed rights to hunting, fishing, and gathering wild rice in the region. Please listen to those of us who are pleading on behalf of preserving this area in its pristine condition: Do not allow NorthMet to go forwaRd Now is the time to say "No" to this bad idea. Submitted by Lucy Kennedy 194 Oakview Road W. St Paul, MN 55118

Minnesotans have an ethical responsibility to prevent sulfide mining in our beautiful Arrowhead region. To jeopardize one of the most abundant sources of clean, fresh water in the state and indeed in the world would be a reprehensible, unforgiveable act. Those who are proposing the NorthMet mine and who stand to profit from it may not care about the devastating effects which mining would have on this area and how it would effect our children and our grandchildren, but those of us who live here certainly do. We deserve to live in a healthful environment and to pass along to future generations an environment which has been kept free of pollution and degradation. It is outrageous that this project has been allowed to progress this far, at huge expense. It has diverted attention from other pressing concerns and has caused great upheaval in the lives of all those who have had to come forward and spend hours and hours out of our lives fighting against a proposal that is so deeply flawed as to be inconceivable. It is simply unthinkable that such a hazardous mining operation could ever be compatible with the unique character of the proposed site. Simply stated, water is precious. As demand for drinking water increases due to population growth, global warming, and loss of other clean water sources, it would be unconscionable to put this source of clean and abundant water at risk. The long, drawn-out battle over the proposed PolyMet mine is pitching Minnesota citizens against each other. But this fight is not just about jobs. At the core of this battle is the issue of who gets to decide the future of our state. Who gets to make the decisions which determine what kind of an environment the citizens of Minnesota will bequeath to their children and grandchildren and all future generations. Think about it: Who at the United States Forest Service is authorized to "swap" our public land with mining companies. These lands in the Superior National Forest were purchased under the Weeks Act of 1900 in order to preserve watersheds. Open pit mining is forbidden on such lands. To open these lands to sulfide mining would be a betrayal of the public trust and is clearly illegal. Why then is the land swap being treated as something that could easily be accomplished. These beautiful, pristine lands belong to the American people, who trust the National Forest Service to be good stewards of our public lands. Where is the leadership in the State of Minnesota. Why are our Governor and legislators not taking up this issue with the federal government. Since European explorers first came to the Arrowhead area, the land has suffered the onslaughts of mining and logging interests. The indigenous people who lived here were displaced in a shameful grab for "resources." Although they were forced to cede their lands to the invading miners and loggers, the native populations are guaranteed hunting, fishing, and subsistence rights on Ceded Territories. When we look at the impacts sulfide mining would likely have on wild rice, fish, and game, we can clearly see that these guarantees are meaningless. Again, where is our leadership. Who is standing up for the rights of the Tribal Nations. Indigenous peoples around the world, including in our neighbor Wisconsin, are fighting to save their lands from destruction. Here in Minnesota, we must show good faith to all of our people. Minnesotans- all of us- deserve to have a healthy, clean, sustainable environment to pass along to future generations. Sulfide mining in the Arrowhead destroys all hope for a proud legacy. We must stop PolyMet now.

John Klein

I am excited to see the potential for bringing economic prosperity back to the Iron Range with the Polymet project. I support this project based the positive outlook of the SDEIS and the work that the company has done in the reverse osmosis water treatment. I believe that Polymet has MN best interest in mind in creating a company and project that will bring much needed revenue to the state in an environmentally conscious manner. Best regards, John Knudson

Dear Lisa, I cut and pasted my letter, plus I have attached it as an MS Word file. John Kolstad, President Mill City Music 3820 East Lake Street Minneapolis, MN 55406 March 9, 2014 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us](mailto:NorthMetSDEIS.dnr@state.mn.us) Dear DNR, As a business person I understand that we need economic development and job creation. I have been following the debate and discussion on the PolyMet mining proposal. I withheld any opinion until I could learn a great deal more about this project. There seem to be three main arguments by the proponents: 1- The metals are needed 2- This will create jobs and economic development 3- It is environmentally safe and non-polluting. 1) There is a world full of these and other metals, that could be recycled but are not. If recycling got the same tax breaks mining, there would be an abundant of these metals and others. Recycling would not pollute the environment or put a region at risk of disaster. 2) This will create a minute number of jobs considering the area, the number who need jobs and the jobs projected even by the proponents. Plus there is no guarantee that any area people will get these jobs or what they will be paid. The Small Business Administration has published job statistics for over 50 years. Over 50% of all USA jobs are with small business. In the latest study by the Minnesota House Research Service, 90% of new jobs are with small business. If Jobs is the issue, then our resources should go to the small business sector. These jobs will be locally based and not be able to move the business or the jobs to China. The Fortune 500 companies have had negative job growth in the US. It is so sad to see the Union Leadership representing people in this area, siding with multi-national corporation who will come in, do what they want, then file bankruptcy and leave In all the History of Unions, they have always sided with the people and the community and never with the corporations or "Bosses". That these unions are using their rank and file members to push this project shows this is about money and power and not jobs or the economic well being of the region. 3) The study by PolyMet states that the sites will be polluted for 500 years, but jobs and the operation will only last about 20 years. Who will be here for 500 years to manage this. This is insanity. I know a number of students or young people who have large Student Loan debt and credit card debt. These people are prohibited by federal law from filing bankruptcy and be relieved of debt. So they will owe it until paid off or they die. Yet Mining Corporations, like PolyMet, created just for this project, will be able to declare bankruptcy and walk away and leave the pollution, the unemployed and a devastated community. This makes clear who writes our National Laws. I have been to many industrial or mining towns like this, out West, the Michigan UP, the Cleveland area and many more. Before this project should be considered for a second, the Financiers, stockholders, parent corporations or those receiving any benefits from this project should be permanently responsible until total recovery and liability is satisfied. No opportunity for bankruptcy and walking away scott free. Certainly the people of this area need jobs. Long time history shows that Small Business does by far the best at creating and providing Jobs. The State and Region Resources should be directed to area small business creation that is sustainable into the future and protective of the environment that all their children can grow up in a healthy world. Short term profit producing a disaster vs long term community with sustainable job. A public servant should chose the sustainable path. In my reading and research on this topic, I found stats that 75% of

