Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Water is the cornerstone of Minnesotan identity. We are the people of the land of ten thousand lakes. What this project proposes is, basically, to threaten our very identity. The Duluth Complex will be situated on a 27 square mile swath of land which was supposedly protected as part of the Superior National Forest. How can that be undermined. By boasting that this project will bring in more jobs and economic revenue, and more the PolyMet Mining company has circumvented the very blockades meant to purposefully keep them out. Sulfide mining causes damage that is extensive and practically irreversible, PolyMet itself has stated that the clean-up process could take up to 500 years. 500 years. Over that period of time who knows how much the chemical problem would increase. Compacting, like interest on debt, the length of time to make our land and water pure again. Can we afford to do so much damage to a place so resplendent. And while they destroy our environment PolyMet plans to use those resources of copper and nickel in overseas trade, so the profit will not stay in the United States, but be outsourced. I understand that they do not want to upset their investors at Glencore, but what about the people who will work for them and those that live in Minnesota. Do we not have a say. The environment affects us all; people, animals, plants etc Please do not allow this atrocity. Anyone who has seen this land knows what a loss we, as a nation, would be taking. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Miss Claire Nelson 845 Clayland St Saint Paul, MN 55104-1005

Mar 9, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Claire Sefiane 1065 S 21st Ave Ozark, MO 65721-7842 (417) 732-7172

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I feel that everything is done on a monetary level. Everyone thinks about the jobs that this will generate, so we can't stop progress. But do progress and jobs need to harm the environment. So often things get done for supposedly good reasons only to find out years later the harm that is done and the cost of it to right the situation. Please provide all possible care in the proceeding of this. Our future depends on it. Sincerely, Mrs Clara Groenhoff 1178 Highway 68 Canby, MN 56220-2201 (507) 277-5726

Feb 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, clarence jarvis 2200south blvd south st paul, MN 55075

Ms Lisa Fay: I am writing to express skepticism that mining which requires hundreds of years of cleanup can possibly succeed. It has never been tried over such a long period. There is a high probability of some sort of natural calamity intervening to disrupt the walls, dams, membranes, pipes, etc How the size of a sufficient set aside cleanup fund can possibly be determined through, what tens or hundreds, of economic boom-bust cycles eludes me, and I daresay you, as well. The BWCAW is a national treasure for all the citizens, not to be irreversibly exploited for a few hundred local jobs. - C W "Buck" Malick 715 386 7010

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Sir or Madam, I am writing to urge you not to issue the required permits for the proposed PolyMet mine. I am very concerned about the pollution of our waters, and the lasting impact this will have on the people, economy and environment long after the mine operation has closed down. I understand that jobs are greatly needed in northern Minnesota. But I do not think that sacrificing the quality of our water and all that will impact for the short term economic gain is worth the price we will all have to pay. Given their history, I do not believe that the assurances of the mining companies are valid. Please make a wise decision for a healthy future based on the science, not emotion. Thank you. Clarissa Ellis-Prudhomme 53533 Sjordahl Rd Sandstone, MN 55072 (320)245-2589 -

Mar 13, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has not been done in Minnesota and threatens wetlands, rivers, lakes, and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Sulfide mining's potential for pollution is tied to the presence of water (wetlands), and for that reason it has usually been done in arid climates. Even in dry areas, the sulfide mining has still created severe pollution. The likelihood that sulfide mining can be done in northeastern Minnesota's wetland ecosystem without polluting lakes, rivers, and streams is highly improbable. The legacy of likely environmental pollution, and the price the public would pay is very high. NorthMet would drain into in the Boundary Waters watershed and tributaries of the St Louis River, a stream that discharges to Lake Superior. This is a concern since acid mine drainage and heavy metal contamination have polluted waters in all locations where sulfide ore mining has occurred. Moreover, to ensure proper reclamation and water treatment is done there must be continuous treatment for decades, even if PolyMet goes out of business, at a probable and unnecessary cost to the public. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land and the Boundary Waters Canoe Area Wilderness to help PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Clark Gantzer 112 E 1st St Hermann, MO 65041-1112 (573) 882-0611

I write to express my concern about the proposed Cooper/Nickel "Sulfide" mine. I have compared the 2010 and 2013 SDEIS and I do not see anything in the 2013 version that convinces me that this mine can be operated without damage to our environment. There should be no trade offs - jobs vs the unique water rich environment that is Minnesota. As I watched the State Hockey Tournament last night I noticed that PolyMet references "hundreds" of jobs. This mine would have a LIMITED lifespan. A significant portion of Northern Minnesota's economy is tied to tourism that is centered around our clean rivers and lakes - the rights of these Minnesotans should not be threatened. The mere possibility that Lake Superior could be threatened by pollution from this mine should be enough for denial of this proposal. But factor in acres in Superior National Forest and acres of wetlands that will be impacted. Contamination world wide from this type of mine has resulted at every site where water quality standards existed. PolyMet's 2013 SDEIS certainly does NOT guarantee that it can't or won't happen here. 200-500 years of potential damage to Minnesotans' health and water quality is an unconscionable risk. Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Remember you are entrusted with our resources. No one owns them No one has the right to destroy them. Please don't pollute with this terrible project. Teddy Roosevelt would kick your ass. Sincerely, Ms Claudia Gibson Cascade dr Fairfax, CA 94930 (415) 302-5954

Claudia La Paglia

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Claudia La Paglia Via E. Bernardini n. 8b/20 Genova, None 16138

Clay and Amy Wenner

21244

Dear Ms Fey, I am writing to express my concern with PolyMet's recent SDEIS. The environmental impacts of the project are just too great, and I worry that the state will be left picking up the bill for clean-up and that the water and wildlife of the region will be irreversibly damaged. I am a Minnesota Master Naturalist, a member of the Environmental Commission of Chanhassen, and an environmental educator at Excelsior Elementary. Our family visits the Boundary Waters every year, and our love of the area extends to our children who have been going since they were both out of diapers. The state already realizes the environmental importance of this region, witnessed by the creation on the BWCA and the Superior National Forests. We have friends world-wide who appreciate Minnesota for this gem, and it has been a source of pride for us that Minnesota has done such a wonderful job protecting it. We also have friends who live in Babbitt, and realize the need for more jobs in the area. However, the introduction of this type of mining would irreparably hurt tourism in the region. I would love to see more research and incentives to develop "knowledge clusters" in the region instead. Some research I contributed to in graduate school explains the concept, "HYPERLINK "http://www.hhh.umn.edu/centers/slp/economic_development/documents/rkc_MnSCU.pdf"Rural Knowledge Clusters: Implications for Minnesota Colleges and Universities." Please consider my comments in the DNR's response to the SDEIS. Thank you so much, Amy Wenner 7046 Chaparral Lane Chanhassen, MN 55317

Cliff Odegaard 42033

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Cliff Odegaard Roseville, Minnesota

Clifford Fenton Martin 57187

Yo. Destroying the earth destroys ourselves. Mining does nothing but fuel consumerism, kill miners and communities and kills the environment. We cannot continue to mine or start a new one. Clifford Fenton Martin 1275 62nd Street West Northfield, MN

58092

The extreme extraction of resources does nothing but that Extract. When we extract materials in an unhealthy and unbalanced way from the land, we extract the dignity of the humans who we not only impacted by the poison of this mining but also the workers who have to do it. There's no better way to create hurt, unhealthy, angry, said, and dangerous people, than to have them engage in the active destruction and killing of living things. We can see this demonstrated in slaughter house workers and the resulting abuse in their families. The same applies for the employees of Polymet and the hurt they will cause the land, water, [ILLEGEIBLE] and people. Jobs are never worth destruction, hurt and pain. This mine absolutely should not happen.

Clifford Hansen 14219

Feb 13, 2014 Ms Lisa Fay MN Dear Ms Fay, I would like to express my opposition to the proposed mining of sulfide ore in northeastern Minnesota. Twenty years of jobs isn't worth the permanent damage sulfide mining would do. This proposal should be rejected outright. Barring that, financial assurance should be required for the full cost of the hundreds of years of water treatment that may be needed. Sincerely, Clifford Hansen 318 5th St SE Apt 5 Rochester, MN 55904-4882 (507) 281-0249

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1) Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2) Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3) Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. I am writing to express my firm opposition to the PolyMet mine proposal. The risks posed by this mine to water quality, the health of Minnesotans and the BWCA ecosystem are too severe to allow this project to move forward Clifford E. Kashtan, M.D. 2828 Huntington Avenue St Louis Park, MN 55416

Clifford Moyes 31289

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The mining companies have a history of making promises they can't keep in order to get the permits they need. And when they are later identified as the source of pollution, they place the blame on everyone and everything except themselves. Solve the problem before it exists. Don't grant the permits. Sincerely, Clifford Moyes 905 Division St Horicon, WI 53032-1745 (920) 643-7046

Dear Ms Fay, Lisa Fay MDNR Division of Ecological and Water Resources Tim Dabney US Forest Service Douglas Bruner US Army Corps of Engineers Dear Ms Fay, Mr Dabney, and Mr Bruner I am writing to ask you to reject the PolyMet sulfide mine project, Supplemental Draft Environmental Impact Statement (SDEIS) and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes and does not take into account the true cost of the project. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all lands in the exchange have split mineral rights and no legal barrier to future surface mining. The Land Exchange results in an unacceptable net loss of 6,026 acres of area with high biodiversity; 2,030 acres of mature forest-replaced by 2,000 acres of immature forest and 1,400 acres of floodplains. Secondly, PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swampland and the Partridge River headwaters for its open-pit sulfide mine. This would result in the single largest wetlands loss ever proposed in Minnesota. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres in total due to air and water pollution, mine dewatering and water from wetlands. These comments are made from both the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit. In addition, the PolyMet sulfide mine would negatively impact 2 out of 13 remaining corridors for wildlife, including resident and migratory species, to travel across the Arrowhead region. The PolyMet mine plan would destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which has dropped precipitously by 35% from 2012 to 2013- Eleven endangered or threatened species, including lynx, would be further impacted. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants including wild rice. PolyMet and the SDEIS do not acknowledge the true cost of the proposed PolyMet sulfide mine. PolyMet is a lean deposit of copper-nickel, therefore, 99% of what is dug out of the ground will be waste. For that 1% gain in metal, the true cost will be unfathomable. The toxic extraction process will be energy and water intensive (releasing 200,000 metric tons of carbon dioxide). Even more water and energy (generating 707,000 metric tons of carbon dioxide each year) will be used in processing; leaving us with even more waste that will need to be managed for 500 years. This is in direct opposition to Minnesota's goal of reducing greenhouse gas emission by 30% by 2025- Lastly, it can no longer be ignored that fresh water is a precious resource and must be treated as such. By rejecting PolyMet's SDEIS and sulfide mining plan, you have the opportunity to pass on to future generations of humans and nature alike, the gift of irreplaceable wetlands, mature forests and fresh water resources of the Lake Superior Basin. You have the responsibility to do what is right and lead the way to a future that faces the fact that we live on a finite earth with finite natural resources. I respectfully ask you to reject the PolyMet sulfide mine project. Sincerely, Cole Christenson 12309 Fiona Ave N White Bear Lake MN 55110 colejchristenson@gmail-com Cole Christenson 12309 Fiona Ave N White Bear Lake, MN 55110

Colin Walker

Dear Ms Fay, My name is Colin Walker and I live and work in Ely, MN. I have some major concerns regarding the SDEIS and specifically, the water model, which is at the foundation of the entire SDEIS. The water model basically portrays the estimated amount of water in and around the potential site. This includes where the water is coming from, how it flows through the ground, and where it will end up. In essence, it is a reconstructed prediction of the pattern of water flow. On January 23rd, Marshal HelMBERger published an article in the Timberjay, revealing the inadequacies of this model. The specific miscalculations are related to the amount of water that flows through the mine site at the headwaters of one of the tributaries of the St Louis River, the Partridge River. A misjudgment in math could potentially result in catastrophic, irreversible impact on the watershed. One of the world's largest fresh water sources, Lake Superior, is at stake. Several environmental agencies have issued similar statements regarding the inaccurate reflections set forth by the water model. Mike Liljegren, a DNR hydrologist said that it is "more than likely" that a new model will need to be developed in a revised SDEIS. The Great Lakes Indian Fish and Wildlife Commission also highlighted the miscalculation in water flow near the mine site, which eventually drains into Lake Superior. (Found in Appendix C) From the beginning, we've been told to "trust the science." Well, until a mining company can prove that sulfide mining can be completed and not harm a watershed, this is the wrong place with too much at risk. I demand that the DNR addresses this issue, with the highest expectation that the water model within the SDEIS will contain accurate data prior to any further decisions are made. Because of the fundamental flaw in calculation, the SDEIS is fundamentally inadequate and unacceptable. We must stay committed to the environment if this mine is going to happen. Yes, metal is a precious and sought after resource but not at the sacrifice of the greatest resource, our water. Colin Walker PO Box 104 Ely, MN 55731

Hello I am absolutely for Polymet opening in northern minnesota. I believe they have gone beyond what is needed to prove they can obtain the minerals safely. I am tired of northern minnesota being denied the capability of supporting itself with great paying careers for the residents. I am from Duluth, MN originally. I am one of thousands of people from northern minnesota who ended up leaving 25 years ago due to lack of well paying jobs. Please continue to work towards goals of the people who actually live on the Iron Range and surrounding areas. I am tired of people who do not live there dictating to residents what should go on there. I love Northern Minnesota and want the people there to have a legacy of great paying jobs and the economy that will flourish due to Polymet. I spread the good word of Polymet whenever I can. Keep going PLEASE. Colleen Fisher Maple Grove, MN Sent from my iPad

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, To avert the greatest tragedy in our state's environmental history, you must demand strong scientific evidence that our precious woods and waters will NOT be damaged. That RESTORATION can be guaranteed. Reassurances are not enough. Intentions and beliefs are not enough. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Colleen Krebs 3655 Garfield Ave Minneapolis, MN 55409-1112

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
Many thanks for this opportunity to express my concerns regarding the proposal put forth for Polymet to establish their mining venture in northern Minnesota. I am strongly opposed to opening up this pristine area of boreal forests and majestic waterways to the magnitudes of unknown challenges to the health of this valuable environment as well as the quality of life and health of the residents and animals who call this their home. I myself own acreage just south of this area — and have lived in and learned to appreciate the value of this healthy environment for most of my younger years. It seems absolutely ludicrous to me that any business involving mining with all of the potential toxic pollution that goes along with these operations would ever be allowed to establish itself in the heartland of this vital watershed district. While I understand that PolyMet has proposed innovative ideas to deal with some of the potential anticipated hazards, there simply is no guarantee that incidents resulting in toxicity being released into the environment well into the unforeseeable future will not happen. The aquatic surroundings of the proposed mining area only amplifies the danger of this rapid spread of contamination throughout a huge area of the northland. I am very concerned for the potential sulfate pollution of this area and its impact on human and animal health. Arsenic, mercury contamination and asbestos-like fibers have already presented serious hazardous health issues in some of these areas. Has there been an accurate assessment of how this mining proposal would further affect the well-being of the local residents and animals living in this area. If not, please consider requiring such a study to determine the potential health hazards involved with the PolyMet proposal. I understand that the PolyMet water model significantly understates the amount of water flowing in the nearby Partridge River. If this information is wrong, predictions about water pollution are in question. If the model is incorrect, and there is more water flowing through the site than it assumes, the polluted water from pits and waste rock will move more easily through the soil, and reach lakes and rivers more quickly. The water could also carry more pollutants than the PolyMet model predicts. Please fix the inaccurate water data and redo the water model in PolyMet's mine plan. I am particularly concerned also for the loss of thousands of acres of critical habitat for our legendary moose inhabiting this territory which would be negatively affected by the PolyMet proposal. These animals are already in serious population decline and remain in peril as a result of the recent tick infestation and additional problems. Having recently been listed as animals of “serious concern” because of their requirement for extensive and specific habitats in order to thrive, it is disappointing to me to see that the PolyMet plan has obviously ignored the challenges their plan poses to this majestic being of our northwoods. Please require thorough analysis of the impact of the mining proposal on the moose population in northern Minnesota. Native Americans have been challenged in their cultural practices for far too long. The issue of PolyMet mining also appears to present yet another threat to their way of life by ignoring the impact on their sacred connection to both the moose population as well as to our state grain - Minnesota Wild Rice, a significant resource to local Minnesota tribes. Unfathomable gallons of polluted sulfate waters released into the watershed will undoubtedly have a negative effect on wild rice crops in the northland. The PolyMet proposal should clearly address these expressed concerns of Minnesota’s tribal populations and further guarantee the safety of this vital, natural crop. The PolyMet operation

I have additional comments: - The sulphuric acid and toxic metals produced by this type of mining are the result of exposure of this rock to air and water. This contamination happens wherever such mining exists and has always - with no exceptions - polluted surrounding waters. - This particular site is in a water-rich environment and, as such, facilitates/accelerates the seepage of pollutants (sulfide, heavy metals) due to the open-pit mining process. - The PolyMet site is within the confines of the Superior National Forest (public land). Federal law prohibits open-pit mining within national forests/parks. - Since federal law prohibits mining in national parks, a "land exchange" of some 6000 acres has been proposed as an equal exchange for the land and water that will be polluted by PolyMet's mine. This is not an equal exchange. An "exchange" misses the point entirely. National parks/forests are set aside as recreational areas for humans to enjoy Nature as well as habitat refuges for flora and fauna. The reason for setting aside large tracts of land is to provide an extensive natural habitat; a mine in the middle of such an area cannot be compensated by token land elsewhere. - The DNR, as presently set up, has a conflict of interest relating to mining decisions. By federal statute the DNR is mandated both to regulate and promote mining on public lands ~ and, in its promotion capacity, to maximize the royalties collected for any mining on state land. Promotion and regulation are two different jobs; one government agency should not be responsibly for both. The EPA should be given the regulatory responsibility ~ for the sake of citizen's health and, of course, the ecological impact. - A recent article (January 27, 3014) in the Star Tribune noted, as has the WaterLegacy organization, that 99% of the rock from which the mined metals are extracted would be waste. It is not only the sulphuric acid mentioned above that will contaminate surrounding water and land, but other pollutants such as mercury, arsenic, lead and unspecified others. This contamination, it is estimated, will last 500 years. And our state government would sanction this for so little copper.. ..and when Duluth's children already exhibit high levels of mercury in their systems. - The DNR would compromise our water resources for copper when, per "the Institute of Scrap Recycling Industries, copper scrap now provides half of the annual US demand for that metal and the US provides 23% of the world supply of recovered copper" The 500 year certainty of polluted water that will compromise the St Louis River and others that spill into Lake Superior is, I think, too high a price to pay for the small amount of copper and the huge amount of polluting waste. - Last Monday (March 3, 2014) the Star Tribune ran an article: "Duluth tires new view on tourism" and, next page, "Duluth: Not just a pretty view." This article announces the city's effort to expand tourists' awareness of the city's surrounding attractions. These include "miles of hiking and biking trails, a zoo, a ski hill, a campground and several places to launch canoes and kayaks ON THE WIDE AND SCENIC St LOUIS RIVER." (my emphasis) I'd be willing to wager that mothers will not want their family members to canoe on waters contaminated with sulphuric acid, mercury, heavy metals, lead PLEASE do not allow this permit to go forwaRd Our water and the health of our children is just too important. Thanks you. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Collette Leonhardt 1582 Circle dr Winona, MN 55987

50420

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.

Feb 24, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. To whom it may concern, I am writing in regards to the proposed construction of the NorthMet mine in Minnesota's Arrowhead region, a few miles south of the Boundary Waters Canoe Area Wilderness (BWCAW). The NorthMet mine, a project conceived by PolyMet Mining Corporation, would be the first metallic sulfide strip mine in Minnesota. Though supporters claim that it will produce large quantities of precious metals (copper, cobalt, and nickel), the NorthMet mine will have destructive ecological and economic impacts. The most threatening of these adverse effects is the potential for Acid Mine Drainage, a phenomenon in which sulfide ores become exposed to air and moisture, undergo a chemical reaction forming sulfuric acid, and leach into surface water and the aquifer. This process decreases pH levels, thus destroying many aquatic ecosystems and contaminating drinking water. According to the US Environmental Protection Agency (EPA), Acid Mine Drainage from metallic sulfide mines is the leading source of water pollution in the Mid-Atlantic States. NorthMet mine will also have dampening effects on the economy. The Draft Environmental Impact Statement (DEIS), a federal document projecting the ecological consequences of business proposals, estimates clean-up costs of over \$44-6 million, to complete clean-up tasks including land reclamation and acid remediation. In addition, construction and operation of the mine could disrupt the natural serenity of the area, which, in turn, would negatively influence ecotourism, a significant contributor to the region's economy. Besides its ecological and economic consequences, the NorthMet mine would have harmful impacts on my recreational and spiritual life. Since my childhood, I have viewed the BWCAW as an utterly divine place, the destination of my daydreams Each year, my family and I would travel north to paddle the placid waters, camp amongst the ancient pines, and submit to the enveloping aura of tranquility. In this peaceful wilderness, I developed an undying appreciation for nature and contemplated life in its most primitive form. Destruction of this blissful refuge, an inevitable result of the NorthMet mine, would be absolutely devastating to me and the thousands of other people who enjoy the BWCAW each year. Please oppose any legislation that would allow the PolyMet Corporation to begin sulfide mining in northern Minnesota. If passed, these bills would set a precedent for selling public lands to private corporations and undermine the National Environmental Policy Act. Sincerely, Collin Motschke US Student Fulbright Program The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Collin Motschke 1514 11th Ave S Saint Cloud, MN 56301-5638 (320) 761-8112

3-13-14 Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resource Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us Dear Ms Fay: I am writing to request that the Minnesota Department of Natural Resources, the United States Army Corps of Engineers, and the United States Forest Service either suspend the NorthMet Project Proposed Action and the Land Exchanged Proposed Action, or extend the amount of time left to discuss possible alternatives to these plans. I believe that these mitigation techniques to reduce the impact on the environment are not strict enough and should be further amended to have as little impact as possible on the environment. I feel that Alternative B does not really accomplish anything, as all it really does is reduce the amount of land being exchanged between the NorthMet Project area and federal lands. It does not put further restrictions on waste and toxin management, so does not reduce any of the affects caused by the mine. I feel that if a different, more effective alternative cannot be made, no action should be taken, in order to protect the plants, wildlife, and local tribes at risk. In the NorthMet Project Proposed Action, they state that 90% of the ground and surface runoff that comes in contact with the various toxins and contaminants at the mine and plant site will be treated. But that still leaves 10% untreated water contaminated with hazardous materials that can seep into the ground or runoff into the Embarrass River, St Louis River, and other streams and lakes nearby. This could cause significant water quality degradation throughout the area, possibly disrupting fragile aquatic ecosystems nearby. Also, local animal wildlife rely on these bodies of water for drinking water. If such a significant amount of untreated water gets into these waterways, it could have detrimental effects on these animal species. They also state that a side effect would be an increase of aluminum and lead amounts entering into tributary streams north of Tailings Basin. Aluminum and lead can be very toxic, and if they get in the waterways, it could lead to further degradation of water. In order for this mine to work, the mitigation techniques to stop pollutants and chemicals from entering into water ways should be stricter. It also concerns me that 912-5 acres of wetlands will be directly affected and 6,498-1-7,350-7 acres of wetlands will be indirectly affected by this plan. Wetlands are a very important part of the environment that play a vital role in the purification of water. If this many acres of wetlands are going to be directly and indirectly impaired in some way, it could have some effect on the water quality. A good chunk of these wetlands will be removed and replaced with the mine and plant site, along with various buildings. So instead of having a natural environment allowing for water to percolate through and be purified, there will be open barren land bringing toxins to the surface. So this plan is decreasing the amount of land used to remove pollutants from water, and increasing the amount of pollutants put into the water. I believe a good alternative would be to decrease the size of the mine, and develop a layout that would build around the wetlands, while removing as little of it as possible. Another concern is the 4,016-3 acres of vegetation and wildlife habitat that will be reduced. Eleven special concern plant species will be directly or indirectly affected by this plan, which would only endanger them even further, and could disrupt the balance of the local ecosystem. It could also lead to the decrease of the local Canadian lynx population and other species, such as wolves. These are special status species, and any action that can threaten their habitat and endanger their population should be looked at with some scrutiny. As you are aware, this land sits

I do not support PolyMet! Please consider possible water contamination. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Commissioner Keith Nelson

18196

Hi. I'm Marla Fredrickson, and I'm deferring my time to Commissioner Keith Nelson. Commissioner Landwehr, Supervisor Halter, and Deputy District Engineer -- and I'm going to try this -- Tahanus? Close. Okay. I'm sorry. My name is Keith Nelson. I'm a St. Louis County Commissioner. I am going to ask this audience to show me the respect that I would certainly show you as I speak. All of my career as an elected official, I've had the luxury of following Tom Rukavina. He was the representative from the very same district that I serve, and once again, Tom Rukavina has stolen a great deal of my thunder. At 5' foot 4", he can do that. AUDIENCE MEMBER: He can steal other things, too. KEITH NELSON: With that, I would like to address something that I don't feel has seen a lot of attention, and this idea that somehow construction jobs are temporary jobs. I respectfully submit that construction jobs are temporary in their location. I would like to tell you Kermit's story. Kermit was my father. He came to the Iron Range in 1952 after serving his country in the Korean War. He came there because he heard there was jobs there. He brought my mother and an infant son, my brother, with him. He went to work, ironically, for Foley Building Mining Company, the very same site that we're talking about PolyMet today. Thirty-seven years later, he was still working that temporary job. Our construction workers are not temporary employees. As Former Representative Rukavina stated, jobs matter on the Iron Range. I will tell you that that one person who came to Minnesota's mineral range from western Minnesota now has 24 direct descendants living, working on Minnesota's mineral range. Thank you very much.

I would like to show my support of the Polymet, Northmet project near Hoyt Lakes.. We need a safe and viable means to support economic growth in this region and with the states help I believe this is 100% possible. Sincerely, Conn Mattfield 311 Coventry Rd Hoyt Lakes, MN 55750 Sent from my iPhone

Connie Grundhofer 3656

Dear DNR Please do not let the dollar signs dancing around your heads be the ultimate deciding factor for having the Polymet mine plan come to be. The people of the United States needs for quality water and land are more important than money. We can not keep on destroying the earth and still live on it. Money won't fix all of the destruction. The Great Lakes is the largest body of fresh water on earth. Why would you take the chance of risking it. Really. Have you truly thought of all the possibilities. You do know that the least amount of destruction from this type of mining is to be far away from bodies of water and wet lands. Did any decision maker watch the PBS special Great Plains: America's Lingering Wild with Michael Forsberg. Did you see the destruction in the west because of the process of the mining. Have you heard about Alaska's Bristol Bay. People are trying to save it from losing a valuable fishery. Do you need to see destruction first and then say, "Well maybe that was a bad idea after all." Through destruction there are lives lost, ecosystems ruined or destroyed for years after. As you are well aware of, we are losing too many species of flora and fauna now. So please do not take the risk because of dollars signs dancing around your heads. Thank you for your time. Connie Grundhofer 235 Linda Ave Lino Lakes, MN

Connie Lacher 38732

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Connie Lacher 12325 County Road 51 Apt B1 Saint Joseph, MN 56374-9808 (320) 363-4364

Connie Lanphear

43277

Hi, I want to register my opposition to the PolyMet mine proposal. I have so many concerns about the project but my main concern is the potential to contaminate the Embarrass and Partridge Rivers, which flow into the St Louis River and then Lake Superior. The plan to contain pollutants sounds weak and I have a very hard time believing any company would be around in the next 200-500 years to oversee the required and promised containment. Secondly, I don't like the precedent this mine would set for the many other mining projects waiting in the wings. I love our state's water resources especially, and want my teenage girls (and all Minnesotans and visitors) to continue canoeing the BWCA and to have the opportunity to share it with their own kids someday. Please, please, please keep the big picture and the value of our natural resources in mind when evaluating this proposal, and I urge you to deny the project permit. Best regards, Connie Lanphear 3715 45th Ave S, Mpls, MN 55406 612-384-3405

Connie Lehr

43796

My name is Connie Kirvida-Lehr and I would like to make a few comments about Polymet's SDEIS and the process that ends today. 1) It is my belief that the MN DNR and ERM have acted as proponents of this project, rather than in unbiased roles protecting the best interests of the residents of the state of Minnesota. 2) The access to information was frustrating at best, and included a maze of different resources available in different ways. Transparent, it was not. 3) I also question the amount and location of wetlands used in remediation. They are outside the Lake Superior watershed and the amount less than most believe is an adequate replacement. 4) I believe the state of Minnesota deserves to put this project to rest and concentrate on mining that does not come at such a risk. If the copper is so valuable, we should keep it safe, just like the water. We protect our environment and our future that way. 5) Lining the pockets of foreign investors at the risk of our environment is not worth 350 jobs on the iron range. It is time for the people who choose to live there to realize that Minnesota's heyday of mining was just that. You cannot expect to do the same job your grandfather did today anywhere. Jobs evolve over time for everyone, unless they are sustainable like fishing and farming. As you can see, my concerns are all over the place. Just as they are for many I know. This, along with the continual release of new information, I also believe your decision to not extend the comment period was wrong. Polymet had years and millions of dollars, along with data provided by those protecting our resources to create their case. The residents of MN got 90 days to digest it and comment. Connie Kirvida-Lehr 8679 243 rd street Forest Lake, MN 55025 -and- PO 217 Lutsen, MN 55612

40463

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Connie Metcalf 802 Mendenhall Ave Breckenridge, MN 56520

Mar 6, 2014 Ms Lisa Fay MN Dear Ms Fay, Dear Mr Governor and DNR, I support the position of the MN DNR and associated legal bodies. The mining operations should go through as planned. As an environmental scientist that specializes in water quality, I believe that mining, tourism, and good environmental quality can coexist I am writing from the Audubon society webpage, where I have found dozens of inaccuracies that they support and willingly spread to the public. A brief list of inaccuracies would include: Calling the mining "sulfide mining" when in fact it is copper-nickle mining. 500 years of treatment will not be required as stated by the Audubon, that figure is used in modeling the sub-surface water percolation in the EIS and does not represent treatment estimation. There will be no toxic runoff as all drainage will be treated, and mining will have no impact on the boundary waters (BWCA) as the watershed is not affected. The Audubon society is being intellectually dishonest when they make a number of unfounded claims that have no scientific basis. The deceit by the Audubon society is hard to ignore by anyone familiar with the science. I truly hope that good data will make it's way to the general public. Sincerely, Mr Connor McComas 426 Wheeler St N Saint Paul, MN 55104-3623 (651) 231-3239

Please reconsider the environmental impact that could possibly occur (and generally does), if their mining project is permitted. It seems to me that all mining projects, whether it be for oil, minerals or whatever, end up with some sort of catastrophic consequence. There is always an unforeseen event used as an excuse when the catastrophe occurs. Now is the time to do something about it. The jobs created are not worth the eventual costs. I'm sure that there are plenty of other industries that could be located in this area without the possibility of environmental endangerment. Sincerely, Conrad and Kathy Gill 1270 S. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Constanza Raber Saint Paul, Minnesota

This project may have benefits of jobs, but with all things pros and cons must be considered. This project is such a short term mine in the first place. 40 years is not long-term for job seekers. Is it worth building a home in a place that will loose all it's boom in 40 fast years. The environmental impact has to be considered. Mining absolutely will pollute the ground and water with toxic materials that have been known to cause cancer. It's not worth 500 years of cleanup for 40 years. Just because the natural resources are there does not mean it has to be mined right now. Waiting for the right technology that can extract without polluting is very worth it. The sensitive ecosystem will never be the same. The land holds so much value, let alone beauty. All that matters to mines is making money. Even with guidelines it cannot be done safely. Let's wait for technology to develop better techniques. The environmental impact is a serious issue and needs to be a real concern. Prevention of having the water contaminated is the best route. Not an attitude of it can be eventually cleaned up. This project should not happen. We need to preserve the land in order to sustain the population. Thank you for your time, Coralee Thilges

Hello, Wondering if written comments must be received by March 13 at 4:30 PM, or postmarked by March 13- Thank you for the clarification, Cori

Corie Ekholm 9607

As I downloaded the SDEIS for Polymet, I was amazed at the size. As I read through it, it became obvious that a lot of time, money, and effort went into the document/project to ensure all topics were thoroughly investigated and discussed. Polymet has a well thought out plan to minimize and mitigate the environmental impacts associated with copper-nickel mining in Northern Minnesota. We need all the minerals Polymet will mine, they are essential to live in our society. I would much rather mine them here, where we will do it in an environmentally friendly manor, than in some other country with no regulation that will pour the pollutants into the air and water. We are already seeing the effects of Chinese factories air pollution in the US. The SDEIS is good but I would like to have more explanation on the model used to predict the number of years of water treatment. I do not think the SDEIS fully discusses the fact that the model allows for no decrease in the amount of pollutants coming from the various areas. As the rocks weather (oxidize over), pollutants will no longer be leached out at the same rates. The weathering will form a barrier covering the rocks preventing more pollutants from reacting and being leached out. This will cause a decrease in the pollutant load as time goes on, which is not addressed in the model or discussed in the SDEIS. The Polymet project will have numerous benefits for the community. It will provide good paying jobs that are needed in the area. The additional jobs will enable people to stay and live in the area instead of having to move elsewhere to find work. The local communities will benefit from the tax revenue and additional jobs. Overall, I feel the SDEIS did a good job at addressing the environmental impacts of the Polymet project. We can do both, mine and protect the environment. I support the SDEIS and the Polymet project. Corie Ekholm 4413 Woodlawn Dr W Eveleth MN 55734

Correy Merritt 3072

Everyone is very concerned about the negative effects of mining, with good reason, but we need to look closely at the facts. The need for mining precious metals is being driven by the demand for; cars, computers, phones, televisions, appliances and any other technologies that require these metals. Whether we like it or not we are all "supporting" mining by creating this demand. The need and demand for these things is not going away so how do you protect the environment and provide the things that people want and need. I suggest that it is by conducting mining in countries like the United States who have systems of laws and regulations in place that protect workers and the environment. By having mines here we can keep control of how they are operated and have accountability. By blocking projects in the United States we are simply shifting the supply source to countries like; China, South Africa and Russia. It will probably be cheaper to get our precious metal from these sources because they don't have the cost of government regulation to deal with but is that the right thing to do. If you're really concerned about the environment but you're not ready to give up your modern technology it seems to me that we should all be supporting companies like Polymet. Here are a few more facts that you may not be aware of; If you are a supporter of solar energy, wind energy, electric cars, hybrid cars, renewable energy, electronic devices, then you are a supporter of metal mining. Did you know that wind energy requires 30-50% more copper than larger base loaded power plants. Did you know that a hybrid car uses 50% more copper than a standard car and an electric car uses 3 times more copper. If you really support these greener energy and transportation alternatives, then you are supporting metal mining. Where will these metals come from, an area without strict environmental regulation and oversight. Or an area that is highly regulated and has been metal mining for generations. Think about which is better for our planet. Correy Merritt 8561 W Hwy 61 Schroeder, MN 55613 [HYPERLINK "mailto:merritts@northlc-com"](mailto:merritts@northlc-com)merritts@northlc-com

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Cortney Evans 800 nw fork Rd 1-p stuart, FL 34994 US

Cory Hertog

57995

I believe that going forward with the NorthMet Mining project will not be a good step to developing a sustainable future for Minnesota, and the world. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Federal and State Agency Leaders: Please do not support approval of the PolyMet sulfide mine because the Superior National Forest is an environmental gem for the community, the State of MN and for our country. I ask you, have you cross country skied there in the winter when the frozen snow sparkles on the trees. Have you hiked there in the summer time to witness the numerous, clean waterfalls. I could provide scientific studies that don't support this, but I'm asking that you simply visit this area and decide what makes sense when you look back at your legacy and how you left this community, this state, this country as pristine as when you first saw it. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Courtney Boettcher-Whited 5829 Chowen Avenue South Edina, MN 55410

Feb 15, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. The SDEIS acknowledges that amphibole fibers are present in the rock to be mined, that crushing the rock for processing releases these fibers, and that these fibers are suspected of causing mesothelioma in workers. The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the PolyMet mine and plant site. A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process. Specifically, the DNR should: 1) Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length 2) Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure 3) Revise the SDEIS to eliminate inaccurate characterizations of the University of Minnesota mesothelioma study. Specifically, eliminate statements that imply that commercial asbestos is the primary risk factor for mesothelioma risk Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I am a concerned citizen, grassroots activist, auntie, traveller, herbalist, and dedicated bioregionaliSt Recently I had the privilege to travel to the southern part of what we call the united states where the corporation transcanada has built - or is finishing - construction on the infamous keystone xL. though it was an immense privilege to travel and spend time in the communities along that route and to experience the landscape and the terrain it was also devastating to witness and hear the stories of people who live along the route and in the communities where that nasty tar slosh is being transported and . refined. these were stories of legacies lost and people facing DEATH simply b/c a company was irresponsibly given rights to the landbase. aside from the outright racism that moves such as this by a greedy corporation perpetuate the environmental hazards are devastating. michael bishop (who is now running for governor) is suing several state and one federal entity for the failure to enforce regulations. the land that he bought with plans to turn it into a self-sustaining farm yard is now torn up and polluted with the futures he planned for his grandchildren taken away just like that *insert finger snap here.* lovely maya, who's mother cooked us dinner and heated up the sauna for us, and who's church brought us in and fed us soup EVERY sunday that we were there (and housed us when it rained) is feeling the affects of the pipeline on her land: her father is suffering from cancer caused by the gas that comes through the

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, courtney butcher 1298 32nd st sw pine river, MN 56474

Courtney Kerns

I am writing to register my total opposition to PolyMet's proposed copper-nickel mine near Hoyt Lakes. I am originally from West Virginia where we have so many dead rivers and creeks due to acid mine drainage. These rivers and streams ran clear, beautiful, and brimming with life for thousands of years until companies came along and extracted a couple decades of short-term profits from the land. The jobs and companies are long gone, but the rivers still flow dead- and in some cases yellow and orange. We CANNOT risk this happening in northern Minnesota. The short-term gains (the vast majority of which will go to out-of-state shareholders) are absolutely not worth the risk to our state's clean and living waters. Thank you, Courtney Kristina Kerns 2505 Elida Dr Grand Rapids, MN 55744

41851

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Courtney Werk Moorhead, Minnesota

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I've been following the Polymet project for several years, and my concerns are satisfied that the due diligence required of PLM has been performed. Let me state that my family owns lake property in Northern MN and I trust that the MN DNR and overseeing agencies will monitor very closely any data and react with Polymet to correct if there are any surprises not anticipated by EIS (although that seems unlikely with a 1000 page study). Our State, especially Northern MN, needs jobs and this project (future projects) can bring economic vitality into the communities where the young generations have been forced to leave. It wouldn't be right for Washington DC or the Twin Cities environmental lobbies to kabosh a project for Northern MN that is complying with all rational requirements. We Northern Minnesotans don't stick our noses into the business of the Metro area, nor do we necessarily have the clout to do if we tried. The polls and surveys for Northern MN residents are overwhelmingly positive. Northern Minnesotans are the most knowledgeable of the mining industry- they are not afraid. I believe strongly that the net Global effect on the environment is positive if Polymet is permitted. This copper/nickel mine will set an example for the rest of the world to follow. The environmental lobbies should spend their time on where the real problems are (third world) rather than claiming the end of the world is coming if Northern MN operates one brand new mine with tons of oversight. I thank all the good people of the DNR for their work in this matter. Please help breathe some life to Northern MN. -Craig Swenson Craig Swenson Financial Advisor Ameriprise Financial Services, Inc. 1201 Tall Pine Lane Cloquet MN 55720 Cloquet Office: 218-879-6784 International Falls Office: 218-283-3051 Toll Free: 888-256-3292 Learn more at: [HYPERLINK "http://www.ameripriseadvisors-com/craig.a.swenson"](http://www.ameripriseadvisors-com/craig.a.swenson)ameripriseadvisors-com/craig.a.swenson LinkedIn: <http://www.linkedin-com/pub/craig-swenson/15/373/b07> We shape financial solutions for a lifetime® An Ameriprise Financial Franchise. Dear DNR Commissioner: I wish to voice my opposition to any sulfide mining in Minnesota at this time, for the following reasons: As a landscape photographer, I make my living photographing the wild beauty found within the watershed the proposed PolyMet mine would impact. I've paddled, hiked, and photographed these areas my whole life, and have struggled to protect them from various threats over the decades. No previous threat has been as sinister or long-lasting as the ones presented by sulfide mining. I'm not alone in relying on the area's relatively pristine beauty as a source of income and inspiration. Tourism has been, and could sustainably continue to be a stable, long-term employer in northern Minnesota. I'm very concerned we might be sacrificing these sustainable jobs in favor of a short-term boost in employment from mining. We humans have a pretty myopic outlook on life — especially if jobs are involved. We build on flood plains that haven't flooded for a few years and are surprised when it floods. We build houses in forests that haven't burned in decades, and are surprised when things go up in flames. Like floods and fires, the effects of sulfide mining present threats we can predict with near certainty, and common sense would dictate we prohibit it— especially adjacent to the BWCAW and Lake Superior. What is predictable is that Sulfide mines will cause pollution. What is also predictable is that mine companies may go out of business far sooner than the need to mitigate mine pollution, sticking tax payers with clean up costs. It happens over and over. One of the really outrageous realities in the PolyMet proposal is the need to actively manage the waste for hundreds of years. This would require a guarantee that our system of government would still be in place that long, and that it would have the necessary funds, ongoing technical ability and political will to continue this. There is no example of that kind of stability in the history of mankind. And besides, who are we to place such a burden on that many generations. It is my opinion that if anything requires active management beyond a few years, it should not be permitted — as there will surely come a time when it is allowed to fail. Budget cuts, wars, plagues, famines, all come about with the same certainty as floods and fires, and will be much more likely as climate change and commodity shortages due to population growth strain global stability. If someone were proposing a hazardous waste disposal site, with the exact same specs as the PolyMet proposal, rather than a mine, EVERYONE WOULD BE OPPOSED TO IT — ESPECIALLY THOSE LIVING NEAR IT. I'd like to raise an additional thought, which is perhaps the largest reason to deny permits at this time. Any mining operation takes lots of electricity. Actively treating water through reverse osmosis creates the spectrum of huge amounts of electricity into the foreseeable future. Climate change is an imminent threat to the planet. Many scientists feel we must stop adding any more carbon dioxide into the atmosphere to mitigate what will already be severe environmental damage, especially to northern areas and forests. The DNR is charged with protecting our natural resources, including the health of our forests and waterways, and certainly must take this issue into consideration. Currently, any new mining operations in the area would be primarily serviced by fossil-fueled electric power plants, emitting huge amounts of carbon dioxide and other pollutants. The mineral deposits these companies wish to extract, are not going to go away, and the demand for these minerals in the future will only produce higher prices as they become scarcer. Humans will, within the next few decades, develop much cleaner sources of electricity — sources such as liquid fluoride thorium reactors, and advancements in solar and wind energy. In light of this, it would be totally irresponsible for the DNR to allow mining to go ahead now. If it

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Craig Blacklock 3853 County Line Road P.O. Box 344 Moose Lake, MN 55767 2184850478

Dear Ms Fay and other members of the EIS for the proposed non-ferrous mine, I believe there are multiple problems-among them tax structure, water quality, lack of a health impact assessment, water quality issues-and so I would ask that you not allow the mine to be built as described in the current plan. Beyond that, I simply do not trust that any mining company (or any private company) can be held to a 500 year clean up plan. Capitalism is a remarkable economic system, but its view is short term; it seeks to maximize short term profits, and minimize losses. When the nickel and copper are gone, they will shift to loss prevention-by either loosely following clean up agreements or by abandoning them altogether, thereby forcing them into the courts (whichever option minimizes the losses would be the preferred option). That's not a judgment statement, that's how capitalism works. Bankruptcy is also a tried-and-true method for minimizing losses. The history of capitalism is littered with externalities-economic costs that private companies foist onto the public. When the private snowplowers here in Saint Paul push all of the alley snow-which they are being paid to remove-out into the street, the snow becomes an externality that the public plows must deal with. Simply look at the lumbering industry here in the early days of our state. When the trees were gone, the lumber companies moved west. The slash and the stumpage was sold to immigrants as "cleared farm land," even though most of it would never be successfully farmed. In this regard, I would ask you to fix the Polymet mine plan by hammering out a detailed plan that provides solid financial assurances to the current owners of the nickel and copper: Minnesotans. Thank you for taking my thoughts into consideration. Craig L. Bowron 1396 Sargent Avenue Saint Paul, MN. 55105

From: cbrown@monkeybridge-com [cbrown@monkeybridge-com] Sent: Monday, March 10, 2014 5:33 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Craig Brown 2908 Southbrook Drive Minneapolis, MN 55431-2447

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

42074

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Craig Dienger Minneapolis, Minnesota

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Craig Geiger 2810 Galloway St Se Olympia, WA 98501 US

I would like to discuss for a few minutes the concept of risk management. All decisions involve risk. It's the ability to properly evaluate, account for, and mitigate the risk that sets apart the fly-by-nighters and the professionals. I think that we can manage the risk to provide our people resources that they need to advance and maintain our current lifestyles. I think we know how to manage the risk better than anyone else in the world could. We have over a century of mining experience to learn from. Undoubtedly some of these examples are not good ones. But yet we have learned from them and are better prepared to face the challenges that may arise tomorrow and long into the future. We do have some of the most pristine habitat and natural water quality in the United States. And maybe even the world. And have standards that far exceed those of our contemporaries to ensure that these blessings that we enjoy remained unblemished. Moving ahead with the NorthMet copper-nickel mine involves risk. I believe those risks have to be evaluated, accounted for, and mitigated to meet one of the highest standards, the Minnesota-not-in-my-backyard standard. I believe we can set a new standard of mineral extraction that will be used as an example for generations to come. And hopefully without eight and a half years of prior scoping and evaluation. As I mentioned in the beginning, all decisions involve risk. It should be understood that determination to not allow a proposed mine also involves risk. We risk allowing someone else of lower standards than ours to gain an advantage in the precious metal market. We set up a big warning sign for future investors in Northern Minnesota that says, "Don't even think of mining here unless you can guarantee that nothing will ever happen. That absolutely no habitat will be impacted. And your pre-scoping budget must be greater than \$100 million." I mean how else will we support our economy? And finally we risk the wellbeing of Minnesota's most important resource, our people and our children, which are all stakeholders in this project. Thank you for all who have spent an enormous and expensive amount of time and resources choosing to professionally address the decisions and the associated risk before us in a highly professional manner.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

My name is Craig Olson, O-L-S-O-N. I'm a proud fourth generation (inaudible). What makes me even prouder is my daughter Christie is a fifth generation. She works in the painter's union as an apprentice. Very proud to be five generations. My family has been able to live in these communities from Ely to Duluth and be able to make a living here. I'm speaking tonight as the President of the Duluth Building Trades Council. Our 17 construction trade unions, many of them were here tonight. I was proud to see all the apprentices are that here. The men and women, the young people were here. They care about this issue. Speaking as the president, we are on record in support. The Northeast Area Labor Council is also on record. I'm on their executive board. Of course we have a project labor agreement on this project. PolyMet has done everything we've asked them to to ensure our members, who live in these communities, from the Iron Range to Duluth and the region, to make sure that our people are the ones that will be employed there. And that is absolutely going to happen. This project will produce a lot of jobs. Not only construction jobs. The construction isn't just for the PolyMet site. The recycled LTV site, which by the way I worked at LTV as a construction worker. I'm proud to have a good job. That project alone will bring in 2 million man hours construction. 2 million man hours. That's the equivalent to the Target Stadium that was built here recently in the Twin Cities where the Twins play. There is 360 full-time mining positions. And there's more than 600 related jobs that will be produced. That will produce good-paying jobs for the families that are very much needed. We cannot afford to miss the opportunity of these full-time job, including the construction jobs. Copper-nickel mining can be done right. I've listened to a lot of good speakers on both sides tonight. My members of my unions, trade unions, they are environmentalists. You bet they are. I spend in my time in Tower, Minnesota, every chance I get at the family cabin. We fish. We hunt. We are environmentalists. We're going to protect our environment. But we're going to make sure it's done right. The agencies in front of us tonight we know. We trust them. We know it's going to be done right or it's not going to be permitted. We know that. But it's about time we put our people to work. A lot of men and women in the trades, over 6,000 in this region. We need the jobs. Thank you.