My name is John Landgraf. I am an archeologist. I lived for 15 years in the Middle East. And I studied for nine years in Germany. But I was born here in the US. I just think it would be very nice for many of our workers here, especially with all the unemployment in the United States, to earn more money; but we have an environmental impact that is too great in my opinion. But I would like to just point out where the profits of such mining might go. PolyMet is on the New York Stock Exchange, the world stock exchanges. About 40 percent of PolyMet's money is in Switzerland and the – I mean and, of course, they're at the top 1 percent that have a certain amount of PolyMet here in the United States. I'm just pointing out that most of the profits of PolyMet will go to people not in Minnesota. To the 1 percent. To the people in foreign countries. I would be more inclined maybe if it were possible to mine environmentally clear and if the money, actually the real profits the mining, went to Minnesota. But, ah, it will go to the wealthy stockholders and the foreigners. Thank you.

John Lawrow 39597

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

John Lhotka

43080

Dear Minnesota DNR - I have lived nearly my entire life in Minnesota and if there is anything I have learned during that time is Minnesota's lakes and rivers are what set us apart. Meeting people from across the country, it is not uncommon for me to get comments like "I LOVE the Boundary Waters" or "I caught my first Walleye in northern Minnesota". Our lakes and rivers are arguably one of our single most important assets, not only from a quality of life perspective, but also because tourism is a significant economic driver for northern Minnesota. I also am a property owner on a lake in the Ely area, so the decisions on the Polymet project may directly impact me, if it negatively impacts the watershed that flows through my lake. Needless to say I am deeply troubled when I hear that the Polymet project could require on-going water treatment for CENTURIES to come. While I understand the desire to acquire more mining jobs in Northern Minnesota, I urge the DNR and other decision-makers to look at the bigger picture to what extent are we willing to jeopardize our lakes and streams for CENTURIES (and the jobs that are linked to tourism that could be lost) for 350 mining jobs that might only last for 2 decades. I can give you my answer: It seems incredibly short-sighted to take that risk. Please do not move forward with this project. Kind Regards, John Lhotka 3817 Lyndale Ave S Minneapolis, MN 55409

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. No amount of financial profit (for companies, company executives or or hired employees) justifies or offsets the potential long term damage "sulfide mining " could have on the Northeast Minnesota environment. Any related Mining Process must be proven to be safe for employees, residents and the Environment. Good luck with that. I don't say these things for me. I'm retired, have lived and travelled throughout the country and world. I'd have no problem leaving the area when things around here "go south". I'd do so, however, with unparalleled distain for those who willfully or unknowingly, destroyed an unparalleled wilderness and unique culture. I sincerely hope PolyMet has the right answers and Government oversight will not be inappropriately influenced by self serving political or financial motivation. Much has to be done right; to get it right. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr John Lindroos 729 S 2nd Ave E Ely, MN 55731-1308 (218) 365-6887

John Linnerson

40435

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

John Louis 15754 Hayes Trail Apple Valley MN 55124 Short term jobs for long long term problems after all is said and done. Please review the past record of PolyMet and it's owners with other mining operations they have undertaken and think this over, is that how you would want this to turn out. Cleaning up after mining operations has a bad history and the saying goes if one does not study history one will repeat it. Bad idea for a beautiful part of our state that will be lost for generations to come. My time is limited on this earth but others that follow will have to live with this mess. Thank you allowing me to speak on this issue. I pray that you do careful consideration and let your heart lead you not your pocket book.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