Craig Poorker

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Craig Poorker 3711 York Ave N Robbinsdale, MN 55422-2312

From Craig Prudhomme 53533 Sjordahl Rd Sandstone, MN 55072 [HYPERLINK "mailto:craigprudhomme@gmail-com" craigprudhomme@gmail-com](mailto:craigprudhomme@gmail-com) 320-245-2589
Comments on SDEIS PolyMet Minnesota has a long history of natural resource extraction from fur-bearing wildlife like the beaver, to our forest resources like the big pines and the Big Woods, to mineral extraction like the great iron mines. It has consistently been a story of huge changes on the landscape, of boom and bust. When we are done, the land is never the same, never as good. We can never fully undo the damage and the change. In the 1970s and 80's we began to see the price of such unsustainable practices and to create some agencies and laws to protect the land and the water. Though it seems like the land of 10,000 lakes has a never-ending water resource like the loggers thought of the the great pine forests, we are seeing that too is not true. Excessive draws on groundwater is draining lakes, water quality is decreasing, invasives are increasing, wetlands continue to be compromised, and the habitat surrounding our surface waters is under constant attack from development - residential, commercial and industrial. Northeastern Minnesota, though somewhat beat up, is one of the last great reservoirs of wild land in this region. It is an international resource that includes the Superior, the greatest of our Great Lakes. PolyMet is proposing to create a mine that will further destroy wetlands and put at risk watersheds that include Lake Superior. This is done for a finite mineral resource that will be extracted for a finite number of years with the promise that the waste left behind, will be adequately and safely monitored and the environment protected - for many lifetimes - far longer than this corporation, this government, or current agencies can even imagine paying for and maintaining. This is not going to occur in a desert region, it will occur in a temperate, wet, leaky region, where we have the occasional flood event. I have personally observed the immediate after effects of when heavy rain caused a "secured" ash pile to fail and wash across the highway into Taconite Harbor near Schroeder in 1993- We can look to reports of power plant ash dikes that have not been adequately inspected here in Minnesota. How do we think we can take the risk to monitor and inspect for hundreds of years when we do not have enough institutional memory to keep from revisiting past errors. This mine should not be permitted. The potential costs are too great for the potential short-term gains. And these gains will be short-termed by comparison to the costs. The people who moved to the mining areas for the past booms bemoan the bust. They'll get some jobs and it will revitalize their communities until the next bust, and then, unlike beaver and trees which can grow again, a bunch of grassed-over, leaky, walled-off tailings piles and polluted water will leave the land even less able to sustain a living. We think copper and nickel are valuable resources, but when we look at the one most important resource to life, fresh water, we are only now beginning to realize that it is the number one, most important resource. Clean water is finite. You just have to go to different regions of our country to see it is our most basic necessity. Do not put this at risk. Sincerely, Craig Prudhomme

Dear Lisa Fay, I believe the Minnesota Department of Natural Resources' DEIS on PolyMet's mine plan is flawed and inadequate, as it does not fully describe impacts on Minnesota taxpayers or the surrounding environment. It is very problematic that PolyMet's details about a financial assurance or a "damage deposit" the company provides are not outlined in this revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability. As a former shareholder of PolyMet stock I have changed my position on this mining project 180 degrees and am now strongly opposed to this mine proposal. I am very concerned that PolyMet Mining company anticipates that at least 500 years of polluted water will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Also, every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. Who will be paying for all of this after the mine is closed in just 20 years. As a current stockholder of many other mining companies, I do not believe that PolyMet's plan is reasonable, responsible or in the best interests of Minnesota, its citizens or environment. The DNR's DEIS must be revised to more fully analyze the range of environmental and economic impacts of this flawed proposal. Sincerely, Craig R. Miller 1849 Whitaker Street White Bear Lake, MN 55110

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Craig Westgate 3523 Saint Paul Ave Minneapolis, MN 55416-4344

As a lifelong resident of Minnesota, including living in Eveleth, MN and currently owning a summer home and property on the Iron Range, I am highly concerned about the proposed PolyMet Mine. While I appreciate the need for livable wage jobs in this generally depressed economic area, it seems the risk of wide-spread, long-term contamination of the area's water-supply far outweighs any potential benefit of a few hundred, relatively short-term jobs. Currently, tourism is the one of the largest sources of jobs and revenue in and around the Iron Range. Given the tourism industry is driven almost entirely by the area's lakes, streams, and outdoor recreation opportunities, it seems absurd to consider any large-scale plan that would place those invaluable natural resources at risk. It is not worth risking large-scale harm to the environment and established tourism industry for the prospect a relatively small number of jobs expected to be created by PolyMet. I sincerely hope the DNR will advocate for the long-term health of Minnesota's environment, water, and tourism and deny PolyMet's permit to mine in Northeast Minnesota. Thank you for taking comments on this matters. Craig Zlimen 2203 Ogden Court St Paul, MN 55119 651-245-5330

craigaparsons

I would like to voice my opinions regarding the SDEIS for the proposed Polymet mine. I believe the SDEIS has serious shortcomings that need to be addressed before any permitting decisions are made. The location of the proposed mine is identified throughout the document as being on the Iron range, implying that it is part of the Biwabik iron formation. However I've read reports that contradict this and place this mine location in the sulfide-bearing rock of the Duluth formation. I'm concerned about this beyond simple semantics. Are the assumptions underpinning the studies of potential pollution caused by hydrologic and geologic activity consistent with this misclassification. I feel the economic benefits section of the document is misleading. There has not been quantitative accounting of the many environmental effects on the economic outlook. Full and part time jobs have been lumped together in the analysis. Also the economic benefits of mining should be compared to a no-mining scenario. Without such a comparison, how does one claim the mining option results in a net social and economic benefit, even if the huge environmental risks are deemed acceptable. The environmental risks completely dominate the decision on whether the mine should be allowed or not. Mines such as the one proposed here, where sulfide bearing rock will be exposed have the monumental task of containing the sulfide runoff from that waste rock. In fact, no mine of this type has been successfully operated without accompanying acid pollution. This proposal fails to convince me that this mine will be first to avoid that outcome. It is paramount that the technical plan for mine cleanup and water treatment be beyond reasonable question especially in light of the location of this mine so close to pristine wilderness such as the BWCAW, and Lake Superior. The SDEIS as it exists now does not meet that requirement. I have read that even other taconite mines that have been shuttered in the state of MN have not been in compliance with acceptable levels of sulfide runoff, and those were mines where the waste rock was of much lower sulfide content. In the last week, it has been announced that the MPCA will soon release new standards for sulfate release into waters that are capable of growing wild rice. This is expected to have far reaching consequences for any mining operation. Because these new standards, this proposal should be delayed for further consideration until it has addressed compliance with these new rules. The most disturbing shortcoming of the SDEIS is the lack of an accounting for the financial aspects of the closing and decommissioning of the mine. The report indicates unacceptably high levels of sulfide in discharge water for hundreds of years after mining ceases, yet none of the projections actually show safe levels being reached for the hundreds of years over which the models were run. How can a decision to permit be discussed without a timeframe identified where active and costly water treatment such as reverse osmosis are no longer required. Polymet has been quoted in the press as saying that they are able and willing to treat mine runoff for as long as it is required. This is clearly a ridiculous statement. No realistic business plan could be based on an infinitely long treatment plan that would at some point negate all profits realized from the mining operations. Knowing the length of this treatment time is absolutely necessary to determine if the mine can be a successful business venture. Polymet knows this and I imagine they know exactly how long they can afford to treat water and stay profitable or otherwise they wouldn't have been able to attract investors for this project. The corollary to establishing a true cost estimate for the long term water treatment is to also understand how much money Polymet must place in a trust to ensure the treatment needs can be met without taxpayer support. Without this trust, there i

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Proponents of the project argue that it will create jobs however, there are other and better ways to create jobs that do not deplete and pollute our natural resources for generations to come. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The proposed mitigation measures for dealing with the risks are costly and are not guaranteed. This project puts too much at risk The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Crystal Myslajek 2731 14th Ave S Ste 620 Minneapolis, MN 55407-1126

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Crystal Yakacki 1014 27th Ave SE Apt E Minneapolis, MN 55414 (516) 987-6328

Ronald and Carol Tokarczyk 243 Kent Road Hoyt Lakes, MN 55750 218-225-3564 Fact: Each season has differing amounts of snow levels, and rainfalls. Question: Will they in fact be prepared to meet the varying demands for safe handling of the byproducts of production. Fact: We hear that Polymet is reluctant to put money into a trust fund for cleanup. Question: Can they be trusted to be responsible for long term water control and reclamation. We would like to see Polymet become a reality, but we are uncertain whether they can be trusted as a good neighbor.

Dear Ms Fay, As a downstream resident on the Whiteface River near Cotton, Minnesota, and because I have been learning about sulphide ore bodies once uncovered, I gotta ask you to demand a renewed environmental review based upon accurate water flow measurements at the Polymet site. My real hope is that the DNR will work with the tribal agencies and form an alliance to protect our water resources. My ultimate hope is that the whole darn project will be evaluated as too risky, in too sensitive an area, and should be abandoned. I have so very little faith that Polymet, or any mining corporation, would be trustworthy partners in understanding the critical value of water conservation and environmental protection and doing what they say they will. Please give my letter to you, every consideration we don't have many clean water areas left. sincerely, Curt Bush 7789 Arkola Rd Cotton, MN

Dear Ms Fay, Dear Federal and State Agency Leaders: The PolyMet sulfide mine is an extremely bad idea for Minnesota. Our legacy is clean air, water, and recreation. Mining in such a sensitive area is not compatible with our values and presents substantial risk to air and water quality. I realize that work has been done to quantify how the discharges would affect the environment, and predictions have been made. The sad fact is that "stuff happens" and it will take the environment hundreds or thousands of years to recover. In addition the mine would destroy wetlands which we and our wildlife desperately need. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. My name is Bernie Rissanen. I'm a representative of the Pipefitter's 539 Minneapolis. And I yield my time to Curt Steinerbraun. CURT STEINERBRAUN: Hi my name is Curt Steinerbraun. This morning when I left my home in Winter Springs, Florida, it was 81 degrees. Let me assure you I'm happy to be here. And I am grateful for the opportunity to speak here. Actually, my journey started in 1923. 90 years ago last month my grandfather got off the boat, went through Ellis Island seeking a better life. Four days later he was working for the Westinghouse Corporation. He worked in the factory 42 years. My father was an apprentice. Worked in the same factory for 43 years. I was blessed with the opportunity to get a mechanical engineering degree. I have two sons, both mechanical engineers. With the four generations we have 151 years in the energy business. My first trip to The Range was in 1973. 25 years ago I had my first shore lunch. I fished the Boundary Waters -- and they truly are beautiful -- two of the last three years. I'm hoping to be there again this summer. Minnesota has beautiful scenery, has wonderful resources, and some of the best people in the world. And I'm here to advocate on behalf of the Minnesota mining initiatives. I work for Siemens. Siemens is a large global company, a leader in the field of energy and electrical equipment. We're a \$100 billion company doing business in the US of \$25 billion every year. We are approaching 60,000 employees globally here in the US. And I'm responsible for the western part of the US for our energy sector. We build products that make electricity and deliver it to your homes and your businesses. We need copper and other critical metals to build our products. An example you can see in your community here is wind turbines that we are building in the state of Minnesota and North Dakota that feed this territory with clean, renewable energy. One of my issues or problems is every one of those wind turbines requires about 8,000 pounds of copper. And it also requires other specialty metals. If I -- if my company is to maintain a thriving, healthy business, we need a secure domestic source for copper and other metals like that. And I would speak just a moment on the EIS process. Every major power plant we build is required to go through EIS. I know how thorough it is. I know how time consuming it is. And I know how many hours everybody puts into it. So thank you to the US Corps of Engineers, the Department of Natural Resources, and the US Forestry for your effort.

Curt Thompson

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. NAME ADDRESS Sent from my iPhone

---Original Message--- From: curt@panelworksplus-com [mailto:curt@panelworksplus-com] Sent: Tuesday, March 11, 2014 11:38 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies' view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Curtis Stendel 4861 Ambassador Blvd NW Saint Francis, MN 55070-9716

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Cyn Goustin 6029 Dupont Avenue S. Minneapolis, MN 55419

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, CYNDI SALINAS 1632 PARK DRIVE SCHAUMBURG, IL 60194 US

From: Cyndy Klinksiek [mailto:klink@visi-com] Sent: Tuesday, December 31, 2013 4:58 PM To: Fay, Lisa (DNR) Subject: PolyMet Ms Fay: My husband and I moved to Duluth because of the great natural beauty and unspoiled resources of northern Minnesota. I'm writing to express my views about the SDEIS draft for PolyMet. I understand that people need jobs, and we citizens of Minnesota want to build a strong, sustainable economy, but we also need to consider the legacy we leave our children. The proposed copper-nickel mine may bring money into communities in the short term, but when the metals have been extracted, tax-payers will be left holding the clean-up bill. Our precious pure supplies of water are the envy of the world. We need to safeguard them for future generations. I've read about the chemistry of sulfates, and I believe we need to value our supplies of fresh water more highly. With waste that may need to be treated for more than 500 years, the risk is too great. Mining will create wealth for few, leaving generations of Minnesotans wondering how our citizens could have been so short-sighted as to approve this extraction at so cheap a price. Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms cynthia hardy 1145hudson rd apt 335 st paul, MN 55106

Feb 12, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved. You all know the problems with PolyMet - and you know that the public does, too, and that people like me are spreading the word that PolyMet has a horrible plan which will make them rich, and then they'll duck out on taking care of their mess. We all know this. Don't think that there are any good sides to their proposals, because what small good things come of it are not even close to outweighing the damage that will result from this. So I say to you: Reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Miss Cynthia Lee 1882 Shryer Ave W Roseville, MN 55113-5412 (612) 570-4595

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Cynthia Peterson 518 N 23rd Ave W Duluth, MN 55806

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Cynthia Williams 1940 E Hearn Rd Phoenix, AZ 85022-4515 (602) 482-1089

Dear Ms Fay, Mr Bruner and Mr Dabney: I am writing to ask you to reject the PolyMet sulfide mine Project and the proposed exchange of 6650 acres of Superior Forest Lands. The US Forest Service does not allow strip mines on Federal land within the Superior National Forest where this proposed mine would be located. I feel it is wrong to do this land exchange to basically get around the intent of this law and it is not in the public's interest. Sulfide mining has a track record of water contamination caused by acid mine drainage. In particular water rich areas are most vulnerable such as in the Superior National Forest where this Polymet mine is proposed. Even lower sulfide content can be quite toxic when there is a lot of waste rock which is the case for this proposed mine. Many if not most owners of mines declare bankruptcy leaving taxpayers with the cleanup costs which run into the millions of dollars. In fact Hardrock mining is considered by the United State EPA as being the top toxic producing industry. Acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The SDEIS has admitted treatment of water would require 200- 500 years or more. This is basically perpetual treatment. This violates Minnesota Rule (6132-3200) calling for a mine to be left maintenance free at closure. With that said it amazes me this is even being considered. We need a law as strong as Wisconsin's "Prove it First" mining moratorium law. This is what I want and Minnesotans deserve, we should not be risking our valuable resources. Sincerely, Diane Borgmann 2285 Stewart Ave #2123 St Paul Mn 55116

D Hudson

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, D Hudson Tracy st Los Angeles, CA 90027 US

This email is intended to communicate my personal opinion that the NorthMet Supplemental Draft Environmental Impact Statement should be deemed complete in every respect. This project should proceed to permitting without delay. This is a good project capable of creating good jobs in northern Minnesota. It will also allow many of the legacy issues that exit due to past mining activities to be addressed by PolyMet in a technically sound manner in a shorter timeframe. Respectfully submitted, David King 7563 Park Lane Eveleth, MN 55734 218/780-8868-

Board Resolution Regarding PolyMet Mining January 28, 2014 The Duluth Area Chamber of Commerce supports the emerging strategic metals mining industry in Northeastern Minnesota. The Chamber's board of directors passed a formal resolution, illustrating this support, on May 28, 2013. The Chamber's board understands how the strategic mining industry of Northeastern Minnesota will generate thousands of new jobs for our region. As well, the board appreciates how strategic metals mining will have a positive impact on local tax revenue and education funding. Additionally, the board realizes how mining companies operating in Northeastern Minnesota, such as PolyMet, will utilize advanced technology to meet rigorous environmental standards established by the United States Environmental Protection Agency and the State of Minnesota to ensure protection of human and environmental health. These agencies rely on years of scientific research to set these standards that safeguard our air, water and land. The board also recognizes and appreciates how members of our Chamber have already benefited from the planning phase of the PolyMet project. For example, Barr Engineering is doing much of PolyMet's environmental work. Additionally, Krech Ojard is providing PolyMet engineering support. PolyMet has spent more than \$1.2 million doing business with Duluth companies in 2013. We recognize that, once PolyMet receives its permits, several more Duluth area businesses will provide services and product to the Polymet Project. The positive economic impact of PolyMet will exponentially grow when construction and mining begin. In summary, the Duluth Area Chamber of Commerce stands in support of the emerging strategic metals mining in beautiful Northeastern Minnesota. The PolyMet Project is the most immediate example of this mining. Therefore, the Chamber's board is passing this formal resolution to: fully support and publicly advocate for the PolyMet Mining initiative. We respectfully encourage decision makers empowered with determining PolyMet's future to allow this needed project to proceed.

POLYMET COMMENT/EDITORIAL 1/22/14 • My family has N.E. MN roots dating back of the turn of the century (early 1900's). I have lived in other areas of the Midwest but have lived here on the Iron Range since the late 1970's and chose to raise a family here in large part for a love of the outdoors & this area's unique environment. • I do not wish to impugn the motives of those against this project but I am a bit mystified by their positions, especially "the sky is falling" mentality environmentally. "Conservation" is the wise use as opposed to misuse or nonuse of resources. It seems to me that our presence here at this evenings forum is proof that here in America, we have policies & procedures in place designed to protect the environment. Polymet is utilizing environmentally friendly technologies designed to utilize resources without abusing the environment- technologies that simply were not previously available. For years this Nation has been concerned with becoming "energy independent"... Why not the same sentiment re: "metals independence"? Regardless of how well intentioned, on at least two fronts that I can think of, those who are against this project for "environmental" reasons may not have entirely thought through their position. 1. Overreaching under the "environmental protection" mantra actually does more harm than good to the very environment they are claiming to protect. How so? To the extent that we find ourselves dependent upon foreign supplies of these resources, are we not simply shifting at much higher environmental cost (and social & economic cost I might add) the liability to countries who do not have policies in place designed to protect the environment? That many of these other countries are unwilling to invest in technologies & infrastructure designed to utilize resources without regard for the environment should be obvious, just ask the average Chinese citizen how they feel about their air or water quality. By refusing to move forward with projects such as Polymet, we in effect do more damage to the environment globally and are subsidizing atrocious policies where concern for the environment takes a back seat and stringent environmental measures are paid lip service at best. 2. Furthermore, refusing to utilize resources given the protections and processes we have in place is irresponsible economically and socially. Not only are wages and benefits lost to N.E., MN and our state generally but, as alluded to previously, our refusal to responsibly mine these resources means that we are subsidizing entities who, as demonstrated by their wanton disregard for the environment, obviously have little regard for economic or social stewardship. Are those who work in the mines and industry of China enjoying a dignified standard of living? If so, at what cost? At the cost of wearing a respirator just in order to be outdoors or of being afraid to drink the water? Shame on us if we allow a well intentioned but misguided few nix projects such as Polymets and thereby promote continuation of these policies globally. Finally, in my opinion "Polymet" and all those involved with the project, ought to be commended for their conviction, patience and persistence and used as model rather than vilified. Thank you for the vision and risk you and your investors have been willing to take for all of our benefit. Respectfully, D.V. Sandstrom 3747 Hwy 5, Hibbing, MN 55746 d.v.sandstrom@gmail.com (218)262-3987 or (218) 966-2720 cel

Mar 13, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I'm a student at the University of Minnesota Duluth. The natural beauty of the Great Lakes is what drew me to going to school here. I love Minnesota because it is a state that values and protects these natural spaces. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Dabney Bullivant 7518 130th Ave Milaca, MN 56353-4437 (763) 898-0268

18257

My name is Dagmar Romano. I am from St. Paul. I am 71 years old. My professional background is in environmental remediation. I am a mom and a grandma. My granddaughter is six years old and my grandsons are four-year-old twin boys. I call them my three little munchskins. They are so cute. They are my greatest source of joy and my greatest source of fear. The joy is self-explanatory. My fear is that they will not experience the natural health, beauty and serenity of Minnesota's northland as I have been able to do for so many years. I fear that they will inherit from my generation a state that is much less environmentally sound than it was when I found it. It is a well-known and honored practice that when camping in the BWCA we always leave our campsites in as good a shape or better than when we found them. Wouldn't we want to do the same for our precious state? The PolyMet SDEIS isn't a plan. It is an experiment that would put Minnesota's clean water at risk for hundreds of years, as stated in the document. The document doesn't provide the basic information to support its predictions. How much polluted wastewater is going back and forth through nine miles of pipes? What is the total volume of wastewater in tailings and processing residue? Just how polluted is the wastewater and waste rock piles, pits, sump ponds, the tailings basin and the hydrometallic waste dump? The SDEIS is incomplete because without this basic information, we can't estimate what would happen if PolyMet's unrealistic assumptions, not based on data by the way, don't come true. The project -- the SDEIS admits that the project is an experiment. On page after page it says that in the event that modeling shows violations of water quality, PolyMet will adaptively manage the problem. How does "adaptive management" as a plan sound to you? The document is incomplete. It must reveal wastewater volumes and pollutant levels at every step. It must have facilities from day one to meet water standards. In closing, can someone help me understand how on earth we, as Minnesotans, would even consider a project that threatens to pollute our water for hundreds of years? Is this the state and the legacy that we want to leave our kids and grandkids? And for what? Some jobs that last a few years and huge profits for a mining company? I'm reminded of a poem by Robert Fulghum titled, "All I really need to know I learned in kindergarten." Particularly these lines, "Share everything, play fair, don't hit people, clean up your own mess, don't take things that aren't yours." PolyMet, are you listening?

42447

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, The SDEIS is incomplete because important issues, such as environmental assurances, are not adequately addressed. In addition, there is inadequate data to make an informed decision about the 500 year time frame that is being proposed for water treatment from the operation. In addition, how can any state agency agree to a 500 year time frame for water treatment/monitoring. That proposition is nuts I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms dagmar romano 1840 Goodrich Ave Saint Paul, MN 55105-1509

Daisy Dominguez

54221

Dear Ms. Fay I am a student at Humboldt High School and we are an environmental school. We like to take care of nature, we also try to prevent damage to our environment. Environmental impact statements show that water from mines will have toxic levels of metals after 500 years. Of course it does not have to be that way. This is all preventable. I have noticed that your map is incorrect. I am sure that you are well aware of this. Giving false information and leaving out very important information is not okay. I am asking for you to redo your map correctly and show the correct length of the swap. I also find it necessary for a hydraulic conductivity test to see how much the swap and the mines could effect the boundary waters. Also there must be a water test in the boundary waters to make sure there is no chemicals in it. The boundary waters are very important and special because they are pure and clean, not too many places are left like that. You do not have the right as well as any other person to contaminate the boundary waters. You can not take your own selfish decisions and harm our environment. Sincerely, Daisy Dominguez 58 East King St. Paul, MN 55107

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The fact that we are even considering this mine is ludicrous. We have so much to protect, so much to lose, it is not worth the few measly jobs this project will create and for how long. Jobs for 200 people for 20 years. For what. Loss of rice beds, loss of wildlife habitat, loss of water security and the loss of fragile, pristine ecosystems. The copper mine must be stopped. That is the bottom line. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Dakota Hoska 5152 10th Ave S Minneapolis, MN 55417-1724 (612) 823-2821

I am writing to encourage you to not approve the proposed PolyMet mine project. After studying the available research, I am convinced that this mine would be detrimental to the people of Minnesota as well as all those who visit this area. The long term effects on the land and water of this area would be disastrous. Sincerely, Dale Shimmin 2832 Minnesota Avenue Duluth, MN 55802

Dale Boeff 39527

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dale Dahlquist 1005 Argyle St St Paul, MN 55103

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I would like to add my comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The records are clear, the mining industry has a terrible record of pollution and note standing behind their statement of taking care of problems Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. There is no proof that they can contain the pollution from this mining practice and only proof that they will not keep promises to protect the value of clean water and the species that thrive in that water. Once some pollution gets in the water flowing to Lake Superior it will be impossible to clean it out. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Dale Gustafson 1845 Wisconsin Ave N Golden Valley, MN 55427-3962 (763) 544-4215

PolyMet EIS Project Manager I wish to submit my opinion concerning the release of permits for the construction and operation of the PolyMet project in Minnesota. I sincerely believe the citizens of Minnesota and the United States would environmentally and economically benefit from the construction and operation of the PolyMet project in Minnesota were the facility would have to be managed and operated under strict US and Minnesota environmental regulations. If the capacity of the proposed operation were to be developed in other Nations, such as China, our western States would receive atmospheric pollutants as they experienced from other mineral beneficiation processes located in countries with little or no environmental regulation. Build the capacity in the United States were it can be environmentally controlled-do not submit to building the capacity in a foreign nation were we only experience the environmental pollution from unregulated processes. Thank you Dale A. Hintsala, P.E. 11152 County Road 553 Nashwauk, Mn 55769 218-262-3654

Dale Johnson

To Whom It May Concern: Time after time we are assured all necessary precautions have been taken to protect the environment yet when damage is done the responsible parties declare bankruptcy and walk away. I cite the company that released chemicals into the water supply in Charleston, West Virginia as the most recent example. What assurances are there this won't happen the first time pollutants are "accidentally" released. The beauty and quality of Northern Minnesota is too valuable to risk for a few jobs that will end up costing the citizens of Minnesota multiple times their value in damages and clean-up. Dale F. Johnson 4141 Victoria St N. Shoreview, MN 55126

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Dale Johnston 14615 Oakwood Rd Minnetonka, MN 55345-2322 (952) 929-3765

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

I am concerned in many ways. Number one, does the MN. DNR have up to date fish surveys and inventory of fish populations present. Aquatic plants present. As a person who is very familiar with the use and labeling of copper sulfate By the US EPA as a herbicide, pesticide, fishicide etc. it can be deadly at very low levels. Montana still has Blue ribbon trout streams completely void of fish due to runoff of copper sulfate waste from mines closed years ago and still having problems containing the runoff and leaching. Copper Sulfate at concentrations as low as 0-2PPM, which is equivalent to adding 0-5 pounds of copper sulfate per acre foot of water as Mn. DNR records show moves fish. At low alkalinity if present for more than a day has the potential to kill fish. Higher concentrations will definitely kill fish. These levels may even be lower than the levels Wild Rice can tolerate. Also any acidification of the water will cause soluble mercury levels to rise and work into the food chain, causing levels in fish to rise, which recommendations for people to eat are already very limited in the area. Recent study along the north shore indicates 10% of women who are pregnant have too much mercury in their system at present time. Dale Lockwood 13894 Two Mile Rd Brainerd MN. 56401 email: dale.lockwood@hotmail-com

Dale Long

18101

My name is Dale Long. The last name is spelled L-O-N-G, from Orr, Minnesota. I was the mayor in Orr for several years. And water and resources are dear to our hearts. I am an operating engineer for Local 49 and also a business representative there. I am speaking today for the Iron Range Building and Trades, which consists of 17 trades, with 6,000 plus members in this region alone. We support the state and federal agencies' document that has analyzed the PolyMet project thoroughly. This is not just about the construction jobs and building this project, but it is also about the long-term jobs to run the plant, as well as the spin-off jobs and positive effects to our area communities. I have seen this east end of the range deteriorate from the time I was in high school to where it is today. This region definitely needs this project. Thank you.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dale Stewart - Life long Northeastern MN resident Addendum: Tourism is a much, much more important industry in this area than some copper nickle mine. Let them go open a mine where water is not an issue. Dale Stewart PO Box 792 Willernie, MN 55090

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Furthermore, given Glencore Xstrata's well-documented irresponsibility as a long-term steward of the environment, I think any claims the corporation makes about its commitment to multi-decade or even centuries-long containment of environmental externalities should be treated as nonsense. To put this in the plainest English possible, Glencore Xstrata intends to treat northern Minnesota as a third-world resource provider and waste sink. I live in northern Minnesota, and I have no doubt that given a thorough understanding of the issues, none of my neighbors would willingly trade our environment for a short-term solution to economic problems that could be solved in a variety of ways that wouldn't involve making our home unlivable. Sincerely, Dr Dan Allosso 9400 Cottonwood Ave NE Bemidji, MN 56601-8663 (218) 333-0480

We have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. We would also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. The model used to calculate the alleged economic benefits of the mine takes into account the costs to the environment and the displacement of other economic activity. Tribal rights to hunt, fish, and gather under the 1854 Treaty will not be adversely affected; nothing is the same as it was when the treaty was signed. Tribal people have, and always will adapt. Further: The supplemental draft Environmental Impact Statement is a detailed, independent review of the PolyMet project. Federal, state and tribal agencies shaped the development of the SDEIS, which was written by an independent, third party. I am confident that the lengthy, thorough environmental review process has addressed potential environmental impacts and how to mitigate them. I am confident that the SDEIS gives regulators the information they need to issue PolyMet Mining permits to operate while protecting natural resources. The PolyMet project has been designed to minimize environmental impacts. It reuses an existing site and existing infrastructure, minimizes the disturbance of wetlands, and utilizes multiple safeguards to protect the environment. PolyMet's planned mine layout minimizes impacts to wetlands, and its reclamation and mitigation plans will replace the wetlands that are lost due to mining. In fact, PolyMet will restore and protect more wetlands than it impacts. PolyMet will control and manage stockpile water with proven technology, including foundation liners, water collection systems and cover systems. PolyMet will have dramatic, positive socioeconomic impacts to a region that has been built on mining. This project is located in an area that supports mining and the jobs it will bring. The land exchange with the US Forest Service will open up new public recreational opportunities for all Minnesotans. We cannot afford to miss this opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Dan and Lucy Anderson 810-7th Street Cloquet MN 55720

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dan Burnett

41570

Howdy Lisa, I am Dan Burnett, resident at 2308 Elliot Avenue S Minneapolis, MN 55404 who works with the Lutheran Volunteer Corps at Open Arms of Minnesota - a nonprofit located in the Phillips Neighborhood - and I would like to express my objections to the proposed Mining Project. It is simply foolish to ask a company to provide water treatment for the area for a length of time that is over three centuries. If the contaminated water is projected to be undrinkable for longer than white people have been politically organized in a meaningful way then we should not allow the water a chance to be contaminated in the first place. It is irresponsible to expect anyone to be obligated for such a period of time. Therefore I urge the DNR to deny this permit to PolyMet. Best, Dan

My name is Dan Carn. I would like to address the location that we're talking about. I believe this is the absolutely perfect location that we're looking at. I see Hoyt Lakes as the birthplace of our mining industry. And I see history repeating itself. If the mining company hadn't stepped forward at that time, we wouldn't have the construction we have today. We have a great opportunity here. This is a world-class resource. And I think this is a stepping-off point that has an awful lot of merit. Everything that we do has an impact and we should make as small of an impact as we can. This is already an industrial site. We already have a huge facility there. We're using the existing tailings basin. And we have the railroad infrastructure in there. The only thing we're doing is moving the pit area (inaudible). Regarding the issue of risk, we've said a lot about that tonight. And I also trust all the agencies that have worked very hard for eight years or more, maybe closer to ten. And I'm assuming they have an awful lot of work to do in that time. And I believe they've been hard at it. Regarding the issue of adverse risk. Nobody wants to (inaudible). If we want to eliminate risk, you can't do anything and we will have nothing, which brings me to my next point of unintended consequences. If we don't do this, there is a cost of not having it. Look at the Middle East in the last 50 years. (Inaudible) wars since the history of mankind since the beginning of time are resource based. You don't have it, you take it. You're not immune from pollution here.

DAN DEMARINO

21971

EIS Project Manager- I support the Polymet Mining project. I have followed the project over several years and watched how socially responsible solutions to concerns have progressed nicely. The seemingly never ending long term assurances voiced by those opposing the mine may be able to be resolved by the requirement to have long term bond assurance. Sometimes the pleasures of having a recreational retreat are not realistic and that location may have to move to a new location. The hard points are that families will be able to survive with a great quality of life if they are allowed to have an income. The mine will provide that. The community will be able to grow economically. The advances in contamination control should help to ease the concerns of pollution. The checks and balances in place should also alleviate concerns. Let people work. Let people advance. Let the mine open. Dan DeMarino 142 Sonning Rd Irmo, SC 29063

Dan Dimick

57969

I am deeply opposed to the project. The economic gains are outweighed by long term environmental risks. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Dan Esposito

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Dan Esposito 1510 N Rowell Ave Manhattan Beach, CA 90266-4082

Dan Humay

18062

My name is Dan Humay. I live just outside of Ely in Eagle's Nest Township. I've reviewed some of the EIS. And obviously it's a cumbersome document. But I look for assurances that what is being claimed can in fact be accomplished. And I must admit I have some really great concerns. I think my initial concerns were triggered by reading that copper mining has never been conducted anywhere in the world without producing grave pollution of water resources in the mining area. I look for some hope in this project that that won't happen. Yet I see veiled attempts to prevent information in one way without answering with some pertinent questions. I'm especially concerned about the contamination of mercury from the mining operation. Northeast Minnesota already has a serious problem with mercury. And the Minnesota Pollution Control Agency has listed a number of water, rivers, lakes, and streams in this area as impaired with methalized mercury found in fish tissue. So there are some warnings about eating levels of fish beyond a certain point. And it seems to me that the mining company, PolyMet, does not do anything to assure that this is not going to become worse because of their activity. They are talking about releasing annually from the tailings container 11 million gallons every year of untreated seepage right into the water system. Furthermore, they're going to release another 6 million gallons of untreated seepage from the mine site itself into adjacent streams and rivers. Any increase in the level of mercury in the water table, whether it be in a stream, river, lake or aquifer is not acceptable. And I don't see where they can give any assurance that this will be done. Children born in this region one in ten have elevated levels of mercury in their bodies when they are infants. Elevated to the point where they are listed by the National Board of Health as hazardous. This is an anomaly. And women who are pregnant are warned about ingesting sources of mercury. To date I think they've tested 1,465 children and they found their bodies are contaminated with mercury poisoning. And yet we're going to allow a mining company to create a situation that will only exacerbate this. I think that's unconscionable. For 360 jobs for 20 years that's an embarrassment that we will perpetuate a widespread health problem to that end. I also think that corporations are not living things. They are entities that are driven by profit. And the only reason PolyMet is here is because they're interested in making money at our expense. And I wish the permitting people would wake up and smell the coffee. I think it's just wrong, unconscionable, and it may even be criminal. Thank you.

18126

Thank you. My name is Dan Humay, and I live between Ely and Tower, about halfway and I want to thank you for having the hearing, and I hope you're listening carefully because a lot of good things were said tonight. None of us are as smart as all of us, so it's important that we take what we hear and really think about it. This is really kind of an not going to tell you that I read 2,300 pages because I didn't. I think that's impossible. But I did focus on some things that were a concern of mine, and I'm not going to talk about what if, what would be our how long it would be. I want to talk about what is right now. Right now, today, as we sit here, in this watershed, the Minnesota Pollution Control Agency has classified dozens of strange rivers and lakes as impaired. What would make them impaired? Levels of mercury above what are considered to be safe. Methylized mercury appearing in fish tissue. One in 10 children who are born in this watershed have elevated levels of mercury in their body when they are born. That's not a statistical anomaly, but compared to other places in the state, it's astronomical. This project, as good as it appears to be, and the science you are examining, what it claims, admits this in this document. Annually, 11 million gallons of untreated water will be released into the watershed from the tailings containment area. Another 5 million gallons will be released into the watershed from the mine site itself. Sixteen million gallons of water this year, the next year, the next year, the next year, the next year. How much mercury is that? The EIS really falls short in dealing with mercury, and I think behooves you to hold them accountable. We certainly expect that. Everybody here who is in mining community expects it and those of us who aren't, but live here, also expect it. As a matter of fact, we demand it. We cannot put at risk children who are innocent residents the way we are now. 1,675 kids have been tested positive so far, and I think that's unconscionable --in the name of jobs or minerals or anything else. Children is all we have. Thank you.

Dan Iler

17693

To who ever is in charge, I am concerned about the potential opening of a copper/nickel mine by PolyMet Mining Corp. in northern MN. It is my understanding that in October 2009, a Draft Environmental Impact Statement for the proposed PolyMet mine was released for public review and comment. Following that statement in February 2010, the US Environmental Protection Agency (EPA) gave the proposal its lowest ranking: Environmentally Unsatisfactory-Inadequate. The EPA gave many reasons, including: missing information, failure to address pollution problems, structural issues, and lack of financial assurance analysis. PolyMet Mining's response to this was a revised draft called the "Supplemental Draft Environmental Impact Statement" or SDEIS. There are a number of reasons that I object to allowing a copper/nickel mine to open in northern MN by PolyMet Mining (or any mining company). My first and primary concern is the environment. The second concern is financial and the third concern is a lack of trust in mining companies. 1- With a projected mine life of twenty years and a projected water clean up of the mine site for a minimum of 200 years and 500 years at the plant site the risk to reward is skewed to the way too risky side. Environmentally it is reckless and naïve to believe that any company or agency can contain and clean all of the waste water from the mine site or processing plant. It is impossible to account for all the variables mother nature can throw like floods, cracks in bedrock allowing seepage to ground water, plants and roots tearing into a possible synthetic cover over the tailings pile or Not to mention inevitable mechanical breakdowns, leaks or breaks in piping used to move waste water, human error, or . The EPA identifies the hardrock mining industry as the largest toxic-waste producing industry in the US and no sulfide mine has ever operated without polluting its nearby waters. Even if the projected water clean up is off by a hundred years or so it is still not a sound or viable deal for Minnesota's fish and wildlife, the people relying on the region's water supply, or the vegetation (wild rice ect..). 2- When it comes to the financial assurance side of the equation I feel it is unrealistic to think there is a magic formula to get a monetary number for 200 - 500 years of water clean up and reclamation. Once again, there are too many variables to try and account for with such a long time span involved. Even if the company sets aside a "damage deposit" for financial assurance and gets a back up insurance policy for financial assurance, there is not a company out there that has a track record of being in business for 500 years. It seems inevitable that eventually Minnesotans will be on the hook to cover the cost of clean up. 3- The track record of mining companies abandoning mine sites that are no longer profitable is long. The EPA has designated many of these sites as "superfund" sites, leaving tax payers to shoulder the cost of cleanup (if clean up is even possible at all). It is easy for corporations to hire good lawyers to write a nice "plan" on how well they will take care of the land and be good stewards to the environment. It is an entirely different thing for them to actually honor that plan and implement it. PolyMet Mining Corp. is simply the pawn on the chess board set up to fail. PolyMet Mining Corp. will have sent most, if not all, of its earnings to major backers (like Glencore International PLC). Once all the valuable minerals are extracted from the mine site and it is no longer profitable they will close up shop and file bankruptcy to evade clean up coSt At the end of the day the only people that really benefit from all this are some top executives of the company, some well paid lawyers and a few bought off politicians. When a person sits back and looks at this, from a common sense and scientific approach, they will see that twenty years worth of jobs mining the precious metals is

Dan Iverson

19944

It is apparent to me or any one with more than a passing interest in the sulfide mining issue, and let's call it sulfide mining because that is really what your mining, that the DNR and the Corp of Engineers and to a lesser extent the US Forest Service has no issues with the potential impact of sulfide mining to the recreational treasure Minnesota posses and has, until recently, protected from the grasping hands of logging and mining interests. At the initial hearings at the capitol in St Paul I was stunned at how the DNR's presentation mimicked the Poly Met proposal and then angered at the arrogance of the national mining representative who arrogantly stated to all that this was an opportunity for income to the state of Minnesota and jobs and so what is "your problem." Over the past few years now, as one independent source after another has pointed out the folly of this venture for the state, the DNR has remained steadfast in it's support for sulfide mining, consistently willing to tweak the computer modeling of the project to meet the desired outcome. At the last public hearing in St Paul, it was disgusting to see the parade of paid for spokesman for the mining interests profusely thank the DNR and the Corp of Engineers for their hard work and good judgment. Obviously, the deal was in the bag as it always had been and the DNR was just going through the motions, a little dance all government agencies must do to appease the public with a show of democracy. Your actions and others in government who have been tasked with preserving Minnesota's legacy of clean water and quality of life have failed us. Your betrayal is unprecedented and will plaque and sadden future generations as the true impact of your shallow deceit slowly and forever befouls our treasured northern lakes and streaMs Dan Iverson Master Electrician Silgan Containers Savage, MN. 55378 Office (952)707-1635 Main Plant (952) 890-2120 diverson@silgancontainers-com

45242

March 12th 2014 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road St Paul, MN 55115-4025 Dear EIS Project Manager, I recently attended the public meeting in St Paul regarding PolyMets proposal to open a mine in Northern MN. I went into this with an open mind and heard presentations from both PolyMet as well as watched the video regarding what this project would entail. I want to thank the DNR and other agencies for their hard work in objectively evaluating this project. After viewing the video of this project a number of questions came to my mind so I spent a considerable amount of time with one of the representatives from the MPCA. This gentleman was very informative and provided me with as many facts as he could and clarified a number of things for me. 1- One of my biggest concerns is the lining that will be used under the stockpile of the most highly reactive rock. The MPCA told me there would be damage to the liners, holes and punctures so some highly acid waste would seep directly into the ground and would not be appropriately treated. I realize there are projections of what this would look like but what if they are not accurate based on some unforeseen circumstance. I am also questioning the viability of these liners over the long run of 50 to 100 years, especially when it will be constantly exposed to an acidic environment. Can we reasonably say that these liners will hold up for the long term. If they do not what is the plan to mitigate this possible scenario. 2- High levels of lead and aluminum due to the overall mitigation process of treating this water have not been addressed. These levels are well above the norm according to the MPCA. Recently a waiver was revoked on one of the taconite mines in northern MN which was allowing for high lead discharge levels. I would not be in favor of any such waiver. What a waiver tells me is that we are willing to take an environmental risk. 3- Copper is one of the key minerals that will be mined and is currently not in short supply. After attending this open house I did not walk away with the confidence or complete certainty there would not be significant impact on the water in this area. The Mayor of Hoyt Lakes said "is it a risk, yes but it is time to take it". I am not in favor of taking a risk at this time when there is a possibility that future technology would provide us a better way to mine these metals. 4- I am concerned about the pressure being put on the DNR, legislators, and other decision makers by the business community that has a direct financial incentive on this project moving forward. 5- The MPCA told me there has never been this type of a mine around this much water. These mines are usually in arid areas which helps mitigate the possibility of water contamination. I am not a scientist and I do not have many alternatives to provide solutions. But I do believe we need solutions that will guarantee beyond a shadow of a doubt the protection of our water resources in this area. Thank you so much for considering my comments. Sincerely, Dan Jobin 1716 Heritage Lane New Brighton, MN 55112

Name is Dan La Vigne, L-A space V-I-G-N-E. I have a couple talking points more or less. My first one is 200 years of water-pollution treatment from the mine site and 500 years of pollution seeping from the pit is not a viable solution to prevent an environmental catastrophe. Such a proposal indicates there is not a real method to deal with the problem of sulfide mining in Minnesota. Balanced against some 250 to 300 jobs for an estimated 20 years of employment is not an equitable deal for Minnesota residents. Minnesota's resplendent with wetlands and this puts them at high risk. Owning lake property makes me very concerned. There is a possibility that eventually this could affect Lake Superior, which contains 10 percent of the fresh water on the planet, and also, the Boundary Waters, the BWCA. This applies to quotes section 404 permits and the SDEIS. Even current tailing ponds leak, for example, the one at Minntac. It has been out of compliance for years. How is PolyMet going to do better? Putting money aside in a fund is not feasible, especially for 200 to 500 years. Who can predict the cost? Besides, human nature being what it is, the probability of that fund remaining untouched is next to nil. I can easily imagine it being raided to reduce taxes or for something else. A DNR report shows the rate of groundwater base flow is 200 to 300 percent higher than PolyMet's plan, so we should reject this plan. Just a comment that sulfide mining may be feasible in a different ecological system, but in Minnesota, it just makes no sense.

Dan Little

47508

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dan Little 2729 E 6th St Duluth, MN 55812

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Dan Mork Chanhassen, Minnesota

Dan Murray

42006

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Hi, I do not remember whether I sent a comment or signed a petition so excuse me if I already sent a comment but I want to make sure I have voiced my opposition to allowing a permit for the Polymet project for the following reasons. Water Pollution - there are no sulfide mining operations that have not had problems and I do not believe PolyMet has shown that they will prevent any major pollution problems. The tailings and mine waste are reactive for too long a time period to take this lightly. Fiscal Outlook - 20 years of mining is not enough to pay for hundreds of years of pollution risk and monitoring when the company could easily renege on its pledges by selling its assets or opting for bankruptcy in the case of a disaster. Precedence setting - there will be other permit requests and if this first permit is put through without it being bullet proof then other companies will use that as the benchmark. So even if Polymet, by some stroke of luck, does everything right and does not have an issue, other companies may have issues that they can't handle. So Polymet, as the first one down the pipe, needs to be conservative in their projections and promises and liberal in funding for all the risks now and for hundreds of years. Job Outlook - Any pollution problems from this project will negatively impact the tourism industry jobs for far more than the 20 years of mining jobs. Thank you for your time and consideration and the very professionally run public meetings on this topic. Dan Nelson 3010 Winnetka Ave N Apt 423 Crystal, MN 55427

Dan Nyberg

39908

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. This is all short-sighted and bad for our state. Minnesota deserves better. Sincerely, Mr Dan Nyberg 3285 Emmert St Shoreview, MN 55126-4116

To Whom it May Concern, I would like to voice my support for Polymet Mining and their pending mining project. I have followed the company for many years now and have reviewed the SDEIS and other relevant documents. I have also had the opportunity to visit the actual site and speak with the company's management and operating teams. I feel strongly that they have put together an excellent team of professionals and that this project will meet and exceed all environmental standards. In addition this project will bring much needed jobs and tax revenue to the area. I hope you allow this project to continue. Best regards, Dan Parsow dparsow@aol-com

My name is Dan Pearson. So the spelling is D-A-N P-E-A-R-S-O-N. So nobody can serve two masters. It is you either hate one or love the other or else you can loathe one and despise the other (phonetic). You cannot serve God. A very famous man once said these words. You might have heard of him. His name was Jesus. "First, learn right from wrong and good from evil (phonetic)." Today I stand in front of you, looking into your eyes (inaudible), to bear false witness in the name of the Lord. I always (inaudible). PolyMet has the right to sit here tonight, as indicated, and talk about their mine in front of the people, where in fact their mine is only about the profits (inaudible). They have taken a path away from God, away from love, and now they put a profit before the lives of others; simple. In the past and present (phonetic). Do these words have any meaning? We've turned our backs on these words so many times, in so many different ways. PolyMet acts as the hearts and minds, but we are still here today calculating whether PolyMet is right in the eyes of God, even though we might hurt others. I will tell you right now, no. PolyMet's actions are not just and not right in the eyes of God. Any corporation that will (inaudible) disregard life for the personal needs for themselves is committing sins in the eyes of God; and these are. (Inaudible) reparations for such acts. To me, children die every day, every minute and every second from actions of corporations like PolyMet. Due to their actions (inaudible). All of these actions have to stop. (Inaudible) these words and (inaudible) rethink their actions (inaudible). Put love in your heart and not evil. (Inaudible) doubt that. If not (phonetic), your actions can be taken for life severe consequences in the eyes of God. Thank you.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. To the DNR, Let's be responsible to the future people of Minnesota and make sure the fragile rocky ecosystem of Northeastern Minnesota is protected from the kind of devastation the dumping of taconite tailings did to Lake Superior. I worked hard to prevent what happened to Lake Superior in the 1950's and see the same tactics being used today regarding PolyMet. The people of Minnesota will make a good decision regarding PolyMet if they are given honest and complete answers. It is not rocket science to understand the make up of the soil in Northeastern Minnesota. All the data regarding the rocky soil and shallow bed rock structures is available in any public library. Water in Northeastern Minnesota doesn't soak into soil because the soil is primarily rock. Water simply runs through the rocks and directly into the rivers. We found good solutions regarding the mining of taconite and I'm sure we can find a good ecological solution to copper-nickel mining if we deal with the honest facts. I urge we find other ways then is currently proposed to dispose of the water tailings from the copper-nickel mining. Sincerely, Dan Petrella 5809 Whited Ave Minnetonka, MN 55345 Sincerely, Mr Dan Petrella 5809 Whited Ave Minnetonka, MN 55345-6659 (952) 934-2529

Hi: I am writing to express my opposition to the proposed copper/nickel mine in Northern Minnesota. I am sympathetic to the positions of residents of the area that stand to benefit from the influx jobs and money, especially given the economic hardship many face and the migration of young people from the area. However, the history of copper sulfide mining repeatedly shows a short window of increased employment and a certain future management of contaminants that remain long after the economic benefits and Polymet have gone. The lackluster initial proposal by Polymet is indication that any mining in Minnesota will be business as usual and business as usual with copper sulfide mining has a short window of benefit, generations worth of contamination and local communities and states left to deal with the mess. Every time. No thanks. Dan Steinhacker 1407 Arona St St Paul, mn 55108 Sent from my iPhone

Dan Sullivan

11327

The Polymet proposal does not sufficiently address the amount of money that should be set aside for environmental degradation. The mining industry has a long history of declaring bankruptcy and leaving taxpayers with the bill. The risks of this project are so much higher than the reward and I am opposed to it. Thank you. Dan Sullivan 1004 Chatsworth PL Shoreview MN 55126

Dan Turpening

My name is Dan Waters, W-A-T-E-R-S. I am a member of Up North Jobs, which has over 600 members in Ely. It's a non-profit organization in favor of jobs, any kind of jobs, on the Iron Range. I'm a business owner in Ely. Last year was my 50th year in business. Unlike some of the people here I am in the tourist business. Doesn't have anything to do with mining. It's strictly tourism. My business is not open in the winter time. It's strictly a seasonal business. So I don't have any links to economic help from a mining industry necessarily other than the ones from reduced taxes and things. That being said, I'm also a conservationist. I think I can consider myself an environmentalist. And I'm in favor of clean water. I am also in favor of mining. Especially copper-nickel mining and the PolyMet project. I think the Environmental Impact Statement that was done was excellent. And I think that not being a scientist I will rely on what they said in that statement. One fact I would like to clear up, in Ely it seems that some of the organizations that feel like Ely is they call it sustainable, and that is based on that tourism can sustain Ely. Tourism cannot sustain Ely. Since I started in business, Ely has changed dramatically. We used to have year-round bus service. At one time Ely had passenger train service. We had five grocery stores. We're down to two. We had two lumber yards. We're down to one. We had 1700 plus students in the schools. We're down to 500 and some. We're in danger of having our school go through consolidation. We're in danger of losing our hospital. All these things point to the fact that Ely and the entire East Range needs mining. This is what the range was built on. This is what will sustain Ely and the rest of the range is mining. We can have both. We can have mining. We can have clean water. We can have tourism. There's no reason not to have any of those. Thank you very much.

Dan Wicht

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, dana dembinny harsdörfferstr. 20 nürnberg, ot 90478 DE

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Darin Harth Dana Harth 19592 state hwy 28 Glenwood, MN 56334

When considering sulfide mining proposals, please take climate change into careful consideration. And please make sure the PolyMet NorthMet SDEIS explicitly states the assumptions about Minnesota's climate, economy, society, water security, food security, and political system for the next five hundred years; upon which its conclusions depend. And please require that every one of those assumptions is backed up with strong evidence that those assumptions can be dependably relied upon for the next five hundred years. Any sulfide mining proposal that doesn't address and plan for the reality that our climate situation will deteriorate is not addressing everything it should. There is an extraordinary amount of consensus among the scientific community that climate change is happening. Reporting on a major U.N. study, The Atlantic explained that "We are Terrifyingly Close to the Climate's 'Point of No Return.'" (<http://www.theatlantic.com/technology/archive/2013/09/we-are-terrifyingly-close-to-the-climates-point-of-no-return/280076/>) The Guardian reported that scientists are now saying that the planet is likely to warm by 4C by 2100, and that "4C would likely be catastrophic rather than simply dangerous." (<http://www.theguardian.com/environment/2013/dec/31/planet-will-warm-4c-2100-climate>) Even if governments around the world were doing everything they have pledged to do to prevent catastrophic climate change, which they aren't actually doing, it still wouldn't be enough to prevent our climate situation from getting perilously worse. (<http://www.theguardian.com/environment/2013/dec/03/un-2c-global-warming-climate-change>) Some climate experts say we aren't even aiming for the right target. Mother Jones reported that scientists are now saying that the: "Current International Warming Target Is 'Disastrous.'" (<http://www.motherjones.com/blue-marble/2013/12/scientists-current-warming-threshold-would-be-disastrous>) In fact, even if we immediately stopped all fossil fuel emissions, which we are not doing, our climate situation would likely continue to deteriorate. (<http://www.princeton-edu/main/news/archive/S38/51/51I69/>) Some climate experts think we would need to make radical changes in an extremely short amount of time in order to give our species a fighting chance. (<http://www.youtube.com/watch?v=T17YF4fmh4o&feature=youtu.be>) As you have probably noticed, we aren't making radical changes quickly. Because some climate feedback loops may become practically unstoppable by human efforts once they get going and because carbon dioxide emissions remain in the atmosphere for prolonged periods of time, by the time most people realize how dire our situation is, it may be too late to prevent catastrophic change. Professor Richard Zeebe said: "The legacy of our fossil fuel burning today is a hangover that could last for tens of thousands of years, if not hundreds of thousands of years to come." (<http://www.sciencedaily.com/releases/2013/08/130805152422-htm> and <http://www.sciencedaily.com/releases/2013/05/130530095020-htm>) So unless the PolyMet NorthMet SDEIS bases all of its conclusions about the next five hundred years on the assumption that our climate situation is likely to be significantly changed for the worse, it is not taking reality into consideration. Different regions are expected to be affected by climate change to different extents, at different paces. And it is extremely likely that there will be a period of time when people continue to live in Minnesota under much more environmentally stressful conditions than exist today. There may even be large numbers of people seeking refuge in Minnesota from coastal and more severely drought stricken areas. Any sulfide mining proposal that does not take into consideration, and plan for, a time period such as this, is grossly inadequate. The University of Oklahoma reported: "OU Study Suggests Non-Uniform Climate Warming Affects Terrestrial Carbon Cycle, Ecosystems and

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. The studies done to support the PolyMet mine project have been deeply flawed and do not adequately protect our environment. There are also insufficient economic guarantees to address pollution issues in the event that the company goes bankrupt. Sincerely, Ms Dana McCarthy 1681 Lafond Ave Saint Paul, MN 55104-2214 (651) 644-2831

Dana Wahlberg

Good Afternoon~ Thank you for providing the opportunity for the public to make comments on the PolyMet Project. I attended the public meeting at the RiverCenter earlier this week. My name was not drawn to speak, so I would like to share my thoughts in a written format. Like so many others, my family is extremely hopeful that this thoughtfully and carefully developed project will soon become a reality for all of us in Minnesota. The co-lead agencies have invested significant time and resources in this initiative, for which we are both appreciative and thankful. Sincerely, Dana Wahlberg 5188 Midway Rd Duluth, MN 55811

Can you not build a mine near our lakes cause waste run which can pollute our waters. It can also mess up our trees for sight-seeing. I can disturb our forest animals heavily. Sulfur pollutes water sulfuric acid. And it decreases they're PH. And fish die because of the acid that goes in the water and it effects the fish. No human wants to eat acid fish cause its bad for you.

Danette Vassilopoulos

39497

The SDEIS for the Poly Met Mining Project is flawed and does not guarantee that sulfide mining can be done in Minnesota without seriously harming water and habitat. This project should not go forward. It seems an absurd assumption that water treatment for hundreds of years is a reasonable expectation. There are no models for replacing the types of habitats that will be destroyed. The major impact to the water shed is too complicated to know what the outcome will be in all scenarios. Let's protect the valuable parts of our state that have already been set aside for future generations. Danette Vassilopoulos 13704 James Ave South Bursnville, MN 55337

Feb 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Reader, I am writing after carefully studying the information on several sites about the Polymet and Twin Metals Copper-Nickel Mines Proposal(s). I also write as a nearly life-long Minnesotan, and someone who has canoed the pristine waters of the northern Minnesota's BWCA and the Canadian Quetico Park areas for 45 years. I have also guided canoeists in the BWCA-Quetico for three summers as a canoe guide. The beauty, spiritual renewal, and invigorating physical aspects of travelling in the untrammled wilds of the northern Minnesota Boundary Waters is unparalleled, and leave a deep, lasting impression. There is NO PLACE like it on earth. I have traveled around the world and visited countless wilderness areas, including in Alaska and Asia, and I can say that there is no place like our Boundary Waters. It is an unparalleled, pristine wilderness area. I have always drunk the water straight out of the lakes. Never have I gotten sick, nor has anyone, to my memory, on one of the trips I guided. I want to see the BWCA and Lake Superior Basin kept pristine for my children and grandchildren. and for others' grandchildren This is why I am writing. I am convinced that Polymet's and Twin Metals' plan will not keep our BWCA and surrounding rivers and lakes (watersheds) safe. The fact is: other copper-nickel mines around the world have led to terrible pollution of surrounding waters. It will be tragic if this happens near our beloved BWCA or Lake Superior - and the wonderful watersheds surrounding them. I am convinced it is just a matter of time before the mines and there extensions will do just that - cause environmental devastation. I realize jobs are important. But, the long-term risks do not justify the short-term "gains" - for anyone. The greatest freshwater lake in the world, Lake Superior is also at risk, as is the St Louis River and estuary. The fact that it will take hundreds of years of monitoring and cleanup after the mines finally close, is evidence supporting this: "don't start mining." The EPA has identified "hard rock mining" as the nation's top toxic producing industry. The sulfuric acid produced by this kind of mining is known to leach into rock and dissolve compounds that are toxic and that can then leach into waters - impacting birds, fish, amphibians, and the whole web of life. That's not acceptable to Minnesotans. In fact, the EPA reports that hard rock mining produced 41% of all toxins in our country in 2010- In addition, Polymet's mine would destroy 1000 acres of irretrievable wetlands. We already have lost most of our wetlands in Minnesota. We can't afford to lose more. Again, this is unacceptable. The bottom line, there are just too many risks, and I am deeply opposed to both of these proposed mines. In my opinion, it will be a big mistake if they are allowed to proceed. Sincerely, The Rev. Daniel Belgum-Blad 301 Ramsey Ave W. Atwater, MN 56209 Phone: 320-974-0736

I have reviewed the environmental information posted on the DNR website regarding the Polymet mining proposal. I will just get to the point. It appears the company has done their research into the process and have a reasonable plan forward in their mining operation. I am in favor of allowing the company to mine. I would also like to make the point that the public input for the process is somewhat unproductive and at times unreasonable. Rather than open all of this public opinion why doesn't the DNR simply have the best professional field determine if the mining is reasonable and allow the operation to proceed. I would bet most of the people weighing in on this haven't even bothered to read all of the information on the website and very well may not understand the information. This is too much politics and should be more scientific. Let the mining move forward. Thanks, Daniel L. Butler Cohasset, MN

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Daniel Donnelly 2533 34TH AVE S MINNEAPOLIS, MN 55406

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Additionally, mining has historically put strain on the surrounding communities via the boom/bust cycle that tends to follow an influx of capital and workers in mining towns/areas. It is my view that mining should be withheld from the region altogether. As northern MN is a beautiful and wild area that houses countless treasures that are uniquely ours and of great importance to the ecosystems that comprise northern MN, allowing potentially harmful mining practices to be used in advance of a full exploration of all options and a full report of the environmental consequences within that range would be irresponsible. Open pit mining is an abhorrently destructive practice that leaves landscapes irreparably damaged. Please ensure that every alternative is considered throughout this process and fight for the health of MN's gateway to the north as our voice in a position to be heard Sincerely, Daniel Drehmel 9733 Wedgewood Bay Woodbury, MN 55125-9313

I am extremely opposed to Polymet and any Sulfide mining in Minnesota. The proof is that no sulfide mine can escape the terrible pollutin that comes from this. The Jobs argument is also false given that mechanization has changed the way mining is done. I am someone who was once for this and am not opposed to taconite mining and using natural resources responsibly. Sulfide mining cannot be done responsibly and The studies have already shown that. Thank you for considering my comment for the public record - Dan Engelhart "The function of an ideal is not to be realized but, like that of the North Star, to serve as a guiding point." -Edward Abbey

Dear Ms Fay, Dear Federal and State Agency Leaders: Our family owns property and resides seasonally near Ely, Minnesota. We believe the PolyMet SDEIS is inadequate and that this destructive project must not proceed as currently proposed because of the 1) widespread and severe environmental damage inherent in the PolyMet project and 2) the failure of the SDEIS to include a cost/benefit analysis and specific provisions regarding amounts and sources of financial assurance. We believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: 1) Economic Impacts -The SDEIS contains no cost/benefit analysis of the PolyMet mine. - The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. - The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. - What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. 2) Permanent Water Pollution -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. -The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. 3) Absence of Planning for Inevitable Accidents and Failures -The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate (see below), the SDEIS does not tell us how the costs of responding to such failures will be covered. -The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The Mine Plan Requires an Absurd and Unachievable Level of Monitoring and Maintenance for Many Centuries -Minnesota Rules 6132-3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment. -526 acres of land, covered by more than 167 million tons of waste rock, would be covered by a plast

To: DNR, State of Minnesota Regarding: Comments about PolyMet Sulfide Mine Proposal From: Juliana Elchert, 513 7th Av. S., St Cloud, MN 56301 Please include this commentary in opposition to the PolyMet Sulfide Mine Proposal as part of the public recoRd I am following the PolyMet Sulfide Mine proposal with great concern. How can you assure that precious Minnesota water and land resources will be preserved and protected. The scale of the proposal is so overwhelming and the technology so unproven that it appears that a failure is all too possible - and at what cost. For example, how can we be certain that attaching a huge wall to bedrock for long distances will not fail. What if the bedrock crumbles. What if an attachment fails. Or more attachments fail. We know that water is so mobile that any failure will lead to immediate leakage. Minnesota is known for its 10,000 lakes. We cannot accept the potential of seriously polluting pristine areas. I have only to remember the breach of a tailings holding area along the Northshore onto Highway 61 a number of years ago to know that calamities can occur. A failure in this project would be a calamity on a much higher scale. Do we want to risk it. NO. It is not worth it.

Daniel Holsinger

42078

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Daniel Holsinger Minneapolis, Minnesota

Daniel J. Peters

Hello, I am writing to urge denial of the proposed PolyMet mining operation near Babbit, MN. In my opinion, the risks to MN water quality, at a time when potable water is becoming more scarce and valuable, is too great. Furthermore, I do not trust PolyMet or its parent corporation, and suspect they will simply declare bankruptcy and walk away with their profits, leaving the taxpayers of the state to foot the bill for potentially centuries of water pollution mitigation. All that risk for 5 years of jobs for a few hundred people. U think that's a foolish trade. Please oppose the proposed PolyMet mine in Babbit. Thanks, Dan Peters Minneapolis, MN 100 Melbourne Ave SE Mpls, MN 55414

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Daniel Merfeld

57367

To whom it may concern, I believe that this mining project is a great project. It will help the communities involved and have a small impact on the local environment. I would like the DNR to listen to the voices of those that live in the area, not residents of southern MN, who will see no impact of the mines in northern MN. This project will not only provide MUCH NEEDED jobs both now and in the future, but will also create many off-shoot jobs in the process. When it comes to the impact on the environment, all I ask is that the state of MN keep a close eye on how the plant is being run, as you do with all the current mines in the state. Continue to monitor what the mines put back into the environment and regulate it as you have been. If people have a problem with anything leftover from mines, feel free to feed them some of the trout from Miners' lake in Ely, MN. I grew up eating fish from that lake and nearby Shagawa. I have never seen a problem from the water in these lakes (Now that the local sewage plant is better-controlled). And this mine was from a time when there were very few regulations on mining.. Between mining and logging, these two jobs are the life-blood of Northern MN. We need these jobs or else our communities will quickly die out. Even Ely is not able to survive on tourism alone in our current economy. WE NEED MINING IN MN. Thanks for listening to one person's opinion, Dan Merfeld 2309 3rd Ave West Hibbing, MN

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Daniel Mettner 19 N. 44th Ave E. Duluth, MN 55804

Any times we destroy wet lands we add co2 to the atmosphere and this causes global warming so I support the no action alternative. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnninage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Daniel Olson 21186

Daniel Olson, 1495 Simpson Street, Saint Paul, MN, 55108: These are some of my concerns regarding the proposals and plans of the Poly-Met Corporation as of 2014- - The plan covers a period of between 200 to 500 years and beyond. Our knowledge is not sufficient to make predictions for that long of a time period. Accurately making predictions over such a long time horizon is very difficult, and our confidence in the outcomes must be quite low. For example, a variation of a half to one percent can create vast changes in outcomes over such a long period. We are essentially saying that we are going to successfully complete an action plan that has never been completed successfully before. We will hope it is a good plan. We will hope that the outcomes will be close to the predictions. By the time that we learn if the plan worked or not, this mine will be long closed. It could also be true that several mine operations had been opened, closed and similar waste treatment plans had been put in place for other sites as well. By the time we learn whether or not the plan worked as predicted, it will be too late to prevent similar outcomes with similar operations. There could be unforeseen damages and costs that will have to be borne by our very distant descendants. Northern Minnesota is a wet, watery land of abundant lakes and streams and includes the world's largest and cleanest freshwater lake, Lake Superior. This region has vast, natural resources that will sustain healthy lives and healthy economies, if we protect them from degradation. We like to think that we are so wise and knowledgeable to accomplish anything that we need to do. Our scientific capabilities are great, but we are simply not smart enough to know if this plan, this experiment with our northern environment, is worth the risks that it presents. The time frame is simply too large. We do not have those kinds of capacities at this time. We may need to conduct some long-term demonstrations and experiments to give us better understandings of this kind of challenge. We need to know more confidently, that this plan will be a workable and durable and successful plan. Our climate is currently undergoing an unusually high rate of change. Human beings have not seen such changes over the course of recorded history. This current situation, alone, makes prediction models for what will occur 200 to 500 years from now much less reliable. We do not have the knowledge that we need to implement this plan at this time. Sincerely, Daniel R.C. Olson, St Paul, MN Daniel Olson

Daniel Otterstrom 11252

Sent from Windows Mail Hello, my name is Daniel Otterstrom. I have been a resident of Minnesota for a number of years, mainly in the Duluth area. I have seen the economy of that part of the State go from good to bad because of lack of jobs and tax money's not being there. I believe that we have resources that should be looked at with Polymet Mining. I have been following the progress of Polymet Mining and believe that they are going to be careful with the environmental issues so that the mining does not impact the land and wildlife in a negative way. They already have the resources to process the ores from mining and with them using the reverse osmosis to make sure that there are no residues left in the water to pollute the environment, I have faith that the Polymet Group will make the responsible choices so that both sides will be working together for the greater good of Minnesota.

Daniel Pauly 42966

Please find enclosed my comments on the NorthMet SDEIS. A hard copy will be delivered to the MNDNR this afternoon. Regards, Daniel Pauly 2100 West 49th Street Minneapolis, MN 55419 612-325-1237

Daniel Telin 19528

Daniel Telin, T-E-L-I-N, 1540 North 8th Avenue East, Duluth, Minnesota 55805.I would just like to go on record that I believe the EIS, as written, is insufficient in that the project introduces sulfites and other contaminants into an essentially uncontaminated environment and a partially compromised St. Louis River watershed. The potential for environmental degradation is high because of untested assumptions in the EIS as written. And finally, there is no long-range plan for the treatment of the tailings and the sulfide wastewater whose treatment would run into centuries.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Daniel W Iverson 4640 North Arm Dr 4640 north arm drive Mound, MN 55364

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Daniel W Iverson 4640 North Arm Dr 4640 north arm drive Mound, MN 55364 952-472-7835

The plan to mitigate waste-water run off is not adequate. It is irresponsible to expect our grandchildren to continue to clean the waste-water from our jobs project. Please send PolyMet back to the drawing boards and ask them to come up with a workable plan. Daniel Zachman Minneapolis, MN

Daniel Ziegler 30041

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining on tourism. I hope someone other than taxpayers will pay for the clean up future mining operations. Sincerely, Daniel Ziegler PO Box 115 Port Washington, WI 53074-0115 (920) 892-7377

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Daniel Ziegler 2040 W Wayzata Blvd Apt 115 Orono, MN 55356-5605

Danielle Cabrera

To who it may concern at the Department of Natural Resources, Please do not grant the permit to PolyMet for building a mine in Northern Minnesota. The gravity of losses that would be incurred as a result of the mine are much greater than the economic benefits. You must consider the health, social, cultural, and environmental consequences of a mine. While I understand the need for jobs in northern Minnesota, you can neither rebuild an environment full of biodiversity nor reverse the negative health impacts of local families. I ask that you decline the permit and set a precedence that affirms the dignity of humans and the life in northern Minnesota. I also ask that more sustainable jobs be presented to the local communities in the North. Thank-you for your time. Danielle J. Cabrera - Danielle J. Cabrera Communication Studies Major '15 Student Senate Co-President Collegiate Fellow Gustavus Adolphus College

I do not think that the Polymet Mining Project in Northern MN will be a good project for the people of this region. I believe that use of water for hundreds of years to clean up the mining is too precious of a resource for our people. The threat of contamination of our fresh water is something that I don't think is outweighed by the minerals and jobs that will be mined and created. If a mining is allowed try it on a scale that is only 25% of what Polymet is currently proposing for 20 years. Use this as a way to both compromise with business and environmental interests and as a way to study the impact of such mining in MN. Brian Smith 5001 Oakely St Duluth, MN 55804

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I live in the Minnesota Arrowhead region and I do not want my home and farm polluted by toxic waste from mining. My husband is a member of the Fond du Lac Band of Lake Superior Chippewa and he is concerned for the future of wild rice, which is a culturally important food as well as a means of economic and nutritional support for many people on Fond du Lac Reservation and throughout the Arrowhead region. If waste from open pit mining gets into wild rice beds the wild rice will die off. If the waste reaches our ground water, we will have to leave our home. I am strongly opposed to open pit mining and I believe that PolyMet's short-sighted vision will quickly become a nightmare for those of us who live near the mines. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Danielle Lake Diver 1811 Big Lake Rd Cloquet, MN 55720-9708

I DO NOT SUPPORT POLY MET [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Danielle Sveiven

54205

I am against building a mine up north, sulfide mining is one of the dirtiest mining types. Sulfide mining is 99% waste. The boundary waters has some of the purest watersheds, where people LOVE to go camping and canoeing. I personally love going camping up there and enjoy how clean and beautiful it is.

My name is Alice, A-L-I-C-E, C-L-O-S-M-O-R-E, and defer my time to a mentor of mine, Danielle Taylor. Thank you, Alice. My name is Danielle Taylor, D-A-N-I-E-L-L-E, T-A-Y-L-O-R. Almost 20 years ago, I moved to a small town on the shores of Lake Superior where its vastness and its power and its beauty inspired me. It was then that I knew that I had to do everything in my own power in the defense of the water. Recently, I was talking with my friend Pete who works tirelessly in defense of the water, the land and its creatures. Day in and day out, he does educational work taking people out to where they can see the source of Class 1 trout streams bubbling up in small streams, and he lets them decide for themselves; is this something that we collectively value? Sometimes when people are seeing a Class 1 trout stream for the first time, they are hooked, and that is inspiring. But sometimes the work of the educating can seem so small. So I asked my friend Pete, "How do you do it? How do you keep the energy and the commitment when sometimes it seems so futile?" He just said, "What else am I going to do." Working together patiently, defining our collective values and looking for creative approaches to our economic needs, these are activities that keep us going. What else are we going to do? The idea of the greatest good for the greatest number of people for the longest time is at the heart of development-oriented managed approach to our natural resources. The proposed PolyMet mine promises 300 jobs for 20 years, but it also calls for up to 500 years of monitoring cleanup. This equation does not add up to development. It is simply extraction. Although it merged at the beginning of the 1900s within the US Forest Service, the idea of the greatest good for the greatest number for the longest time also applies to our ways of governing ourselves and living together in communities. In an essay on patriotism, Terry Tempest Williams said that "This is the bedrock of democracy: The greatest good for the greatest number of people for the longest time." Few organizations by the numbers, United States, 250 years old, Minnesota just over 150. Minnesota DNR, 80 years old. USEPA founded in 1970 -- same age as me. PolyMet, how long has PolyMet been in existence. Among these groups, I would like to know which can make a genuine and credible promise to be around monitoring for up to 500 years? I can tell you, as far as I know, the only people that have been around here for 500 years are not too pleased about this proposal. I think there are a number of ways to do the greatest good for the greatest number of people for the longest period of time. We need to keep talking with each other, working together, one (inaudible) at a time.

20033

Attention: Lisa Fay What else are we going to do. Almost 20 years ago I moved to a small town on the shore of Lake Superior where its vastness, its power and its beauty inspired me. It was then that I knew I was to do everything in my own power in defense of the water. Recently I was talking with my friend, Pete, who works tirelessly in defense of the water, the land and its creatures. Day-in-day out he does educational work – taking people out to where they can see the source of Class 1 Trout Streams bubbling up in small springs. And he lets them decide for themselves. Is this something that we collectively value. Sometimes when people are seeing a Class 1 Trout Stream for the first time, they are hooked and that can be inspiring. But sometimes the work of educating can seem so small. So I asked my friend Pete, how does he do it. How does he keep up his energy and commitment when it sometimes seems so futile. He just said, “what else am I going to do.” Working together patiently, defining our collective values and looking for creative approaches to our economic needs—these are activities that can keep us going. What else are we going to do. The idea of “the greatest good for the greatest number of people for the longest time” – is at the heart of a development-oriented managed-use approach to our natural resources. The proposed Polymet mine promises 300 jobs for 20 years. But it also calls for up to 500 years of monitoring and clean-up. This equation does not add up to development—it is simply extraction. Although it emerged at the beginning of the 1900s within the US Forestry Service, the idea of “the greatest good for the greatest number for the longest time” also applies to our ways of governing ourselves and living together in communities. In an essay on Patriotism, Terry Tempest Williams says that this is the bedrock of democracy- “the greatest good for the greatest number of people for the longest time.” A few organizations by the numbers: · United States is not quite 250 years old. · Minnesota just over 150- · MN DNR about 80 years old · US – EPA founded in 1970 – 44 years old. · PolyMet – How long has Polymet been in existence. Among all these groups, I would like to know which one can make a genuine and credible promise to be around monitoring for up to 500 years. As far as I can tell, the only people who have been around here for 500 years are not too pleased by this proposal. I think there are a number of ways to “do the greatest good for the greatest number of people for the longest period time.” We need to keep talking to each other, keep working collectively and creatively— It’s one story at a time. One peace at a time. What else are we going to do. Thank you for listening. Danielle Taylor 12325 County Road 51 Apt. B4 Saint Joseph, MN 56374

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dannell Shu 1814 Taylor St NE Minneapolis, MN 55418

Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dannell Shu 1814 Taylor St NE Minneapolis, MN 55418

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Danny Ayotte 14 Park Dr Northfield, MN 55057-2640 (507) 645-9447

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze, environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. We must be stewards of the land, stewards who use science and the long view, to determine actions. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. This is not what we want scarring the pristine sacred land of Minnesota. I say no more mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Darlene Subialka 702 N 64th Ave W Duluth, MN 55807-1120

41977

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Darlene Subialka Duluth, Minnesota

Sulfide mining in northeastern MN lacks common sense and is not a responsible thing to do. There is a high risk of pollution to our water, land and wild life. Tourism will be ruined for years in this area. This company lacks experience. Cleanup is expensive; they should have "billions" in a cleanup fund which no one can use except what it's intended for. Darrell & Delores White 22710 County Rd 70 Bovey, MN 55709

Darrell Godbout

18073

My name is Darrell Godbout. I represent approximately 1600 union ironworkers in my regions, and a while back, I was thinking, around the area, around the country, how many small towns there are who would love to have a project like this built in their small town to bring up their community, their schools, small businesses, and all of us that have had kids have to send them off somewhere else to go to work. Here's an opportunity we can have our kids stay right here, Hoyt Lakes, Aurora, the Iron Range, and get a job and stay here. I think that's very important. I've been at the PolyMet meetings in the past. CEO, John Cherry, Steve -- Steve Ryan, Joe Scipioni; I've talked to them many times, I've been to all their meetings, and not once has any of these guys ever said on this environmental impact that we need to change our laws or lift our laws to allow them to do some things that they shouldn't be doing. I think they need to follow the laws 100 percent and make sure we have clean water, clean air for everybody. But like I said, not once has any of these guys ever said, "We want to change these environmental laws and get this thing pushed through." I think they're outstanding people. I think they want a good project. And another thing I thought about quite a while ago is, at one of the meetings I heard 70 percent of our copper is imported in this country from other parts overseas where there is no environmental protection at all, spewing crap in the air and everything else. Here, we got a company that's going to do it clean. We won't have to import this stuff no more. We can sell it right here in Northern Minnesota. I guess that's all I had and thank you very much for your time.

---Original Message--- From: darwinroth@msn-com [mailto:darwinroth@msn-com] Sent: Monday, March 10, 2014 5:49 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Darwin Roth 4517 W 84th St Minneapolis, MN 55437-1356

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Dat Tran 124 Academy Lane Upper Darby, PA 19082 US

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dave Carlson 5818 Co Rd 2 Ft. Ripley, MN 56449

I have lived and worked in northern Minnesota all my life. The mining industry has provided me and my family the means for a quality way of life, excellent education, and the opportunity to remain in the area to enjoy all it provides. I have seen technological improvements within the industry to improve and protect our environment and believe there to be a “check and balance” between state and industry. With the time, research, and money that has been invested towards this project and Polymet’s commitment to the environment, providing well-paying jobs and tax revenue, while providing the metals so badly needed to improve our quality of life. I feel that it is very important that this project, already heavily scrutinized, be allowed to move forward. Respectfully, Dave Cicmil Industrial Lubricant Company

Dave Clapper

To whom it may concern, I remember years ago when LTV was shut down and the impact it had on the local economy. When an opportunity like PolyMet comes around to mine the world’s largest cooper reserves, we owe it to the region to create hundreds if not thousands, of jobs. It would be a shame not to jump at this opportunity that we have been so blessed with. I for one believe that PolyMet Mining would operate the mine responsibly and protect the long-term environmental concerns. I say, move ahead and do not miss out on this tremendous opportunity. Our economy could use a boost in that region and help Minnesota continue being a leader and the envy of other States. Sincerely David F. Dear Ms Fay, Dear Federal and State Agency Leaders: PolyMet's initial DEIS was found inadequate. The SDEIS is still inadequate. I have the following concerns and I request the actions stated with each concern: The PolyMet SDEIS fails to acknowledge the Tribal Cooperating Agencies' position that there will be a need for containment or treatment of contamination from mine waste, mine pit, and tailings pile in perpetuity. Require the SDEIS to be redone to include this testimony and an objectively substantiated response from PolyMet. The PolyMet SDEIS does not adequately substantiate PolyMet's claim that 99-37 percent of the seepage from the tailings pile will be captured and that no contaminants will seep from the mine waste rock pile. Require the SDEIS to be redone to provide verifiable substantiation of claims of protection of surface waters from contamination. Damage to wetlands surrounding the project site and direct destruction of 913 acres of wetlands by the project are inadequately mitigated. The majority of mitigation for direct destruction will take place outside the Lake Superior Basin and therefore does not mitigate the impact of the project on the Lake Superior Basin. There is no plan to replace most of the indirectly damaged wetlands which will likely be compromised in the area surrounding the project. Deny the Section 404 wetlands destruction permit and require a reassessment in the SDEIS of likely impacts to surrounding wetlands outside the project footprint. The PolyMet SDEIS does not adequately assess the potential impacts of contaminant seepage through existing bedrock fractures and through additional fractures which may result from routine blasting operations at the mine pit. Require the SDEIS be redone to accurately address these impacts. The PolyMet Land Exchange would result in net losses of thousands of acres of high biodiversity plant communities, floodplains, and mature forest. Deny the land exchange in both of its two proposed alternatives. The PolyMet SDEIS lacks a health risk assessment which sufficiently addresses likely impacts to PolyMet workers' health and the effects of airborne and seepage contaminants on drinking water wells, surface waters and their human-consumable resources of fish and wild rice, and on aquatic and terrestrial wildlife throughout the watershed, including threatened and special concern species. Require a health risk assessment. The PolyMet SDEIS fails to explore alternatives such as comparing an underground mining alternative with the proposed open pit mine; placing waste rock back into the pit; placing liners under the waste rock pile and tailings piles; or implementing engineering solutions to reduce water drainage away from Partridge River Watershed wetlands and streams. Require a new SDEIS which documents these alternatives and compares them with the current proposal. Deny PolyMet a mining permit until all of these inadequacies are corrected with well-substantiated data and with guaranteed measures to negate adverse impacts for the entire expected duration of the problem.* This is of particular importance because the precedent which is set in allowing a hard rock mining permit in sulfide-bearing rock will set the bar for any subsequent applications for similar mining. Insufficient regulatory attention to human and environmental safety has characterized all similar mining projects across the US. Minnesota needs to set a precedent which will not leave the state facing the problems which plague communities and governments saddled with the presence and aftermath of sulfide mining elsewhere. *Mining companies are temporary entities, but the PolyMet proposal creates a permanent problem. Regulatory oversight is not sufficient unless it guarantees that the party initiating a proposal will take, and be held to, all of the responsibilities for all costs and damages, present and future, which may arise as a result of implementing the proposal. If the initiating party can't make this gua

Lisa Fay, EIS Project Manager, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to the citizens and taxpayers of Minnesota and the impact this project will have on water quality. Please respond to the following questions: There has not been enough research and analysis to identify the impact of a 100 or 500 year flood on containment systems and the site in general. The state, country, and world in general has had an increase in the number of large storms that resulted in historic flooding. Recent examples include the Duluth flooding in 2012, Colorado, Estes Park / Bolder areas, and the Ontario, CA flooding in the spring of 2013- Please take the following action: Conduct a impact assessment for potential historic flooding for the PolyMet project, and include the results of the assessment in the EIS. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Dave Ethier 4209 S River Run Savage, MN 55378 952-447-6332

Dave Gaddie

6605

To Whom It May Concern: As a business owner/manager I would like you to approve the permits necessary for PolyMet to proceed to construction. This project has been thoroughly vetted as it should be, but it should not be held to higher standards than any other mining project currently operating in NE Minnesota. The company has fulfilled all of the requests throughout the EIS process and it is now time to approve the project and move forward with jobs and materials that will help drive the economic environment for all of us who operate a business in NE Minnesota. We operate bank in Hibbing and know first hand that people that live on the range are in dire need of living wage jobs and benefit packages. Regards, David M. Gaddie President/CEO Republic Bank with locations in Duluth and Hibbing

Dave Gibbens 9655 Inver Grove Trail Inver Grove Heights MN 55476 To Lisa Fay and the good folks at the DNR: I want to add my comments to the copper-nickel mining issue. Basically, I'm FOR it. While I hope to see Minnesota is as well-protected as we can make it, I think it's important to move forward on the Polymet project. Other proposals have to be evaluated on a case-by-case basis, but again I am generally favorably disposed. This is just too good to let it get away from us. One thing for sure: copper and nickel will be mined, and we Minnesotans will do it better, cleaner and safer than anyone else. Unlike tourism, mining actually creates wealth. To the extent that deleterious effects are minimized, it's a good thing for northeastern Minnesota and the state as a whole. I grew up a child and grandchild of miners on the Iron Range and my grandfather worked in copper mining in Michigan. My dad was a mining engineer on the Range. I too worked in iron mining in the 1960s before graduating with a degree in physics, but I still spend my summers there and follow local issues. The iron mining companies' steel built our nation and gave us the materials to win WWII, but the nation needs copper now. Mining companies once made Range area schools the best in the state, if not the nation. That was then, but now the Iron Range is suffering and has lost much of its population as the better jobs migrated out. I have long been aware of the nickel, copper, gold and palladium deposits in the area Polymet proposes to mine, from acquaintances who worked on exploratory drilling rigs 50 years ago, and it has been surprising that it has taken this long for concrete mining business plans to emerge. It's a shame that it had to be at the hands of foreign mining multinationals, but that's better than nothing - the Iron Range economy has always been controlled by outsiders, whether they be from the Twin Cities, Pittsburgh, Wall Street, Canada or Europe. Nevertheless, copper-nickel mining will be a tremendous economic benefit to northeastern Minnesota and the whole state, and I urge you to help make it happen. Thanks again for your attention - Dave Gibbens

Sulfide Mining Comments: "Does The End Justify The Means" 1/28/2014 I am a native of this precious state. I was raised on a small farm in the south central area of rural Minnesota. As a youngster after school, and after the farm chores were done, I could choose to walk the many miles of fence lines between farmers fields hoping for a shot at a ring neck pheasant or I could sneak into one of several dozen grassy slews or swamps and wait for the ducks and geese to return from feeding all day in the bean and corn fields. Sadly, these opportunities do not exist any longer in rural Minnesota. Why. Global food demand caused our prairie lands and wetlands to disappear, first by removing the fence lines between farmer's fields, then by plowing over the grasslands and finally by tiling the wetlands. Although the yield per acre doubled, today, tons of nitrates flow into the Gulf of Mexico expanding the Dead Zone by hundreds of feet per day. Next, exhaustive global requirements for steel left acres and acres of massive holes in our northern forest land but not before we almost poisoned Lake Superior to death with tailings. Finally, urban sprawl has been chewing up acreage since settlement. In total, these operations have changed forever 2/3 of the state's natural landscape/geography, leading the nation in that category. Did the end justify the means. Maybe. I am sternly opposed to the activation of the Polymet mine or any sulfide for the following reasons. 1- No history exists, anywhere in the world, proving that sulfide mining does not negatively impact the environment. In Minnesota this means damage to our: . Natural wild rice plots . Streams, rivers, lakes, peatlands . Forests and vegetation . Wild life and Fish . Current and future drinking water supplies (including Lake Superior) 2- Stop endangering our wetlands. According to the National Wetlands Inventory, Minnesota has lost 1/2 or 10-6M acres of wetlands since pre settlement. 3- The Polymet mine would destroy 1,400 acres of precious purifying peatland increasing the state's CO2 level by 2% over 2005 levels. 4- Swapping nationally protected BWCA acreage for mining is renegeing on land promised for preservation. 5- How can we ignore the 2008 recommendations of the Minnesota Climate Change Advisory Group stating that protecting our carbon reservoirs (peatlands) is critical and that we should design policies to maintain those protections for the future. 6- Allowing sulfide mining not only carries the risk of pollution with perpetual cleanup and filtration, the natural resources being removed are not renewable. 7- Risk of losing tourism revenue in the NE counties. 8- Foreign owned/backed mining companies have NO risk to their own soil and environment. 9- Indications are that of Polymet's estimated 350 jobs only about 75 would involve local resources. We must protect our water supply at all costs. By now we all should be aware that an inevitable water shortage is forthcoming that will dwarf the agitating cost of current gasoline prices. Awareness of our state's diminishing water supply should be enough of an impetus for us to strictly protect ALL ground water, from ANY and ALL type of pollution, OR the RISK of pollution. Without fuel we don't move around, without water we die. Ok, let's consider some alternatives. 1- How about we change our environmental stewardship attitude from "reactive" to "pro-active". The Clean Water Act of 2008 (Legacy Amendment) was a beginning but is mostly reactionary by using money to fix a problem (533M allocated/committed to date) after it arises. I submit that our attitude towards damaging environmental issues should be pro-active and prohibit proven polluting operations in the first place, like sulfide mining. 2- Find a substitute for copper/nickel. Surely, just as man invented the wheel, tools, black powder, automobiles, plastics, airplanes and space ships to the moon and Mars, we can put the resources together to find substitutes or alternate products

Dave Hamlin

39339

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Dave Hamlin 12363 195th Ave NW Elk River, MN 55330-4143 (763) 234-4349

dave hillier

39117

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Dave Hiller 3634 Campaigne rd Brimson, MN 55602

dave hunsche 7623

Name: David R. Hunsche Address: 24 West Chapman Street, Ely, MN 55731 Mailing Address: PO Box 788, Ely, MN 55731 e-mail: dhunsche@hotmail-com I am wondering if there is any research into the presence of asbestos or similar fibers in the soils or rocks at the proposed mine site. If any of these fibers are present what are the implications for worker and the surrounding populations health. Thank you, Dave Hunsche