As a longtime user of the BWCA, I am very disturbed by the PolyMet proposal. Bottom line is that the SDEIS is flawed and does not guarantee that sulfide mining can be done in Minnesota without seriously harming water and habitat. This is classic short-term thinking, ie we will have jobs now and for a relatively short time and risk one on the country's most amazing natural areas for future generations. You should treasure this resource, and not take ANY chance that it will be ruined for the chance to make some short term money. It is not worth it. This project should not go forward. Thanks for reading and taking into account my position. John W. Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, John M Ek 5076 Hermantown Rd Hermantown, MN 55811

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, John Matheson 4550 Central Ave NE Hilltop, MN 55421-2482 (763) 572-2190

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, John Mette Minnetonka, Minnesota

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. This is too great a risk. There has to be other ways to help Northern Minnesota economically. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. I have often gone to the Boundary Waters and I want this experience for future generations. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr John Mischke 821 Raymond Ave Ste 300 Saint Paul, MN 55114-1525

58128

Any cleanup is unacceptable to me. Northern MN is too precious. Only if Polymet can show past success not polluting would I sign off on mining our wilderness.

John Muehlbauer

7195

I'm a fisherman. I'm a hunter. I'm a father. I plan to live the rest of my days in Minnesota, which includes a lot of outdoor enjoyment in the Arrowhead region. I'm sure the folks up on the Range would like to do the same. Polymet has done their homework on this one. Block out the noise from the radicals who are blind to the environmental protections that Polymet has built into their plan. We can keep improving our environmental quality of life and at the same time, retain the proud heritage of the Iron Range people. John Muehlbauer 3785 Stebner Rd Hermantown, MN 55811 218-390-4898

Sent from my iPhone On Mar 11, 2014, at 7:04 PM, John Mugford <[HYPERLINK "mailto:jbmugford@msn-com"jbmugford@msn-com](mailto:jbmugford@msn-com)> DNR I urge you not to accept the SEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model In conclusion it is my

John Munter

18086

My name is John Munter. I'm 64. I work at Delta Airlines. And if you ever need a job, you can come over to Delta. We're hiring continually there and we're one of the best res office -- actually the best res office, according to the CEO of Delta, that we have. So we'll be here for a long time. My grandfather worked at the mines and my great uncle shot deer year-round and netted fish and cut cord wood for moonshiners on county land and life was good, but my family has moved away and my siblings are gone, and my kids may also move away, but I'll be darned if I want my kids to work on a 500-acre, 20-story slag pile, superfund toxic waste site straddling the continental divide on wetlands surrounded by rivers over an aquifer at the headwaters of the St. Louis River Basin. I think this project is going to fail several reasons. One, it's like signing a nuclear waste dump in your back yard. I mean, why would we do this? Two, the SDEIS is like lipstick on a pig. Everybody likes the pork, but that pig don't fly for some underlying assumptions. And thirdly, there's too many people that are going to sue, I think. The two Indian tribes, I believe, might sue. The people downstream scared about their wells. The environmental groups may sue. One of the problems, for example, is the DNR should require PolyMet to buy, not lease, the mineral rights for the south -- the west pit so that it can be back filled from that 20-story tailing pile and so it can be under water, then, when the financial assurance collapses at some point. And secondly, plastic liners leak. This is one of the assumptions the EIS makes -- they don't leak. Well, they do. Faulty heat sealing of seams. Fluid accumulation can push fluid down, even through tiny holes, they can push it through the membranes or bumps and pressure points can cause problems. And the peak pollution won't happen in the sulfur mining -- sulfide mining for 500 years and then there's the downside of the Bell Curve after that. So it's in perpetuity, basically. This brings us to the most bizarre assumption of the EIS. You cannot guarantee financial instruments for 500 years or a thousand years in perpetuity. It's going to cost \$3-and-a-half billion -- \$3-and-a-half million to \$6 million a year for two water-treatment plants. That comes out to \$1-and-a-half to \$3 billion over 500 years, and of course, we're looking at 1,000 years. You'll need a whole new EIS after PolyMet coughs up the final financial assurance at the eleventh hour. At the 11th hour, and they're currently thinking about roughly \$200 million. That's not going to make it. The current SDEIS is a bait and switch. Okay, this is a great EIS, now, can you pay for it? And we may have to cut corners, there, but eventually, the fund will fail, the trees will grow through the plastic, sulfuric acid and heavy metals will fill the rivers. But we're right now in a runaway-global-warming climate cycle. We had a 41 billion-dollar disasters last year. And warm air is upsetting polar vortex. That's why the cold air is hiding out in our backyards. The arctic will be ice free in the summer in a couple years. Methane is already ballooning up the swamps and the lakes and the shallow seas, which is 70 times worse than warming gas and carbon dioxide. Seventy times, not percent. Insurance companies and economies will fail and you'll be trying to be fish and drink out of the polluted rivers. Mark my word.