Dave Kinzer 41755

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. To the environmentalists, it does not matter if they are wrong. Even if they make no sense they feel they must fight on. They have bet the farm against Polymet and are convinced, losing will seriously wound their entire movement. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. David Krings 1329 Isleview Rd Grand Rapids, MN 55744 Phone: 218-327-8289 E-Mail: gofishingmn@msn-com

Dave Lacey 3246

These mining firms cannot be trusted with our water supplies and the health of the citizens around their for profit operations. Just say no to this project. We are dealing with a similar misinformation campaign in Oregon. The short term jobs do not compare to the degradation left over when they are gone. Happy Holidays. Dave Lacey 541 373-0487

Dave Laliberte 43063

Comment on PolyMet Project In 1946, the Reserve Mining Company announced plans to build an enormous new plant and nearby company town in northeastern Minnesota. Utilizing innovative new technologies focused on obtaining taconite—iron particles magnetically extracted from crushed rock—the Reserve mine promised thousands of jobs and hundreds of millions of dollars for local economies. By the 1960s, Reserve produced 15% of all taconite used in the American steel industry, according to historian Thomas Huffman, and had brought a financial windfall to Silver Bay, the site of its processing facility, and to neighboring communities along Lake Superior's North Shore. For a resurgent mining industry, these were boom times. By 1986, however, Reserve Mining Company declared bankruptcy. Its Silver Bay plant closed that same year. By 1994, when the downsized plant re-opened under new ownership, its host community had lost 1,000 of its 3,000 residents. Boom times, it seems, did not last forever. Today, Minnesotans are considering another potential mining project, this time for copper, nickel and other precious metals, again in the state's Arrowhead region. As seven decades ago, the current proposal of PolyMet Mining Inc. contains innovative features—this time for environmental controls—and the lure of enormous economic gain. Northeastern Minnesota's history, though, should caution us that in all likelihood, any mining proposal for the region is likely to feed another boom-bust economic cycle simply because the extraction of minerals from northern Minnesota is inextricably linked to the broader society's demand for that mineral—a trend that cannot be accurately predicted decades into the future. Just as lower-cost iron and steel imported from Brazil led to plummeting taconite demand from domestic sources in the 1980s, according to historian Norman Risjord, new sources of or reduced demand for today's sought-after minerals may prove PolyMet's requested 20-year operation in Hoyt Lakes overzealous. And in the end, whether PolyMet's operations continue for a portion of two decades or beyond it, a private company cannot be expected to endure—and financially ensure the environmental health of the area it impacts—for centuries. Ultimately, the PolyMet proposal determines to take from the land what we want now; I deem it more important to leave in the land what our children may value tomorrow. Respectfully, David J. Laliberte 1108 Seventh Ave N. St Cloud, MN 56303 [HYPERLINK "mailto:dlaliberte@usa-net"](mailto:dlaliberte@usa-net) dlaliberte@usa-net 320-251-0019 Dave Laliberte 320-251-0019 dlaliberte@usa-net

Dave LaZella 7152

First of all I'd like to express my support for the Poly Met project. As a native Iron Ranger I understand the economic value that this project brings to the state and local area. Poly Met will provide many jobs for the local economy along with generating a substantial amount of tax revenue for the state. Having grown up less than 20 miles from the mine site I understand how mining and the environment can co-exist This doesn't have to be an "either or" proposition. Jobs and the environment can be balanced out. I believe that the supplemental draft EIS has thoroughly looked at and addressed all environmental concerns. This has gone on long enough and I want the permits to be issued and the jobs to begin. Thank you, David LaZella 18362 Sherry's Arm Road Grand Rapids, MN 55744 218-259-4349 [HYPERLINK "mailto:dlaz1951@yahoo-com"](mailto:dlaz1951@yahoo-com) dlaz1951@yahoo-com

To Whom it May Concern: This Minnesota citizen now adds his voice to the many concerned people of this state regarding the proposed Polymet mine. From all reasonable accounts, this mine will have a devastating effect on the environment of the immediate landscape, as well as poison the drinking water of local residents. The beauty of our state must be preserved. This mine might provide short-term profit for its owners and share holder.. it will also wreak havoc with the surrounding countryside as well. if there was a statewide referendum on this topic today, I would vote NO, against the Polymet mine. Sincerely, David Leitzke 1404Raymond Avenue, Apt 2 St Paul, MN 55108

Dave Lislegard

44276

My name is Dave LislegaRd Like our late Senator Paul Wellstone, our Range Delegation, Congressman Nolan and Senators Franken and Klobuchar, and other Community, business, and Labor Leaders are working hard to support urgently needed mining jobs on the Range, while protecting our environment and quality of life in Northern Minnesota. This unified approach is exactly the kind of leadership needed to make progress. As a lifelong resident of the Iron Range, I have a strong interest in supporting responsible mining projects that will breathe new life into our region while protecting our natural environment. I am not a scientist or engineer but recognize that PolyMet's reverse osmosis water treatment design is well tested and used in many applications today. The Minnesota Department of Natural Resources is a respected agency responsible for determining that the PolyMet project will meet our state's strict standards. They along with the EPA and Army Corps of Engineers have been deeply involved with the evaluation of the state of the art technologies that will be used by PolyMet. Senator Paul Wellstone was a champion of both economic and environmental justice and did a great deal to help my family and so many others after the LTV plant closure. As with the late Senator, I believe the economic opportunity represented by mining and environmental stewardship are not mutually exclusive. PolyMet represents an opportunity to create hundreds of direct jobs supporting families on the East Range, as well as thousands of additional jobs statewide. And make no mistake, our Range communities want this in their backyard and fully believe we have the ability to do this project right. Personally I am offended when the opposition uses fear tactics and suggests that our communities are divided. What better way to stand up for environmental and economic justice than to create mining jobs in a state with some of the strictest environmental regulation in the world and labor and safety laws designed to protect workers. Senator Wellstone fully understood that Iron Rangers are fighting for a way of life that balances our love for our natural environment as well as our desire to see families stay in the region because they have economic opportunity. Like my daughter Hailey who is currently enrolled in the heavy equipment operator program in Staples with the hope and dream that she will be able to come home to work and raise her family. I commend the agencies for doing their homework and using their professional expertise to ensure this project will be held to our State standards. Dave Lislegard 720 Arrowhead St Aurora MN, 55705

Dave Mills

45008

Dear Lisa Fay, Firstly, thank you for your time. Secondly, down to business: Please reject the Polymet project. I grew up in Grand Rapids, MN. It wasn't a mining town, but had had a little mining nearby - close enough to bike to. The tailings piles were an eyesore, but they also gave the land some character. They were fun to explore. The pits were fun to swim in, kind of scary deep, but fun. They almost seemed exotic. The land had been torn up and not yet restored, but the danger was minimal. There was no toxicity to treat. Just pits to fill, but it wasn't done. Not the worst consequences from what I can tell, but a lack of follow through with a lasting impact. The Iron Range had a reputation of not quite being stable. Mines were shut down while I grew up, and sometimes re-opened, but then shut down again. Mining is not a economically sustainable industry. Sometimes a boost to an economy can help revitalize a community, but if there is significant potential harm it would seem a dangerous wager. Minimizing risk seems to be in the best interest of the community. I would suggest minimizing the environmental risk of the area from a safety standpoint(potential leaks, leaching, drainage - the Fukushima radiation is still not contained as an example of how technology, albeit different, can fail) as well as minimizing the environmental risk from a financial standpoint, if bankruptcy occurs (and it has been occurring around the globe quite a lot lately). The safest way to do that would be to reject the project altogether. The consequence of rejecting the project seems to be the status quo, and my understanding is that the economy of the area is not flourishing. The area HAD flourished while more mining operations were happening, but like previously stated, mining is not sustainable. The Polymet project would potentially improve the economy for less than a lifetime, yet the potential hazards will last for much longer than a lifetime, much longer than Minnesota has been a state, and much longer than any living thing in our State. The EIS of the project does not sufficiently cover our interests. There is too little evidence supporting the project, especially considering the real potential harMs Please reject the project for the good of everyone and all things good. Thank you for you time and hard work. Sincerely, Dave Mills Grand Marais, MN

Dave Redelman

43605

Subject: Comments on the PolyMet Supplemental Draft Environmental Impact Statement From: David Redelman 2115 E. River Terrace – 202 Minneapolis, MN 55414 I have some general comments about the SDEIS concerning the process that will be followed by four issues that are not adequately addressed in the SDEIS. I feel the comment period for the EIS should be 180 days. The comment period for the SDEIS should have been longer than 90 days due to the complexity of the document and the modeling used in the document. You could make EIS easier to follow by including all relevant information in the document and not refer back to SDEIS or DEAS. Also, when the EIS is released, the List of References should include links to those references with the references stored and easily accessible on the DNR website. Users of the website should be able to download these reference files. My general comments on the SDIES regard my feeling the process is basically cooked with a predetermined outcome. The presenter for the introduction at the open house on January 26, 2014 at the River Center, St Paul, mentioned four reasons why the SDIES was completed. He made it sound like the SDIES was the idea of the State of Minnesota or Polymet. He neglected to mention that the DEIS was basically rejected by the EPA. In addition, answers to questions by representatives of the State or their contractors at the booths seemed like a sales pitch to approve the mine. This concern is heightened considering the MN DNR and MN PCA signed off on the DEIS followed by the EPA giving the DEIS in inadequate – environmentally unsatisfactory ranking. My primary concerns involve addressing long term water quality issues. Sulfide mining has a generally poor record leaving long term water pollution after closing the mines. I am sure the proposals for these polluting mines also looked good on paper but still resulted in long term pollution problems. There have also been many mining companies going bankrupt with inadequate financial assurances resulting in taxpayers paying for the cleanup. The proposed PolyMet mine would be the first sulfide mine in Minnesota. Everyone is learning as we go through this process so we need to proceed with great caution. If errors are made, these errors should be on the side of caution. Specific issues that are not adequately addressed in the SDEIS: Financial assurances are not adequately addressed. Detailed financial assurance calculations with the associated risk analysis need to be completed for the EIS. This risk analysis is crucial in the EIS and any decision to proceed forward to the permitting process is dependent on this risk analysis. Section 3-2-2-4 of the SDIES states “The level of engineering design and planning required to calculate detailed financial assurance amounts is typically made available during the permitting process and was not available at the time that this SDEIS was prepared.” What is typical of this process as the SDEIS is for the first sulfide mine in Minnesota. Also, forgive me but it seems absurd that more detailed engineering and analysis of risks would only be completed during permitting. Again, the engineering design and the risk analysis are both crucial in the EIS. Any decision to proceed forward to the permitting process is dependent on this risk analysis. I do not understand how the financial arrangements between PolyMet and Glencore results in Glencore getting a free pass and not accountable for any financial assurances. Glencore seems to be getting an increasing ownership stake in the operation with the right to sell the metals. PolyMet has not operated a mine but chosen a partner that seems to leave pollution problems in its wake. At the open house, DNR staff was confident that lessons have been learned from past mining pollution and that financial assurances would be adequately addressed. I do not share that confidence. Sulfide mining h

Dave Salo

18085

Hi. I'm Dr. Dave Salo. I currently reside in Mountain Iron, Minnesota. This is an introduction to the medical and pharmaceutical applications of these local metals, that's going to include cooper, nickel, platinum, palladium, gold and some other isolated isotopes. First off, copper we see as a pharmacological category as a trace element. We see it in over-the-counter supplementation; we see it in total (inaudible) nutrition; and most importantly, is going to be the anti-bacterial property that copper has because it is much cheaper than silver yet acts just like it. Along with that, nickel. Nickel is present in stainless steel, and it is a durable stain-resistant surface. It's easily cleaned and we've used this quite a bit within the hospital settings and other areas of healthcare. We also see it implemented in a number of our instrumentation, especially in the surgical suites, and it's also used in drug eluting and/or bare-metal stents after somebody has a coronary event. Anyone had a heart attack? Probably got a stent; okay? That's what some of these metals are going to be used for. Platinum. Anything with a platin on the end of the molecular name is going to have a platinum molecule attached to it. We use these as far as anti-cancer agents, alkylating agents. We have three of these available on the market, now, as pharmaceuticals; cisplatin, carboplatin and oxaliplatin; and we've got one in phase two of clinical trials, satraplatin. If anyone has had cancer before and known someone who has had cancer before, they more than likely have had one of these drugs or at least considered as part of the drug regimen. Some of the indications include but are not limited to bladder, ovarian, testicular, colorectal, cervical, in vitro, head and neck, mesothelioma, lung, non-Hodgkin's, et cetera. Palladium. Palladium is a radiopharmaceutical. We implant these into the prostate. It's a alternative to a prosthetic in removal of a prostate. And also, too, anyone who's a diabetic, or knows some who's a diabetic, this is present in their electrodes in their blood-glucose meter. This results in electron flow that is measurable and directly proportional to the concentration of glucose in the blood resulting in quick and accurate measurements for which we are familiar with today. Now, in conclusion, we know these metals are not readily available on the surface, but we need to extract them from the ground, and we need to do this to maintain the current manufacturing of these drugs and these products. Also, to foster the future pharmaceutical manufacturing and/or development of drugs, advance the practice of medicine and to treat -- in an effort to treat cancer, control infection and diagnose and monitor the path of physiology of affected individuals. And I will state one thing about statistics; there is lies, dam lies and then statistics. So the science is very good.

Dave Sandstrom

9560

Please find my Polymet Op Ed published by the Hibbing Trib 1/28/2014 attached. Thank You, Dave Sandstrom 3747 Hwy 5 Hibbing, MN 55746

Dave Semerad

18158

My name Sam Burke. I'm a third-generation ironworker from Local 512. And I yield my time to Dave Semerad. Thank you, Sam. My name is Dave Semerad, S-E-M-E-R-A-D. And I'm the CEO for the Associated General Contractors of Minnesota. We're the state's oldest and largest trade association representing the building and highway heavy-construction industry. Collectively our members perform the vast majority of heavy highway construction, and commercial and public building construction in the state. Today our members employ over 75,000 construction workers. We are construction professionals who since 1919 have built Minnesota schools, places of worship, stadiums, roads, bridges, hospitals and clinics, locks and dams, power plants, refineries, water treatment facilities, pipelines, municipal utility projects, airports, hotels, retail centers, factories, high-tech manufacturing facilities, shopping malls, and countless other projects. And if you worked on one of those projects, let me hear it from you. For years, and before it was vogue, we practiced industrial recycling and conservation. We have partnered with environmentalists on the job site to develop practical and effective rules and regulations to preserve our environment; and worked with our partners in labor, engineering and design to develop best practices that enhance safety, improve quality, and maximize value and efficiency. We believe this project near Hoyt Lakes represents an extraordinary opportunity for the Iron Range communities and for Minnesotans. As in any project, there are risks. And we believe these have been carefully vetted and mitigated in the planning and review process. We believe this project will infuse economic vitality into the communities that understand and embrace the importance of clean air and water and the conservation of forest and wildlife and countryside. Not only will meaningful projects be created across a wide spectrum of careers, but confidence and faith in Minnesota industry will be uplifted finding its way into communities, schools, and families. For every \$1 million of investment, 28,500 jobs are projected. We urge that this project proceed without further delay. It will be safely and responsibly by proud men and women who believe their efforts will contribute (inaudible).

Dave Vukson

58164

I think the format of this meeting was very misconstrued people should not be able to give away there time to speak. If they don't want to talk they should pass. Not give it to politicians. I didn't come here to here politicians I came to here the people speak.

Dave Zins 45274

David Zins 307 Kent Road Hoyt Lakes MN 55750 I would like to begin by stating that i am a life long resident of Hoyt Lakes, Minnesota. My father started working for Erie Mining Company (which later became LTV) in September of 1957 a year before I was born. I have lived in Hoyt Lakes my entire life. I am currently serving in my tenth year as a member of the Hoyt lakes City Council. I was elected to office in 2004, this was around the time many of the former LTV employees were running out of unemployment and leaving the area to find work. I state this because I know what the economic impact of Polymet getting permitted would mean for our city, schools, and local businesses. We in city government have had to face the financial decisions of not replacing several of our retiring employees and still provide the basic services our residents had grown accustomed to. i am confident that the agencies involved in the decision making on this project have thoroughly reviewed all of the scientific data on this project and are well aware the project can be done environmentally safe. The project has been designed to have minimal environmental impact and yet utilize a an existing processing facility where my father was able to work for forty years and raise a family of five children. Restarting this existing plant site would be one of the largest recycling projects that has ever happened in the state of Minnesota. Polymet's mine site is one which is surrounded by mining company properties. The only way the public could ever utilize the mine site for recreation would be by trespassing. This is the reason I believe the land exchange with the US Forest makes sense. This land exchange would open up lands that have been privately held, for the general public to use and enjoy for generations. I believe that the technology exists for this project to move forward now and start a new generation of mining with sustainable jobs for years to come. In closing I would like to state that I feel i am confident that Polymet will adhere to the strict regulations that the agencies have laid out. I also believe they have answered all of the concerns and will operate while protecting the natural resources which I consider are in my back yaRd Respectfully submitted, David Zins

Dave/Lynn Horwath

39156

Speak the Truth by Donella Meadows Material accumulation is not the purpose of human existence. All growth is not good. The environment is a necessity, not a luxury. There is such a thing as enough.” Lisa Fay, EIS Project Manager DNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 FR: David and Lynn Horwath 1612 kingsbury Rd Washington, IL 61571 RE: PolyMet SDEIS Response To whomever it may concern: Our family owns property and resides seasonally near Ely, Minnesota. We believe the PolyMet SDEIS is inadequate and that this destructive project must not proceed as currently proposed because of the 1) widespread and severe environmental damage inherent in the PolyMet project and 2) the failure of the SDEIS to include a cost/benefit analysis and specific provisions regarding amounts and sources of financial assurance. We believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: 1) Economic Impacts -The SDEIS contains no cost/benefit analysis of the PolyMet mine. - The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: “Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted.” SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. - The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. - What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. 2) Permanent Water Pollution -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. -The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. 3) Absence of Planning for Inevitable Accidents and Failures -The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate (see below), the SDEIS does not tell us how the costs of responding to such failures will be covered. -The SDEIS provides no details on the impacts to water quality, wildlife,

davec

19912

Dear Sirs, Just a note to let you know I am for the Polymet mining proposal. My whole life, 58 years, has been spent here living around mining. This industry has enhanced our environment and my standard of living. Many areas within 20 miles of my home have been mined, mother nature has done a great job reclaiming the old mines, pristine water, and beautiful trees growing right out of rock piles, and where mines have been reclaimed by man the results are outstanding. The government agencies are doing a wonderful job insuring the mining companies currently running are following the rules and leaving the environment as good as or better than the original terrain. The process required for Polymet’s proposal although time consuming has left no stone unturned. The time for uncertainty has passed, government inspectors will make sure this mine is done right. It is time to let them get going, they will follow the rules set forth by the EIS, otherwise our government will shut them down. Our community and country will be better for allowing this project to move ahead. Thank you for your time. Sincerely yours, Dave Clement Minnesota Farmer, hunter, and construction worker 2372 N Yoki Road Zim, MN 55738

David 7736

TO: Lisa Fay, EIS Project Manager Lisa, After observing Polymet Minings efforts over the past several years and carefully reviewing the recent SDEIS, I feel the company has met the environmental requirements and should be issued a permit to proceed. Although, I do have empathy for the long term concerns of the projects opposition, I am far more concerned about the negative economic affects (loss of jobs in Logging and Mining) caused by the creation of the Boundary Waters Canoe Area and the closure of Erie Mining Company have had on the people and communities of Northeastern Minnesota. I have no doubt that environmental issues beyond the future closure of Polymet Mining can and will be dealt with in a responsible manner. Thank You David Krings 1329 Isleview Road Grand Rapids, MN 55744 Phone: (218) 327-8289 E-mail: gofishingmn@msn-com

45117

Dear Ms Fay, I would like to make a comment against sulfide mining. My objections are based on: - This type of mining has never been done without polluting the surrounding area. - The owners of the companies proposing the mining project are foreign owned, and almost impossible to go after once problems arise. - Your Department and the other regulating entities can't be trusted to to protect these areas. The incestuous relationship between regulators and the businesses they regulate make that impossible. You can see it when you look at the DNR website which does not mention the flaws in the water model, which I believe underestimated the river flow rate on purpose. - The taxpayers will be on the hook for the reverse osmosis mitigation. Estimates show that we will have to provide mitigation for at least 500 years. The average corporation like Polymet has a much shorter lifespan. They will be sold or go out of business, and we will be left holding the bag. There is no way the companies can make enough money to build the infrastructure to change public opinion, start up the mine, pay salaries, buy equipment, ship and process the ore, close the mine, and treat the ground water forever. It doesn't make any sense. - These proposals always wildly inflate the number of jobs that will be created. I believe that these objections, and many more not included here make this project totally unacceptable. There is no change I could offer except to scrap the plan. I would like to see a way to "claw back" the revenues of this project from the corporations, officers, employees, shareholders, unions, vendors, and public employees who supported this project. In the absence of all of these entities guaranteeing the safety and environmental protection, we can't go forwaRd I also believe that the DNR should work to protect the environment and not be a spokesman for private, for profit corporations. Thank You. David Mykkeltvedt 4900 W 86th Street Bloomington, MN. 55437

David & Alison Edgerton 46933

Comment: I urge the State of Minnesota to deny the permits and leases for the nonferrous mining proposed by PolyMet. It has too many risks to our environment- the flora and fauna of the area including the people who live or recreate in the region. There are too many unknowns about the process, the heavy metals that may be released, and the cleanup and reclamation required for years and years after the actual mining. Please protect our northern forests and lakes, our world-reknoned recreational area, and the people who live there. Alison Edgerton 2009 Hogans Island Dr NW Backus, MN 56435 218-947-4709 HYPERLINK "mailto:edge02@tds-net"edge02@tds-net

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I am an Alternative Energy consultant and installer and live in the Lake Superior watershed. Although copper is an essential element in alternative energy components, no respectable alternative energy advocate would ever trade the kind of environmental damages inherent in the PolyMet proposal. Sulfide mining in the water rich environment of northern Minnesota is not worth the risk. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, David Abazs David Abazs 5879 Nikolai Road Finland, MN 55603

I stand with my representative Phyllis Kahn in her statement of concerns (listed below the MPR link) and I believe: We have plenty of copper to recycle already. I'm not confident of the protection of people and environment. A reputable third-party insurer, such as Lloyd's of London, must be found. We need a robust public debate. MPR asked Are you confident that the proposed PolyMet mine would avoid polluting. Read others comments from the mpr "today's question" Sincerely, David Alexander of Minneapolis, MN 612-666-5532 <http://blogs.mprnews-org/todays-question/2014/03/are-you-confident-the-proposed-polymet-mine-would-avoid-polluting-minnesotas-water/> My answer: No, I'm not confident the proposed PolyMet mine would avoid polluting Minnesota's water. If we need to boost our economy and protect the environment let's beat Colorado's projected gain of 100 million dollars in taxes by repealing the prohibition of cannabis/hemp altogether. My representative (who also is for repealing prohibition) Phyllis Kahn's statement is: The scope of the PolyMet NorthMet SDEIS [Supplemental Draft Environmental Impact Statement] is seriously lacking. This is especially the case when the issue of financial assurance is concerned. I have three points:

- I. In chapter 3, pages 136 to 138, you list information that includes the preliminary cost estimate of closure. The source cited is "Foth 2013-" I've looked at the Foth memo cited in the SDEIS. The Minnesota DNR has simply copied information from PolyMet's hired consultant without confirming or fact-checking their work. If the Minnesota DNR and its co-lead agencies are unable to fact-check the work they presented on financial assurance, how are we to expect that they are capable of the adequately protecting the citizens of Minnesota.
- II. This project should not go forward unless a third-party insurer, such as Lloyd's of London, can be found. The simple fact is, if a third-party private entity will not take on PolyMet, the state shouldn't. Private insurers have expertise in managing risk that the State of Minnesota can't match. Additionally, policymakers could tap the assurance funds for other purposes. Private insurance is clearly superior to a state managed approach in this case.
- III. In the SDEIS you say that financial assurance will be done in the Permit to Mine stage. Looking at the most recent MinnTac Permit to Mine document, there is one short paragraph on financial assurance. This project shouldn't go forward without robust public debate, and the opportunity for legislative hearings, if what we can expect is a paragraph from the DNR in the Permit to Mine phase. You must ensure that the public, including financial experts and those elected to represent the citizens of Minnesota, have a chance to weigh in on financial assurance. It has not been your practice to do so in the past; will it be in this case. <http://blogs.mprnews-org/todays-question/2014/03/are-you-confident-the-proposed-polymet-mine-would-avoid-polluting-minnesotas-water/>

David And Alicia Newell

38974

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs David And Alicia Newell 826 N 9th St Saint Peter, MN 56082-1264

Feb 16, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

To: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 From: David Aquilina 4817 Vincent Ave S Minneapolis, MN 55410 [HYPERLINK "mailto:davidaquilina@q-com" davidaquilina@q-com](mailto:davidaquilina@q-com) PolyMet is seeking approval to mine and refine 32,000 tons of copper-nickel ore per day in Northeastern Minnesota. If the state allows them to proceed, there should be no doubt that sooner rather than later, PolyMet will be back, pushing the state's elected officials and regulators to let them scale up their operations to 90,000 tons per day. Moreover, they will put their considerable weight behind other companies' efforts to open even more copper-nickel sulfide mines. Why. Because the company's investment advisor has concluded that given the capacity of their proposed processing facility, such a huge expansion is necessary in order to achieve maximum operational efficiency, maximize their return on investment, and thereby boost the company's stock price by 300-400 percent. With such an increase in shareholder wealth at stake, who can doubt PolyMet's real intentions. PolyMet's spokesperson has claimed that enlarging mining and processing operations are not part of their current discussions or plans. To characterize that statement as disingenuous is way too Minnesota Nice. Even if expansion were not under discussion, it should be. And, that discussion should involve all citizens of our state. I know that the government can only review the EIS for the company's plans as currently proposed. But we should be clear that if they get the go ahead to mine and refine 32,000 tons day, the government is opening the door to triple the size of that scale of mining and refining. A chemist with more than 30 years of experience at the Minnesota Department of Natural Resources (DNR) and the US Environmental Protect Agency summarized the hazards of chemical contamination from copper-nickel mining and processing in a letter to the Star Tribune ("A chemist speaks of the dangers," December 2, 2013). After PolyMet ceases operations in 20 years, measures to monitor and manage the tailing wastes and regional water quality will be required for 200 years at the mine and for 500 years at the processing facility. The total estimated cost today is about \$3 billion. In the decades ahead, who knows what the costs might be – especially if PolyMet is just the first of many copper-nickel mines in the region. As the Minnesota Center for Environmental Advocacy has made clear, the environmental impact statement only addresses PolyMet's proposed plans at present. However, the actual scale of their operations is sure to be vastly bigger. What is the environmental impact of a threefold increase in the volume of ore dug up – at the PolyMet mine and at other mines that would need to be opened to supply their processing facility. Do we know. The impact of shipping more and more tons of ore by rail every day from its mine and from other mines to PolyMet. Do we know. How will doubling or tripling the amount of ore processed affect the scope and costs of current and future environmental controls at the plant. Do we know. What we do know is that for decades and decades after PolyMet's shareholders – including Glencore Xstrata, PLC, the Anglo-Swiss multinational commodity trading and mining company that is PolyMet single biggest stakeholder – have extracted their profits from the rocks of Northeastern Minnesota, our children, grandchildren and their descendants will be left with the rubble of the environmental consequences and costs.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
Dear Ms Fay, The PolyMet NorthMet open pit mine project proposed to extract copper, nickel and other metals from northeast Minnesota is more than “groundbreaking” in a literal sense; for better or worse, it will set Minnesota on an irreversible path that will define our future. With so much at stake, it is appropriate that state rules and regulations guiding the review and approval process provide for an admirable degree of public involvement. And with more than 40,000 comments submitted in response to PolyMet’s Supplemental Draft Environmental Impact Statement, I expect that most issues regarding the project’s impact have been identified and addressed in some form or another. Still, one fact remains: The right decision hinges on the trade-off between a reasonable expectation of economic benefit over a short twenty-year period in exchange for an unreasonable expectation that mitigation will prevent incalculable and irreversible environmental damages, economic costs and human health issues that will be felt by generations. Can anyone seriously doubt that this is a terribly risky bet. Minnesota needs a healthy economy and our people deserve rewarding, well-paying and safe jobs. But opening the State to open pit sulfide mining will not get us there and represents a trade-off that we should not make to achieve more limited goals. The PolyMet NorthMet SDEIS is impressive in many ways, but it also is dramatically inadequate in a number of ways and should be rejected, along with related proposals for open-pit sulfide mining. Among them are inadequate assessments of long-term risks, a bias towards “best-case” scenarios that convey a false sense of prospects for mitigating risks, a complete failure to analyze risks to on-site workers, the absence of a Health Risk Assessment of the effects of toxic pollutants on people and habitat downstream, and the absence of compelling evidence that technologies needed for reducing long-term risks to acceptable levels will be capable of achieving that outcome. PolyMet’s 2,169 page SDEIS documents PolyMet’s plans for three impacted areas: a mine site, transportation and utility corridor, and a plant site. It covers 18 months of construction, 20 years of operations, and reclamation, closure and post-closure maintenance “if or when proven effective” for a period that PolyMet acknowledges “would last for an unknown duration.” This last sentence is telling: what if no effective method exists for putting the genie back into the bottle when a toxic contaminant is leached or released – especially once operations have ended. To PolyMet’s credit, the SDEIS represents a significant investment of intellectual resources and makes the case that copper-nickel sulfide mining can be pursued with close to zero risk to the environment, supported by extensive analysis and complex modeling marred by often questionable assumptions, mitigations that involve many untested technologies, and promises of an enduring commitment to reduce risk to implausibly low levels. If the SDEIS were an academic exercise, it would probably deserve an A-plus. Yet, the assumptions made and scenarios used to demonstrate a low-risk result defy what we already know – even under “blue sky” conditions, risk cannot be reduced to zero. So what about the cost of a highly improbable scenario should it occur. Can it really be measured and who, if not the public, will end up paying for it. Must we forget the results of catastrophic failures such as Fukushima, Exxon/Valdez or Deepwater Horizon. Or on a more modest scale, but perhaps more germane, must we forget the effects of the Elk River chemical spill on water supplies affecting residents of nine West Virginia counties. Yes, PolyMet has depicted scenarios that might possibly be effective, but sulfide mining

I would like lakes and streams as clean as my grandfathers enjoyed for my grandchildren’s grandchildren. Water is a precious resource. If you have ever been a real fisherman you understand that. The trout sure as hell do. If you must know, I mined on the Iron Range like my father & grandfathers did.

David B. Edgette

46258

Please DO NOT issue a mining permit to PolyMet. The St Louis River and Lake Superior already have too much pollution flowing into them as a result of past and present industries. Potential additional pollution from PolyMet should not be allowed. In fact, more clean up of all fresh water should begin ASAP. The copper concentration in the ore body that PolyMet plans to mine is of such low concentrate that a large amount of material will need to be removed for a very small return of copper. Minnesota should not permit any mine of this type. The destruction of forest and pollution produced for 100's of years is not worth 15-25 years of mining jobs. Sure it might be profitable for corporations like Minnesota Power to sell more electricity produced from their polluting coal burning power plants. This also would not be good for the environment. Mining should not be allowed in the Superior National Forest. A land exchange does not replace the location and original forest as was intended when it was set aside for the future. Recreational land is one of Minnesota's largest long term assets. Please DO NOT issue a permit to allow PolyMet to profit for a short term by shipping their copper to China, leaving Minnesota with another polluting hole in the ground. Thank you for your consideration, David B. Edgette 12049 East County Road B Lake Nebagamon, WI 54849 [HYPERLINK "mailto:dbasil2@gmail-com"dbasil2@gmail-com](mailto:dbasil2@gmail-com)

David Brown 18290

David Brown. I'm just against the mining just simply because of the 500-year exposure and what it would mean to the wetlands and the water there. I think ultimately that's all going to come to be billed to the taxpayers. And I would -- I think like my wife said, I would rather use that money to create other programs for the people that would essentially benefit from this. So, I understand that they make some comments about nobody is saying we should use less copper, but I would say, yes, we should use less copper and all sorts of industrial products. And I don't think the fact that people aren't yet ready to give up copper is a reason to create more mines for copper. The end. Thank you.

42119

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

There are hundreds of reasons to say no to this mine. Reasons for it. Maybe a couple hundred non union jobs for 20 years. The risk to the waterways of this state are just not worth it. The costs the taxpayers will end up picking up to clean up their mess when they leave will be endless. The damn copper won't even stay in this country. This company can not be trusted. We have something far more precious than the copper in the ground. It's the liquid gold that flows all around us. Clean water is far more useful than any metal, and we are very lucky to have as much as we have in this state. And this will be even more true in the future. Just say NO to this damn mine..

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Once again the shiny empty promises of international conglomerates are distracting Minnesotans from the harsh and inevitable consequences of a poorly planned industrial project. No copper-sulfide mine has ever operated without polluting its environment. Not one. Ever. What is in the history of the backers of PolyMet, or their plans, to make us think they're the exception. Nothing. There's a weird short-sighted Minnesota exceptionalism that prevents us from seeking out the experiences of other states when a controversial issue like this comes up. We need only look to the U.P. of Michigan, right up Highway 2, where 'Copper Country', potentially an outdoor paradise, is littered with abandoned mines and their long-lasting pollution. The latest: fish consumption warnings for Torch Lake in the heart of the region, where fish with "tumors of unknown origin" have been caught - nearly 50 years after full scale mining in the area shut down. Sure, the PolyMet mine will bring money and profit - mostly for the mine execs and investors of course - but PolyMet -and other mining operations that will surely follow whatever precedent you set - are more than likely, long term, to turn the region into another abandoned 'Copper Country' - chronically polluted, chronically depressed, decaying and depopulated. Thank you for your attention, David Christenson 3615 35th Ave S. Minneapolis, MN 55406

The motivation for sulfide mining is greed, monetary, and political. There is no justification to mine low grade sulfide for the benefit of a few and ruin the environment for generations to come. And , if they think PolyMet or any other mining company will clean up their mess just look at the mess in the Yukon. David D. Cameron 9397 91st Ave SW Staples, MN 56479

Polymet has few ties to Minnesota and is foreign-owned. The corporation has little incentive to fix any damage it causes. The company should be required to create an escrow account for damage repair that is acceptable to most Minnesotans. If the company falls short on its obligations, Minnesota should be able to shut it down. - David Davison -- This email is free from viruses and malware because avast. Jan 30, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Hundreds of thousands of Minnesotans like myself vacation near this area every year and support the local economies with our tourist dollars. I myself have family that lives in the area and do not wish to have their ecosystem harmed for the sake of a few thousand jobs that one day will be replaced with massive clean-ups that cannot leave the ecosystem nearly as pristine as it is now. I am against this mine for profit . David M. Donch, Sincerely, Mr David Donch 1792 Duluth St Maplewood, MN 55109-4310 (651) 771-0895

"http://files.dnr.state.mn.us/input/environmentalreview/polymet/sdeis/fact_sheets/commenting.pdf" fact sheet located on the DNR website states that "All comments must be made by 4:30 PM on March 13, 2013-" I believe that should read "March 13, 2014"

52263

Dear DNR Review Board: I strongly oppose the proposed mining operation. There is every reason to believe there will be unintended consequences and hidden costs. Having personally seen the toxic waste problems in Butte Montana, Kevin Montana, and Libby Montana go without resolution for decades I cannot support this current proposal. The permit request in front of you is disguised with assurances that a clean up program will be adequate, funded and carried out. All of the aforementioned sites in Montana were abandoned by the "responsible" corporations and after years of lawsuits the American public is facing the costs of ill-health and decades of clean up. There is also reason to believe that some of the toxins that will enter our waters will be neurotoxins. While these will potentially effect children as yet unborn one of the decisions you are making is if you should risk the future intelligence and health of our grandchildren for a few jobs and the short term profits for a few shareholders. I hope you will think of them as you cast your vote. Sincerely, Thomas Evans 13231 Arcadia Ct NE Bemidji, mn 56601

David Farr

42023

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, David Farr Minneapolis, Minnesota

David Ferenci

57976

I feel this is a bad idea for many reasons and should not be allowed. The following are just a few of my reasons. 1) Production of Sulfide Acid. 2) Never has there been a copper/nickel mine anywhere in the world that has not polluted water. 3) Polymet has never operated a mining operation. 4) The mine would be located 20 miles upstream from the largest fresh water lake in the world. 5) 20 years of mining with 500 years of monitoring is an unrealistic thought. 6) Threat to thousands of jobs in the recreational and tourist industry over the next 200 years, for a handful of 20 year mining jobs.

David Flessner

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Sulfide mining is illegal in Wisconsin, in fact, until it can be proven safe This project will impact the region's natural resources and public health, including risks to water quality, loss of wetlands and harm to both wildlife and people. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit would be an ecological disaster. No matter what PolyMet says about their environmental practices, they will inflict severe damage on the area and bring a significant level of toxicity to a pristine area. This outweighs the benefit of any jobs that might be created. Sincerely, David Flessner 3565 S 83rd St Milwaukee, WI 53220-1027 (414) 545-2744

Below are my comments: Mining in northern Minnesota I am not against metal mining in northern Minnesota as long as it's done properly. I have read the articles that suggest that there will be acid based runoff and leaching for up to 500 years. That tells me that the process was not done properly. When iron ore was first made into taconite pellets the 'waste' product was piped into Lake Superior. The mining process was not done properly. Steps were taken to correct the process. The 'waste' product, tailings and water, was then deposited on land. The tailings were dumped on land as the tailings were produced. At all government levels we have accommodated business by allowing them to reduce their profits by accelerating their costs and pushing the final disposition of their spoils into the future. I think it's time that we make both the cost causer and cost payer the same, and tie the time line of the process to the time line of the fix. By that I mean that the waste product created each time period, I suggest each quarter of the year, be neutralized during the next time period (or before). The companies and Minnesota know from the test drilling and from the details of the extraction process the volume of the waste product and the possible quantity and pH of the 'waste' and possible leachate. The DNR should require the mining company to mix their 'waste' with a substance that is similar in consistency to the 'waste' and in a quantity that will neutralize the 'waste' so that any runoff or leachate will be have a pH that will not degrade the environment. From what I've read the 'waste' products produce an acid waste or a 'waste' that produces an acid product when exposed to air and/or water. If that 'waste' were mixed in something like a hot mix asphalt plant with crushed limestone then as the resulting mix was exposed to air and water the acid products would be neutralized as they are created. I am sure that PolyMet will say that it can't be done. What they are really saying is that doing this will reduce our profits. They would rather gain the high profits now and then, as the chemical company out east did, declare bankruptcy, when the cost go up and the profits down. If you present the problem to several universities and their chemists and chemical engineers say that it is impossible to treat or process the waste as it is created to reduce or eliminate acid runoff or leachate I would read their reports. Engineers see 'can't' as opportunities to find a way David Frame 25826 Skyline Circle Elko, MN 55020 952-461-2909 dframe@integra-net

David Franseen

6185

Greetings, I have reviewed the executive summary of the Northmet SDEIS, as well as the Major Differences of Opinion and the supporting SDEIS sections. It appears reasonably certain that this project can move forward without undue or significant impact on the environment. Or it may even have positive outcomes for the site and surrounding ecosystems. Double win if that can be achieved through permitting and development. I support moving this project forward to the Final EIS and ROD. I also support diligence from the Co-lead agencies in assuring desirable environmental outcomes. Thank you for your efforts, David Franseen 2411 W Skyline Parkway Duluth, MN 55806

David Freeman

18312

My name is David Freeman from Ely, Minnesota. The following comments apply to the SDEIS and the Clean Water Act Section 404. The SDEIS is wholly inadequate in scores to reflect the real environmental and economic costs of the proposed project. My comments focus on the inadequacy of the SDEIS with respect to the major associated economic costs of the proposed project. The perpetual treatment costs. An inescapable conclusion from the SDEIS is does the water treatment to remove toxic pollutants and the maintenance and monitoring of water treatment will require hundreds or thousands of years. The SDEIS is wholly inadequate to provide definitive information about the total cost of such treatment, the mechanisms for providing for or requiring for payment and ensuring payment of such costs. And the socioeconomic costs to the people in Minnesota and the nation when it seem likely that the mechanisms for ensuring payment are insufficient or failed entirely. The SDEIS acknowledges that toxic water pollution from mine sites, tailings piles, and waste piles will require treatment for a very long time. The mechanical water treatment is part of the model proposed to action for 200 years at mine site, 500 years at the plant site. The SDEIS states that while the exact period is uncertain, it is expected to be long term. End quote. After noting that, "Financial assurance would be required indefinitely." The SDEIS states in section 3.2.2.4 that, "The level of engineering design and planning required to calculate detailed financial assurance amounts is typically made available during the permitting process and was not available at the time that this SDEIS was prepared." Indeed a major flaw in the project is the cost of engineering, designing, planning, building, and maintaining the water treatment is unknowable. Any project for which the cost of water treatment is unknowable, but according to the project proposer will be in the billions of dollars, should not be considered for approval by the state. It is irrational to believe that any water treatment facility or corporation will last for hundreds of years, but any financial institution or instrument can provide credible guarantee for hundreds of years and that there will be no catastrophic failure by humans or equipment over hundred of years. Take for example just last week the chemical spill in West Virginia, the Fukushima nuclear reactor destruction, the Deepwater Horizon explosion, or the I-35W bridge collapse. Thank you very much.

David French 10803

I have been following the progress of Polymet Mining since I first heard of the Company in the UK 3 years ago. I have been most impressed with the professional approach of the Company to systematically dealing with the very valid concerns of the environmental lobby, particularly with the subject of water pollution. As a professional engineer, I applaud the Company's reverse osmosis solution, and I doubt if there is a mining operation anywhere where environmental concerns have been given such a high priority. On the positive side, the mine clearly contains large quantities of very valuable minerals which will benefit the whole community and the country, and the creation of hundreds of well paid jobs in an economically deprived area could only be a major boon. In summary, I would hope that the whole community takes this project to their hearts, invests in the Company and shares in the prosperity that the project will bring. David Garelick 39464

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The negative impacts of sulfide mining upon surrounding environments is beyond debate. Credible science corroborates the extreme environmental risks of these operations. Those that purport to tell a different story are bought and paid for by mining dollars and lobbying. Who's kidding who. Even a child doesn't trust fake make-believe. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr David Garelick 2116 Randolph Ave Saint Paul, MN 55105-1333 (612) 690-4042

From: David Givers Moorhead, MN 56560 “Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site). The duration of the simulations was determined based on capturing the highest predicted concentrations of the modeled NorthMet Project Proposed Action. It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modeled, NorthMet Project water quality performance, as determined through required monitoring.” (ES-11) As you know, the scientific method requires a testable hypothesis. This condition is missing from the SDEIS. The uncertainty described in the document (see above quote) means that it is impossible to model the scenarios that can occur given enough time. For example, there is no way for DNR to certify that a postulated containment wall drilled into bedrock will keep water within its boundaries over the unknown length of time that the SDEIS cannot and does not specify. Other unspecified events, while they seem improbable, can still occur. Geoscientists can estimate the probability on an earthquake on the Laurentian shield. That probability is not zero, but given enough time an event could occur that fractures or shifts the steel wall thereby allowing water to escape. These events do not include the climate change we are destined to experience. Climate scientists are clear that climate change is on us and will continue to escalate over what was the Cenozoic Era. This is borne out by the following statement and shows that the SDEIS is seriously flawed: “For example, the Continuation of Existing Conditions Scenario model does not include future expected additional mitigation at the existing LTVSMC Tailings Basin, because these mitigation measures have not yet been determined, nor does it try to account for climate change. The No Action Alternative, on the other hand, is not static and anticipates for other predictable changes in the NorthMet Project area, such as other planned projects, required mitigation, and climate change (5-2) There is an error in this statement and an error in logic. (a) it implies that the science can determine the climate change impacts in the No Action Alternative. This is a basic error in the understanding of climate change at the local level. Climate models do not at this time tell us what will happen in Northeast Minnesota. We only know that the climate as we experience it today is likely to deviate from historical climate normals and, also, that there is a likelihood of extreme events, which can not be predicted. (b) The statement also errs because it does not take its purported finding of climate change in the No Action scenario and apply them to the PolyMet scenario. this is a logic error and misrepresents the purported reasons to approve this SDEIS. If this study subsumes these modeled climate changes within the SWM (Gold Sim) models, then the written report needs to spell them out in the narrative so that the citizens of Minnesota, and the rest of the United States, can read the results.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I want to comment on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The Great Lakes are a valuable and irreplaceable resource for the central mid-west and should be cleaned-up not made more dirty. Mining is one of the worst sources of toxic materials known and should not be allowed to contaminate these lakes. Minnesota is largely unspoiled and should remain an important drainage source for two of the great lakes. Sulfide mining can destroy wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. This area is home to a wide variety of animal and plant life and should continue to supply clean water to the lakes. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, David Greene 806 Francis Ave Columbus, OH 43209-5412 (614) 231-8417

David Homans 47312

Lisa Fay MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (“PolyMet SDEIS”) fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota’s Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates. The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate. For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project. We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of t

Members of my church's Caring for Creation Committee at Macalester-Plymouth United Church have discussed the proposal for a large scale copper-nickel sulfide mine near the BWCA, to be conducted by PolyMet. We have shared our concerns about the long-term and destructive impacts on this special area of Minnesota. We are concerned about: 1. The major loss of wetlands, primarily bogs, that cannot be replaced. The SEIS already makes it clear that wetland "restorations" will not take place in the Lake Superior watershed and are highly unlikely to replace bogs. The wetlands at the site have been rated as "having high wetland quality." How can they possibly be "replaced?" 2. Predictions of chemical pollution, not just from sulfate and its acceleration of toxic mercury conversions, but also heavy metals like nickel and aluminum, that kills fish. 3. The long term need to clean up water from pollutants, possibly for 200 years. How can that be assured, especially with more mines ready to ask for permits in that area? 4. The questionable suggestion that a company, that plans to mine the proposed site for 20 years, could possibly provide "financial assurance" to cover the expensive costs of water treatment for 200 years or more into the future. And can such treatment truly control all the sorts of pollutants that will come from the mine site? The SEIS predicts the company will excavate 307 million tons of bedrock in 20 years, at 70,000 tons per day. 5. We are concerned that a lot of the proposed PolyMet site area has been designated by MN DNR as "Sites of High Biodiversity Significance" and support eleven state-listed species of plants. Destruction of such an area cannot be rectified, nor justified. We urge our government officials to take courage and SAY NO to this mine and to others waiting in the cue for permits. There are other ways to secure jobs in this fragile and unique area of Minnesota than this. One suggestion is to create metal recycling facilities and hire people to work on recovering the metals we need. Please reject the PolyMet mine. It's a short term venture with long term harm to MN. 20 years of extraction and "360" jobs—followed by 200+ years of monitoring for pollution makes no sense to me. Then there is the history of delaying litigation that follows any unforeseen problems [illegible]... Short term gains for corporations and the job [illegible].

Ms. Fay: Please take extreme care while assessing the environmental impact of the PolyMet mining project. Constantly keep in mind that you are dealing with an extractive project of limited duration that, in all probability, have centuries of environmental impacts.

Dear Ms Fay: My name is David McMillan. I am a 25-year resident of Duluth. My wife and I attended UMD and raised a family here. In addition to my roles in the local and regional energy sector, I am heavily engaged in non-profit, public and private sector leadership and governance roles at the regional, statewide and national levels across the transportation, higher education, and health care sectors. All of these sectors are vitally important to our region as well as our State and all are integrally linked to the environmental and socioeconomic health of this region that so many of us call home. My reasons for submitting written comments in this proceeding focus on each of the following. First and most importantly, I want to express my fundamental interest in preserving and protecting the natural environment that is at the heart of the region I call home - NE Minnesota. Second, I believe the regulators charged with investigating and developing a record regarding PolyMet's plans for mining and processing the NorthMet Deposit ores east and north of Hoyt Lakes, MN have done an exceptionally thorough and comprehensive job. Led by Minnesota's own Department of Natural Resources (DNR), the Army Corps of Engineers, the USFS and the DNR have thoroughly and competently assessed PolyMet's project and applied the stringent standards set forth under state and federal law. This process has been long and arduous at times and expensive for PolyMet to be sure. Nevertheless, protecting our natural environment warrants considerable time, resources to ensure that the Supplemental Draft EIS is accurate, comprehensive and complete. Third, I feel that it is critically important to highlight the resources and infrastructure we have here in NE Minnesota that will enable us to responsibly and effectively support expansion of mining in our region should PolyMet's Permit to Mine be issued by the DNR - which I believe it should. Minnesota has a long and rich heritage of timber and mineral resource development and processing. We have the infrastructure, the know-how, the support industries and the workforce to responsibly mine and process these non-ferrous ores. "Infrastructure" means much more to me than railroads, ports, drills, trucks and businesses that supply all of those industries. It also means a K-12, technical college and higher education system that can train the workforce, produce the chemists, the welders, the engineers, and environmental experts needed to safely and economically extract and process these minerals. "Infrastructure" means the research engine that is our University of Minnesota and, in particular, University of Minnesota-Duluth's Natural Resources Research Institute right here in Duluth and Coleraine. Both have needed expertise and know-how to bring to bear on the challenges associated with mining. Most importantly, infrastructure also includes the Minnesota DNR and other state and federal agencies charged with permitting and then regulating the ore mining and processing work that will occur over coming decades. No state in this country is better prepared to assure that PolyMet mines and processes ore in a safe and environmentally secure manner than Minnesota. Indeed, I daresay that no place in the world is better able to assure that the strategic minerals needed for today's technologically and energy savvy world will be extracted with more care for the environment than right here in northeastern Minnesota. As a citizen and long-term resident, as a parent, as a business leader, as a member of governing boards for many of the region's leading employers, I am fully supportive of PolyMet's proposed project being permitted to move forward at the tail end of what has been a thorough, transparent and well-managed regulatory process. Sincerely, Dave McMillan 2724 Greysolon Road Duluth, MN 55812 David J. McMillan 2724 Greysolon Rd Duluth, Minnesota 55812 The views and opinions expressed in this message my own. I am solely an

MN DNR PolyMet Mining I would not like to see the MN DNR or the state give a permit to do any copper, nickel or other metal mining in Minnesota. I have been to the meeting in St Paul. At that meeting NO one had shown me a true safe way of mining without poisoning our great state of Minnesota. Lets think about it, this state has a lot to offer everyone in the whole United State. Water recreation for one, camping, fishing, hunting, tour guides, lodges for people to get away from the big city life. No one can predict the out come for the generations to come, our young people are at stake. The miners said the only thing they no is mining. Come on now what about cross training. Hunting, fishing, camping tour guides and lumbering just to name a few. I had cross training before. Why not put the people to work building some of these things. I know money talks, lets look beyond poisoning Minnesota. When it comes down to do copper mining in our Minnesota. My answer would be NO. Because its not a safe bet in my book not for 500 years. David Nelson MN Mater Naturalist 2574 4th Ave E. North St Paul, MN. 55109

Hello. My name is David Kane, K-A-N-E. I grew up on the Iron Range. I graduated from Mesabi East 1990 from Biwabik. I'm the kind of person that, you know, was pro-mining. I started looking into what sulfide mining entails. I switch sides. I don't think it's wise to mine toxic material on top of a (inaudible) that straddles the continental divide. Your lives are important. Your health is important. People on the Iron Range's health is important. I'm also concerned about who is going to be paying for the perpetual water mine. We are talking about a Canadian mining outfit backed by foreign banks. 20 years of mining. And then basically we are not talking about cutting down a tree, we are talking about blasting into a toxic rock formation and leaving tailings piles forever. Sulfide plus oxygen equals sulfuric acid just like one plus one equals two. So we're talking about -- I don't know -- thousands, millions of tons of sulfides baking in the sun, water. Everybody knows how much it rains in Minnesota. We're not only talking about surface water but we got a lot of aquifers underground. I grew up close to the Embarrass River in Lakeland and chain of lakes, close to Bass Lake, which is a spring-fed lake. I'm curious what kind of study has been done with the underwater type studies of this kind of mining and fracturing of rock formation like this. I am also concerned about, you know -- I think it's a noble cause to stand up for the little guy without a voice, the wilderness or the tourism industry. You talk to somebody on the Iron Range and somebody needs jobs. Polluting your environment for 20 years' worth the jobs and then taking care of that water for 500 years -- a number pulled out arbitrarily -- to me I don't know who is going to be paying for it. I think it's going to be dumped on the taxpayers. I'm a taxpayer of Minnesota. You're taxpayer of Minnesota. The Federal Reserve prints, you know, money out of thin area. Keep that in mind when you're thinking about poisoning our waters for 20 years of jobs. This is going to set a precedent for the future proposed mining on the other side of the continental divide. So if we set a precedent here and stop this in its tracks, hopefully (inaudible). Thank you.

David Kranz

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr David Kranz 2401 34th Ave S Minneapolis, MN 55406-1426

David Kremer

I would like to extend my support for approving the Polymet mining project. I have followed the project closely for years, and my family has been a presence on the Iron Range for many decades. based on the data that has been provided, I feel comfortable that the environmental concerns have been largely addressed, and that those remaining are as well managed as they can be with the current technology. Certainly, I have a great deal of respect for those who disagree with my view, and I also share their wish to protect our environment and leave our children with clean water and access to the wonderful outdoor experiences we have always enjoyed in Minnesota. At the same time, I think it is important that we balance those values with a belief that good, secure and well paying jobs for our citizens are a necessity, or no one will be able to live here productively. We must come together to achieve both goals, not crush the goal of one group to claim victory for our own. There is no perfect option, and mining is somewhat disruptive to the environment by its very nature. However, I believe that we need to take advantage of the resources that exist under the ground, the forests growing on the ground, the water flowing over the ground and the air we breathe above the ground. The key is to put into place plans for recovering the land after the mine is retired, and I am convinced that this will happen in such a way that the current landscape will be healthier than it is now. Since the area is already impacted by previous mining activity, this is our chance to recover more metallic ore and to fund a true rehabilitation of the land so our grandchildren will find it in a better condition. I don't think many people are aware of the current site conditions, and they picture a pristine wilderness in their minds. It is far from that, in fact is quite a barren, scarred place, and this project is a chance for much of the existing mining equipment to be used for a good purpose for decades to come. Please approve the project and let it proceed with all due speed. The Iron Range needs the jobs, and the economic value that follows a good business will help us all. Kind Regards, David W. Krings II Kenyon, MN

David L. Ivonon

53223

Protect our water! Hooded Mergansers swim in northeastern Minnesota's pristine marshes, ponds, and rivers, feeding on fish, crayfish, frogs, and insects. PolyMet Corporation is proposing to destroy thousands of acres of pristine habitat to mine sulfide ore at the headwaters of the St. Louis River - a major waterway that flows over 180 miles to Lake Superior. PolyMet's proposal calls for 20 years of mining, and they acknowledge that 500 years of toxic runoff will need to be collected and treated. Just like the Hooded Merganser, our children and grandchildren all deserve clean water. Let clean water be our legacy - not toxic pollution from mining! Dear Governor...I was born & raised in the Iron Range; I love the area, people, & work ethic I was raised in & around. I would love nothing more than to see good paying jobs...However, NOT at this expense. The majority of the X I vote DFC; I will not vote for anyone backing Polymet.

David Langfeld

43343

I would like to stress my opinion that I believe that the Polymet project be given full approval by the State of Minnesota agencies involved for permitting. I believe enough scrutiny has been applied to the project by all of the agencies involved over the many years that it has been waiting, not to mention the vast amount of money spent by the company to address the environmental concerns of those special interest groups who, I believe, don't have valid argument against the project. I believe the Aurora and Hoyt Lakes communities have patiently waited long enough through the various delays that have been placed on this project. They have waited far too long for the day that good paying jobs would return to the former LTV site that once sustained a good quality of life. I know this first hand, as my father worked at LTV and retired from there in 1992- I have observed the closures of schools and businesses, as well as the losses of the various civic organizations that made for an enjoyable upbringing in these communities. Thank you for your consideration of an approval to the Polymer project. Sincerely, David Langfeld 706 1st Avenue N.W. Chisholm, MN 55719 Telephone: 218-254-0032

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dec 21, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I want to know who really stands to benefit from sulfide mining in the Arrowhead Region. Do the taxpayers of Minnesota benefit. Does the state benefit. PolyMet and other companies seeking to mine in the region are not Minnesota companies, nor are they even US companies. Does the tourism industry in the region benefit. The Boundary Waters and other lakes and parks in the region draw thousands of visitors each year from around the country and around the world. Some businesses in the tourism industry are already experiencing a decline in business because of test-drilling sites located nearby, What will happen to the tourism industry once sulfide mining begins production. Do we really want to trade one viable industry that can continue and flourish for generations (tourism) for another industry that will only provide jobs for a couple of decades yet will scar the region for centuries. Do the locals in the region who are pro-mining really have the chance to benefit as much as they are being promised. PolyMet's operation is estimated to provide a few hundred jobs only, and only for 20-some years. How many locals can realistically expect employment. Do we really want to trade a few hundred temporary jobs for 500 years of cleanup. Do the property owners in the region benefit. I'm one of those property owners, and I pay a small fortune each year in property taxes that help support the region. I view my own property, and the region as a whole, as a JEWEL, as a LEGACY to pass on to the generations that follow me. I do not want to see this jewel poisoned by poorly managed sulfide mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, David Lasecke 3124 Christopher Ln Shoreview, MN 55126-4146 (651) 486-7625

51635

Dec 21, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. To whom it may concern, As one who has a master's degree in biology and lives up north for the beauty of the lakes and wildlife, it concerns me to see the Polymet proposal. My wife and I had a very unique experience this February to have a female lynx, a Minnesota threatened species, entertain us in our back "yard" for a good three hours. She spent most of that time about six feet away from our house. As a "threatened" species, it is of concern to the DNR to see that this species is successful in reproducing and able to forage for food. However, the proposed Polymet project would add on to the fence-like barrier the Iron Range mines present to lynx and other mammals in this region. Lynx are known to avoid disturbed areas and occupy spacious territories of 4 to 20 square miles. In times of food shortages they will migrate as much as 250 miles (Kurta's Mammals of the Great Lakes Region). The mining activities of the Iron Range, a rather vast disturbed area, therefore, acts to restrict the movements of lynx. Further extension of the Iron Range will further restrict the lynx when it comes to breeding and seeking food. Should the Polymet project win approval it is easy to see that more projects of this type will then be approved to where this barrier will extend from Grand Rapids to the Boundary Waters. You folks at DNR are in a poor situation. On one hand you are here to serve and protect the wildlife, while on the other hand you are here to encourage mining of natural resources for the benefit of people. In the situation of the lynx, you have a built in conflict of interest That shouldn't be. It would be nice if our wonderful politicians could find a way to solve this problem separate departments. Of course, the lynx are not my only reason I oppose this project. Environmental concerns alone should stop this folly. Also, the fact that Polymet has never had a mine and doesn't have the financial resources for assurances in case of (and they will occur) environmental mishaps, well, this project should not be allowed to go forward Dave Litsenberger outside of Ely

David M Windseth

I am strongly against the proposed sulfide mine in northern Minnesota. This mine has a strong potential to pollute northern Minnesota waterways, including areas of the Boundary Waters and Lake Superior, and is not worth the risk to the wilds of northern Minnesota, which many people depend on for tourism to make a living. These types of mines have a bad track record in wet environments like Minnesota, and should not be allowed to compromise the state we all live in and enjoy. Most of the money used to mine will not remain in MN, and if the tailings dam does leak many times the company will take the money and declare bankruptcy to avoid having to pay for cleanup costs, putting the responsibility unfairly on the citizens of MN. I implore the DNR not to allow the permitting of this mine in Minnesota to make sure the state may be enjoyed by all future generations of MN. 50 years of jobs is not worth the 500+ years of monitoring and risks it puts on one of the cleanest water systems in the world. For the good of all Minnesotans, present and future, please deny the permitting of the Polymet copper mine. David M. Windseth 11410 53rd Ave N Plymouth, MN 55442

To: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
Dear Ms Fay, I am writing to provide public comment concerning the Polymet Mining "NorthMet Project". I am a Civil Engineer who has worked in cultural resource management in Minnesota for more than 20 years. I am deeply troubled by the prospect of Sulfide mining in one of the most environmentally sensitive areas of the United States. As an engineer, I am fully aware that there is not a single case study documenting Sulfide mining that did not lead to long lasting watershed pollution involving increased acidity and heavy metal contamination. PolyMet is a new company with no mining experience or track record of responsible pollution management. However, the track record of PolyMet's parent corporation Glencore is riddled with environmental disasters, labor violations, and human rights abuses around the world. The company was founded by Marc Rich, who was Federally indicted on 65 criminal counts, including income tax evasion, wire fraud, racketeering, and trading with Iran during the oil embargo (at a time when Iranian revolutionaries were still holding American citizens hostage). The charges would have led to a sentence of more than 300 years in prison had Rich not been controversially pardoned by President Clinton on his last day in office. The Chairman of Glencore's board of directors is former BP CEO Tony Hayward, the man who presided over the largest oil spill in US history and BP's subsequent efforts to avoid responsibility for the disaster and clean-up. I strongly urge you to consider the history of Sulfide mining in general, and Glencore's record of environmental stewardship when considering this issue. Furthermore, as a cultural resource professional I have deep reservations concerning the effects Sulfide mining will have on the natural and cultural resources of the Partridge and Embarrass Rivers. Both rivers contain significant wild rice resources. Wild Rice is a traditional cultural property of the Anishanabe people. Heavy Metal contamination, both real and perceived, will have a negative impact on this traditional resource for the next 200 to 500 years. I strongly urge you to reject PolyMet's shortsighted plan for polluting Minnesota's public waters. Short-term profits do not justify centuries of pollution. Thank you. David Maki 4150 Dight Ave #110 Minneapolis, MN 55406

David Martinson

38708

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr David Martinson 3000 W River Pkwy Apt 207 Minneapolis, MN 55406-2355

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. My god, this is an area where motor boats are restricted. How is it even possible that a proposal like this even gets drawn up on paper. If industrialists had their way the whole world would be a turned over waste land. Between oil, sulfur, and fracking this country is under attack. Leave the forrests alone .. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest In fact only the interest of those who would be making money. Go elsewhere and earn a living. Sincerely, David Mccue 1602 Remington Rd Rockford, IL 61108-6227 (815) 543-9769

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Thank you. My name is David McMillan, MCM (phonetic). I am a senior vice-president of External Affairs for Elite (phonetic). I am a 25-year resident of Duluth and I went to school here at UMD. My wife and I are fortunate enough to raise a family here in Duluth. In addition to my role in the regional and local energy sector, I have also been engaged in a not-for-profit, private and public sector, internship (phonetic) regarding the transportation, higher education and healthcare industries here in northern Minnesota. Each of these sectors and industries is vitally important to the economic well-being for northern Minnesota. And upon that, I want to speak tonight. I have three purposes to my comments. The first being that I am fundamentally committed to the environmental well being and protecting our national resources of northern Minnesota, that we all call home. Secondly, I want to say to the lead agencies and the DNR that the roles you have been charged with, you have done a thorough and comprehensive job in looking at this and applying the stringent standards in regard to the state's applicable laws, and that the SDEIS and the EIS is accurate, comprehensive and complete. Finally, the point I want to highlight the most is the resources and infrastructure that this region can bring to bare, to make certain that we do this in an environmental and economically responsible manner. As far as the construction and resources goes, we have a long and rich heritage of mining and timber resources in northeastern Minnesota. We have the infrastructure, the support industries and the workforce to responsibly mine and process these resources. What do you think of when you think of infrastructure? Well, it means a lot more to me than railroads, ports, ships and tailings basins, and all the businesses it supplies by those. What else does it mean? It means a K12 and Technical College and a higher education system that can train a workforce that can do the work, the welders, the engineers, the environmental experts that we need to extract these minerals safely. And it is the University of Minnesota, and very specifically, the Natural Resources Research Institute, right here in Duluth (phonetic), who have the expertise and the experience and training that we need to help us safely move forward in addressing the challenges associated with mining. Most importantly, the infrastructure also means the Department of Natural Resources and the other state and federal agencies in charge of permitting, and secondly, regulating the unknown processes that will occur in the coming decades. No state in this country, in my opinion, is better equipped and better prepared to ensure the quality of the mines throughout the process are safe and environmentally secure in northern Minnesota. I dare say that no place in the world is better ready to pull the resources out of the ground, with the technology and the safe processes that are needed. Thank you.

To the Co-Lead Agencies: I wish to respectfully submit the following comments on the NorthMet Project and related SDEIS. I am a property owner on a lake in Lake County. I came to Minnesota over 35 years ago because of its abundant and clear waters. But the Proposed Connected Actions pose a grave threat to our State without meaningful corresponding public benefit. To those who proclaim our long history of mining, I would say simply “this is not your grandfather’s mining.” The SDEIS, populated with inadequate and self-serving PolyMet-provided data, offers the following summation: “In summary, the Proposed Connected Actions would produce some additive effects on certain resources.” This grossly understates the cumulative and perpetual damage the PolyMet mine would visit upon the area and Lake Superior watershed. Further, the SDEIS fails to consider a range of common sense risks by making rosy and unsupported projections concerning water capture and treatment, wetland mitigation, air pollution and other side effects of a massive, industrial mining zone in the heart of the Superior National Forest. The existing taconite mining discharges have resulted in elevated concentrations of pollutants that persist downstream in the St Louis River-one of America’s largest fresh water rivers. The NorthMet Project will contribute additional sulfate to the groundwater from tailings basin water that is not captured and treated, water that seeps through fractures in the mine pit walls and stockpile infiltration and run-off. Every year, 11 million gallons of polluted seepage from the tailings basin and 5 million gallons from the mine site will enter groundwater and the environment without being treated. All of the PolyMet predictions regarding discharge from the mine pits and waste rock piles, including the more reactive waste rock piles and the ore surge pile as well as the unlined permanent Category 1 waste rock pile, are made without considering the effects of documented fractures at these sites on discharge to groundwater and surface water. Groundwater contamination from the previous mining activities is still an issue near the LTV tailings basin and mine pits. Engineering controls that are planned for the mine must function perfectly for hundreds of years to meet applicable water standards. The assumed performance of these critical water capture systems in the SDEIS is over 90% effectiveness. This assumption is neither reasonable nor realistic. PolyMet’s favorable water modeling is also based on groundwater base flow data that now appears to have significantly underestimated the likely speed and volume of water flow and resulting sulfate discharge around the mine and processing plant. The modeled rate of water movement at the site is completely unreasonable and does not come close to reflecting actual conditions. The water infiltration rate is lower than the design targets for engineered controls at landfills, has never been observed in any known wetland system, and accounts for only five percent of precipitation falling at the site. Nor is the assumption reasonable that human constructed water capture and treatment facilities will operate at any level of effectiveness for hundreds of years. Even the most reasonably foreseeable problems at the site, including pipeline breaks, dam or slope collapse and problems with waste water treatment go unaddressed in the SDEIS. Design for the 100-year storm also fails to account for the current state of our climate and is insufficient. Although PolyMet’s testing indicates that its waste rock leaches mercury at more than four times the water quality standard, it proposes not to conduct an analysis of the amount of mercury that will enter the watershed. Yet it has done this analysis for each of the 28 other solutes, many of which have nowhere near the potential impacts that mercury does. This appears to be a clear attempt to avoid federal and state regulations that do not allow

Dear Ms Fay, Dear Federal and State Agency Leaders: Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. We cherish our beautiful lakes and are all very afraid that if PolyMet fails to be thorough/convincing in their pre-planning efforts, they will be even more reckless in their physical treatment of our land. Sincerely, David Miranowski
David Miranowski 290 Commonwealth Ave Boston, MA 02115

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I am a physician who has seen patients in Minnesota for over 25 years. I’m writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The study of potential health effects has been inadequate and I am VERY concerned that 10% of infants born in St Louis County have mercury toxicity today and this project will likely put more citizens at risk. The SEDIS study has several deficiencies including inaccurate assumptions about seepage of toxic metals into surface and ground water. Health impacts include complex neurological changes that are irreversible. You each have a responsibility to safeguard the public and future generations from poorly planned insults to our public and individual health. I ask you to exercise leadership on behalf of those of us who are concerned. Thank you, David W. Moen, MD 290 Laurel Rd Mahtomedi, MN. 55115 David Moen 290 Laurel Rd Mahtomedi, MN 55115

Keep all these mining companies away from the boundary waters! The risks are much too great to this treasure of nature! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

David NN 58133

I have spent 3 summers of my life guiding canoe trips in the BWCA. I know firsthand how valuable this resource is to the resort owners to tourists. This industry is a proven, reliable economic engine for northern Minnesota. To risk losing and [ILLEGIBLE] damaging this precious resource in favor of Polymet CEO's and 300 employees is absolutely not worth it. No Mine has ever successfully run without major environmental effects. For everything that will happen, pollution, environmental degradation, it will be MN taxpayers footing this bill. This mine will cost Minnesotans more [ILLEGIBLE] it pumps into our economy. Bad idea, where is your conscious and common sense?

David Oliver 38390

Lisa Fay Please see attached. Regards, David C. Oliver PO Box 543 Ely, MN 55731

David Olson 18142

My name is Alan Hanson. I live in Maplewood. I represent the International Union of Painters Allied Trades GC82, which we have glazers, drywall finishers, painters, and sign display. And I would like to yield my time to David Olson. Thank you. My name is David Olson, O-L-S-O-N. President of the Minnesota Chamber of Commerce. Also a eagle scout. Minnesota Chamber represents more than 2,300 companies around the state of Minnesota. Businesses that care about Minnesota and want to see it succeed. We support copper-nickel mining and more specifically PolyMet Mining in its proposed project in Northeast Minnesota. Minnesota is famous for our natural resources. How we use them, how we take care of them. Copper-nickel mining should be no different. We enjoy one of the richest deposits in the world for copper nickle. We have been waiting a long time for the right time, the right technology, the right reasons, and the right people to mine it. We have the technology. We have the Right rules and regulations in place. We have a need for these metals in our modern lives. They are integral in winter events, electric and hybrid cars, solar panels, and a host of other important technologies and uses. Now is the time to mine them here in Minnesota. We support the environmental review process that this project has been involved in for seven years. It is thorough and it is complex for a project like this. But seven years is long enough. We have reached a point where an important decision needs to be made based on sound science, and to be true to the process set forth by state and federal law. We have confidence in that process. We applaud the DNR and other agencies for the ample time -- twice what the law calls for -- for interested parties to review and provide feedback on the environmental review. PolyMet has already invested \$150 million in this state and will invest hundreds of millions more. Their investment will return billions of dollars with economic benefits to Minnesota. An estimated 300 million in new local and state tax revenues, and an estimated \$900 million in new federal tax revenues. We must continue to move forward in the review and permitting process, uphold our high environmental standards -- nobody has asked for them to be reduced -- and bring real economic expansion to Minnesota. This project will diversify our economy and create hundreds of jobs that can support families and sustain communities. An economic impact that will be felt not only on the Iron Range but throughout the state, which is why the Minnesota Chamber of Commerce and so many local chambers and their members support this project. Thank you.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I want to express the following thoughts on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have polluted waters in all places where sulfide ore mining has occurred. It boggles my mind that this type of mining would be allowed in the state of Minnesota and specifically the Arrowhead Region, Lake Superior and canoe area wilderness. This mining project would have potential impacts that would include risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, David Osteraas PO Box 1178 Gualala, CA 95445-1178 (707) 785-9633

David Passmore 13875

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Mr David Passmore 4000 Creighton Ridge Rd Cazadero, CA 95421-9500

To Lisa Fay, I have read much of the SDEIS and would like to make the following comments regarding the project. I feel the SDEIS has addressed all possible environmental concerns in a manner that will protect the environment from harm. The enormous amount of effort and study that went into this SDEIS is mind boggling. Spending over 8 years and \$100 million dollars to prove that you can run a mine in a safe manner should be commended by Polymet. I feel they have taken all necessary steps to comply with the state and federal standards and will continue to do so into the future. I also feel that this project, once operational, will attract more intense scrutiny by State and Federal agencies, environmental watchdog groups, and the local communities, which will further strengthen the environmental stewardship that Polymet has committed to, and continues to show throughout this process. I trust that our State and Federal agencies have followed the permitting process to a tee, and that your review and involvement in this process will produce a mining permit that will ensure all aspects of the environment are protected. After all of the years of study, restudy, and further review, I feel the time is now for the project to move forward and begin providing the crucial raw materials that today's world demands. We cannot produce the much wanted green energy without the copper, nickel, and other precious metals in our world. We also cannot import these metals from other parts of the world without knowing that they were produced with more environmental impact to the environment. We would be harming future generations if we decided to leave this treasure of green energy in the ground, while importing it from a country that has lax environmental regulations. Why would we do this. Why wouldn't we take advantage of this opportunity to help our world and at the same time avoid environmental problems in other parts of the world. I know our regulators won't allow problems to occur here. We live in an area that values and regulates our environmental protection more than anywhere in the world. We all want wind power, solar power, green power to succeed for our future generations, they all need copper, and they all need nickel. Let's do our part to help our local and global environment by allowing this mine to produce the green power products that will further reduce our impact on the world for centuries to come. Sincerely, David Rannetsberger P.O. Box 2185 Tofte, MN 55615 218 663-7111 rannets@wildblue-net

David Reisenweber

Date: Wed, Mar 12, 2014 at 1:35 PM Subject: Comments on PolyMet's NorthMet SDEIS 3/12/2014 Dear Ms Fay (MN DNR), Mr Bruner (USACE), Mr Dabney (USFS), and Ms Hedman (Adm., EPA): SUBJECT: Weather extremes affects on the proposed NorthMet mining operation A major omission in the NorthMet SDEIS that particularly concerns me is the affects of weather extremes. A lightning strike or a windstorm could destroy equipment used to move polluted material to the right place at the right time. Is there a backup plan. How will the mountains of sulfide ore be successfully contained when catastrophic precipitation events occur. The NorthMet SDEIS lacks plans for accidents and emergencies that will happen, when something goes wrong with ponds, pipes, pumps, filters, etc needed for water treatment. If the questions of pollution, monitoring points, health effects on workers, long-term treatment, employment provided, and tax revenues had viable answers and solutions, why hasn't it happened at existing mines of this type. I have lived through two 500-year and one 200-year precipitation events over a 20-year period. I also was working for the city of Grand Forks, ND, when the flood of 1969 crested there at 45-69 feet, just inches from the top of dikes protecting downtown Grand Forks. The 1997 flood breached the dikes and caused \$3-5 Billion in damage to North Dakota and Minnesota. The crest was 54 feet and destroyed most of downtown Grand Forks. The Duluth flood of June 2013, has been called a 200-year event. Did anyone predict the damage done, when upwards of 10 inches of rain fell. We lived in Watertown, SD, when a 500-year flood ravaged the town in 1997- Much of the town was flooded and the sewage system overflowed into lower areas of town. I've farmed all my life, and one night in July 1993, our place received over 10 inches of rain. There was widespread flooding from western ND through Missouri covering 9 states and 400,000 square miles causing \$15 Billion in damage. The 1993 event on our farm caused hydrological changes that took two years to become apparent, as excess moisture from higher ground 9 miles away seeped to lower elevations in our area. Our topsoil is silt and the subsoil is clay, and our aquifer is 155 feet deep. This happened underground. It was not surface movements, as basements and pothole sloughs began filling with water in 1995 two years after the 10-inch rain event. The bedrock of northeastern Minnesota has many cracks and water will probably move differently depending on amounts of precipitation received. Is there flexibility in the SDEIS to find what is moving where. I could not find it. Does the state of Minnesota have maps of the complete hydrology of the Duluth Complex where this mining is proposed. The certainty is that all water in that area moves toward Lake Superior, which holds one tenth of the world's fresh water. This is not in the public's best interest. Reject the plan. I appreciate your listening to my concerns. Sincerely, David F. Reisenweber 111 Garden Street Duluth, Mn. 55812 HYPERLINK "tel:218-20728-1508"218- 728-1508 HYPERLINK "mailto:bigwater@clearwire-net"bigwater@clearwire-net

David Robert Ott 18249

I'm David Robert Ott, last name O-T-T, Minneapolis, Minnesota. I'm here tonight. I would like to voice my opposition to the PolyMet plan. In my opinion, my humble opinion, I feel like -- I feel like it hasn't been proven beyond a reasonable doubt that the water quality issues will be adequately addressed. Therefore, I think the risks are too high, and I think it would spoil a great treasure of our state, being the water quality of the whole drainage ultimately going to Lake Superior. So quite simply, I just don't think it's safe. That's essentially my comment. Thank you.

David Sandbeck 11449

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity DNR hydrology data show that the PolyMet water model significantly understates the amount of water flowing in the nearby Partridge River. If this information is wrong, predictions about water pollution are in question. If the model is incorrect, and there is more water flowing through the site than it assumes, the polluted water from pits and waste rock will move more easily through the soil, and reach lakes and rivers more quickly. The water could also carry more pollutants than the PolyMet model predicts. David Sandbeck 245 West Baker Street Saint Paul MN 55107 Sincerely, Mr David Sandbeck 245 Baker St W Saint Paul, MN 55107-2704 (651) 428-2736

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, David Schaezner 2456 west 24th street minneapolis, MN 55405

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. After assisting with flood disaster clean up in / and around Duluth in 2012, I am very much against the PolyMet mine, and the connection between many interconnected watershed districts, and the topography of Northern Minnesota - is too precious to chance. Allowing mining in this very sensitive eco system is not the legacy we would want to leave for future generations. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr David Schluchter 4433 46th Ave S Minneapolis, MN 55406-3617

David Shaw

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr David Shaw 960 27th Ave NE Minneapolis, MN 55418-2962

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr David Stack 3306 W 46th St Minneapolis, MN 55410-1717

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, David Stewart 2549 Cedar Hills Dr Minnetonka, MN 55305

David Tomasoni

18107

Thank you, Karin. I'm David Tomasoni. I'm State Senator representing Senate District 6, which you are all sitting in right now. On behalf of the Iron Range delegation, as Representative Dill (phonetic) originally talked about, I'm also speaking for the Iron Range delegation. And I'm here to tell you that we all support this project. As I was saying in Duluth last week, this DEIS is 2200 pages long and it has cost PolyMet upwards of 65 million dollars and has been in the works for over eight years. There have been over six agencies involved. There have been six agencies involved both on a state and federal level, as well as the tribes, in order to ensure that all of the "I"s are dotted and all of the "T"s are crossed. We want it done right. And our laws require it to be done right. And our people want it to be done right. This SDEIS addresses subaqueous storage, refutes acid rock drainage and includes a financial assurance reference, which are unique to an EIS. You know, we have been mining up here for 125 years. In fact, it is a result of mining proceeds that the Delta Airlines Reservation Center was built. You know, John D. Rockefeller once said that, "Had it not been for the Mesabi Iron Range, we never would have won World War II." Well, man, how much copper is being used in our high-tech military today? PolyMet is an open-pit mine, which will provide 500 to a thousand construction jobs, 366 direct jobs and over 700 spin-off jobs. Some people say it is not worth it. Well, tell the people of Aurora and Hoyt Lakes that these jobs aren't worth it and see what kind of reaction you get. Tell the people of the Iron Range that mining jobs aren't necessary and see what kind of answer you get. Try to even imagine living on the Iron Range without mining. The entire area would be a huge ghost town. PolyMet is mining. This is not sulfide mining, this is precious metals mining. These will be conflict-free metals. In other words, no ten-year-old kids will be employed at 50 cents per day, no wars will be fought to overthrow regimes. But rather, we will have an environmentally considerate mine in a region where mining has existed and provided for our economy for over 125 years. And after all of these years of mining, we still have some of the cleanest water and air in the country. And that was noted recently by a previously referenced University of Minnesota study. Yale University just concluded that of about 62 different minerals that they studied, that there is no good substitute for these minerals. Well, guess what, folks? All of these minerals don't fall out of the sky. Every single one of them has to be mined. The National Academy of Science just released the finding that pollution in China makes its way to the U.S. They wrote -- We can do this thing right. We can do it right here, right now, in the right way, with jobs and the environment working hand-in-hand and side-by-side.

David Tomassoni

18167

Steven Biondich, (inaudible). I yield my time to Senator Tomassoni. DAVID TOMASSONI: You don't have to "boo." I'm David Tomassoni State Senator from Senate District 6, home of five of our six taconite plants where mining is our way of life. The SDEIS, of approximately 2,200 pages, costing more than \$65 million, eight years in the making with seven agencies, both state and federal involved, is extremely a comprehensive analysis of the proposed PolyMet Mine. It's hard to imagine that more can be done. The agency has done a very good job and deserves credit for making sure it was done right and for even going further and having three such public meetings as opposed to the one that is required in law and doubling of the comment period to 90 days. PolyMet will be done right and jobs and the environment will co-exist to the benefit of everyone in the state. Mining is the Iron Range's economy. It has been for more than 125 years and will continue to be for the foreseeable future. Our water is clean and our air is clean. PolyMet is mining. 500 to 1,000 construction jobs, 366 direct jobs, over 700 spinoff jobs. This is not sulfide mining. This is precious metals mining. These will be conflict-free minerals. The National Academy of Sciences has just released a study on pollution from China that simply stated, "When we outsource our jobs, we import China's pollution." We have a perfectly good alternative right on the Iron Range. PolyMet. Our green economy demands copper, nickle, platinum, palladium, gold, and more. There are four tons of copper in a windmill. There is copper and precious metals in solar panels, computers, electric cars, medical devices, catalytic converters, TVs, and, yes, broadband. At this very moment many of you may be texting, Tweeting, surfing, and maybe just talking on your i-Phone. There are 39 different minerals in that cell phone. Every one of them must be mined. With never-ending technology advances our society needs these minerals more every day. And in this turbulent world of seemingly never-ending conflict our country must have its own source of these minerals. Really. Now do we want to continue outsourcing jobs, importing pollution, and buying our minerals from countries in a constant state of conflict, and worse yet, employs 10-year-old kids by the millions or do we want to have great-paying, environmentally friendly jobs on the Iron Range with all the benefits to go along with them to develop a domestic source of precious metals to advance our green economy? The choice is clear, it's PolyMet. The SDEIS is a complete document done according to the toughest environmental laws in the country; and it shows that we can do it right, right here, right now, the right way with jobs and the environment working hand in hand, side by side. The SDEIS has my full support and the support of the Iron Range delegation.

Thank you, Tony. And thank you all for coming. It's quite an event when you see a room like this full, because people are very, very interested in what is going on in the state of Minnesota. How we're going to address this particular issue. I'm the state senator for Chisholm. I've been in the legislature -- I'm in my 22nd year now. I'm the chairman of the economic development, environmental, and agricultural finance committee. I am also the co-chair of the LCCMR. And I can tell you that for the people who say 90 days isn't long enough or 2200 pages is too long and too complicated, well, regardless of what the DNR decided it wouldn't be right. The 90-day comment period the DNR has put out there is twice as long as they need to put out there. And so now people are saying "That's not long enough. We needed longer." Well, if we went 180 days, people would say, "That's not long enough. We need 360 days." So these types of comments I don't believe are valid comments. I've been watching this over and over again. I've been watching people say, "This is too complicated. It's 2200 pages. We can't understand it." If we a 100-page document, that wouldn't have been long enough, wouldn't have been complete enough. And so I have to give a lot of credit to the DNR and the agencies doing this, because those of you that don't know, this thing has been going on for eight years. The company has spent \$65 million hiring scientists and engineers to analyze this in a way that has never been analyzed in this country. And the fact that we have six different agencies involved, Minnesota DNR, the PCA, the Army Corps of Engineers, the federal EPA, Federal Forest, fish and wildlife, the tribes that have been involved, PolyMet is involved. How much more analysis by experts do you want here? This is a good document. This is a document that has been scrutinized and gone over and over. Wetlands have been mitigated. There will be no acid drain off that has not already been decided. You people are who are saying this is sulfide mining, this is not sulfide mining. This is copper-nickel mining (inaudible) sulfide in the sand way less than anything that they had in any of the other places that you're all alluding to that have had problems in the world. Quite frankly, this copper, there's four tons of it in these windows. There's copper all over the place in solar panels. Cobalt -- I got lot more to say. But I'm for this thing. It can be done, and we can do it right on the Iron Range.

David W Johnson

18233

My name is David W. Johnson, J-O-H-N-S-O-N, and I'm from Ely, and I worked in the mines and in logging, and we have four generations of relatives buried in the Ely cemetery, and I have reviewed EIS, and I feel all the conditions have been met and let's start mining, stop whining. Thank you.

David Walsh

43371

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, David Walsh 1463 Portland Avenue #2 St Paul, MN 55104

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, David Warfield 608 2nd St SE Roseau, MN 56751

David Welch

18262

David Welch, W-E-L-C-H. My non-substantive comment is I am not in favor of the proposed project. That is my comment. My substantive comment is a comprehensive analysis of water flow cannot be done. Climate change is progressing so rapidly that it is not possible to predict with accuracy the extent of pollutant migration into the hydrological system. Mitigation must be planned from the basis that passive water treatment is not applicable due to the inability to accurately project rainfall and to accurately project future rainfall and climate change. That's my comment. The action I urge is what I already said, which is that I am not in favor of this and to not permit it. Thank you so much for your time.

I am writing to express my concerns regarding the introduction of copper mining into Minnesota and the NorthMet Mining Project. Having reviewed the SDEIS and listened to a great deal of the discussion and exchange regarding the project, I find that I cannot support this project or the introduction of copper mining into Minnesota. The Northeastern area of Minnesota, currently being considered for the NorthMet project, is a unique land and water resource. So unique that a significant portion of the area has been designated as a National Wilderness Area (BWCAW). As a result, there are limits placed on the area with respect to how it can be used with the intent of preserving it for the long term. Copper/heavy metal mining will put the BWCAW in jeopardy. This area has a great many lakes and includes two watersheds, one emptying into the Hudson Bay and the other into the Great Lakes. These watersheds represent a substantial amount of the fresh water reservoir on the planet. Fresh water is an increasingly scarce and essential resource for life itself. It is for this reason, I believe, that copper mining should not be introduced into Minnesota. The copper deposits throughout the Duluth Complex are embedded in rock containing sulfide. Large amounts of sulfide bearing rock will be extracted along with small amounts of copper (and other minerals). Oxidization of sulfide bearing waste rock resulting from extraction and processing will create sulfate. Sulfate contact with surface or groundwater, accidental or otherwise, results in acidification of the water. Lakes and wetlands in NE Minnesota are very sensitive to changes in pH. Small changes effectively "poison" the water and will kill fish and wildlife. There is no denying that copper is a vital component of many of the devices we use everyday. That said, studies have shown that there is a great deal of copper in the earth's crust distributed around the planet; enough to last thousands of years at current rates of use. In addition, we continue to increase our recycling rates for essential minerals. The SDEIS acknowledges that the environmental impact of untreated waste rock and water as a result of the NorthMet project could be serious and perhaps devastating. As such, multiple treatment and containment techniques detailed in the SDEIS will be employed to manage the threat of environmental damage. However, despite best efforts at protection, every existing copper mine has caused significant environment damage. Worse still is that the possibility for damage exists not just during the mines operation but for many, perhaps hundreds of years into the future. In an anticipation of the possible future cleanup costs, there are suggestions, not detailed in the SDEIS, of a surety bond or some financial instrument that sets aside monies to pay for ongoing management/treatment of the mine's waste products. Given that few corporations remain in business for hundreds of years, including those involved in mining or backing bonds, how then can Minnesotans be assured that we collectively will not be responsible for future cleanup/ treatment costs associated with copper mining. In conclusion, given the potential devastating impact to our scarce freshwater resources, I believe that the risk of introducing copper mining into Minnesota is too great. We should increase our recycling efforts and/or mine copper in areas where there is less freshwater than in the "land of 10,000 lakes." It is for that reason, I feel the state of Minnesota and/or the federal government should deny any applications for mining of copper or other heavy metals in Northeastern Minnesota. Sincerely, David Williams 2639 Humboldt Ave So Minneapolis, MN 55408 Sent

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Poor planning in Japan has already put one ocean in danger and it looks as though the number of oceans effected may be two possibly three very soon. The Atlantic. Pacific and Indian oceans will just be large bodies of poison where any food we normally get from these beautiful waters will be infected with radiation. Now you want to build and open a mine here in my home state. You have got to be kidding me. A company with a track record like yours, you expect us to bend over and take it up the keester. I guess companies like yours just won't be happy until you totally destroy this planet. Do you even think about that shit before you plan a project. I don't see it or any planning to protect the earth from you people. Oh you'll just clean it up if a spill occurs. Well there is no way you can clean it all up before it damages the water animals fish and any other life forms here. I only know one way to stop this from happening and that is to stop you from before you even start. If you do start I know what needs to be done its isn't pretty and I get know happiness out of doing it but I will take any action needed to stop you. Lets start by dangling you in the courts for a couple of decades. Then enlist the power of the catholic church to do some damage as well. I'll bet they have enough money to keep you busy until the three horsemen arrive. Just don't build it stay away put your building equipment away and find some thing else to waste your money on. Maybe even think of another way to make the world just a little better. Sincerely, Mr David Wohlfeil 1427 Hazel St N Saint Paul, MN 55119-4218 (651) 307-7560

I am a professional engineer in metallurgical engineering. My review of the PolyMet draft EIS and SEIS is that the report and [ILLEGIBLE] of data appears as a thorough evaluation of the project, potential impacts, and how to mitigate the impacts has been completed. They will use the best available technology to create an effective operation. These technologies need to more efficient use of water, [ILLEGIBLE] and a [ILLEGIBLE] stack of tailings.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, David Zimney 7110 Excelsior Way 7110 Excelsior Way St Louis Park, MN 55426 6125010968

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Dawn Baker 4708 Oakland Ave Minneapolis, MN 55407-3538

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Dawn Baker 4708 Oakland Ave Minneapolis, MN 55407-3538

Dawn Brink

42035

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Dawn Brink Brooklyn Center, Minnesota

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dawn Drouillard

9637

My name is Dawn Drouillard I am originally from Grand Marais and currently own a business here in the Twin Cities. My dad is a Grand Portage band member and a former employee of Erie Mining and LTV Steel in Silver Bay. My mom's dad, Bill Burge, moved to Taconite Harbor in the 1950's to work on the development of that mine. While our family has a historical connection to taconite mining, we have a much deeper connection to the land and to Lake Superior and the surrounding watershed. Lake Superior is already under siege from mercury poisoning created by coal fired power plants, invasive species, climate change and the pollution left behind by early mining activities. The addition of non-ferrous mining, which has never been done safely without polluting the surrounding waters, could very well be our Lake's point of no return. I reject the PolyMet Supplemental Draft Environmental Impact Statement (SDEIS) because:

- The SDEIS greatly underestimates groundwater flow rates. Real and accurate numbers are needed to predict the actual pollution and seepage from mine pits and the actual size of waste rock piles to be added to the Partridge River watershed.
- There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin failure and extreme rain events, like the one in 2012, are not covered in their plan.
- During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down.
- The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates.
- The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure.
- 526 acres and over 167 million tons of reactive waste rock would be left on the surface. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A plastic sheet placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of deep-rooted woody plants that might perforate the synthetic material.
- A pit “lake” and tailings basin pond would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River and the Embarrass River. I don't believe that PolyMet will see this situation through for 500 years or more.
- A lengthy network of pipelines conveying polluted and treated water would need to be monitored for hundreds of years. I don't believe that PolyMet will see this through for 500 years or more.
- Details about financial assurance — a “damage deposit” the company provides — are not provided in the revised mine plan. The public does not know how much 500 years of water treatment will cost. According to Grand Portage Water Quality Specialist Margaret Watkins, this number could be in the 100 billion dollar range, a figure she calculated using the mining company's own financial assurance formula. The SDEIS does not address how the company will be held responsible for centuries of costly water treatment — or how the public will be protected from liability. And these are just some of the technical flaws within the SDEIS. There are many other unanswered questions and related issues that are important to consider, including:
- The threat that an enormous industrial zone in NE Minnesota will have to a thriving and growing tourism economy. 200 or 300 jobs compared to over 245,000 jobs in the tourism industry seems like a very bad trade.
- The effect that increased sulfates will have on

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dawn Jensen 4119 normanna rd Duluth, MN 55803

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Dawn Mulle-Friday 262 chemin de Dabiou Cintegabelle, ot 31550 FR

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. Hello, I would like to make a comment about the proposed PolyMet mine. I believe that Minnesota should be a leader in sustainability. That means thinking about what is best for the state in the long-term, not just the short-term. Just because there is a company interested in mining our minerals doesn't mean now is the best time to do so. The minerals are not going anywhere. Perhaps in the future we will have more sustainable methods for extracting such minerals. Just because iron mining is socially acceptable in Minnesota doesn't mean that all mining should be. Copper-nickle mining is very different from iron mining, and those differences and long-term impacts need to be taken seriously. Dawn Trexel 7717 Hwy 169 Virginia, MN 55792

To all involved; I feel that the governing bodies that are involved in watching over PolyMet will do a good job and enact policies that will be enforced for the good of all who live here. I have been a miner for 35 years, 31 at Minntac and 4 at Northshore Mining, while working at Minntac I was involved in much of the process and worked under some of those that run Polymet. I can tell you that environmental rules always played a big part in any changes we made. The same holds true at Northshore. The governing bodies did a great job on the SDEIS and should continue making changes and watching out for us as the process goes on. You have my full support in this project. Please continue on.