PolyMet: What Happens When The Music

Part 1—FollyMet and Pollyanna Even if the DNR in their Copper-Nickel

mining computations in Northern Minnesota can determine how many angels can dance on the head of a pin and PolyMet can manipulate them so they don't overflow into the St Louis River Basin—there is a problem. Even if the DNR can rationalize away the implications of the water flow issues that they vastly underestimated even though they were correctly advised for years by tribal experts—there is a problem. Even if some coming lawsuit by the three tribes of the 1854 ceded territories claiming infringement upon their legal rights to harvest local foods and medicines is thrown out in court (a big assumption)—there is a problem. Even if the tremendous rock blasting at the mine site doesn't open up more and wider fractures in the underlying bedrock and the toxic leachates don't penetrate well through the underlying granitic aquifer but flow like hypnotized children of the Pied Piper of PolyMet to be sucked into the pipes and water treatment plants—there is a problem. Even if the forty-six lbs a year of airborne mercury PolyMet creates during the twenty year mine is not judged to be a burden on a region where one in ten babies born already has too high a mercury level—there is a problem. Even if the most reactive rock is back-filled into a hole and only the least reactive rock is piled two hundred feet high—there is a problem. Even if all the plastic is replaced regularly over the five hundred acre site, and all the leachate is collected from the twenty story tall reactive waste rock, and the pipe leaks are repaired quickly, and a fund is established by PolyMet to fund the two water treatment plants that will cost between three and a half to six million dollars a year—there is a problem. Even if the estimated minimum sixteen million gallons of escaped toxic seepage a year into the ground and surface waters isn't considered a problem—there is still a problem. Even if PolyMet isn't just a shell company that will grab the profits and then declare bankruptcy—there is a problem. Even if proposed PolyMet processing facility isn't re-used after twenty years to process ore from a dozen other future copper-nickel mines for a hundred years—there is still a problem. The problem is that the mine becomes a superfund site requiring perpetual treatment for the run-off of antimony (similar to arsenic), sulfates, and heavy metals. DNR admits that the Mine Site will require water treatment for more than two hundred years and the Plant Site will require water treatment for more than five hundred years. However, there is no clear rationale for why water treatment won't be needed for thousands of years rather than hundreds. Perhaps, 'progress' or 'science' will solve all of our problems for us someday but that 'pass the buck' or 'put it on the credit card' methodology hasn't worked very well yet for the problems of nuclear waste, carbon pollution, and all the other sulfide mining sites. This problem of a perpetual waste stream brings up the associated problem of devising a perpetual funding mechanism which can pay out millions of dollars a year indefinitely without spending down the principal. PolyMet seems to be thinking of spending something on the order of two hundred million dollars that would probably be set aside in some kind of a trust fund. Taking the high end of cost estimates by the DNR of six million dollars a year this would run out in about 40 years depending on how much interest was garnered. Of course, there is a limit to how much PolyMet could put into a fund and still make a profit on the mine. But, this isn't the bigge

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

I support your efforts to extract important resources from this state. However, I think you've got a major trust issue; not just your company, but the mining (including oil) industry in general. Many think you're saying "Trust me, let me get the permits - and then we'll do what we please to make as much money as possible by getting around what regulations we can." Sorry for being so direct, but this is the case. Your PR campaign should focus on factual statements and demonstrations of how large mines can be operated without screwing up the environment. How did the uranium mines around Bancroft, Quebec do. I don't know, but you should. If they happened to do a good job, you could use that to say "Hey, they did it 20 years ago with radioactive waste, we've got better tech now, etc" Of course, if the whole place glows in the dark. oh well. Good luck (p.s. I'm a mineral collector, so gotta love mining, eh. Sign me up for a tour underground when you hit the mineralized zones) John - John K. Nash, PhD, L.P. Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr John Norton 307 Laurel Ave Saint Paul, MN 55102-2105 (410) 458-3380

john Oertel 42889

John Ottis 41213

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are there

41215

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely John Ottis John Ottis Box 609 Grand Marais, MN 55604

John Ottis

41217

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, John Ottis John Ottis Box 609 Grand Marais, MN 55604

John P. Gorski

To Whom It May Concern: I grew up on the Iron Range. My father was a mining engineer. I worked summers in the mines while I attended college. In general I support mining and have witnessed the economic benefits it can afford My father was forced into an early retirement in the 80's and his greatest hope was that the copper nickel industry would be his salvation. Despite the hardships my father endured I am glad that the copper/nickel mining did not happen. The technologies available at the time were simply not adequate to protect the environment. Few people can look back and truthfully say that they regret the delay of these past 25 years. Most can agree that had we mined those minerals with 1980's technologies great environmental damage would have been done. The landscape of Minnesota, its waters, the plants, and animals that inhabit it, and its minerals belong to all who live here today and also to those who will inhabit it in the generations to come. The technologies proposed by PolyMet are vastly superior to those of the past but probably inferior to those of the future. In just the past few years PolyMet has made great progress in its efforts to ensure that our environment can be protected. It is reasonable to believe that with each ensuing year our knowledge, and PolyMet's, will continue to improve. It is also reasonable to believe that the value of the resource will continue to grow. The Minnesota DNR, our Governor, State Representatives, Senators, and Congressmen have all committed themselves to the highest degree of environmental scrutiny. As of today that has not been accomplished. Questions persist about dust and particulates (asbestos like) drifting into the BWCAW. Questions about the accuracy of aquifer mapping and water migration persist. Lastly there is great public doubt that contaminated waters can be contained for the many years needed to protect our cherished waters. There is an old saying "near money is dear money" it talks to the very high cost, that is always paid, when cashing in quickly. Lets not make that mistake here. John P. Gorski Grand Marais Mn.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, John Paul Roy 3231 37th Ave So. 3231 37th Ave So. Minneapolis, MN 55406

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, John Paul Roy 3231 37th Ave S Minneapolis, MN 55406

Supporting the NorthMet SDEIS: Polymet's project has rightly been contrasted against the backdrop of the waters of the State of Minnesota, which serve multiple functions, but most importantly they are the lifeblood of our environment. In contrast, the use of water for consumption, agriculture, recreation, fishing and industry have sustained human cultures for all of history. While our state is a unique entity which possesses some of the world's greatest density of fresh water lakes, streams and wetlands (and has thus been a primary emphasis of the cultures that have populated this region), what sets us apart is that for generations our environmental law and regulation have led the world when it comes to water quality protection. I believe we are leading again with the NorthMet SDEIS, the process for public input, and the ongoing open and honest dialogue related to precious metals mining in Minnesota and the need for environmental protections. In this case, I strongly believe that the State of Minnesota's Department of Natural Resources (DNR) is uniquely qualified in the world to oversee and permit this form of mining and the requisite environmental obligations that are required to protect our state's water quality. With over 100 years of active mining-related experience in the state, the Minnesota DNR has proven it has not lost sight of its multi-faceted obligation to protect the environment while helping to facilitate economic vitality. While the NorthMet project is a new form of mining and processing in Minnesota, it is with our state's unique perspective and experience (that is steeped in a lengthy history of mining regulation and water quality protection) that convinces me this project is in the right hands. As written, I support the SDEIS for Polymet's NorthMet Project and expect (as with all permits to operate within the State of Minnesota) there will be adequate requirements for operational controls that greatly limit the possibility of operational or accidental pollution. I encourage the Minnesota DNR to continue to balance the necessity of human industry and environmental regulations and protections. - John Paulson - 25 East Mankato Street - Duluth, MN 55803

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, John Peace St Francis, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, John Peck 12299 Sauk River Rd St Cloud, MN 56301

Dear Ms Fay, Dear Federal and State Agency Leaders: One of the most profound thinkers of the 20th Century was astrophysicist Carl Sagan. In 1980, he published a book entitled, "Cosmos." In that book, Dr Sagan wrote: The Earth is a place. It is by no means the only place. It is not even a typical place. No planet or star or galaxy can be typical, because the Cosmos is mostly empty. The only typical place is within the vast, cold, universal vacuum, the everlasting night of intergalactic space, a place so strange and desolate that, by comparison, planets and stars and galaxies seem achingly rare and lovely. If we were randomly inserted into the Cosmos, the chance that we would find ourselves on or near a planet would be less than one in a billion trillion trillion (10³³, a one followed by 33 zeroes). In everyday life such odds are called compelling. Worlds are precious. And so, I write in grave concern for the effects on our environment and waters by the proposed PolyMet copper sulfide mine (and any others proposed) in Northern Minnesota. In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely John Pegg 1335 Minnesota Ave Duluth, MN 55802 218-349-1786