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I also think that this never needs to be done anywhere in the USA, due to the fact that all it is doing is ruining the environment. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Dean And Tristan Jacobson 420 Old Farm Rd Saint Paul, MN 55126-2052 (651) 248-1363

Baseflow affects pollution seepage and impacts on wetlands and streamS • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dean Borgeson 9208 Erickson Ct N Brooklyn Park, MN 55428

Thank you. Well, I will be submitting more technical comments in writing. I just want to make the point that in the late 1970's the St. Louis River (inaudible) and the entire watershed, including the upper watershed was designated by the International Joint Commission, which manages the air and water concerns in the United States and Canada, as an area of concern. So an area of concern basically means you all got a big mess and you got to clean it up. And so we've been working since that designation to develop a plan through decades really at this point of input to clean up the lower St. Louis River. And that's continuing right now. It just came up with a new draft of remedial action plan for the St. Louis River area of concern. That puts us delisting the beneficial (inaudible) the area of concern in about 25 years or so if we can make it. Some of the beneficial use includes mercury contamination, degradation which basically means the critters in the water that are the basis of the ecosystem in the food chain can't survive due to mineral and salt contamination in the water. We already see pretty marketed impact in conductivity, which inhibits the growth of pretty much everything that lives in the water at the streams that flow out of the Iron Range and below the Iron Range. It looks fine. Because it looks fine doesn't necessarily mean it is fine or that we're sustaining the amount of life that we should be sustaining in that ecosystem. The addition of potential sulfuric acid drainage into the St. Louis River Watershed, which is the largest watershed in the United States, flowing into the largest body of fresh water on earth seems unacceptable. And the MEPA and the other organizations that are collaborating to do this, we are spending -- we expect to spend \$420 million cleaning up our mess in the area of concern. \$420 million. That's our money. And it seems contradictory I guess I would say to be spending that much money to be cleaning up something when we're not tending to the 11 headwaters. I also just want to point out that we base our predictions of water flow on the past. What we're seeing in the future is not the same as what we've seen in the past. We have minimal understanding at the revolution we need of climate change impacts in our watershed. And the flush scenarios are likely inadequate. And then finally I just want to say that we are a ceded territory. And we have a lot of things that we need to take care of on behalf of the original people on this land.

Dean Evenson

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Dean Evenson 35 Luverne Ave Minneapolis, MN 55419-2623

Dean Flugstad

15811

I can scarcely believe that it has come to this, that one of the most treasured jewels in the crown of outdoor America, the BWCA, is being threatened by the mining industry again. But the poison this time is thousands of times worse than iron ore mining could ever be. How will retention dams hold back sulfide and toxic metals for hundreds of years. This mining has no place in or near the place we hold dear in our hearts. Mining of all kinds has a very poor long term record in environmental integrity. It is get in, extract, get out and let the people pay for the clean up and mourn their lost environs. A 2200 page document perhaps was intentionally made so long it could hide all sorts of sins. Sorting this out Should be allowed to take years to be done. Be careful and cautious please, Dean Flugstad 72243 300 th Ave Lake City, Mn 55041 Sent from my iPad

Dean Graveel

10714

Gentlemen, I could not make the comment section of your Email on the "Mining Meeting" work. So I am writing you separately. I travel to the BWCA two to three time a year and guide various groups. I love the area and think it is one of God's greatest creations, besides the birth of a child. I also am a Mechanical Engineer with about 50 years experience. I do not like all the negative reporting and the negative groups that are trying to stop the Mining proposal for the BWCA. They do not seem to have many truthful facts to support there "NO" answer to everything that is presented on this subject. As an Engineer, their is always many ways to solve problems and remove all dangers. We must work together for the solutions and keep everybody satisfied and still accomplish the "Mining " goal. Dean A. Graveel Alexandria, IN 46001

Dean Halverson 18331

My name is Dean Halverson. I am from Barnum, Minnesota. I have no script or anything. I'm a mill worker. I'm a taxpayer. And I live in one of the greatest states in The Union. I am going to take my hat off to the DNR people, department of natural resources, for timber, taconite, copper. It's natural resources, folks. God gave it to us for a reason. We're going to use it. Good luck to everybody involved in this project. My hat off to you.

Dean Mohs 16064

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

RE: Technical comment on the Polymet Draft EIS In the early 1980's, the St Louis River was designated by the International Joint Commission (which manages air and water concerns between the United States and Canada) as a Great Lakes Area of Concern, making the river mouth one of 43 areas slated for clean up and delisting of Beneficial Use Impairments. With momentum behind this clean up building as a result of the Great Lakes Restoration Initiative, a newly updated Remedial Action Plan developed by the Wisconsin DNR and the Minnesota Pollution Control Agency lays out a plan to delist the Area of Concern by 2025, spending over 420 million dollars in public funding to accomplish the cleanup efforts. In order to delist the St Louis River Area of Concern (which includes the entire watershed of the St Louis River), MPCA and the MN and WI Departments of Natural Resources will need to delist the following Beneficial Use Impairments that could be made considerably worse by the impacts of sulfates and sulfides in river water: BUI 1: Fish Consumption Advisories. In order to delist this BUI, "There are no Area of Concern-specific fish consumption advisories issued for the St Louis River by the State of Minnesota or the State of Wisconsin. Tissue concentrations of contaminants of concern in representative samples of resident fish are not significantly elevated from regional background samples" The two contaminants of concern are mercury and PCBs, as those are the reasons for current consumption advisories in the AOC. (Text from the Remedial Action Plan). Sulfates and sulfites are essential components in the methylation of mercury. BUI 2: Degraded Fish and Wildlife Populations. An essential component of delisting this BUI is to "(Develop) a wild rice plan and wild rice restoration at Rask Bay and additional sites in the estuary in Minnesota" in order to foster wildlife habitat. The growth of wild rice is severely inhibited by over 10mg/L sulfites in the water and sediment. The Polymet Draft EIS does not make any mention of the Area of Concern or the Beneficial Use Impairments, nor does it adequately address how these impairments might be mitigated in the event that sulfuric acid enters the water column of the St Louis River. In order to ensure that the Polymet proposal does not impede progress on delisting the Area of Concern, impacts to the St Louis River Beneficial Use Impairments should be clearly addressed in the Draft EIS. I am not in favor of this proposal and believe that on behalf of the largest US river entering the largest freshwater lake in the world, we are internationally obligated to deny permits for the Polymet operation. Sincerely, Deanna M. Erickson 3138 Minnesota Ave, #2 Duluth MN 55802

Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Deanne Roquet 315 W Oxford St Duluth, MN 55803-2235

Deb Blair 46373

I am concerned with the Polymet proposal and am fiercely opposed to this project moving forward in Minnesota. Best regards, Deb Blair Business Manager Sunny Hollow Montessori 636 S. Mississippi River Blvd St Paul, MN 55116 651-690-2307 x110

Deb Brinkman 19960

We do not oppose sulfide mining, per se, it must be done without polluting our environment. The SDEIS is inadequate; it does not provide any reassurance that this mining will not result in irreparable harm to the watery environment in our Arrowhead. PolyMet's proposed mine threatens our clean water and public health. To keep pollution out of the environment, the only sustainable option is to clean the environment while mining is in progress. We need to promote an environment beneficial to life through the protection and wise management of natural resources in the public interest. Pollution should be controlled to preserve the physical, chemical and biological integrity of ecosystems and to protect public health. Deb Brinkman 4327 Alabama Avenue South St Louis Park, MN 55416 612 803 6142

41406

Dear Ms Fay, Dear Federal and State Agency Leaders: 500 years of pollution is unacceptable. In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Deb Brinkman 4327 Alabama Avenue South St Louis Park, MN 55416

Deb Bryant 45866

I am vehemently opposed to the prospect of a copper sulfide mine being developed in Minnesota for many reasons to include the poor track record of the Glencore corporation, the risk to habitat and water quality, and the direct disruption such activity would create next to a wilderness area. The estimated gain of a limited number of jobs for a mere 20 years is not worth the huge risk of damage done that will last potentially for centuries. It has become a well known fact that whatever precious metal is produced through this mislead endeavor will not be available for use in the United States and will be shipped overseas, most likely to China. There is huge weakness in the environmental draft statement pertaining to water quality, and based on the unsuccessful track record of preventing environmental damage as demonstrated through other such mines, there can be no assurance that the proposed mine will be any different. Deborah Bryant, DVM Greater Minnesota Veterinary Behavior Services ["http://www.gmnvetbehavior.com/"](http://www.gmnvetbehavior.com/) [HYPERLINK "http://www.gmnvetbehavior.com"](http://www.gmnvetbehavior.com) [HYPERLINK "mailto:info@gmnvetbehavior-com"](mailto:info@gmnvetbehavior-com) [info@gmnvetbehavior-com Ph: 320-292-6608](tel:320-292-6608) [Fax: 320-529-9696](tel:320-529-9696) P.O. Dear MN DNR, Please accept these as my comments since due to health issues I am unable to attend the public hearing in Duluth. Outlined below are my main concerns regarding this specific mining project and subsequently any similar mining projects that involve mining for primarily copper, nickel and other metals from sulfide ores. 1). Mercury: Fact: Minnesota already has substantial mercury pollution, mainly from air deposition that has polluted our water, land and air and the food we eat. This project will significantly increase mercury pollution. In my opinion the EPA, DNR and the MPCA and MN Health Dept. currently have not done enough to lessen mercury pollution from its sources. No agency has done any significant research which has looked at the accumulated effects of mercury pollution on children and women of childbearing age and why there is a higher rate of autism and other neurological disorders around the Great Lakes and in particular Lake Superior and Minnesota than in other areas of the United States. Therefore: Because of the magnitude of this proposed mining project and because if this mining project is approved it will open the doors to over 35 other similar mining projects being proposed in Northern Minnesota - this EIS should not be accepted and/or approved until a long-term (20 year minimum) research project be conducted in Minnesota on the accumulated effects of mercury on children and women. 2). Watershed impairment: This project will adversely effect the Partridge River watershed and the St Louis watershed by eliminating over 900 acres of pristine wetlands and by the potential for contaminating this watershed with sulfide ore runoff. This watershed is part of the Lake Superior watershed and the Great Lakes watershed. Millions of people and including businesses live "downstream" from this proposed mine and depend on the clean water of its entire system to survive. Therefore: Since there has never been a sulfide ore mine in the world that has not polluted and has not left a polluted site for taxpayers to bare the burden to live with and try and clean up; why does the DNR and the state of Minnesota think that proposed Polymet project will be any different. The MNDNR has never not approved any EIS permit and both the MNDNR and MPCA have a poor record of monitoring permits and enforcement. A check over the past 10 years shows a clear record of many abuses by industry - including our existing iron ore mining industry of violations of their existing permits which end up polluting our rivers, land and air. Therefore: If the MNDNR and MPCA can't prevent current industries from continually violating state and federal permits how are they going to be able to hold Polymet accountable. Note: I would like the MNDNR and the MPCA to show one existing mining operation in Minnesota that has never, I repeat never - violated one of their permits. They can't because it doesn't exist Approving this proposed mine is a ludicrous based on the past history of mining operations in Minnesota and based on the poor record of the MNDNR and the MPCA in effectively monitoring and enforcing federal and state laws to protect our environment. 3). Wetlands When Rep. Willard Munger and other state legislators passed the MN Wetlands Act it was to insure that we protect existing wetlands within the watershed(s) where they exist If he were alive today he would be appalled at how his legislation has been watered down. He and other legislators original intent was never to allow wetlands in one county to be replaced in another county. We need to preserve and protect existing wetlands not use gravel pits (which has been done) to try and build new ones that will never replace natural wetlands that took years to make. For every acre of wetlands that is impacted a natural, existing wetlands must be permanently preserved forever. I was on a Wetlands Technical Committee and was involved in testing the quality of man-made wetlands and our rese

Mar 1, 2014 Ms Lisa Fay MN Dear Ms Fay, I write as a Minnesotan who advocates for protecting our clean water far into our future. Citizens such as myself have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement. I believe that the SDEIS is insufficient and should not be approved because it lacks information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest, the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. I personally care a lot about birds and view them as an indicator of the health of our land. I advocate on behalf of birds because they have no voice in decisions made about their habitat and homes. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Goshawk and Boreal Owl. I urge decision-makers to reject the proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining could result in long-term water pollution and negative (harmful or fatal) impact to sensitive birds and habitats. In my opinion, which considers the long term, this short term trade-off is not worth the risk. Thank you for your consideration. Sincerely, Mrs Debbie Brown

As I watched on the news the river in West Virginia and the town's impacted by the contamination spill, I thought "perhaps NOW the individuals who can stop the PolyMet mining in Minnesota will rethink this." Do not destroy the best of what Minnesota has to offer. Debbie Legan 1004 Glen Paul Ct Shoreview, MN 55126

Debbie Meister 15978

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Debbie Mucklow champlin, Minnesota

Debbie Neimark

40363

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Debbie Neimark 6018 N. Oakley Ave Chicago, IL 60659 US

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Debbie Wall Minneapolis, Minnesota

I am totally against the sulfide mining in northeastern Minnesota. Question? If Canada is own by the Queen of Enland and that Enland rejects exports from the USA pertaining to international laws, (example) if I wanted to send cookies-cereal-smoked sausages to a friend in England I cant because of the chemicals in our food. Then we have the right to stop the company from Canada coming here and destroying MN.

Deborah Cheek 32765

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt There are things in our lives and in the world that are much more valuable and precious than money. The National Forest lands near the Boundary Waters Canoe Area Wilderness and Lake Superior are considered by some to be one of the most beautiful wilderness areas in the world. My heart aches that some corporation thinks that it is right/moral to seek permission to put an open pit sulfide mine on this land. Please act now to block this proposal put forth by PolyMet. Sincerely, Deborah Cheek 503 W Center St Mount Morris, IL 61054-1315 (815) 734-6228

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: My God, I am horrified that this has gotten this far. If this goes through it will COST US big time It will destroy our great north woods, animal life, AND the money from tourism It will also cost us money to clean up It will probably never really be clean or will we have our great north woods ever again, at least in my life time. It seems to me the costs are TOO great just for a few jobs. Unless some people are getting paid alot of money who make this decision Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Deborah Crocker 3012 Darling Dr Alex., MN 56308

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Bottom line The people of MN. do NOT want or need this company in our state. The CONS far outway the pros I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Deborah Crocker 3012 Darling Dr Alex., MN 56308

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Deborah Hendrickson 301 N 18 1/2 Ave W Duluth, MN 55806

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Deborah Hendrickson 301 N 18 1/2 Ave W Duluth, MN 55806 218 391 5133

Deborah Huskins

18232

I'm Deborah, D-E-B-O-R-A-H, Huskins, H-U-S-K-I-N-S, and I live in Woodbury. My family has been involved for four generations in north woods activities, and I want to make these statements because I'm very concerned about the proposed NorthMet/PolyMet project. Any large undertaking requires us to plan and hope for the best but to prepare for glitches and unanticipated events. While we all hope sulfide mining can be done without damaging the environment, experience throughout the world shows otherwise. There are foreseeable problems. Just one example is the Duluth flood event that occurred in 2012. Nearly 7 inches of rainfall fell in 24 hours, causing flash floods, widespread flooding, tearing apart roads and river beds, et cetera. This rainfall exceeded the 100-year flood records. PolyMet says that they can capture all of the contaminated water on site and treat it before it's released into the environment. Their own mine plan shows they will have millions of gallons of polluted water that will seep offsite untreated. PolyMet will be collecting some of the water in pits lined with membrane -- membrane liners. These liners will eventually leak. What will happen if we have a flood event like the Duluth flood event? Contingency plans are important. No one has explained how the damage can be retracted once it occurs. If leakage occurs, or worse, a spill, how can the acidified water be pulled back? It can't. It proceeds downstream and down into the groundwater killing plants, fish and all aquatic life it contacts, leaching dangerous heavy metals and mercury into the environment. How do you reclaim water that has been acidified and the plants and animals that are killed off? Reclamation costs are used to determine what the financial assurance is that will be required. But how can we give a dollar value to the damage once it's occurred? Financial assurance must be enough to protect Minnesota taxpayers in the future; long after the mining company is gone. Protection from bankruptcy is important, also, because Minnesotans otherwise would be left liable for any costs. The SDEIS is inadequate. It doesn't provide a financial assurance plan that will remain viable for 500 years and account for all unanticipated liability. How can it? How can a corporate entity be held accountable for these costs over centuries? The answer is get all costs up front. But we really don't know what the costs of the water treatment monitoring maintenance and repair for decades and even centuries are. This mine plan still fails to provide details on the amount and form of financial assurance that is needed to fully protect taxpayers. The actual cost of monitoring, maintaining, replacing equipment and protections over the course of hundreds of years needs to be built into the costs and the financial assurance estimates. The PolyMet's Director of Environmental Permitting and Compliance says that we don't need to know how long water treatment will be needed. They will -- the company will prepare for treating the water for as long as it takes. This doesn't make sense. How can the state be assured that sufficient financial assurance will cover the costs if we don't know how long these costs will last? And so we can't know the total costs. The SDEIS is inadequate for that reason, as well. Another reason the SDEIS is inadequate is that the economic analysis is not complete. What jobs really will go to Minnesotans and which ones will go to non-Minnesota, non-U.S. employees? What about the jobs that are displaced or disappear when the mining starts, and what about those jobs that disappear afterwards? A cost-benefit analysis is needed. When the mine closes, there will be costs due to the impact of lost jobs, unemployment and other societal costs. The SDEIS does not take these into account. Displacement of other economic activities should be part of the cost-benefit analysis, including activities associated with hunting, fishing, ecotourism and outdoor recreation. In conclusion, the SDEIS is inadequate in multiple ways and doesn't provide insurance that our water and our environment will be protected, despite the mining for the entire period of time that the damage will occur. We must be strong and vigilant to protect these precious natural resources. Thank you.

42918

Hello, this message is addressed to Ms Lisa Fay, EIS Project Manager, MDNR Division of Ecological and Water Resources, Mr Douglas Bruner, US Army Corps of Engineers, and Mr Tim Dabney, US Forest Service. My comments on the SDEIS for the NorthMet Mining Project and Land Exchange are attached. I will also send a paper copy to the mailing address listed for Ms Lisa Fay at the DNR. Thank you for the opportunity to comment on this extremely important SDEIS. Please keep me on all mailing lists/groups regarding the NorthMet/Polymet proposal. Sincerely, Deborah Huskins 2624 Windsor Lane Woodbury, MN 551225

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Deborah Meyer 4970 150th Ln NW Ramsey, MN 55303-4293 (763) 323-9338

Deborah Robinson 58142

I, Deborah Robinson (774 Timber Lane, Shoreview MN 55126), do not support copper/nickel mining in northern Minnesota because:#1) The risk to water quality is far too great (sulfuric acid pollution for many years, perhaps centuries, into the future) for the limited number of jobs (350) that would result over such a limited time (20 years); There are many less risky ways (both financially and environmentally) to revitalize the economy of northern Minnesota without copper/nickel mining;#2) Hardrock mining history in other U.S. states has proven that hardrock mining companies usually declare bankruptcy long before mine site cleanup is done leaving tax payers, such as myself, paying for the long-term cleanup costs - there is no reason to believe that PolyMet would or could do better;

Deborah Walsh 16392

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Deborah Walsh 1124 N 2nd street Stillwater, MN 55082

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I'm sure you've read many similar messages from other Sierra Club members. My main concerns are irreparable environmental damage and lack of a good plan to prevent accidents, along with sufficient funds being set aside to clean up the mess after PolyMet has stripped the earth of anything valuable. History has shown that other mining interests have simply declared bankruptcy to avoid paying clean up costs. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Deborah Webster 2298 Snowshoe Ln E Saint Paul, MN 55119-5900 (651) 731-4662

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please consider these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota, but we must learn from past mistakes. Acid mine drainage and heavy metal contamination have polluted waters everywhere sulfide mining has occurred. It threatens wetlands, rivers, lakes and streams and will affect the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I'm concerned about our region's natural resources and public health, risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, not to mention the cumulative effects from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet not in the public's interest, only PolyMet's. Sincerely, Deborah Zeleznik 1200 Beach Ave La Grange Park, IL 60526-1243 (708) 352-3141

Debra Cless

18117

My name is Debra Cless. I'm a resident of Ely, Minnesota. And I would like to address some issues that have come up again and again in this discussion. Science-data-driven outcomes and socioeconomics. My comments will really focus on what I perceive to be flaws in two interactive parts of the SDEIS, modeling of water movement at the mine site and current hydrology. And the impact of these model errors on another section, which is the socioeconomic section. After reviewing the information -- I have read the whole SDEIS, and I have especially paid attention to Chapter 8 and Appendix C. And in there there are scientific studies. And the ones I found most compelling were the five letters and memos contained in the hydrology section of Appendix C. I contend that these problems in the model -- and we've heard some questions about the importance of modeling -- and I would also call attention to the fact that it's PolyMet's modeling itself that has contained 200-year and 500-year outcomes. However, the model water quality at 500 years is only the point at which the water doesn't get worse. The predictions in these models create serious challenges to prediction of critical economic components. Future mitigation and remediation costs. Risk assessment cannot be separated from risk management. Therefore, critical flaws, present in the assessment of risks, will lead to critical flaws in estimations of future costs. I will highlight the flaws briefly. I included them in my comment that I submitted. First of all, when we're looking at the model, the major tenet of the model is that computer simulations are discredited if the things you are looking at have not been tested and do not reflect adequate field conditions. The surface water model failed to do that. Secondly, the (inaudible) model, which predicted water quality at the mine site also did do (inaudible) that's it.

Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The slew of recent tragedy-inspiring broken pipes, holding tanks, and containment systems should be warning to us enough: There will be an accident. It is a matter of time. What happens then. Will this company be around in 50 years to take care of the problem. No. And we are talking an extension of 500 years for possible containment problems. We trade all this for jobs that will last at best 20 years, and the bulk of the profits will be exported. It does not make sense to open the flood gates of permits to the dangers of this kind of mining. But let us at least have a fair idea of the health dangers, not brush this under the rug for after the fact. I have read the materials on both sides and understand what it means to be without work in a community. We must do better than this. Please do not proceed with this mining effort without the health assessment. Sincerely, Debra Frasier 45 Barton Avenue SE Minneapolis, MN 55414 Sincerely, Ms Debra Frasier 45 Barton Ave SE Minneapolis, MN 55414-3511 (612) 379-0424

I have come to this meeting because I am 60 years old and grew up in Florida. After 30 years in Minnesota I can tell you that the pristine beauty of your state is the most valuable treasure you have. It seems, from the present, that job here-and-now is the gold --- it is not. Look at Florida, my homeland ---sold for jobs and now plagued with natural disasters in water quality run off, and soil erosions, contaminating water ways. Now, water is the gold. Minnesota has a chance to keep its gold. Every protected area of this country has proved its value and that will only increase. Don't sell to the short sighted job – protect the gold – we cannot sign up for a “plan” that counts on 500 years of cleanup for a job today. The math does not work.

debra haveri 4410

People just have to check out what happened in Ladysmith Wisc. The Flambeau river.. Maybe then theyandapos;ll take their head out of their as___es and realize we should not allow polymet here.. “*NorthMetSDEIS (DNR)” wrote: Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Debra Thurlo 1135 Loma Linda Ave Mound, MN 55364-9759

Debra Wilde 40030

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the “evaluation locations” used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Debra Wilde 902 3rd Ave S Virginia, MN 55792

Deborah, D-E-B-O-R-A-H, B-I-L-L-M-E-I-E-R, Mound. I've never been able to find the words to adequately express the value that the wilderness has on, from as far as I can tell, everyone that has ever been there. That is the wilderness of northern Minnesota would probably be a little more accurate. There is no amount of money that could ever replace this ancient wilderness. I think if everyone could have the amazing experience that the peace and freedom nature provides, they would agree it is stupid and reckless to open mines that would endanger this rare and interesting environment. I find the history of the Polymet/Swiss owner's mining company's practices extremely disturbing. Despite the sulfide mineral mining company's promises, they have never proven that they can prevent the extremely toxic waste and the sulfuric acid from entering into the surrounding environment. With fresh water being the most valuable resource, this mining project, it is like the worst location for it to be a test site. It is near Lake Superior, the largest freshwater source in the world. It seems like a pretty stupid place to just see if it is not going to do it. I hope that we will continue to protect the wilderness and truly leave a better Minnesota for future generations.

Debsonstage

I am concerned about the sulfide mining that is proposed on the range due to the great risk of our ecology from Babbit through The Great Lakes. Not one of the mines that has done this type of insult to the land has contained the pollution and my question is why is this even on the books waisting tax payer money. Todd Gremmels 1626 London Road Duluth MN 55812

Dee Ann Christensen

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Dee Ann Christensen Coon Rapids, Minnesota

Feb 19, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I don't think you should allow this mine to be done. The boundary waters is the only natural and beautiful land here in Minnesota. Digging this mine will intamenate the waters. Ruining the habitat of the animals around it and in the waters. Your polluting the waters with sulfuric acids making the pH go down. Which means no more fishing for the people who love to do so. The wilderness is a very historic place being open since 1978. What about the future generations? Building this mine will polute multiple lakes and rivers.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Denise Coviello 1338 Virginia Trail Youngstown, OH 44505 US

The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Allowing sulfide mining to begin would pose a threat to wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness, as has been demonstrated by the heavy metal contamination that has polluted waters in all other places where sulfide ore mining has occurred. This proposed project has major potential negative impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, and harm to wildlife. Allowing PolyMet to build an open pit sulfide mine, using a Federal land exchange that includes protected Superior National Forest land is not in the public interest. I beseech you not to move forward on this project. Sincerely, Denise Wunderlich 13730 Vernon St Oak Park, MI 48237-1387

Dennis Cleaveland

37282

Dear Sir or Madam: I have read the SDEIS and attended a public meeting regarding the Polymet Northmet Project at Hoyt Lakes, MN. My conclusion is that as a result of the treatment facilities and methods proposed by Polymet, the industrial water returned to the St Louis river basin will be cleaner than the water currently in the river and its basin. In the chapter of the SDEIS labeled "Major Differences of Opinion", detractors arguments often include "we don't know . or . has not been addressed". The totality of the SDEIS belie those statements. The project is environmentally responsible and should go forward lest I think all reason is lost in Minnesota. Dennis Cleaveland 2454 Cliff View Circle Two harbors, MN 55616

Dennis Dietzel 3099

There are many concerns I have about the proposed Polymet nickel and copper mine. The main concern is around the subject of ongoing water quality. From my reading of the environmental impact statement there would need to be water remediation for 200 to 500 years. I don't understand how one can plan for remediation that would last that long. The United States as a country is just over 200 years old, and, to my knowledge there are no corporations that have ever existed nearly that long. I cannot support a project that compromises water quality of the area and Lake Superior that far into the future. We have no idea how many resources would be required 100's of years from now to handle such a situation. Based on my comments above, I would like to register my opposition to the proposed Polymet nickel and copper mine project. Dennis Dietzel 2954 Hamline Avenue Roseville, MN 55113 651-633-0432

Dennis Dunphy 50934

The DNR has not been able to answer any of my questions on the Poly Met Mine proposal. Now, Let us stop this madness. The DNR continues to back a project without being able to answer basic and important questions. Such as, how to they plan to forecast the value of a human life lost due to pollution from the mine. How many mines will open up. How can Poly Met open a mine when they have not money to do so. Why would we let a Canadian mining company like Poly Met open a mine in Minnesota since they have no ties to the United States. How can they predict the success of technology never used in the Boundary Waters area. Have they looked at the pollution of other mines and told the public the truth about the pollution from these other mines. Why has the DNR used numbers given them by Poly Met without doing their own analysis. How can they not look at the action needed when pollution takes place which it will. What are the actions that will take place when a river is polluted. It is stupid to continue on with this political game when Mr Brad Moore used to work for the Minnesota Pollution Control Agency and not is a mouth piece for Poly Met. He has a degree in political science. And we know how politicians lie all the time. It is insane. Stop it. Dennis Dunphy 1-320-290-5330 [HYPERLINK "mailto:dunphy@cloudnet-com"](mailto:dunphy@cloudnet-com) 535 6th St Apt. 101 Avon, Mn. 56310

50935

I have proof that Poly Met, DNR, and Minnesota Pollution Control Agency don't hAve History. History is the real story of truth and pollution. Pollution that takes place when those know it all said that technology will make certain pollution will not happen. Look at the mines in Nevada. Look at Reserve Mining and the asbestos in Lake Superior some forty years ago. If you don't remember you are to young to remember it. Look how the Gulf of Mexico turns red from pollution. Technology fails all the time. Look at how the Titanic was unsinkable. The Poly Met Mine will pollute and kill. It will kill a large area right off the bat. As soon as the first shovel is dropped to remove rock, it is dead forever. Look at the zebra muscles spreading like wildfire from lake to lake. OK. The water from northern Minnesota goes all the way to the ocean and is used several times by cities on its way to the ocean. Once that water is polluted it is no good anymore. You wouldn't be able to drink it or swim in it. You wouldn't be able to fish it. So, nobody comes to Minnesota anymore to fish or camp. Because politicians set on their duffs and let it happen. The Chamber of Commerce and their buddies wanted the jobs. I can't see any future or benefit here at a Poly Met Mine. Finally, Poly Met has not money to do what they keep promising along with the DNR to do. Poly Met is a Canadian company with not legal or moral ties to Minnesota or the US The only source of money for them is the American citizens. NO. Now, People have been warned and they need to stop this catastrophe from happening to our beautiful state and other states.

Dennis Falk 39977

I am writing to oppose the NorthMet (Polymet) Mining Project. As I read the SDEIS and understand state statutes and regulations, this project will not meet the allowable standards for water quality. The mining activity will last perhaps 30 years, but the need to treat water to bring it to an allowable standards will likely last 200-500 years. I do not believe this situation meets the letter or spirit of the law, and I urge you to NOT issue a permit for this project to proceed at this time. Sincerely, Dennis R. Falk 16 South 25th Avenue East Duluth, MN 55812

Dennis Ferche

43089

To: Minnesota Department of Natural Resources Fr: Dennis S. Ferche, Phd-Chemical Research and Life in General Re: The possibility of the mining of copper and nickel in Minnesota as proposed by Polymet Mining Inc.-The related Supplemental Draft Environmental Impact Statement (SDEIS). NOTE: In December of 2007, The Minnesota Pollution Control Agency released a report for public environmental review of a proposed Ash Disposal Facility in West Lakeland Township of Washington County- (this is as near the St Croix River). I compiled and made my comments before the MPCA at that time. Now we have the current mining proposal and this again involves the hazards of exposure to heavy metals via land, air, and water contaminants. My concerns with the heavy metals, at that time, carry over to this SDEIS. Therefore, I won't take the time from preparations for gardening (food production) and other worthy endeavors. Instead I offer some philosophy and some proposals that I believe pertain: 1) As I see it this proposal projects to give our youth another task into perpetuity. 500 years for monitoring and maintaining quality control seems almost comparable to tending to nuclear waste facilities for thousands of years. It seems time to review the nature of such endeavors, versus bringing on new ones-(How is the atoms for peace initiative working out around the world-as 400 tons of radioactive water escapes from the Japanese plant daily). I contend our creative youth may want to do otherwise. Note: This is evidenced by many choosing pathways where the ownership of an automobile can be avoided. 2) It has been reported that a ton of typical high tech equipment contains much more gold and other resource material than does several tons of related ores. I contend we need to get at reclamation in a proper manner. Currently, I understand that many items get sent to China for recycling-Reports are that much of this is done in a manner that is not respectful of the Earth or the life upon it. Meanwhile, over the years, I have listened to the statement via the Bill and Melinda Gates Foundation: "All people deserve a healthy and productive life". I concur, and we need to work that philosophy into current and future activities-Here, in China, and Everywhere. For this purpose, I propose that before any mining might be provided for that Reclamation of related resources be done and evidenced near the 100% level. Further, if any mining is to be allowed, that an accounting of resources be provided for-Meaning: Mined resources shall be tracked and followed through production and reclamation. Those planning to use the minerals need to provide the plan and the means for their reclamation in environmentally sound manners. 3) These days, as in much of the past, we hear jobs, jobs, jobs as the mantra-I contend that now we need to put the emphasis on evolving more worthy jobs. My top priorities are for the production of healthy soils and healthy foods-and grown locally as first preference. Secondly, in the worthy job category, we need to get on with the production of our fabrics, and related materials, via the growing and processing of industrial hemp-In contrast to importing these products. ∴ Gotta go now-Worthy Endeavors to Everyone, With Appreciation, Dr Dennis S. Ferche, Phd 1535 Stagecoach Trail South Afton Mn. 55001-9703; 715-338-2342

Dear MN DNR, As an aquatic biologist and resident of Duluth MN, I would like to voice my support for the mining industry in northern MN. There are several people that are rightfully concerned about the degradation of water and habitat in the mining areas. However, with proper mine planning, the short and long term effects can be turned into positive assets. In the short term, the extra air emissions from processing can be mitigated with today's technology, it will not cost too much more. Sulfide runoff can be reduced with proper mine contouring, wastewater treatment (even something as simple as limestone treatments). In the long term, the abandoned mine pits can be contoured properly and be turned into new lakes, lake homes and property tax revenue. The catchment areas for these new lakes can be contoured and coated with bentonite and/or top soil and replanted. These mines are future lakes. Even though I am a proponent of mining in northern MN, I do recognize, in the past, mining companies have taken MN's resources, siphoned the profits away from MN, declared bankruptcy and left a mess behind. Today's mining industry should come out with short term and long term plans to alleviate these concerns and gain public support. In short, most everyone agrees that northern MN needs the industry and nobody wants mining to leave our water and habitat degraded, but with today's technology, we can turn the future abandoned mines into lakes and recreational assets. Thank you for your time, Dennis

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources March 10, 2014 I am a resident of St Louis County, Minnesota and for many months now I have been listening and reading about the pros and cons of the proposed PolyMet copper mine in my county and region. After much thought and study, I've come to the conclusion that, while this development, like any of this scale and investment, would provide good-paying jobs in my part of the state, I see this mine as doing much more harm than good. I have seen copper mine operations in the American West and am aware of the long-term consequences. Copper mining is fraught with environmental problems There's a long history of toxic tailings and wastes, and mining companies that simply "take the money and run", leaving others to deal with the problems they've left behind. And these mines aren't placed like this one would be, in fragile wetlands near protected wilderness and the Lake Superior watershed. The minerals are there, but is this the right place to unearth them. There are far too many unknown variables with this project. The very process proposed to treat the toxic wastes is in question. Doesn't it border on insanity to talk about treating mining wastes for hundreds of years. This is not something that's been done before and planning to do such a thing, for this length of time, only proves how strange this type of thinking is. The health effects of this project, unearthing toxins and exposing these to air and water are unknown, and this has not been addressed in the EIS. Recently a group of health care specialists in Duluth pointed this out. Some of these concerns are mercury, toxic metals, arsenic, and asbestos-like fibers. What are the cumulative effects of pollution/toxins from the proposed operation along with current iron ore mining operations. A Health Impact Assessment should be required and it is surprising that this hasn't been done. We should know how many lives will be affected by these environmental toxins, and the sociological and economic costs. It is my understanding that native wild rice areas are already impacted by problems linked to water quality. I think it is of utmost importance that wild rice be protected and managed for no further loss and, in fact, wild rice should be re-introduced where it's been lost It is unknown how this project will affect wild rice, hence our water quality and our quality of life in Minnesota, where water is our life. Some talk about changing our environmental standards and regulations to accommodate this new form of mining, but that is terribly misguided and shortsighted. How will this development affect the tenuous moose population. Thousands of acres of wetlands and moose habitat will be destroyed, with an impact that reaches beyond this immediate development. Critical Canada lynx habitat will be lost, as well. These concerns should be addressed. It is not required in this EIS, but considering the scope of this project and the pervasive pollution it will create, the technology and costs of containing and remediation of this pollution for hundreds of years MUST be part of this permitting process. It seems likely that more jobs would be created to clean up the pollution over hundreds of years, long after the twenty years of active mining. Ultimately I feel the question is: Are we in Minnesota willing to take a gamble on hundreds of years of toxins in our environment for a few hundreds jobs that will last a couple of decades. It has become an emotional issue for many on the Iron Range, an "us versus them" attitude, but this activity would have an impact far beyond the immediate area. One generation of good jobs is not worth twenty generations of pollution and health risks. Sincerely, Dennis Kaleta 1424 W. Knife River Rd Two Harbors, MN 55616

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dennis Mashuga 754 Havenview Ct Mendota Heights, MN 55120

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, For what it is worth, being an experienced wildlife observer (including a "birder" with a "life list" of over 500 bird species), I have enjoyed visiting Illinois Beach State Park and Indiana Dunes State Park/Indiana Dunes National Lakeshore, besides Northerly Island Bird and Butterfly Sanctuary on Chicago's South Side, along Make Michigan-especially during the spring migratory bird season. As a naturalist and an environmental researcher who has lived in the Chicago Metropolitan Area since the Winter of 1982, the entire Great Lakes Region MUST be immediately protected from ALL forms of toxic pollution. Therefore, please accept my comments on the PolyMet Mining Corporation's proposed NorthMet open-pit sulfide mining project Supplemental Draft Environmental Impact Statement (EIS). Lake Superior-a vast freshwater resource unique among the Great Lakes-and the millions of acres of wildlands, about 1,000 pristine lakes and streams, and around 1,500 miles of canoe routes within the Boundary Waters Canoe Area Wilderness MUST BE PROTECTED FROM THE PROPOSED OPEN-PIT SULFIDE MINE. The destruction of fish and wildlife habitat from polluted lakes and rivers, contaminated drinking water, huge cleanup costs (preventing the toxic chemical pollution in the first place is always the best option), and "hundred-year recovery" make ANY (AND ALL) OPEN-PIT SULFIDE MINING JUST TOO 'TOXIC' AND 'HAZARDOUS' FOR THAT REGION. (In fact, inherently 'dirty' sulfide mining has never been done in Minnesota. Again, this threatens wetlands, rivers, lakes, and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness.) Continuing on, acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has happened. I have really serious concerns about this project's potential impacts on that region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife species/populations (like the threatened Lynx and declining Moose populations), and the cumulative impacts from open-pit sulfide mining. (Even according to the PolyMet Mining Corporation's own study, the water from the open-pit sulfide mining site will require at least 500 years of treatment.) Finally, the federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open-pit sulfide mine is NOT IN THE PUBLIC INTEREST-AND SHOULD NOT BE ALLOWED. Sincerely, DENNIS NELSON 3817 S Winchester Ave FL 2 Chicago, IL 60609-2011

Dennis Purkat

18102

Good evening. My name is Dennis Purkat. I was born and raised in McKinley, Minnesota. The only reason I'm here is because my father raised eight children on a miner's salary, in a three-bedroom house. We didn't kill each other. We have all gone on to successful careers and lives here. I am fully behind this project because I work for a company. I am an independent sales rep and a lot of my friends and business associates are here tonight. I would just like to say thank you for all of the support they give me. I could raise my children. They have already -- they are going on to bigger and better things. I want to stay here. I just passed a 20-year milestone for the company I work for. I firmly believe this is a good project and I think that PolyMet is also going to support me in my endeavors in being a sales rep, and I just wish them well. And I hope that everybody here that is young and looking for a good job, that is willing to stay here and pay their taxes, I think it is a win-win situation for all of us. Thank you for your time.

Dennis Szymialis

18326

My name is Dennis Szymialis. My great-grandparents homesteaded in Northeastern Minnesota in (inaudible) township (inaudible) had a cross versed economy in agriculture. Today the St. Louis River is polluted by iron mining, runoff from the iron mines; and it's led to a situation where that once rich land of the St. Louis River Valley no long enables us to feed ourselves. I want to say that my mother was a sergeant in the Army Corps of Engineers. And I'm disappointed that there wasn't anybody with a uniform on that she wore that's here for me to ask questions of at this hearing today. Myself I'm a graduate of the University of North Dakota School of Law where I took courses in oil and gas law, agriculture law. I want to assure people that there will be downstream victims of the sulfide mine runoff that will occur at PolyMet. And I want to point out a couple of things with the EIS. I want to emphasize that it's vague and ambiguous. That the liners are called geo liners because they're merely packed down on dirt of some sort. The reverse osmosis procedure that's being promised won't filter out arsenic, which is (inaudible) at a neutral level. Filter out another carcinogen, nickel sulfate. And these will get into our drinking water downstream and the downstream consumers of that water will be the victims. In addition to our natural environment, the plants and animals that rely on clean water. The Federal Land Management Policy requires that the EIS -- if you read it, there's a number of places where excuses are made for the economics not favoring the proponent, the mining company. They're not required under case law to be allowed -- they're required to do all mitigation regardless of the cost under the Federal Land Management Policy Act. And when this case comes before (inaudible) I want you to all look at the decisions being made by the court and make sure that they follow the Federal Land Management Policy Act and require all mitigation rather than what is economically beneficial to the mining companies. Last of all, I want to talk about jobs. This is isn't a job promoter, this is a job killer. First of all, we've been asked and we are currently subsidizing PolyMet to the tune of 12 percent (inaudible).