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I grew up in northern Minnesota and lived in Babbitt for 17 years. Until recently, my parents still lived there. My father worked at the taconite mine for 30 years. I love the cool blue lakes. I often bring my family up there to canoe, camp, kayak, fish, ski, hike, and photograph its beauty. We buy local and have given to the community. Why must we support the small communities through a short-term effort (20 years or less) of copper-nickel mining, which will result in long-term loss of environment (200 years or more). Tourism is also a precious commodity, but it will be lost with the advent of sulfide mining. Our children's children should be able to enjoy this precious area. We are devastated over this environmental battle. It should be protected, not eviscerated by mining. This will impact not only the pristine waters of northern Minnesota but, over time, may impact our water quality down the Mississippi River basin. Northern Minnesotans are anxious for jobs and delusional over the possibility of mining and construction jobs. Polymet is promising high-paying jobs, but how many folks who live up there will actually be hired. The residents up there are being misinformed by Polymet. PolyMet's Water Model is Scientifically Unacceptable. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Please accept my comments into the public recoRd The groundwater flow model is flawed and must be re-run using corrected data. The model, used to assess the impacts on water resources and how to minimize them, relies upon incorrect assumptions about the amount of groundwater at the site. The model uses a base flow estimate which significantly underestimates flow. As a result, the model likely underestimates the amount of sulfates and heavy metals carried to the Partridge River and Lake Superior. It's not acceptable to base such an important and potentially damaging project on known flawed data. Do it right or don't do it at all. Water channels which is what fractured bedrock is need to be closed to prevent the outward migration of heavy metal laden water. It's not acceptable to base decisions on flawed assumptions when we know better. We know the bedrock is fractured and pretending it isn't is not acceptable. The fractures need to be sealed or the entire basin needs to be lined with peat in adequate thickness to adsorb the heavy metals to prevent their migration from the site. Adequate monitoring and mitigation procedures need to be in place and ready to go if monitoring shows migration from the site. That will require an ironclad financial commitment that is lacking on this project. Monitoring must be part of the permitting process. The permit must require a robust monitoring plan with financial assurances to fund it. The public should be afforded an additional 30 days to take into account the new information. If mineral rights are severed from USFS land swap the project needs to assume that mining will occur on those lands and that needs to be included in this permitting process instead of permitting this as a stand alone project. There are too many flaws in this SDEIS for the project to be permitted. Do it right or don't do it at all. John Reynolds 26385 County Road 3 Merrifield MN 56465

John Richkus

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr John Richkus 206 Congress St Jersey City, NJ 07307-3410

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I have enjoyed the Boundary Waters many times and feel a great responsibility to keep this national resource available for future generations. If there were even a small chance that the copper/nickel mining would harm this resource, it would not be worth taking a chance on losing this rare treasure for future generations of Americans. I do understand the lure of jobs for the next twenty years for citizens who live on the range. However, the Boundary Waters and Superior National Forest and all of the lakes and wetlands that are on state land in this area at risk with this mining. One needs to remember that those lands belong to all Minnesotans including future generations. We do not have the right to put these natural treasures at risk. I believe that PolyMet SDEIS's own research indicates that mining will irrevocably harm these sources for our children and future generations. We simply need to take every measure necessary to protect these treasures for current and future nations. Sincerely, Mr John Roach 8116 Zenith Ct N Brooklyn Park, MN 55443-2749 (763) 566-9387

- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, John Rookey 1605 Wyoming Ave Superior, WI 54880

Dear Lisa Fay, EIS Project Manager, I am writing because I am concerned about what the PolyMet mine site will do to the environment in Northern Minnesota. I am also very concerned about how other future mines (such as Twin Metals) may affect the environment in Northern Minnesota. Northern Minnesota is a water rich environment that supports an ecologically rich set of biodiversity, including 'charismatic mega-fauna' - wolves, bears, moose, lynx etc Northern Minnesota also supports hundreds of other species including deer, eagles, owls, ducks, bobcat, coyotes, as well as fishes, wild rice, and majestic stands of red and white pine, including conifer and boreal forests. Hundreds of thousands of hunters, anglers, and recreationists annually visit Northern Minnesota at all times of the year for recreational opportunities. My family and I are avid users of the North Woods for hiking, canoeing, kayaking, wildlife watching, cross country skiing, snowshoeing, and fishing – since 1970- We have visited Voyagers National Park, the Boundary Waters Canoe Area Wilderness, and Superior National Forest dozens of times in the last 50 years. What we have here in Minnesota is a unique destination that attracts people from all over the United States, but as well from many parts of the world. A PolyMet mine site (and other future copper, nickel, sulfur mine sites) may leak toxic pollutants into the watershed. Consequently damaging and/or destroying the recreational opportunities for thousands of people, and damaging or destroying the habitat and environment for 1000's of species living in the area. I am not against mining these precious metals – because we all use them in vehicles, and electronic devices. However, I believe that there are less sensitive locations to be extracting these metals from the earth. Places that are not so rich in water and biological diversity. Places that do not have the intensive recreational use, and tourism jobs associated with recreational visitors. Arid places like deserts that do not have the water resources, and have fewer visitors are better suited for a mine of this type. I believe that those responsible for making the decisions on the PolyMet mine cannot reasonably assure the public that the site will not be leaking pollution into the environment for 200 – 500 years. Can those responsible for making decision on the PolyMet mine know with any level of confidence that under varying political and environmental conditions that the mine site will not generate pollution for 200 – 500 years. All decisions being made are based on assumptions of the political and environmental conditions. But will they take into account such potentialities as: 1) Climate change that generates storms with torrential rainfalls that exceed 20 inches of rain in a short period of time. 2) All countries have periods of strife and uncertainty. Even the most stable of nation-states and governments experiences crisis of governance including revolution, civil war, invasion, collapse and rebirth. During these periods, the failure of proper governance can last from a year to several years. One is hard pressed to think of a single country that has not experienced some level of uncertainty of governance and strife in the last 200 years. During such periods, will maintenance of mining ponds, tailings, dikes be ongoing. One may not be able to predict. Sincerely, John Rust 9725 Oliver Ave North Brooklyn Park, MN 55444 Board of Directors – Izaak Walton League of America – Minnesota Division _____ This email is intended solely for the recipient. Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Furthermore, the area should not be mined at all. The limited amount of copper and minerals to be taken from the area will have a detrimental impact on the environment. The jobs it creates for the time the mine will be operating are far less important the the jobs the tourism industry creates. Sincerely, Mr John Sayres 23783 Clarissa Haven Dr Henning, MN 56551-9438

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr John Schmitt 5101 Park Ave Minneapolis, MN 55417-1745

John Seymour-Anderson

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Dear Minnesota DNR, Among the concerns I have about the proposed sulfide mining operation are the following: • How will the costs of site management and pollution remediation be handled when the proposal shows no concrete and lasting plan for Financial Assurance. Particularly, what happens if Polymet goes out of business before the 200-500 years of water filtration and other pollution control measures have been fulfilled. • How can an estimated millions of gallons of untreated polluted water per year, if not fully captured and held in ponds and piping, be considered safe. • What calculations have been made for air pollution from the extraction of mineral-laden rock. The particulates created and borne into the air have the potential to affect workers and neighboring communities. • What provisions have been made to fully control the effects of seepage into local aquifers of groundwater, rain and snowmelt when mixed with particulates, sulfide and heavy metals exposed at the mining site during extraction. I hope you give all the concerns expressed by Minnesota citizens full consideration when weighing the merits of the plan at hand. John Seymour-Anderson 3925 Pleasant Avenue south #5 Minneapolis, MN 55409

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Let me be blunt. I will never authorize any group to do something that could permanently compromise the largest and best fresh water system in the world. We need time to review these documents. 90 days is not enough. So, I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Rev. John Sippola - Duluth, Minnesota John Sippola 1715 E 2nd st Duluth, MN 55812 218-724-3203

John Skolte

32638

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Why are we trying to protect our forests if projects like this are allowed. For every acre of open pit mine an acre of forest will be lost forever. The potential economic boost from mining jobs is touted. Ask the people who make their living in the mines in the Sudbury region of Ontario, Canada and take their vacations in the Thunder Bay area of Ontario what they think about the environmental impact of mining. I have spoken, many years ago, with one of these miners, while vacationing in Thunder Bay. He painted a very grim picture of what his occupation did to the surrounding lakes, which was why he vacationed in Thunder Bay, far from his home. As a teenager I went to the Boundary Waters three years in a row, and I also took my wife and children there three times during the early years of my marriage. While it has been many years since I was able to go there, and I doubt that I shall ever be able to return again at my age, I consider it extremely important that this area exist in its present pristine state, and be protected, for the benefit of everyone. Sincerely, John Skolte 266 Woodland Dr Owatonna, MN 55060-3152

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

john sorenson

Lisa Fay EIS project manager Minnesota DNR Polymet has never operated a mine before and is backed by Glencore Xstara which has a history of Environmental breaches resulting in fines. My information sources tell me that there is no known copper nickel mines in similar environments that have operated without pollution. This type of mining has never been attempted in Minnesota. Mining companies often declare bankruptcy leaving tax payers to cover costs of Environmental Disasters and only 350 jobs are expected after construction. This is too high a risk for such a small reward Please stop and take another look at alternatives, ie underground mines. Thank you for your consideration. John Carl Sorenson 12200 Roosevelt Rd S.E. Feb 24, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I find it difficult to find the words to express how opposed I am to this proposal. Allow me a rhetorical question: In what vision of economy does a proposal like this even begin to be considered. Answer: in an economy where the profit motive overrides all other concerns, such as health (of people, animals, plants, and the larger ecosystem). I keep this short in the (possibly vain) hope that it might actually be read. I say "no," resoundingly to sulfide mining in Minnesota. Minnesota says "no." We will not be another Kentucky or West Virginia to the mining industry. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr John Strand 2112 29th Ave S Minneapolis, MN 55406-1118 (612) 824-1140

50996

I have travelled and camped in the Boundary Waters Canoe Area wilderness for 30 years. I have been there countless times. As a father, a teacher and a lifelong Minnesotan I cannot express my dismay and my opposition to Polymet's plans in terms strong enough. Allow me to make a few points.1. Every time, to my knowledge, this kind of mining has been done there has been pollution. That fact combined with the location in such close proximity to the finest lake country wilderness in the world is unacceptable.2. I interned on an organic farm 60 miles by road from the proposed mine (and much closer as the crow flies) near Finland, MN. My friends who own the farm grow vegetables and fruits for over 50 families, and they are one of the only vegetable farms on the north shore. I don't want their water polluted.3. Despite any assurances to the contrary, we know that this company will not be around to deal with the aftermath of their profiteering. Who will pay?For these reasons and so many more I oppose this proposal in the strongest terms.