47215

POLYMET SDEIS COMMENTS Allowing only 90 days for public comment for this project is inadequate to fully vet objections to the project which PolyMet and lead agencies have allegedly spent tens of millions of dollars and more than 9 years. The comments given below should be given deference for judicial review under these circumstances or be determined to violate due process notice and comment requirements. The comments given should be regarded as conservative objections and be given a broad reading. The lead agencies are being paid to provide an SDEIS that will be permitted. This payment conflicts with their permitting and monitoring responsibilities. For them the permitting of PolyMet is nothing less than employment featherbedding. They have an pecuniary interest in permitting PolyMet including the promotion of future projects that will go through licensing and which they will have to monitor. The agencies are denying cumulative impacts because they want to hide their own misconduct. Why should we have to tolerate "evaluation criteria" that they created in the first place. Is every watershed available for contamination of "evaluation criteria." "But no one is sure if arsenic levels below the 10-microgram threshold are completely "safe." And researchers are still studying whether there could be health effects at those concentrations." at <http://www.reuters.com/article/2012/01/24/us-chile-cancer-idUSTRE80N1YJ20120124-> While most sources attribute lower cancer rates from arsenic in Chile there was one at least source that I read that indicated it was from a change in water supply. Future monitoring and the filling in of some very substantial gaps of the SDEIS will be left to these lead agencies that have contracted with PolyMet to act on their behalf. These agencies have already in the DEIS written an EIS that was rejected by the EPA. This does not mean that the EPA will continue to save us. It only means that the EPA will be the focus of pressure to capitulate. Because environmental organizations rely on donations they are also subject to the pressure of being financially influenced. Volunteers cannot be relied on to continue to carry the load. There is little hope without drawing a line in the sand to stop PolyMet. Unlike Bangladesh we have a choice <http://www.bmj.com/content/342/bmj.d2431-> The MDNR that told us that the DEIS would protect us is going to be the agency that will be paid to monitor compliance. They will present us with test results that are self serving. The only thing worse than being poisoned is being poisoned and told to drink the water anyway because it won't hurt you. At their most hoped for best these agencies deal in an imperfect world of subjective standards and judicial over-site. The arsenic standard in particular is unreasonably low as it was the standard adopted from that set by the World Health Organization at a time when detection technology was limited and as a result was set at 10 parts per billion. We should not be threatened by claims that PolyMet will meet government standard that are third world at the outset. The primary obligation of the lead agency is to protect public health and any cutting corners or exception to that rule is a violation of their social contract with individual citizens, undermines their constitutional legitimacy and is a betrayal of the american revolution. What is the deal with putting the filtrate from the mechanical treatment in "licensed landfills." This simply delays the release of toxins like thousands of tons of arsenic into the environment. What licensed landfill would take the stuff and what kind of vicious monster would be doing the licensing anyway. Maybe the Duluth Chamber of Commerce will volunteer the Gary New Duluth landfill that emits a plume down Sergeant Creek into the St Louis River. Reliance on sorption or absorption of arsenic by iron compounds currently is not taking place in the tailings basin or at the mine site. Releases of arseni

The comments given should be regarded as conservative objections and be given a broad reading. The lead agencies are being paid to provide an SDEIS that will be permitted. This payment conflicts with their permitting and monitoring responsibilities. For them the permitting of PolyMet is nothing less than employment featherbedding. They have an pecuniary interest in permitting PolyMet including the promotion of future projects that will go through licensing and which they will have to monitor. The agencies are denying cumulative impacts because they want to hide their own misconduct. Why should we have to tolerate "evaluation criteria" that they created in the first place. Is every watershed available for contamination of "evaluation criteria." "But no one is sure if arsenic levels below the 10-microgram threshold are completely "safe." And researchers are still studying whether there could be health effects at those concentrations." at <http://www.reuters-com/article/2012/01/24/us-chile-cancer-idUSTRE80N1YJ20120124-> While most sources attribute lower cancer rates from arsenic in Chile there was one at least source that I read that indicated it was from a change in water supply. Future monitoring and the filling in of some very substantial gaps of the SDEIS will be left to these lead agencies that have contracted with PolyMet to act on their behalf. These agencies have already in the DEIS written an EIS that was rejected by the EPA. This does not mean that the EPA will continue to save us. It only means that the EPA will be the focus of pressure to capitulate. Because environmental organizations rely on donations they are also subject to the pressure of being financially influenced. Volunteers cannot be relied on to continue to carry the load. There is little hope without drawing a line in the sand to stop PolyMet. Unlike Bangladesh we have a choice <http://www.bmj-com/content/342/bmj.d2431-> The MDNR that told us that the DEIS would protect us is going to be the agency that will be paid to monitor compliance. They will present us with test results that are self serving. The only thing worse than being poisoned is being poisoned and told to drink the water anyway because it won't hurt you. At their most hoped for best these agencies deal in an imperfect wor

To: Lisa Fay, EIS Project Manager Hi, I wanted to submit my public comment on the Polymet project: The possibility of water contamination for hundreds of years is not worth the risk. They should have to PROVE IT FIRST that it is a safe environmental project. We taxpayers could be left with the burden of cleanup, after Polymet is long gone. Please resist the big corporate pressure, money and power to fast-track this project. Don't just take their word for it. Protect our clean water. Thank you for the opportunity to voice my opinion, Dennis FitzPatrick PO Box 563 Grand Marais MN 55604-0563 dfitz@boreal-org 218-387-9000

Derrick Passe

Polymet is proposing to construct a mine in NE Minnesota. Their model predicts and increase in mercury concentration in the Embarrass River. While the Embarrass River is not currently considered impaired for mercury in fish tissue, most of the lakes and many of the streams Northern Minnesota are impaired. This includes downstream resources such as Embarrass Lake and the St Louis River. Given the existing mercury impairments and the likelihood of fish to pass between Embarrass Lake and Embarrass River, I would ask that the Polymet proposal be revised to demonstrate NO increase in mercury to any receiving water. Derrick Passe 763-286-0570

Dear Lisa Fey,EIS Project Manager,The PolyMet Mining, Inc. can be a very good thing and a very bad thing for Minnesota. They have a sturdy plan in place. Mining can be a good thing. it can skyrocket economies, it provides jobs, and it's a good way to get natural resources. Some advantages to PolyMet Mining are a better economy. And, it will provide Minnesotans with more jobs. Some disadvantages are that it could seriously damage the environment and Minnesota's amazing wild animals. Waste could run off into the mighty Mississippi. You need to weigh the pros with the cons and come up with the best decision for all of us.This will also affect cultural resources. I'm part Native American and even though my family doesn't celebrate their traditions, it's still a big part of my life. even though the project does not take place on reservation land it still affects all Native Americans and Minnesotans in general. Will all the waste from the sites affect the people? Will people with seasonal and environmental allergies to dust be affected? I'm affected by it because two of my uncle works in mining and I hardly ever see them. One of them plans on moving to PolyMet if they start up. I don't know if his family would ever see him.I do agree with the Land Exchange.This affects me because lots of my family is in the mining business. This will also affect me because some of my family lives in Fond du Lac and Vermillion. A segment of the Vermillion Trail will be affected. Will that cause a chain reaction to the people being affected? Will people be affected because of the noise, vibrations, dust and access restrictions? These are the questions you need to ask yourselves. Is this the best thing for Minnesota? And, if not, how can you improve the situation so we get the maximum amount of use out of the deal?One of my questions is why did PolyMet pick the state Minnesota? Why did they pick Northern Minnesota? Is that where the maximum amount of ore is? I think the project can be a very good thing for Minnesota. it can make some peoples lives easier and others harder. You need to make sure this is what you want for Minnesota. Because, not matter what you choose it will impact all of us.Devin Vosdingh,

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Dewayne Townsend 3222 39th Ave S Minneapolis, MN 55406-2212 (612) 724-7010

From: diadra@att-net [diadra@att-net] Sent: Monday, March 10, 2014 4:58 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Diadra Decker PO Box 2472 Inver Grove Heights, MN 55076-8472

To: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Minnesota is blessed with water. THAT is a valuable resource. Just because it is not a resource to be "owned" by a for-profit company it is not a resource to be wasted on the environmental disaster proposed by PolyMet. If this proposed mine was on the outskirts of Minneapolis and proposed to use water from chain of lakes it would have been dead a long time ago. Out of sight, out of mind does not apply to water. Sincerely, Diana Wright

My statements almost come across as questions. I am Diana Moore. So, like I said, I think that my concerns come out more as questions. One would be I am concerned about how long these mines will actually -- this mine that we are coming here tonight for would actually be operating, in the whole scheme of things. And, also, after it does close, or it is closed, who is going to be taking care of the land and the water that will be exposed and potentially polluting? After the closing of the plant, I am concerned about the length of time that the purification is going to be necessary. I have read that it could be up to 500 years, 200 or 500 years (indicating). And who would be responsible for this? Who would actually be accountable or who would actually take care of it? Who is taking care of it? I would -- I don't think that the underground mining has been examined thoroughly. It has not been looked at as a choice; an alternative. And I think that there needs to be a study for that. And I am wondering about the number of jobs that it actually does create. The number that would be at the beginning of the project, when the infrastructure and when all of it is getting actually built, and then the mining. But after the initial operations get started, is there going to be a great difference in the number of jobs? I sort of foresee that perhaps there will be a lot of jobs at first, and then when the operation gets going normally, that there will be a lot fewer jobs. That's it. Okay. Thank you.

To: NorthMet [HYPERLINK "mailto:SDEIS.dnr@state.mn.us"](mailto:SDEIS.dnr@state.mn.us)SDEIS.dnr@state.mn.us From Diane Klinefelter Date: March 12, 2014 The PolyMet mine plan should be altered to include greater protection and replacement of wetlands. The peat bogs that will be destroyed are habitat to many animals and plants and the plan does not adequately address replacement of the unique habitat of the peat bogs in the nearby area. I would like the DNR to provide in greater detail and with more accuracy the length of time that water polluted by the Poly Met mine will need to be treated. My understanding is that even after hundreds of years there will be polluted water from a closed mine that will be entering the watershed. A longer projection and plan for protecting the watershed must be included. Another way that PolyMet would affect the environment would be using a large amount of electricity, more than likely from dirty coal power plants in Minnesota. In keeping with Minnesota's goal to reduce carbon emissions, the PolyMet mine plan should be required to use clean energy. The Canada Lynx is a threatened species under the federal Endangered Species Act. Lynx have been found in the mine area. The mine would destroy 1,450 acres of critical habitat and cause fragmentation of the remaining habitat. I would like the DNR to further analyze the effect of Polymet's plan on the Canada Lynx. The effect on human health from the PolyMet mine should be considered with a health impact assessment that would be included in the PolyMet mine plan. Many hazards could directly affect public health due to exposure to arsenic, mercury, and asbestos-like fibers. Mercury, for example, would be emitted from the plant and increase the about of mercury in the water, in the fish, and in the diets of Minnesotans relying on fish in their diets. The risks of mercury pollution, especially for Minnesota children, should be addressed. Minnesota's state grain, Wild Rice, is put at risk and should be better protected in the PolyMet plan. As an important resource in Minnesota, and particularly for Minnesota's native people, the rice beds downstream of the mine would be affected and water there might not meet the state's wild rice sulfate standaRd The plan outlined by PolyMet suggests that water exceeding the sulfate standard will be released in the years after closure. Thank you for considering these comments. Diane Klinefelter 1011 Iowa Ave W. St Paul, Minnesota 55117

To Lisa Fay, Dept. of Natural Resources: From: Diane and Thomas Anderson, 1034 Glen Paul Ct. Shoreview, MN 55126; HYPERLINK "mailto:dbanderson@comcaStnet"dbanderson@comcaStnet and HYPERLINK "mailto:Thomas.anderson9@comcaStnet"Thomas.anderson9@comcaStnet I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan and as a property owner in Cook County, I believe the mine should not be built as described. I have monitored the public meetings and discussions and I am deeply concerned that the state is more interested in short term job growth over the long-term negative effects from the mine on our water quality. Minnesota is known throughout the country as the state with 10,000 lakes. Tourism and a healthy environment for people and wildlife, especially in the BWCA, is vital to the long-term financial interests of our state. PolyMet has never operated a mine, it's not a US company. No mining company, especially PolyMet, could ever provide enough financial resources to clean up ANY site for hundreds of years. Please don't put money ahead of our irreplaceable clean water, wildlife habitat and tourism industry. Don't be shortsighted; this proposed mining will have an everlasting detrimental effect on Minnesota. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and m

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Tthe PolyMet Mining Corp. NorthMet mining project should not go ahead. If approved the mine will pollute Lake Superior, threaten our clean water and wildlands, and endanger public health for generations to come. The Great Lakes have about 25% of North America's fresh water and are the home of much of the Canadian and US population. Any pollution to the Great lakes will negatively affect the health, livelihoods and economies of millions of people. And, as the rate of refresh of the water in the Great Lakes is 1% a year - the pollution will effectively last forever. A decision in favor of PolyMet's proposal would open a floodgate for more sulfide mining in a large area near Lake Superior and surrounding the Boundary Waters Wilderness - considered by some as one of the most beautiful wilderness areas in the world. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Diane Beckett 353 Chapel St Ottawa, ON K1N 7Z5 (613) 231-6274

Hi - I would like to enter a comment about the Polymet proposal and their SDEIS. There is not enough proof that damage will not be done permanently to the watershed here in northern MN and certainly not enough proof that Polymet will escrow enough money to take care of the problems the citizens of MN will face for the next 100, 200, several hundred years. Please do not allow them to build this mine and ruin our watershed. Thank you. Diane Dinndorf Friebe 760 Old North Shore Circle Two Harbors MN 55616

Diane Harper 37778

Mar 1, 2014 Ms Lisa Fay MN Dear Ms Fay, US citizens from everywhere are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). We are spreading the word through Facebook and other worldwide networks. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This mine will also ruin Minnesota's reputation as a great place to find safe and peaceful recreation. Sincerely, Ms Diane Harper 3205 Drew Ave New Bern, NC 28562-8008 (407) 484-8518

Dear Lisa, I believe we should be listening to Minnesota State Auditor Rebecca Otto regarding the financial risk to taxpayers, not only to ourselves but through many generations. We all want to do the right thing here. Her article from the Star Tribune is copied below. We already are looking at have unknown expenses due to the rapidly changing climate. It is getting commonplace in Minnesota to have presentations on climate effects to living species including actions such as moving trees to assist their migration and other methods. With weather records on a yearly basis now and more turbulent weather causing major storm damage, I think we'd be far better to be prepared to have funding available to address unknown issues such as this, and not take on a long-term risk such as non-ferrous mineral extraction that is too hard to quantify. I hope you will deny approval of the PolyMet mine. Far too much is at stake financially. Sincerely, Tony and Diane Hilscher 910 Oakgreen Ave N. Stillwater, MN 55082 State auditor on mining: Long-term risk too hard to quantify Article by: REBECCA OTTO Updated: November 20, 2013 - 7:22 PM <http://www.startribune.com/opinion/commentaries/232745641.html> Thirty-one nonferrous mineral leases were recently approved by the Minnesota Executive Council — that is, by the governor, lieutenant governor, secretary of state and attorney general. I voted against them. In my judgment as state auditor, important financial questions related to nonferrous mineral mining have emerged. Minnesota taxpayers are entitled at least to have a full discussion of the issues. The state owns mineral rights under much of Minnesota's land. It leases those rights to private mining companies. The leases give companies the right to explore for nonferrous minerals beneath both public and private lands. The companies must seek additional permits from the state to begin mining, but the reason for both the leases and the exploration is mining. Iron ore (ferrous) mining has existed in Minnesota for more than a century. It is part of our history and identity. Because of iron ore mining, Minnesota has a fairly well-developed body of mining law to protect the environment and the taxpayer. Nonferrous mining, however, is new to Minnesota. It brings with it unfamiliar risks. Nonferrous minerals are found in sulfur-bearing rocks. When sulfide waste rock is exposed to water and air, sulfuric acid is produced. Toxic heavy metals can also be released. When sulfuric acid and heavy metals get into our surface waters, fish and plant life die. Waterfowl and other wildlife populations follow. Minnesota law requires mining companies to provide financial assurances. A financial assurance is a damage deposit provided by the mining company before mining begins to ensure that cleanup and reclamation can be done after the mine closes. Financial assurances, if sufficient, protect taxpayers from having to foot the bill for cleanup costs. Cleanup related to nonferrous mines is costly and difficult to predict. State regulators estimate that the PolyMet Mining site in northern Minnesota, for example, will require water treatment for up to 500 years. How do we calculate such financial risk 500 years into the future. How do we account for changes brought on by technology, the environment or the economy over such a long period of time. How will local governments and the local economy be financially impacted. Will other local economies suffer a negative financial impact. Will it impact other stakeholders such as hunters and anglers and wild rice gatherers. As state auditor, I am charged with looking out for taxpayers' financial interests. Based on the evidence I have seen so far, I am not convinced that we know how to accurately quantify the size of the financial risk of this type of mining. The US Government Accountability Office, an independent nonpartisan agency that reports to Congress, says that financial assurances fo

As a resident of northeastern Minnesota I am sending my comments on the Poly Met copper/nickel mining proposal in Hoyt Lakes. Sulfide mining has never been done without environmental consequences. All the promises in the world to do no harm to the environment are sincere I'm sure, but accidents happen and people are fallible. (Exxon, BP, Shell, Japan's and Chernobyl's nuclear industries, sand mining and fracking companies, etc were all sure they could go about their work without any environmental disasters. They were wrong.) All the money in the world cannot buy back the treasure we have in this region once it's contaminated. There are no metals more precious than our water and we owe it to future generations to protect it at all costs. Many of us up here depend on tourism for our livelihood. People from all over the country come here for the peace and tranquility that are found in it's woods and waters. Are their needs less important than that of large corporations that are only interested in how much money they can make. Should Native Americans be asked to risk continued wild rice harvests. Wild rice requires clean water to grow, a mining accident could destroy that crop. Yes some people want the jobs that mining might bring, yet they choose to live here because of the environment. I don't believe they can have both. I am a senior citizen who won't be around 50 years from now but my hope is that northeastern Minnesota will still be a place to get away from it all and enjoy a break from everyday life. There is an old Cree proverb that should be heeded. "Only when the last tree has died, and the last river poisoned, and the last fish has been caught will we realize that we can't eat money". Diane Hiniker 147 Bloomquist Mtn. Rd Grand Marais, MN. 55604 [HYPERLINK "mailto:backwoodsneilie@msn-com"](mailto:backwoodsneilie@msn-com) 612-581-7844

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are there

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Diane Hiniker 147 Bloomquist Mtn. Rd Grand Marais, MN 55604

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. You can not turn back the clock to fix the damage. We can find other ways for the local people to make a living. Not a temporary situation which leaves behind nothing but a damaged environment. Sincerely, Mrs Diane Hulke 1830 Ives Ln N Plymouth, MN 55441-4023

Hi, My name is Diane Krueger-Pirnat, CPA. My address is 8231 Stone Lake Rd in Zim, Minnesota 55738- I am a business owner in three Iron Range towns. I am a life long resident of Northeast Minnesota and have had family members all the way back to my Great Grandfather work in the mining companies of northeast Minnesota. I also worked at LTV mining company as a college student in the summer of 1995- I received a college scholarship from LTV mining company which helped me a lot as a nontraditional student. In other words, my family and I have a lot at stake concerning the Polymet project and completely support it. I believe that the environmental review process has been going on too long and that the supplemental draft EIS has solutions to the impacts on the air, water, or land. The land post-closure documentation shows that the land will be reclaimed to protect the natural resources. Polymet will help create jobs that can support a family so that our children do not have to move away as soon as they are out of High School or College. Local businesses need a boost to their bottom line as many have already closed up and have left vacant office buildings or stores in every town on the Iron Range. Enough is enough; let's get the permits out for this mine. I want to see our economy prosper again as it has in the paSt Sincerely, Diane

Diane M Cole

57231

After reading info on what is being proposed – it still makes no sense to put our natural environment at such risk. We should protect all the wetlands, rivers and lakes, the quiet areas from being invaded. These folks are not even from our country and will have even less interest in preserving our land and waters. Diane M. Cole 24553 Evergreen Drive Nevis, MN 56467

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Diane Marie Knott 93 Kent St Apt 5 Saint Paul, MN 55102-2060

Diane Mason

19926

I would like to comment on the Polymet mine situation. I toured the Polymet mine proposed project with a college group, and while on this tour, the college kids began asking questions. Many were very well thought out questions about water, the quality of the surface water, the ground water, and what was proposed. They were either brushed off, or they were told that the water would be re-used from open holding ponds that were so toxic that anything that got into them (ie. Birds landing in them, or wild animals drinking from them) would die. They were told that these ponds would be “impermeable” even though the track record for this is horrendously bad. They asked what would happen if a leakage occurred in an area with the World’s most pristine ground water. They were told that the water would flow “away.” Our students were hydrogeology students. They know that there is no away. They researched the record of mine drainage, and they know that any metal mines using sulfur produces horrible acid. They also know that some of the areas that this company owns are geologically pristine and should be preserved. Even though it feels like legislators and the powers that be are willing to sacrifice our water and one of the only wild areas left in the Midwest, I think it is unthinkable that it is even being considered based on the water issues at hand. Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I* find it difficult to believe that anyone appointed and paid to serve the citizenry could even contemplate an activity such as open-cut sulphide mining in the sensitive Arrowhead Region. Even if contamination abates after the estimated five or so centuries, it is obvious that the flora and fauna we now treasure will not stage a miraculous return. We need the clean waters and all which they support. Particularly at a time when coal seam gas drilling/fracking is despoiling great tracts of land and underground water, surely we should not add sulphide ore mining to the growing selection of ways to destroy the future. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Who will profit and by how much. Polymet would appear to be yet another code word for short-term profit serving mindless greed. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Diane Michel 535 Summit Ave Crookston, MN 56716-1510

Mar 7, 2014 Ms Lisa Fay MN Dear Ms Fay, Dear Gov. Dayton and Minnesota Department of Natural Resources, I am writing to oppose the plan to allow sulfide ore mining in northeastern Minnesota. It is the wrong project for an area so dependent on clean water throughout that watershed. Contaminating that water will harm all living things in that beautiful part of our state, including humans. Water has become a very valuable resource. Why would we do anything to harm that resource. I am 81 years old. I can't believe the damage that has been done to the environment in my lifetime - a mere blip in time. I wish I could honestly think that writing to you would have an impact on your decision, that the decision will not be made solely on political expediency or who has the most money for lobbying. A decision in favor of the environment on this issue would be an encouraging turning point to those of us concerned about our future. I would like to think that you are thinking of what is best for our state and people in the long run. Regularly in the news there are stories of newly discovered polluted sites, newly discovered ways in which polluting chemicals, etc are damaging our health. Why would we pursue a project that would likely be one of those stories long into the future. If we can make sure our state remains beautiful and healthy people will want to live and work here. That is what will keep us prosperous in the future. Sincerely, Diane Mundt 3709 Grand Way #216 St Louis Park, MN 55416 Sincerely, Mrs Diane Mundt 3709 Grand Way Apt 216 St Louis Park, MN 55416-2937 (952) 646-6467

Diane Nelsen

41939

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Diane Nelsen Saint Paul, Minnesota

Diane Norland

16251

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest I GREW UP NEAR LAKE ERIE AND I LOVE THE GREAT LAKES, THEY ARE A NATIONAL TREASURE. EVERYTHING SHOULD BE DONE TO KEEP THEM AS CLEAN AS POSSIBLE. HAVING SULFIDE MINING ACROSS THE ARROWHEAD REGION OF MINNESOTA INCLUDING LAKE SUPERIOR IS A TERRIBLE IDEA. THE OWNERS OF THESE PROPERTIES JUST WANT TO MINE THEM FOR WHAT THEY ARE WORTH THEN MOVE ON LEAVING A TERRIBLE MESS BEHIND NO MATTER WHAT THEY PROMISE. Sincerely, Diane Olson 521 Montana Ave Apt 305 Santa Monica, CA 90403-1370 (310) 395-2043

Diane Overby

38828

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Diane Overby 8059 Kentucky Ave S Bloomington, MN 55438-1247

Diane Peterson

47371

Lisa Fay EIS Project Manager Minnesota DNR Division of Ecological and Water Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay: I am concerned about the inadequacies of the Polymet SDEIS and request that you reject it. I also request that you do not issue permits to Polymet to go ahead with its plans to begin sulfide mining. You would severely undermine the confidence of Minnesota citizens in fair and logical government if you took action which neglected your duty to require strict adherence to statutes, and to prudent protocol, in handling the review process of the Polymet SDEIS. Governor Dayton's administration has failed to follow statutes in federal and state law concerning the handling of Medicaid funds in Minnesota. For professional pride in the mission of the DNR and your responsibility within it, you should avoid following the bad example which the Dayton administration set in the last four years by the Minnesota Department of Human Services regarding that agency's scandalous failure to properly regulate the state's Medicaid programs. The Department of Natural Resources could distinguish itself as an ethical leader—in public esteem far above that other pitiful state agency—by holding firm against shoddy, flimsy documentation submitted by a corporation. The DNR can, and should, uphold the highest standards which protect the state's environment and the state's residents from the harmful consequences of the environmental degradation which is certain to occur from Polymet's current proposal. Polymet's predictions of water pollution rely on unsubstantiated assumptions that no pollution will seep from the 526-acre mine site waste rock pile into the 100 Mile Swamp. Polymet claims that pumps on the edge of the tailings pile will capture 99-37 percent of the polluting seepage. The DNR should require solid evidence that 99-37 percent of Polymet's toxins will be prevented from contaminating our environment. As reported by J. R. Kuipers et al., in Comparison of Predicted and Actual Water Quality at Hardrock Mines (2006), every time sulfide mining has been tried in a water-rich environment, it has resulted in contamination of surface and/or ground water with sulfates and toxic metals. The proposed Polymet mine site is located in a water-rich environment. Require the SDEIS to be redone to provide verifiable substantiation of Polymet claims of protection of surface waters from contamination. I have confidence that the DNR can protect the long-term environmental interests of the majority of Minnesotans. Ms Fay, you are in a position of public trust, a gatekeeper to preserve nature from a short-term corporate exploitation which would inflict death-dealing impacts for centuries. Please exercise your power, uphold your duty. For environmental protection, Diane J. Peterson 4051 Gisella Boulevard White Bear Lake, Minnesota 55110 HYPERLINK "mailto:birch7@comcaStnet"birch7@comcaStnet

The following comments are submitted by Diane Steen-Hinderlie, 2829 Yosemite Av., St Louis Park, MN 55416- First, regarding water resources, a federal website shows that there will be connections/flow to the Boundary Waters Canoe Area, which will jeopardize this invaluable state and indeed national treasure. There will be mine "acid drainage" that will leave lakes, rivers, and streams without most living creatures. Mining pulls water from areas, so a thousand acres of wetlands at the mine site will be lost. No sulfide mine has ever operated without producing polluted drainage. 2/3 of attempted remedies fail. So, secondly, wildlife is affected. Birds, fish, moose, even lynx, etc, are poisoned. Their habitat is threatened, changed beyond their evolutionary capacity to adapt. Of course there's human life threatened, with increased cancer rates, etc. Third, regarding jobs and finances, PolyMet itself predicts that only 25% of the jobs would be from local hiring. World markets make all quickly changeable - highs and lows re the economics of it all. Plus, the end of operations finds a devolving of responsibility from companies to the taxpayers, private to public. This happened right next door in So. Dakota, where a mine went bankrupt and the state had to request Superfund status. I thank Mining Truth for much of the above. Please don't inflict the PolyMet project on our State. Yours, Diane [HYPERLINK "http://thirdpartyoffers.juno-com/TGL3142/532284cc2b5024cc3723st03duc"](http://thirdpartyoffers.juno-com/TGL3142/532284cc2b5024cc3723st03duc) This fish is Toxic (avoid) Impairs brain function, damages your heart, joints, and skin [HYPERLINK "http://thirdpartyoffers.juno-com/TGL3142/532284cc2b5024cc3723st03duc"](http://thirdpartyoffers.juno-com/TGL3142/532284cc2b5024cc3723st03duc) info.inflammationsolution-com

Diane Tessari

58157

The content of the PolyMet SDEIS causes me extreme concern that the proposed project would add dramatically and catastrophically to pollution and habitat destruction in the already polluted and compromised area in which the project would take place, as well in the entire watershed, including the St. Louis River, its estuary, and the waters of Lake Superior. I believe the project would adversely affect worker health, human health in general, wildlife (including endangered lynx and threatened moose, among many others), and plant life (including wild rice sacred to native peoples – and a sensitive indicator species when it comes to water pollution). The PolyMet SDEIS proposes:• The largest wetlands destruction ever proposed in Minnesota• A land exchange that would result in a significant loss of public land in areas of high biodiversity, mature forest, and flood plains• Mining activity and unlined waste storage only 100 feet above the aquifer, in an area with existing fractures, and more likely to occur with blasting• A plan that underestimates water flow through the area• That treated water would dilute pollution, while the EPA says testing must be done at the initial point of pollution Serious omissions include:• No plan to replace most “indirectly” affected wetlands• No water treatment for the perpetual seepage of polluted water from waste piles• No analysis of alternatives such as underground mining, lining waste piles, returning waste to the pit, etc• No analysis regarding worker health or residential wells• No analysis of risks to public health in an area where one in ten babies is now born with elevated mercury levels Given all this, I ask that:• The EIS be rejected as inadequate• The project be rejected as environmentally harmful• The proposed land exchange be rejected• The Section 404 Permit be denied• A state permit to mine be denied

There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Dianne Douglas 2723 E Valencia Dr Phoenix, AZ 85042-7082 (602) 268-7065

Feb 19, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who cares deeply about protecting our environment and who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Dianne Ensign 11600 SW Lancaster Rd Portland, OR 97219-7655

Dianne Knoblen

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. It's not worth the risk of 500++ years of environmental contamination. Do not mine so close to the BWCA. Instead, focus on reclaiming copper from used electronics, homes, etc. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnninage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

I am most certainly NOT IN FAVOR of allowing copper mining in northern MN. We cannot sanction the continued destruction of our wetlands and waterways. The frac sand mining right next to the Mississippi River is also a concern. Please say NO to the copper mines. Dianne Swanson Rochester, MN From: Kenneth Rosemark Sent: Monday, February 17, 2014 9:57 AM To: 'Mark Rieder'; 'gkbkleist@aol-com'; 'Kleist, Kevin J., C.Ph.T.'; 'TODD SLIFKA'; 'Norman Fitch'; 'Chris Benson'; 'John Walker'; 'Chuck Dixon'; 'Vincehila@aol-com'; 'Dustin Rosemark'; 'Michael_dosdall@yahoo-com'; 'jmhockert@charter-net'; 'CSibley@KTTC-com'; AllUsersCOB; AllUsersLBA Subject: FW: Copper Mining Around Ely, Minnesota In March of this year, a decision will be made regarding whether to allow copper mining in and around the Ely, Minnesota Area. If allowed, I believe the silica residue left behind, will destroy the eco system of the pristine area we know as The Boundary Waters Canoe Area Wilderness. I've expressed my opinion in the letter listed below and E-mailed it to [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us) NorthMetSDEIS.dnr@state.mn.us. If you believe as I do, please feel free to sign onto this letter and forward it to the above E-mail address. Together, we can make a difference KBR From: Kenneth Rosemark [mailto:kenneth_rosemark@charter-net] Sent: Sunday, February 16, 2014 6:48 PM To: Kenneth Rosemark Subject: Fwd: Copper Mining Around Ely, Minnesota Sent from my iPad Begin forwarded message: From: Kenneth Rosemark <[HYPERLINK "mailto:kenneth_rosemark@charter-net"](mailto:kenneth_rosemark@charter-net)kenneth_rosemark@charter-net> Date: February 5, 2014 at 11:38:37 PM CST To: ["HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us)NorthMetSDEIS.dnr@state.mn.us" <[HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us)NorthMetSDEIS.dnr@state.mn.us> Cc: ["HYPERLINK "mailto:Krosemark@cobrowm-com"](mailto:Krosemark@cobrowm-com)Krosemark@cobrowm-com" <[HYPERLINK "mailto:Krosemark@cobrowm-com"](mailto:Krosemark@cobrowm-com)Krosemark@cobrowm-com> Subject: Copper Mining Around Ely, Minnesota The Boundary Waters Canoe Area Wilderness is a national treasure, just like the Grand Canyon. The BWCAW is the most pristine wilderness area on the planet. The residue left behind by copper mining seeps into the water, kills plant life, fish and wildlife. In a very short period of time, copper mining will ruin 500 Years Of Echo System. There are several mining companies ready to start mining in this area. As soon as one gets permission to begin mining, the other mining companies will be right behind Poly Met Mining Inc. All of these mining companies are not even US COMPANIES. They are for profit organizations and once they are given the green light, they will destroy this Pristine Wilderness Area. I implore you to take a stand, against allowing the mining companies, anywhere near, any waterway, tributary, stream connected to or running into a Boundary Water Area Lake Or Waterway. Several decades ago, one man stood up against a rich and powerful man, who wanted to dam up this area, to create hydro electric power, for the sole purpose of selling it and making even more money. Something's are worth more than money. The peaceful, pristine, soulful wilderness area, called the BWCA is one of them.. On behalf of my children, their children and your great, great, great grandchildren; PLEASE, SAY NO TO THE MINING COMPANIES SAY NO TO BIG MONEY . Carry on the legacy of the man who originally saved the BWCA. You are in a position to make a decision regarding this matter. On behalf of all of us and future generations, make it a good one. Thank you. P.S. Please forward to Lisa Fay, EIS Project Manager , too. Kenneth B. Rosemark, Rochester, MN. Sent from my iPad

To the Attention of Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Dear Ms Fay: I would like to comment on the proposed Polymet Mining Project. As a concerned citizen of Minnesota, and a regular visitor to our great North including often to the Boundary Waters Canoe Area Wilderness, I find this idea appalling. Copper and other heavy metal mining is among the most environmentally destructive and far reaching types of mining in the world today. One need look no further than Chile or Australia, or our own Western US to view the massive damages wrought on the landscape by this type of mining. The images of the huge gouges, toxic spills, polluted water and other destruction caused by this type of mining of the earth are all over the web, and easy to see. Do we want this in Minnesota. Our citizens are saying overwhelmingly, "No." and as public servants our government employees have a duty to stop this project. To be contemplating this on the edge of our most pristine and sensitive natural wilderness is highly irresponsible. All of this beauty and splendor could be jeopardized for the sake of a few temporary jobs. And at what coSt The information from Polymet's own studies say that the cleanup of the water alone will take centuries. The earth will however never be the same. Polymet touts a new process that is supposedly safer. Frankly, why should we trust them. The fact remains that no project of this scope and scale can be conducted without massive environmental damage. So please do everything in your power to safeguard our irreplaceable Northern Minnesota paradise and keep Polymet and similar ill-advised schemes from destroying our environment. Kind regards, Richard Bortorff 4128 Sheridan Ave S Minneapolis, MN 55410 tel. 612-590-7654

I have toured the Polymet site and listened to their very extensive plan to protect the environment in their operation and am convinced that they are being responsible to the extent possible with the technology available, which is all that can be expected of any new venture. They are abiding by all imposed governmental standards currently in existence. If we were to allow progress to be governed by all of the "what ifs", we would still be in the horse and buggy days. There will always be unknowns, challenges, and yes, mistakes and accidents. But we learn from them and are better able to move ahead and provide for the needs of society. Many would not move ahead at all for fear of the risks and the unknown and then where would we be. It is time to move ahead on this venture to provide the needed jobs and materials for our ever expanding society. Think you. Dick Houck A Minnesota business owner Dick_houck@yahoo-com Sent from my iPad

Dick Houck 2259

Sirs: For a non-engineering professional to read and understand such an extensive and detailed document and then make intelligent comments on it is rather presumptuous at best. However, I have read most all of the PolyMet material and have toured the proposed sight and asked many questions of the officials of the company, and have come to the conclusion that the company is utilizing the most up to date and modern techniques available to mine the needed minerals while protecting the environment as well. If this country is to continue to move ahead in the world with continued growing employment and business development, it must utilize all possible ways in which to progress. Those with an environmental agenda would disallow all such progress and prevent any and all abilities to utilize the materials that are needed for that progress. This country was long built on utilizing the natural materials available while also utilizing the preventatives available at the time to protect the environment. In listening to the safety measures that the company will take in this venture I am convinced that they are all that are available at this time and will protect the environment as much as is possible at this time. I am also convinced that if more protective measures become known in the future they will also be used as they become available. The earth has been created for man's use and should be made available if and when it can be done in the best ways available at the time. By doing such things in the present, can there only be better ways developed for the future. R. J. Houck 1131 Roselawn Ave Roseville, MN 55113 [HYPERLINK "mailto:Dick_houck@yahoo-com"](mailto:Dick_houck@yahoo-com) Dick_houck@yahoo-com 651-489-1069

I am one of a few who has taken time to investigate the PolyMet mining sight in person and listen to the plans for the effort, and am greatly enthused about the possibility for employment for the region as well as the need for the minerals that it contains. I am also greatly concerned that the environmentalists do not want to see anything happen that in any way infringes upon the environment or the "beauty" of the State. There are guarantees in the production of anything, and as long as reasonable means are taken to protect against accidents, moves must be taken to move ahead to use the natural resources that are available to us, and I believe that is the case here. I believe that PolyMet has outlined a very reasonable approach to this effort and should be allowed to proceed with its plan. It cannot, nor can anyone guarantee what will happen in the future, but it seems to me that all precautions are being taken that can be taken within what is known at this time. It seems to me that all the environmentalists want to do is prevent anything and everything from happening regardless of the need or good for society and the nation. The State and the region need this effort and it should be approved for the benefit of everyone. Thank you. Richard Houck 1131 Roselawn Ave Roseville, MN 55113 Dick_houck@yahoo-com

dick krueger 3471

Please do not allow the Polymet mining project to proceed. It will harm water quality and degrade wetlands for hundreds of years. Richard Krueger 55 Holly Lane N Plymouth, MN 55447 Sent from my Verizon Wireless 4G LTE smartphone

Dick Webber

18064

My name is Dick Webber. And one of the concerns with me is the environment. And from what I understand, 70 percent of the rock being mined is low in sulfate and can't produce pollution. And the rest of the rock will be placed on a lined area where anything that runs off it can be collected and treated. This rock then will be dumped back into the mine and covered by water without air to mix with the water. And sulfate acid can't be produced. And I'm confident that the DNR, the pollution control agency, the US Forest Service, Army Corps of Engineers, and other experts have done their research and will make sure the project does not hurt the environment. The other side of the coins is jobs. And we all know that if we don't have jobs we don't pay our bills and don't send our children to college. And as far as I'm concerned, this is 2014, it's not the 50's or the 60's. Let the agencies do their job and make sure it is done correctly.

18302

My name is Dick Webber. One of my comments is that I was inside talking to the person that was in charge of the overflow and which direction the water is going, and from what I learned, one of my main questions is, is this job going to be monitored weekly? Monthly? That's my biggest concern. Because I fish and hunt in northern Minnesota, and if this job is going to be monitored by the DNR, Corps of Engineers, EPA, or other agencies, then I don't see any reason why the job shouldn't go through. If it can be done safely, correctly, and everybody is on board with it getting done the right way, I really, really don't have any problem with it getting done and moving forward, as long as it is monitored. Because I care about jobs and I also care about the environment. So, I don't know why, with the opposition we have for and against it, why the job shouldn't move forward. It's simple.

--Original Message-- From: dindamp4@yahoo-com [mailto:dindamp4@yahoo-com] Sent: Sunday, March 02, 2014 8:14 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: The PolyMet Supplemental Draft Environmental Impact Statement (SDEIS) is fatally flawed, and needs to go back to the drawing board to be fixed. You should not burden the next fifteen generations with toxic water pollution and cleanup costs from a sulfide mine that hasn't been properly planned. PolyMet proposes a complex mechanical system of pumps, pipelines, and filters that it says will capture and hold back the water pollution from getting into our rivers. PolyMet assumes the proposed expensive and complicated water treatment system will continue to operate effectively for long, long after the mining has stopped. It should be expected that mechanical systems like pumps, filters and pipes will eventually fail. In a 2007 report, an organization called Earthworks analyzed the records of 14 modern copper mines in five states found that 100% of these mines experienced pipeline spills or other accidental releases. 92% had failures of water collection and treatment systems that resulted in releases of contaminated mine seepage that significantly impacted water quality. But Polymet's SDEIS lacks contingency plans for predictable failures in the proposed piping, pumping, and filtration equipment. By assuming that a complicated water treatment system will function indefinitely without fail, the SDEIS has failed to take the hard look required at the proposed PolyMet sulfide mine. Please send the SDEIS and PolyMet back to the drawing board with directions to include contingency plans for predictable failures in the water pumping and treatment system, and the power supply to run that system. PolyMet proposes a large open-pit mine in untouched, high-quality wetlands, that are located on public land owned by the US Forest Service. The SDEIS states that building an underground mine would have significant environmental benefits. compared to an open-pit mine. However, the PolyMet SDEIS rejects underground mining, stating that in today's market conditions, underground mining is not considered economically feasible. The minerals will be there if and when the market prices are high enough to mine them right. Not fully considering the underground alternative is a major flaw in the SDEIS. Sincerely, Dinda Evans pob 178695 San Diego, CA 92177-8695

---Original Message--- From: dindamcp4@yahoo-com [mailto:dindamcp4@yahoo-com] Sent: Tuesday, March 11, 2014 12:38 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Dinda Evans pob 178695 San Diego, CA 92177-8695

Protect our water. Hooded Mergansers swim in northeastern Minnesota's pristine marshes, ponds, and rivers, feeding on fish, crayfish, frogs, and insects. PolyMet Corporation is proposing to destroy thousands of acres of pristine habitat to mine sulfide ore at the headwaters of the St Louis River - a major waterway that flows over 180 miles to Lake Superior. PolyMet's proposal calls for 20 years of mining, and they acknowledge that 500 years of toxic runoff will need to be collected and treated. Just like the Hooded Merganser, our children and grandchildren all deserve clean water. Let clean water be our legacy - not toxic pollution from mining. At a minimum - extend review period.

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, The PolyMet NorthMet sulfide mine will pollute wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest PolyMet should not be allowed to destroy high value wetlands for its open-pit sulfide mine. The SDEIS says that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, which makes it the largest wetlands loss ever proposed in Minnesota under the Clean Water Act. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. Under federal and state environmental laws and Clean Water Act Section 404, please: • Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance. • Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS. • Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions. • Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses. • Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin. • Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. Very truly yours, Dirk Hanson 1491 Pyhola Court Way Ely, MN 55731 2182350886

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Disa Moraine 4229 Chicago Ave Minneapolis, MN 55407-3150 (612) 790-9833

Lisa Fay EIS Project Manager MDNR I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. I have concerns about the pollution of waters where wild rice grows. Since wild rice moves around and does not stay in one area, it is crucial to protect the waters in areas beyond where wild rice is presently growing. Who will monitor these waters. I am concern about the present pollution in the former taconite mine area where Poly Met plans to mine. Will there be clean up of the site before Poly Met would be allowed to startup. Who pays for the cleanup. There seemed to be data that says there is already pollution into neighboring streams from the former taconite site at the planned Poly Met site. Are holding ponds for tailings and debris of Poly Met's mining lined underneath to prevent leaching into the groundwater. I saw plans for covering the mine debris and catching the runoff to filter, but I am unsure of what is under the tailings and the holding ponds to prevent leaching of toxins into the groundwater. How often are covers replaced as they deteriorate over time. Is there plans for replacement of covers. Is the present plan to use reverse osmosis to clean the runoff a viable process. Has it been used and shown to prevent toxins and pollutants from entering water from the mining area. If the reverse osmosis process is put in place and fails to keep runoff within water quality standards, are there alternative methods to clean the runoff. Will enough money be collected from Poly Met to pay for the continuing cleanup of pollution of the water in the area and for how long. Who will pay these costs if Poly Met fails to. Will taxpayers pay for poor planning of cleanup costs. How accurate are models that project cleanup processes. Is there an ongoing monitoring that corrects the models to represent the reality of the pollution being created. Is there accurate monitoring of runoff and water in the area to check pollution levels. Who monitors. Self monitoring by some companies has not always been up to standards. Will Poly Met self monitor or is there monitoring by outside reliable sources. How thorough is the regulatory process in Minnesota. Is this type of monitoring water quality in regards to mining already in place in Minnesota and has it been able to prevent water pollution from exceeding standards and reduce pollution that exceeds standards. Will the surrounding residents be exposed to air pollution from the dust created by the mining and extraction process. Can there be more aggressive ways to recycle the many minerals that are thrown into landfills every day in Minnesota, before mining for more minerals. I have huge concerns about creating more pollution from Poly Met's planned mine. The St Louis watershed affects Lake Superior's water quality. We cannot afford to pollute the largest fresh water in the world. I am afraid allowing Poly Met's planned mining operation will open new mines closer to the Boundary Waters area, a very sensitive area needing high water quality. I am not in favor of mining in the Boundary Waters watershed. Minnesota needs clean water to protect our health and our lives and our fishing, birding, and tourism industries. I am writing to comment on the Polymet SDEIS. As a professional forester and educator, I am familiar with the planning processes that natural resource managers complete prior to any major project. These processes help insure that completed projects deliver a net benefit to our state's citizens, while minimizing detrimental effects to the environment. After reviewing the information presented in the Polymet SDEIS, it is apparent to me that a very comprehensive and thorough accounting of all potential environmental impacts has been accomplished. The most contentious issues, those involving effects on the local and regional watersheds, have been addressed in the plan and mitigations appear to be in place to safeguard against potential problems. I have no expertise in mining, or the potential environmental impacts. I expect that the same could be said about the vast majority of individuals submitting comments on the SDEIS, whether they support or oppose the proposed mine. With that in mind, I would only ask that you consider the source of the comments you receive - and that includes mine. Specific, science-based comments, from scientists with backgrounds in closely related fields should be given more weight than those delivered by non-experts. My comments, and those that come from the thousands of non-experts that oppose the mine, should be given relatively little consideration in the process. I would ask that you discount the emotional speculations and exaggerations, and focus on the comments (both pro and con) that have significant scientific basis. In summary, as a non-expert, I support that SDEIS as written. It presents a strong case for balance between mining and environment. I also support any significant changes found to be necessary as a result of this comment period, as long as they follow scientific reason. Thank You for allowing me to comment. Dixon Shelstad 512 E. Pattison St Ely, MN 55731

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

1- Is a performance bond going to be required of the company. 2- How is it going to be determined that the bond will be sufficient to cover the cost of clean up. 3- Can the fund be used to clean up spills or damage as they occur. If so how is the fund going to be refreshed. 4- How is the bond going to be protected from government changing its use designation and reassigning the money for other projects in the state. 5- What is to keep the fund in place for 500 years or until the site is deemed safe. 6- Who is going to administer the fund and be responsible for its use. 7- Is the bond going to be invested to make interest as it sits in place. 8- If a bond is required, how is it going to keep pace with the rising cost of construction costs as the years go on. 9 Who is going to be responsible for monitoring the site. 10- What powers will the monitors have to deal with immediate problems that will arise. 11- What is going to happen to the tailings in the pond after they reach saturation of sulfates. 12- How is the water seeping through the tailings and into the bedrock cracks and pores going to be monitored. 13- As a suggestion, would it be safer for all concerned to build a concrete table on which the tailings could be placed so that the sulfides and sulfates could be better treated and controlled. 14 How are the emissions on the stacks going to be controlled. 15 Who is going to monitor them and be responsible to see that they are being held within the EPA limits. 16- If effects are seen in the environment (effects on the water, plant and animal life) around the mine site, who will be responsible for applying corrective action and how will the effects be monitored measuring the water leaving the site and air off the stacks.