John Sundstrom

57251

As sulfide mining has yet to be demonstrated that it can be done in an environmentally safe manner – Minnesota should wait until Polymet or other mining companies prove that they can do so by a mine in a less sensitive area. The metals will be there in a decade or two and technology to mine them can be tested. (somewhere else)John Sundstrom1314 East 8th StreetDuluth, MN 55805

Greetings everyone. My name is John Sweeney. I'm a Minnesotan, Hoyt Lakes native. I grew up here. I see a lot of members in this gym from growing up here. I am now a small-business owner in Hoyt Lakes. And I actually left the area due to the impending closure of the mining around here and the issues that were going on. I would like to see PolyMet come in and give our youth and our natives here an opportunity to choose to leave if they want to, to go out and find an education, employment in other areas, experience the world but not have to leave. Without PolyMet and other companies like PolyMet we understand that there will be no choice. And as a small-business owner in Hoyt Lakes we can see that if we don't get the industries back into town, in the area, that a lot of us small-business owners will in fact go under. So we are looking forward to having PolyMet come in. And we are looking forward to the checks and balances that are going to be provided to ensure that we do have healthy, clean water; a healthy environment. These chemicals being referred to are not actually leaching into the environment and destroying the environment as many people are claiming. That's about all I have to say. And thank you guys for coming out and giving us an opportunity to express ourself. And I look forward to seeing guys in the future. Thank you.

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine, or at the very least, develop and enforce a truly comprehensive set of regulations (along with an escrow) which will ensure when (not if) environmental damage occurs as a result of the mining, it is remediated on PolyMet's dime. I believe this project presents unacceptable environmental risks and should not be allowed, but I am also realistic to understand that money talks and the pressure it is bringing to bear on the question is likely to win the day. This is why I urge you to make sure when damage is done, it is fully PolyMet's revenue which will pay for complete remediation of that damage. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr John syverud 614 McKinley Pl NE Minneapolis, MN 55413-2610

I am strongly against permitting Polymet for the following reasons: 1- Health concerns raised by doctors concerning the effect of sulfate mining (Duluth News 2/28/14) 2- Environmental harm and unknown potential harm too great a risk. 3- Polymet ownership currently 28% is owned by Glencore Xstrada. Often referred to as being too large of a conglomerate to legislate. Glencore is large enough to own far more than 28% of Polymet and has a very poor environmental track record in 50 countries. 4- Risk of costly litigation because of health effects and environment concerns effecting water and accidents - 5- Not enough funds put in a Trust to offset the likely litigation that could run into trillions and trillions of dollars. 6- Future mining ownership and their responsibility to inherit fines, clean up and paying for the physical and environmental harm caused by Polymet 7- The proposal does not include the impact to the environment and health of people, fish, wild rice, etc that in addition to the Polymet site there are about 20 other sites on the "drawing board". Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

I am totally against allowing any sulfide rock mining in Minnesota. The ore will be there and the lure of making money will likewise be locked into the rock for any future mining. The risk of permanent damage to voiceless flora and fauna without even considering the harm to humans and tourism is beyond the ability of industry or government to mitigate. If and when the process is developed to deal with the runoff and contaminants it will be worth rethinking but at the present time I say stop the process and deny the permit. Sincerely John Tonsager 4364 167 Ave NE Ham Lake MN 55304

As we consider this EIS please keep in mind some of the multiple use issues northern MN has faced over the last 50 years. When there is more mercury in the rain water than coming out of a WWT? In northern MN we need to globally address these issues. Go forward with Polymet and sustain employers and employment in Minnesota.

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. 300 jobs is not worth the potential for long term damage to the fragile ecosystem in the Arrowhead region. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, John Velie 4920 Bryant Ave S Minneapolis, MN 55419-5361 (612) 789-4939

John W. Vennewitz 43332

Dear Sirs, I am concerned that PolyMet's mine plan lacks a comprehensive consideration of chemical contamination of fish and its impact on wetlands also the contamination of drinking water. The health of current and future residents' ride on getting this analysis done completely and competently. Thank you for the opportunity to comment. Regards, John W. Vennewitz 6740 Duck Lake Road Eden Prairie, MN 55346

We understand the need for jobs, but the potential downsides of an environmental disaster are just too great. We were assured by BP that everything was safe. We were assured by Exxon that everything was safe. Both those were disasters that are still with us today. The risks are just too great. We are losing natural habitats daily. We have to put a stop to it. Take pride in Minnesota and what we have and are. Protect Minnesota - John T. Wendt

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. Not only is the science bad, but the provisions for long term clean up are financially inadequate as well. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, John Wensman 15740 Upper 34th St S Afton, MN 55001