Dear Mr Bruner: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Dodd Cosgrove

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Sent from my iPad. Don and Tess Uzelac 1324 Fraser Drive Grand Rapids, Minnesota 55744

Don Arnosti

Thank you. My name is Don Arnosti. I live in St. Paul but I represent Audubon members throughout the state. I work for the National Audubon Society. I'm the policy director here in the state. Audubon members and Audubon is not either in favor of mining or against mining. We are pro-clean water, pro-habitat, pro-clean water for birds and fish organization. And we take a look at this proposal in that light. It's clear that the deal being offered by this proposal is anti-clean water, anti-habitat, anti-fish. On that basis this should be rejected. This is not a good deal for the people of the state, particularly those who are not in the room and who are not yet warned. It is inconceivable that we could consider 20 years' worth of jobs -- that is all of us in the room benefitting from both the materials and the jobs -- and to pass along a legacy of hundreds and hundreds of years of water treatment and the costs associated with that in the hope that we're not polluting our great-grandchildren's waters. We inherited a beautiful Minnesota from our ancestors. And personally speaking I think it's a moral obligation to pass the state along in better condition. This is a bad deal. The particular SDEIS is insufficient and should be rejected because it does not provide information on the water treatment plant or how that will be paid for. Not just when we're alive but for centuries into the future. What is being talked about is perpetual water treatment that would last more than twice the life of our nation. The United States is 238 years old. George Washington was alive 238 years ago. We're talking about more than double that. And there are no details in this SDEIS that would explain how this magic water treatment system is going to be paid for 2, 3, 400 years from now. That alone is sufficient to say this document is incomplete. This is an inappropriate proposal. Beyond that -- just wanted to check the time -- there's a number of other insufficiencies in this document. For example, the proposal to mitigate headwaters (inaudible), specifically the headwaters of the St. Louis River, only concerns the 912 acres that are directly impacted by either excavation or filling. However, in the document is information on more than ten square miles of additional wetlands that are going to be either partially drained or poisoned by toxic materials that flow off the railcars and off the mine site. And the proposal simply calls for monitoring, and if necessary in the future mitigation. That is also insufficient information and should be the grounds to send it back for further analysis. Finally, what I would say is this document refuses to consider alternatives that will reduce

---Original Message--- From: darnosti@audubon-org [mailto:darnosti@audubon-org] Sent: Thursday, March 06, 2014 3:08 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: PolyMet proposes a large open-pit mine in untouched, high-quality wetlands, that are located on public land owned by the US Forest Service. The SDEIS states that building an underground mine would have significant environmental benefits, compared to an open-pit mine. However, the PolyMet SDEIS rejects underground mining, stating that in today's market conditions, underground mining is not considered economically feasible. The minerals will be there if and when the market prices are high enough to mine them right. Not fully considering the underground alternative is a major flaw in the SDEIS. The PolyMet Supplemental Draft Environmental Impact Statement (SDEIS) is fatally flawed, and needs to go back to the drawing board to be fixed. You should not burden the next fifteen generations with toxic water pollution and cleanup costs from a sulfide mine that hasn't been properly planned. PolyMet would operate for 20 years but, according to PolyMet's own data, would pollute water for over 500 years at the tailings basin, and over 200 years at the mine pit. The modeling results provided in the SDEIS show that PolyMet and the DNR simply did not look beyond 500 years. The fact that the SDEIS does not say when the mine pit and tailings basin will stop polluting our water is a major and apparently intentional failure that needs to be corrected by the DNR. Please run the models or require PolyMet to run the models long enough to show when pollution of our water by PolyMet's mine would cease. The PolyMet SDEIS suffers from many major failings. The SDEIS needs to be withdrawn, sent back, and fixed before it is returned for public comment. Sincerely, Don Arnosti 1722 Princeton Avenue Saint Paul, MN 55105-1916

Fantastic, Julian. Thanks for the good work on this. Don Sent from my iPhone On Mar 13, 2014, at 12:29 AM, "Julian Sellers" <HYPERLINK "mailto:juliansellers@msn-com"juliansellers@msn-com> wrote: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay: This comment pertains to the effects the proposed NorthMet mine would have on two avian species: northern goshawk (*Accipiter gentilis*) and Boreal Owl (*Aegolius funereus*). The habitat requirements of these two species are similar, and the proposed mine would affect them similarly. The Supplemental Draft Environmental Impact Statement does not adequately address the status and outlook for these species in Minnesota. Section 4-2-5-1-2, Species of Greatest Conservation Need, of the SDEIS contains the following: Mature upland and lowland forest is the most common habitat type at the NorthMet Project area (primarily at the Mine Site). Section 4-2-4 provides a more detailed discussion of vegetation cover and habitat types. Northern goshawk, spruce grouse, black-backed woodpecker, and boreal owl were observed in these forests (ENSR 2005). These species represent a group that generally requires large forested blocks and/or minimal human intrusion. Section 4-2-5-1-3, Regional Forester Sensitive Species, misstates the status of northern goshawk and boreal owl in Minnesota. That section states: Four of these RFSS species are state-listed ETSC species (ie, gray wolf, bald eagle, wood turtle, and eastern heather vole) and are discussed above. Seven other species are on the SGCN list and are discussed by habitat type in Table 4-2-5-1- These species include the boreal owl (*Aegolias* [sic] *funereus*), . And: The northern goshawk (*Accipiter gentilis*) is not federally or state-listed. In fact, the Minnesota Department of Natural Resources added both species to the list of Special Concern species in August, 2013- The Minnesota DNR defines Special Concern species, in part, as follows: A species is considered a species of special concern if, although the species is not endangered or threatened, it is extremely uncommon in Minnesota, or has unique or highly specific habitat requirements and deserves careful monitoring of its status. Both the northern goshawk and the boreal owl meet this definition. In fact, when the DNR proposed this listing, Audubon Minnesota objected, stating that both species should be listed as Threatened rather than Special Concern. Here is Audubon Minnesota's justification for the Threatened status of both species: Northern Goshawk – Audubon Minnesota believes that the Northern Goshawk should be listed as Threatened. Listing this species on the Special Concern list, as proposed by the DNR, does not properly reflect the current status of this bird and will not provide an appropriate degree of protection to ensure its future in the state. As noted on the Species Status Sheet, there has been an average of only 29 territories found in MN annually in the recent past, in spite of intensive surveys by the DNR and the US Forest Service. Additionally, as the SONAR shows, the Minnesota population has lower productivity than found in populations in other parts of the country. While we recognize that the species habitat needs are not fully understood in this part of North America, there is strong evidence suggesting that large patches of mature forests are very important to the Northern Goshawk. This habitat is currently in decline in Minnesota, and recent land management decisions are likely to exacerbate this slide. There are no plans to increase this habitat type in the future. Boreal Owl – Audubon Minnesota believes that the Boreal Owl should be listed as Threatened. The proposal by the DNR to list this species as Special Concern does not adequately address the needs of this species in the State nor ensu

Please accept these comments on the PolyMet SDEIS 1-Minnesota law is clear that clean up/reclamation after mining activity cannot be perpetual. It appears that the proposed post PolyMet mine cleanup would be perpetual under any common/reasonable understanding of that term. That is, the SDEIS does not and apparently cannot indicate when the proposed cleanup with end. Absent an end date, any proposed cleanup must be presumed to be perpetual. Moreover, it appears that the materials used in allegedly protecting the environment, eg., liner of the mine waste storage pit would need to last forever (perpetually) in order to protect the water resource. Similar concerns exist with respect to other processes (reverse osmosis) and materials such as containment pits. What proof is there that these processes and materials will last until cleanup is finished (perpetual). 2- The SDEIS does not seem to adequately address issues concerning the health and safety of human resources such as those who would be employed and/or living in or near the proposed mine and those living in or near the relevant watershed area. What substances will be released into the air, water or otherwise and what effect will that have on human (and non-human organisms). 3- The DSEIS does not appear to address the effects of releasing heavy metals brands other than mercury into the environment. There appears to be no doubt that certain other heavy-metal released into the environment including but not limited to magnesium. 4- There appears to be no real cost-benefit analysis, or cumulative effects analysis, for the total cumulative impact area – in both the Lake Superior and Rainy River Watersheds. Mar 6, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are NOT very concerned with protecting our clean water. We Do Not have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is sufficient and should be approved. I would like to mine this area and provide the State with the profit they will get from the land they hAve I implore the decision-makers to approve this proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis river. We have been mining this area for over 100 years. Enough study has been done. Sincerely, Don Hilligoss Sincerely, Mr don hilligoss 3509 E Inner Dr Hibbing, MN 55746-2644

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Don Hon 3135 Arthur St NE Minneapolis, MN 55418-2210

Don Janes

Don Markwardt 41018

I believe the DNR has done an excellent job in evaluating the Polyment mining proposal and included restrictions and regulations to make it an environmentally safe operations. They have set rules that have to be met or the process would be shut down. Technology has improved so much over the years that this process can be done successfully. The comments on the SDEIS should relate to the information on the SDEIS not on personnel feelings or misinformation. What was done years ago doesn't apply except to learn what needs to be done. We have so many technological improvements that were not available years ago. The country needs this type mining process to protect it self. Donald Markwardt 414 Arlington Road Hoyt Lakes, Mn. 55750

Don Mitchell 37970

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Treatment of tailings wastewater and waste piles for perpetuity at the headwaters of the Lake Superior watershed is illogical and impractical even if it was successful for the 1st time in the history of sulfide mining. The proximity to the Hudson Bay watershed to the north and the potential to devastate the headwaters of the St Louis River make this mining project's risks unacceptable. New basewater groundwater flow studies indicate incorrect science to support the project were included in the PolyMet SDEIS permit. Impacts to residential wells from tailing seepage must be studied in light of the incorrect data for groundwater and surface flow rates. Sulfide mining impacts on the health of plantlife, wildlife and fisheries for subsistence lifestyles and the health of those diverse biological communities must be adequately accessed before permitting is allowed. This project is not about jobs versus the environment. It comes down to an independant unbiased scientific assessment which assures Minnesotans and all citizens on both sides of the border in the Lake Superior watershed that our treasured irreplaceable water will not be polluted long after PolyMet is gone. Sincerely, Don Mitchell Don Mitchell 2950 E. Pioneer Rd Duluth, MN 55804 2185250509

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I am a lifelong resident of Northern Minnesota accept for my years at the University of Minnesota while working to complete a BS in Fisheries Biology. The information I have seen regarding PolyMet's proposed plan to mine precious metals from this mineral deposit which contain sulfides has not addressed all legitimate science based concerns regarding long term impacts to an aquatic resource which is both unique and irreplaceable. While working for the MN DNR I surveyed many lakes found within the Lake Superior watershed that this mining will impact. This is a special ecosystem I am involved in protecting through involvement in Trout Unlimited, the Lake Superior Steelhead Association, The Lake Superior Coldwater Coalition and as a Landowner that recently added a conservation easement on the French River which is a tributary stream to Lake Superior. This watershed is under stress from many different challenging problems I am committed to protecting this watershed and the species which are found here. I am for economic development but not at the expense of this essential ecosystem. We must be stewards of the land if it is to provide for our spiritual, mental and physical health as well as for the health of the other species found here. History is full of examples of the huge costs required to clean up degraded ecosystems Short term economic gains to often overwhelm long term good decisions. When our water resource is polluted as happened in the cold slurry spill in West Virginia, then we see how irreplaceable clean water is to our health. Risks to our water quality must not be ignored. Until mining in sulfur bearing rock complexes can be assured without degrading the water quality of this watershed the permit should not be issued. Thank you, Don Mitchell 2950 E. Pioneer Rd Duluth MN 55804 Sincerely, Mr Don Mitchell 2950 E Pioneer Rd Duluth, MN 55804-9711 (218) 525-0509

I am from Aurora. I worked out there for many years, the plants and that. I don't know, we had a good living and everything. All of the kids are healthy. But I was just thinking, you know, we have been mining this country for 100 and some years and it is basically the only industry there is. I was just thinking, you know, half of these towns wouldn't even be here and it is just hard to picture what the country would be like without the mining. You know, the amount of taxes that they put out, you know, even Duluth gets half of our taxes. You know, it would just be a dead country. Logging is pretty much all gone. You know, we just got to get something going up here. As one guy was saying, all of the minerals were put into the ground for a purpose, and if we don't use them, what good are they? So, basically that's it. But, you know, our kids would like to stay up in this country. I don't know. Basically that's it. You know, these guys are always saying all of these things that are going to happen but, you know, how do you know what is going to happen? They don't know what the mining company is going to do or what pollution is going to be there, or anything else. All of their theories are going to be there or whatever. I can't say much more. I lay in bed and think of this, I think all we got to do is get it going. Because, you know, tailings basin, they say it is going to hurt the wildlife. Well, I've counted between 50 and 100 deer on the tailings basin a night. The moose are out there. It is all full of wildlife. And in the fall, there is thousands of geese out there. So where is the pollution coming from? You know, wildlife is smarter than we are. The tailings basin is full of walleyes. You can catch one every time you cast. I don't know. Basically that's it I guess.

Don Osborn 41814

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Don Osborn Rochester, Minnesota

Don Pietrick 45271

Dear Ms Fay, Dear Federal and State Agency Leaders: I strongly advocate that the decision on whether to allow hard rock mining by PolyMet be solely based on the most rigorous possible scientific analysis of potential environmental impact. The DNR should make this determination independent of political influence. Don Pietrick 3824 Susan Lane Minnetonka, MN 55345 612-581-1284

Don Portwood 57884

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Don Rudrud 58145

Let me tell you an experience I have personally seen with my own eyes. There is a mining village in the State of Washington name Holden on Railroad Creek. Holden Village was created by the Howe Sound Mining Company to mine copper and other metals for the war effort in the Second World War. Holden Village housed the miners for a few years till it was suddenly closed in the 1950's leaving huge piles of tailings and sulfide polluted water that I have seen many times in the past 60 years. Holden Village was given to the Lutheran Church and thousands of visitors have visited Holden to observe with their own eyes and to learn of the God given responsibility of care for the earth. Now after Al-can sold the mineral rights to Rio Tinto (based in London). Rio Tinto is spending up to 100 million dollars in cleanup. This very year they must build a concrete container to contain two years ago water at Holden. Saw sulfide polluted water still running out of the mine into Railroad Creek and Lake Chelan. Don't let it be in Minnesota!

Don Schumacher 45264

Please don't allow copper mining in MN. Our state is too precious to be polluted. Thank you, Don Schumacher Sent from my iPad

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and I don't see any way that the pollution from this mine can be contained for 500 years. Even if it could, we should not put the cost of this on future generations. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Don Vasatka 4754 Beacon Hill Rd Eagan, MN 55122-2708 (651) 454-8310

Don Yerhot 39918

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Don Yerhot 2501 W 70th St Richfield, MN 55423-2003 (623) 866-9204

Donald Barstad 22173

From: Don Barstad [mailto:donjo2@frontiernet-net] Sent: Wednesday, March 05, 2014 11:16 AM To: Fay, Lisa (DNR) Subject: Polymet Supplemental EIS Ms Fey, After following the Supplemental information, I believe the updated results provide a complete analysis of the project to date. The economic benefit to the area is well certified by many of the comments both in the review and by public comments. The land exchange and wetland are reasonable for the area intended for the project. Future effects on wildlife and plant life are not adverse to the environment of the area. The design of the mining and plant operations are well thought out. Some new processes have covered many previous questions in regards to water and waste. The proposed Reclamation and Financial Assurance add to the feasibility of the return to "mother nature" of an acceptable result. The annual review of the project in this regards gives continuous oversight. As a resident of the Iron Range, I look forward to this project (and future ones) providing an economic and environmental boost to the area. Donald Barstad 5209 South Ave Aurora, MN 55705

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Donald Britt 1102 - 1st St Princeton, MN 55371-1404

Donald Chambers 21581

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Donald Chambers 25958 County Road 62

Donald Nelson 41470

Dear Ms Fay, Dear Federal and State Agency Leaders: There are several reasons I object to the PolyMet mine, but I have recently learned of one that speaks to me in a personal way that I think needs addressing. I was at the Jan. 28th comment session and I heard a lot of people talking about how mining creates good jobs. I've had relatives up in the area working in the mines and the processing. Today I learned that there has been no evaluation of the impact on the on-site workers. Considering the toxicity of the substances, this seems a grave oversight at the start. But more personally, I lost an uncle to one of those "good" jobs because of mesothelioma. And I'll grant that there was not much awareness of the problems from asbestos at the time. Still, there wasn't even an attempt. And now the PolyMet proposal is making the same assumptions - the health of the on-site workers is not a concern. We know a lot more now, and we also know this mining involves substances known to be toxic at many levels. As a minimum, there should be a detailed evaluation of the health effects of the on-site workers and their families (as at least some of that substance is going to come home with them. It always does). Health effects on the general population are also important and should be taken in to account. After all, making the people in the area (or even just the workers) is an effect on the environment. I also object to not having liners for the waste pits. This is a known fractured area and we have more and more evidence that the sulfides cause problems for the plants (such as the wild rice) and animals. So get a fair study of the health impacts on workers and families. And line the waste pits. At a minimum. Sincerely Donald Nelson 812 Queen Av N Minneapolis, MN 55411 612 588 8910

I strongly oppose Polymet's sulfide mine plan. It would not be good for Minnesota or the US. Donald V. Wahlberg 1451 Arden Place Arden Hills, MN 55112

Donella Kubiak 57223

I emphatically object to sulfide mining or any other kind of mining in the pristine forest and lake property of northern Minnesota. Our generation should not produce the kind of pollution from mining, for many generations to come, and leave it to the next generation(s) to clean up! No! We should do a better job of re-claiming metals/minerals through recycling. Donella Kubiak 6830 Three Lake Rd Canyon, MN 55717

Donna 38492

We strongly oppose any form of copper mining in northern Minnesota. The long-term run-off pollution threat to our unique water resources is just too great to take a chance. The possibility of hundreds of years to reclaim potential damage is a frightening prospect to pass on to future generations. And all this for several hundred jobs that themselves aren't for certain sustainable in the long term. WE SAY NO. Donna and Bryce Hamilton 4033 Linden Hills Blvd Minneapolis MN 55410

Donna & Neil Berglund 10720

Dear Ms Fay, Dear Federal and State Agency Leaders: NO NO NO to copper mining in our state Mining has a terrible track record and no amount of so-called "science" will convince us this won't turn into a disaster for not only this generation but future generations to come. How can we justify 25-30 years of mining vs. 500+ years of treatment-more like forever No matter how much money we throw at cleaning the area, it will never be what it is now. Never. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Donna and Neil Berglund 61555 252nd avenue mantorville, MN 55955 5076355195

Donna and Allan Butler 16663

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Donna and Allan Butler 8438 Mississippi Blvd NW Coon Rapids, MN 55433

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Donna and Allan Butler 8438 Mississippi Blvd NW Coon Rapids, MN 55433

Feb 17, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. It is my firm belief that Minnesota should pass on this sales proposal at this time and not be pressured by the empty promises of Tony Hayward who's BP oil spill desecrated the waters of The Gulf of Mexico, then whined about his responsibility. As a close watcher of the tactics used by Northern Dynasty Minerals at the Pebble (copper) Mine in Bristol Bay, Alaska, it is apparent that Poly-Met will likely do and say anything to get at Minnesota's copper resources. 80% of people opposed to the Pebble Mine "don't want their unspoiled home to become the kind of dead zone that surrounds the world's other giant copper mines." Please see the heartbreaking results in Nicaragua and Honduras for example. In all honesty, I don't trust the true ownership. I'm thinking it's the Kochs or Global Bankers who are quietly purchasing precious metal industries. I am highly skeptical that PolyMet's emission figures are credible, that their monetary clean-up guarantee is calculable with any certainty, or that they wouldn't "hit and run" after five years, declare bankruptcy and leave taxpayers to clean up the mess. Let's make the deliberate choice to watch and wait five years or so to collect more third-party data. Everyone knows an accident is going to happen while quibbling over what the damage is going to be worth in dollars. We should be embracing our value of clean air and water, and the quality of life it affords every Minnesotan. Sincerely, Ms Donna Anderson 10211 Cedar Lake Rd Hopkins, MN 55305-5403

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. We don't need it and the risks are too great. Let Poly-Met experiment elsewhere. Sincerely, Donna Anderson 10211 Cedar Lake Rd Hopkins, MN 55305-5403

Short term employment and economic benefits have little value when compared with the spectacular ecosystem of northeastern Minnesota. The risk is much too high with too many unanswered questions. We should not risk the devastation that followed the mining near Butte, Montana. Donna Arbaugh Tacoma, WA

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Donna Hanna 48 Mulberry Circle Staten Island, NY 10314 US

I oppose the PolyMet Mine and Land Exchange. And I Ask that you extend the public comment period for the proposed PolyMet Mine. The current 90 day comment period is not enough time. Due to the size, complexity and difficulty in reviewing the SDEIS - 180 days is needed to adequately review the proposal. The draft EIS was already found to be lacking in several areas and received a scathing EPA review. 90 additional days of review is little to ask in light of the potential for long term problems and the dismal record of sulfide mining around the world, regardless of what mine operators promised. The PolyMet project proposes a land exchange of 6,700 acres of federal land within the Superior National Forest. The Forest Service is under no obligation to do a land exchange with PolyMet. According to current federal law, it is illegal to strip mine land acquired under the Weeks Act for watershed protection. Don't put corporate profits before the people, land, water and wildlife of the Arrowhead. This project will be harmful to the Superior National Forest and Lake Superior Watershed. Treatment of contaminated water will be required for more than 500 years. The modeling done by PolyMet stopped at year 200 (at the mine site) and year 500 (at the plant site) because that was the point at which it became clear that water quality would not get worse. However, the modeled water quality at 500 years does not come close to meeting water quality standards. In addition doesn't include: • No back-up plan if Reverse Osmosis doesn't work for water treatment. • Hardrock mining carries the potential for asbestos-like minerals to be released in water effluent or air emissions. The PolyMet environmental review process does not adequately address their effects on human health as this is already an emerging concern in northern Minnesota. • Destruction of Wetlands - The SDEIS predicts that 912 acres of wetlands will be destroyed by filling or excavation and up to 7,413 acres may be "indirectly" impacted, mostly by converting wetlands to dry land. "Mitigation" for the direct impacts will occur primarily outside of the St Louis River/Lake Superior watershed, in an area to the south that is unlikely to support comparable ecosystems and cannot replace the lost functions to the St Louis River system. The proposed mine is harmful to wildlife, threatening home ranges of endangered lynx, wolf, as well as moose which are dramatically declining in the state. As an Audubon member I urge you to halt the project. PolyMet mine could spell life or death for critical habitats and the birds that live there, this mining operation would ooze toxic pollution into the region's waterways for as long as 500 years. More than 300 bird species spend at least part of their year in Minnesota and three Important Bird Areas would be especially vulnerable. These include winter habitats for Great Gray Owls and breeding habitat for dozens of neotropical songbird species. At particular risk are water-dependent bird species, including Belted Kingfisher, Common Loon, Goldeneye, Red-breasted Merganser, Hooded Merganser, Common Tern, American Bittern, and Least Bittern. Donna Marie Henry 538 So. 8th Avenue Galloway, NJ 08205

The value of our clean water far exceeds any mineral value now or in the future. Its not worth the risk. We need to preserve the wilderness for ourselves and future generations. Our taconite mines are already polluting our lakes and streaMs Donna Johnson P O Box 396 Forbes, MN 55738 - Donna Johnson Vermilion Land Office cell: 218-780-9977 office: Tower 218-753-8985 Virginia 218-741-8985 HYPERLINK "mailto:donna@vermilionland-com"donna@vermilionland-com

Donna Kneeland 41861

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Donna Kneeland Big Lake, Minnesota

Donna Magrina 12525

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, (Y)OUR WORLD of NATURAL HABITAT and LIFE is more important than profits. As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National ForeSt More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Donna Magrina 1908 Pomona Ave Ste A Costa Mesa, CA 92627-6233

The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Donna Seabloom 1206 Pacific St E St Paul, MN 55106

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dorie Gallagher. D-O-R-I-E R-A-E, Gallagher, G-A-L-L-A-G-H-E-R. I was born in Hibbing in a house on Third Street, where the mine actually took the house and whole town. I know mining. I came from a mining family. I am not in favor of PolyMet. I am not in favor of it because it is not the same as taconite mining. Taconite mining, you could move a rock and it would stay a rock, and it wasn't toxic. 80 to 90 percent of rocks moved in the PolyMet mine will be toxic. This toxicity will last from 200 to 500 years. There are homes in Park City that is on 100-year-old pilings that are still toxic and the ground cannot be dug, children cannot play in the ground, gardens can't be planted, and miscellanea. We cannot afford to have our beautiful northern area be destroyed for the few jobs. I understand they need jobs, but jobs should have been provided, and can be provided, without destroying our northern section of Minnesota.

December 31, 2013 To: Lisa Fay MN DNR Subject: Please extend the public comment period on the NorthMet SDEIS Dear Ms Fay and others concerned, I write to urge an extension of the public comment period for the NorthMet SDEIS. On December 24, I heard Commissioner Landwehr express on MPR's Daily Circuit the desire for "as robust an analysis as possible." I understand preparing the SDEIS took over two years of work by agencies and experts. Lay people need time to analyze such a lengthy document dealing with a project which the SDEIS indicates could require five hundred (500) years water treatment. The project's many impacts to water, air and life in northeastern Minnesota demand serious, thoughtful and objective analysis by both the public and by government agencies. As Minnesotans we want the opportunity to study and to ask all of our questions and to raise all of our concerns. Questions need to be raised and to be answered. It will take time to discover and to resolve any problems with the project SDEIS. Afterall, our common goal is to leave a clean, safe environment for future generations. Please consider extending the ninety- day public comment period. Thank you for your attention. Respectfully yours, Doretta (Dorie) Reisenweber 111 Garden Street Duluth, MN 55812-1142 218-728-1508

Mar 4, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I am particularly alarmed by the possibility of sulfide mining in Minnesota. Although the PolyMet mine watershed drains into Lake Superior, the Twin Metals Mine would drain into Voyager National Park. Our family has a cabin on Lake Kabatogama with 4 generations having witnessed its breathtaking beauty. The otter come up to the dock. The location of our dock is only known to family and friends because it is the best dock to catch walleyes. I cannot bear to think of my niece's 2 month old son growing up to never know that beauty because some people did not take good care of the land that God gave to us, telling us to be good stewards of that land. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Doris Bandel 1574 Cohansey St Apt 101 Saint Paul, MN 55117-4567 (651) 489-3226

41676

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, I do not think this PolyMet mining is looking to the future care of Minnesota's great wildlife. My family has used our cabin on Lake Kabetogama for 4 generations. We cherish the time we spend there. There are wild Lady Slippers on the path - we do not pick them because they must be saved for future generations. I have stood nose to nose with a bear at the screen door - I think he was as fearful as I was. I enjoy seeing the Northern Lights and hearing the Loons across the lake. The best walleye fishing is off our dock - but only close friends and family are allowed to know where it's location. :-) Please do not let PolyMet ruin this for my family for the next 25 generations.. I do not trust PolyMet to be truthful -sorry, but their job is to make money, not to protect the water of Minnesota. That is your job and my job. I'm doing my part by informing you of my thoughts. Now you do yours. I voted for you. I appreciate your time. Sincerely, Doris E H Bandel Note - you can read all of these facts below. But I think my thoughts above are most important. I am a mechanical engineer with a minor in polymers and coatings. So, I understand the science of this immoral business. Creating sulfuric acid to poison Minnesota water should be considered a crime. Have you ever seen skin tissue eaten from sulfuric acid. I have and it is not pretty. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Doris Bandel 1574 Cohansey St Apt 101 Saint Paul, MN 55117-4567

41790

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. My family has a cabin in Voyagers National Park. The last 4 generations of our family have joyously spent time at the cabin. I want the next 4 generations to have the same environment available to them. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Doris Bandel 1574 Cohansey St Apt 101 Saint Paul, MN 55117-4567

Dorothea Diver

11355

Dear Madam: I am writing to complain that the SDEIS as proposed by the DNR is very inadequate in failing to offer a plan that leaves the site clean and maintenance free. In addition, the water modeling that involves the ongoing protection of the Partridge and Embarrass Rivers has been recently proven very off - by a factor of four in some cases. To issue a go-ahead permit to a mining plan that so endangers - for 100s of years - our most precious resource - clean water - is an abdication or your department's mission to protect and do no harm to our environment. Please get real science and real numbers behind this plan, Thank you, Dorothea Diver, 1321 E. 8th St, Duluth, MN 55805

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dorothy Dolezal 3005 west 43rd st minneapolis, MN 55410

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, I am a native Minnesotan and an outdoors-lover and a birder. Though I have lived in Michigan much of my adult life, I have often visited northeast Minnesota for its beauty, its clean waters, and the life-changing experience of canoeing in the Boundary Waters. I am very concerned that this area be protected from any intrusion that could potentially disrupt this pristine area. I want my grandchildren and their children to all have access to this wonderland of wilderness. The long-term implications of PolyMet mining operation's water protection seem impossible to actually fulfill for the duration needed to assure that the water is not polluted with harmful chemicals. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Lisa Fay, EIS Project Manager MNDNR Division of Ecological and Water Resources For the past 20 years or more, I have followed the history and development of the NorthMet deposit from an initial indication in early diamond drilling through the creation of this SDEIS. Living in Hoyt Lakes from the mid 1960's until May of 2011, I worked for Erie Mining / LTV Steel Mining companies as a Mining Engineer from the mid 60s until LTVSMC was closed in early 2001- I have a BS degree in Mine Engineering from the University of Wisconsin. As part of my duties with the taconite mine, I traveled the "Dunka Road" many times, passing through the area of the proposed NorthMet mine at the boundary of the Superior National Forest The only road access is by way of private roads not open to the general public. In addition the site is surrounded by the private roads, railroads and Northshore mine pits and LTV mine operations. The site has been logged for pulpwood in the last 20 years and has no unique features that are not available throughout most of the public accessible areas of the Superior National Forest Some folks point to the stockpiled Gabbro at the Dunka mine pit as an example of the issues that may arise at NorthMet. It should be remembered that that pit and its stockpiles were started in the early 1960's before there were few if any regulations, permits or guidelines from State or Federal authorities concerning mining or pollution. The mining and stockpiles at NorthMet will be built and protected under the strictest rules available and will be intensely monitored to prevent any escape of potential pollutants. The fact that PolyMet will reuse an existing plant and brownfield site in an area of the state that has seen continuous mining and processing for over 100 years is a positive in that a minimum of "new lands" will be disturbed. This mine and processing operation will provide well paying and full time employment, that is at a premium. I do not believe that "tourism" jobs will be adversely affect. For the most part unaffected jobs are minimum wage and part time. Those are jobs for students and second incomes and are not family supporting. In general, this is such a high visibility and intensely followed project that it will highly unlikely that any unwanted consequences will be allowed to begin to happen before remedial action is initiated. Thank you for the opportunity to add my comments to the important discussion. Douglass A. Buell 201 Bluffs Ridge Court Duluth, MN 55811-2602

Doug Christy

57338

My name is Doug Christy from Grand Rapids, Minnesota, and I am for the project. I guess I want to start the statement by saying that if people had seen the "Lake of Construction" advertisement on TV recently, it kind of says it all. It states that, "This is mining country." People live here and work here and they play here. And that, you know, from there people have choices. If that's not the way they want to live, they can move, you know, if they feel this environment isn't for them. Also, I would like to state that we have, you know, the best and the brightest right here in Minnesota on our staff, as far as the DNR, the Forest Service, the Corps of Engineers, the University of Minnesota that have been studying this. And if people don't trust the information we are getting from them, who will they ever trust? From there, I guess I feel that there is inherent dangers to any business or manufacturing, whether it is, you know, your power plants or your paper mills or the oil industry. I mean right down to your farming and your, I guess your cattle. I mean everything has got inherent potential for I guess so-called danger. I guess you can pause there. So, this is no different. And for us to progress forward, you know, sometimes we have to take that risk and we have to do our due diligence and try to get the facts and information on what the risks might be. The progress still has to go forward. People -- people have to work to live up here and this is one way they can do it. We need the jobs. I guess I will just leave it at that.

Doug Connell

18370

My name is Doug Connell. C-O-N-N-E-L-L. I'm from St. Paul. I'm here on behalf of Jobs for Minnesotans. I heard from our chair Nancy a few minutes ago. I just want to make a point that the economic impact of this project is not restricted to the Iron Range. It affects all of Minnesota. It affects the region. The jobs that are created directly and indirectly are going to benefit the whole region. I'm the former of CEO of Bar Engineering Company. We've been very active in assisting PolyMet with scientific and engineering aspects of this work. And that is an example of the ancillary jobs that are created from this kind of project. That has led to my company hiring folks in Hibbing, in Duluth, in the Twin Cities, and the also around the country in the technical expertise needed to support and do these kinds of projects safely. Those impacts really have a dramatic effect. If you have read recently about Duluth's resurgence, part of that resurgence, as the articles have indicated, have been because of the jobs that have been created in fields like engineering as well as other areas. And this is the reason why those jobs are being created. This economic development that this project represents is very clearly tied to the fortunes of Duluth, the fortunes of Northeastern Minnesota, and the state as a whole. I'm very proud of the work that my colleagues have done. I haven't had any personal involvement in the technical aspects of the work. I think it's been done very, very well, very rigorously. And I compliment the agencies for the process that they used to put together this public comment period, public meeting, etcetera. I've attended quite a few public meetings in my day. I have rarely seen one that has been this well run and frankly this cordial. So thank you.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I support copper – nickel mining in Northern Minnesota. I believe Polymet is doing all the right things to make their operation environmentally safe. I am very confident that there will be no pollution of any streams, rivers or lakes including the Boundary Waters. There won't be a Smelter involved here, so no acid rain. Even though some people feel that copper-nickel mining pollutes lakes and streams, I beg to differ as I grew up in Coniston, Ontario which is in the Sudbury Nickel belt. Even with 3 smelters running in the 1960's and 1970's there were no lakes or streams or rivers that were polluted by mining and smelting sulphide ores. I swam in every lake and river and creek in the Sudbury area. Copper-Nickel mining will be very safe in Minnesota. Thanks you, Doug Halverson 1330 20th Street Cloquet, MN 55720 Email: dhalverson@mchsi-com

Doug Hildenbrand

19940

My name is Doug Hildenbrand and live at 420 NW 8th Street Chisholm, Mn 55719- My wife and I have followed this process closely. I have toured the proposed mine site and have investigated the proposed process. We are fully in support of proceeding with the project as proposed. Congrats to the agencies who have played a vital role in developing controls and measures that address environmental concerns. Let's begin the mining. Sent from Doug's iPad

Doug Lande

57346

My name is Doug Lande. It is spelled L-A-N-D-E. Okay. I am requesting that the executives in charge of approving or disapproving the DEIS will take the "no-action alternative," as stated in the executive summary, on Page 43, and that no land exchange of public property be allowed to create a mining operation for private financial gain. Could you read that back for me; what I just stated? Okay. You can do a new paragraph. I would say a number of inappropriately addressed concerns give reason to distrust claims made in the DEIS. Specifically, there seems to be a problem with the DEIS, listed at Page 5-413, Table 5.2.7-12. The problem that I see is that the DEIS doesn't take into account uncontrolled Co2 emissions, such as that generated by the electric plant used by the mining operation. I don't think this is accounted for in the edition which says that the Co2 emissions are minor and not a major emission source. So, I would like to see all controlled and uncontrolled Co2 emissions related to the mining operation be listed. Also, I don't believe that the DEIS explains who does the monitoring of potential pollution sites, who pays for the monitoring, and where the public can access in an easy manner the monitoring results. Also, I do not believe that, as stated in the DEIS, that reclaimed wetlands should serve for mitigation lands, as they will never again be as productive as they were before they were reclaimed. Also, I don't believe that the 90th percentile discussion of probable pollution levels related to water is appropriate and I believe the modeling to be flawed as described in the dissenting opinion of the tribes. That's it.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, doug myren 609 Portland, #2 St Paul, MN 55102

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Douglas Ewart 3714 17th Ave S Minneapolis, MN 55407-2808 (612) 722-0910

There exists at least one assessment that yet has not been considered and really needs to be considered before mining should be permitted. That being, whether or not there exists sufficient need for the amount of copper and nickel expected to be mined when considering the current and future developments in replacement products, ie will the new technologies that have been developed using carbon nano-fiber for electronics, building materials, etc rapidly replace the need for even small amounts of new sources of copper and nickel, thus resulting in rapidly making the mining operation unprofitable. The MN-DNR should determine if there exists sufficient justification to permit the mine to begin operation, if in just a couple of years the use of carbon nanofibers results in suspension of mining operations. This may be reviewed on the internet in, among other sources, at HYPERLINK "<http://www.mining-com>"www.mining-com by looking at discussions of the research results of Cambridge University, or simply searching for applications of carbon nanofibers on the internet. Thank you. Douglas W. Kuehl 1401 Minneapolis Ave Duluth, MN 55803 218-391-2768 HYPERLINK "<mailto:dwkuehl@gmail-com>"dwkuehl@gmail-com - Douglas W. Kuehl Duluth, MN (218) 391-2768

Dear Ms Fay, Dear Ms Fay, Mr Bruner, Mr Dabney and Mr Westlake: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes alre

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Douglas Peterson 9508 Russell Ave S bloomington, MN 55431

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Douglas Stephen 8765 Hunters Way Apple Valley, MN 55124-9433

From: Douglas Wood 3835 Pine Point Road Sartell, MN 56377 Dear DNR I wish to state my very strong opposition to the proposed PolyMet and Twin Metals mine operation in NE Minnesota. I am aware of the Duluth Complex deposit and of its size and importance, and of the need for such metals in today's economy and technologies. I also know that such a mining operation is inherently extraordinarily risky in terms of potentially catastrophic collateral environment damage. Because of the location of the minerals, all within igneous and metamorphic bedrock billions of years old and laced with fractures, the chances of acid contamination are high indeed. Soothing assurances about corporate responsibility and effective long term treatment and amelioration are in fact not reassuring at all, given the following circumstances: A waste water treatment program that will need to be in place and stringently monitored and overseen for a period of at least 500 years. (For perspective , 500 years ago it had only been 22 years since Columbus' first steps into the New World.) After recent environmental accidents in West Virginia and Japan, among others, the hubris of such an expectation is self-evident. The fact that virtually no corporation can be expected to last 500, or even 50 or 100 years, and thus assurances of long term responsibility are relatively meaningless. The fact that the location of these and other mining proposals is at the head of two great watersheds - St Lawrence Seaway (including of course incredibly valuable and highly sensitive Lake Superior and the other Great Lakes, destined to become only more valuable in the future) and Hudson Bay. The likelihood of a devastating impact to these watersheds - based on the past record of such mining operations globally - is very high indeed, particularly when extended over 500 years, with all the attendant uncertainties and unknowns. Even if, for instance, there were 1% chance of a failure in a given year, that would translate to a 99% chance over 500 years. The fact that the existing track record alone - of other such mines around the world - is convincing of only one probable outcome. And the transcendent fact that such mining operations would be at the very doorstep of Minnesota's natural crown jewel, the Boundary Waters Canoe Area Wilderness, and downstream Voyageurs National Park. Generations of Minnesotans and other Americans have devoted their lives to understanding, studying, preserving, defending, and enjoying these global treasures. They are bequeathed to our care. And there is simply no realistic, tangible, practical, predictable, or believable way that this responsibility can be honored while approving and moving ahead with these plans. We are told of potential economic benefits - for a relatively short period of time, a few decades, 30 or 40 years, with some good wages for a few workers. PolyMet estimates that 25% of workers would be hired locally, with about 90 from neighboring communities, 72 commuting from regional hubs like Duluth, and 200 coming from elsewhere. While I in no way denigrate the importance of jobs and living wages to these workers, one must point out in fairness that the current jobs, careers, and economic benefits of tourism alone in the area - the Boundary Waters alone is visited by 140,000 visitors a year on multi- day trips - dwarf these potential benefits in the short term, but more importantly in the long term. The greatest economic benefits from these projects - the really big money - will go to enrich a very few who do not live here, who have no ties or feelings or sense of place or responsibility for this globally significant and internationally treasured area. When we are asked a question that requires a yes or no answer, the human bias is toward yes. Yes is positive, it seems forward looking and optimistic. No, on the other hand seems negative, oppositional, leading only toward a stop sign or a dead end. But it all depends on how the questio

I welcome my opportunity to comment on the PolMet mining proposal. It was extremely easy to find links to sign a petition against this mining not easy to find a forum to vote for the mining and opportunity for more jobs in Northern Minnesota. My opinion is the State of Minnesota should be able to monitor the mining process, they do have the experience to do so. Everyones fear is unrecognized fear, have we not made state parks out of past reclaimed mines. I myself have enjoyed these state parks. Are not mining companies requiered to reclaim the land once finished. I could go on and on about this as I have a background in business opportunity. I also have a long history in Northern Minnesota. I could not find a decent job there It has always appeared to me that the state is more in the way than helpful when it comes to emerging business. The cities and counties understand the importance of business and economic growth. We need jobs in Minnesota, we also need business opportunity. Northern Minnesota does in fact have residents and they would like jobs. Northern Minnesota is not a playground for the rich and underworked people to enjoy the boundry water canoe area. It is also not a wolf sanctuary. There are residents in that all over Northern Minnesota. Most barely able to afford a hunting or fishing license let alone pull a 100,000 dollars of boat and pickup around. My family for a number of generations has served the State of Minnesota in a variety of positions. The state would have many more resources if we would replant the State forests once logged off. In summary, I feel the State of Minnesota is more than qualified to monitor and enforce mining laws with this new opportunity. Lets turn a leaf and welcome new business to Minnesota. Better yet, let's help them in any way we can. Dan Richards [HYPERLINK "mailto:dprichards86@zoho-com"](mailto:dprichards86@zoho-com)

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Dr Jay Sullivan 771061st Ave Nw Gig Harbor, WA 98335 US

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Drake Best

54334

Dear Ms. Lisa Fay, EIS Project Manager, After researching the idea of mining in northeastern Minnesota, I disagree with the idea. I think that PolyMet Mining does have a good plan in place, but I feel that the disadvantages overpower the advantages. The copper-sulfate mining process could boost Minnesota's economy, but we can find other ways to boost the economy. The effect on the environment is not good. Although PolyMet is planning to minimize or possibly avoid the effects, they can't stop everything that could happen. Let's take wetlands for example. If the project does take place, 913 acres of wetlands would be permanently lost. I understand that PolyMet plans to recreate some of these wetlands after the mining is done, but they will not be able to replenish the valuable home of organisms and many animals. Mining in this region would also harm the St. Louis River. As many people know, the St. Louis River flows into Lake Superior. There is already a lot of pollutants in the lake, and polluting a river that flows into the lake would only make things worse. Another reason why I disagree with the idea of mining in northeastern Minnesota is, what it would do to the Ojibwe people. The Ojibwe people would lose part of the sacred Mesabe Widjiu. It is not fair to take away even one inch of their sacred land. Many Indian tribes throughout the country have lost most or all of its land. Taking away even more of their land is unethical. The last reason I would like to address on why I believe PolyMet should not mine in the region is, the effect it would have on endangered species. One endangered species in particular would be the Canada Lynx. The Canada Lynx are struggling to sustain a population in Minnesota and mining would only exacerbate the situation. Thank you for reading my letter and considering my opinions. Sincerely, Drake Best

Drew Johnson 58113

To the Minnesota DNR, thank you for this opportunity to comment on the Polymet Supplement Draft Environmental Impact Statement. We are fortunate to live in a place that requires Environmental Impact Statement for the significant mining projects such as this one. We are also fortunate to live in a place where we can publicly discuss significant mining projects. The proposed Polymet mine would be a significant mining project potentially a precedent setting mining project for many mining projects lined up to follow it. The way we handle this proposed mine will surely be used as a blueprint, perhaps even a legal argument, for many mines that might follow. So we are thankful for this hearing and the 2,200 page study that has been submitted. It is a long document, but unfortunately not thorough. Some significant questions are left unanswered, including: How long will the mine need to be maintained? The study mentions 500 or more years. That sounds an awful lot like forever or we don't know to me. How much will maintenance cost? Maintaining a complex and polluted site forever would cost quite a lot, I assume. Who will pay the maintenance cost? I don't believe Polymet will be around forever so I can only assume that means Minnesotans will pay for it. Mining operations are expected to last 20 years, according to the study. After the 20 year boom what support will there be for communities that will face the mining bust? Who will pay for and provide this support? In this state, we are strong community. We care for each other. We want good jobs and cleaner water. For everyone, including those too young to speak tonight and those not yet born. I'm a parent of three very young Minnesotans and I care deeply about the world they will inherit from us. Given the magnitude of those proposed mine on the people and the land we hold most dear, we must get the Environmental Impact Statement right. To act responsibly and avoid recklessness, we must demand concrete answers to these fundamental questions. For this we pray that you will be thorough and you will be courageous that you will be wise. Thank you.

Drew Peterson 41987

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Drew Peterson Montrose, Minnesota

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I'm no expert on this type of mining, but I have done a lot of reading up on this subject and I believe that this is not the right type of mining in the proposed area. My biggest concern is who is overseeing the project? Is it the same person who was in charge of the BP oil spill as reported in the news? Duane Lunda 5940 Eagle Lake Rd Duluth, MN 55803

Duane Larry Gerlovich 54480

I have listened to television news, radio programs, talked to a few people at various places. I have my own opinions also, It seems like the pollution and runoff are or would cause some problems in surrounding area of Polymet. I think we would be better off with some type of manufacturing jobs that would not pollute the area up there. We do need jobs in this area.

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. We must preserve our Minnesota wilderness from these type of activities and stop pollution before it starts. Clean water is what Minnesotans want as they passed the Clean Water Legacy Act "overwhelmingly" - these funds are not to clean up activities such as PolyMet's that never should be allowed to start without full measures to insure our waters are clean well into the future. Thank You Duane Sickmann The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Duane Sickmann 200 Freeport Ave NW Apt 1 Elk River, MN 55330-1567 (763) 259-1844

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404 " Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation " wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect " wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

Dear Lisa Fay, I am a student at Humboldt High School and my name is Dureti Doto. I have recently been informed about the one hundred mile swamp. I learned that the SDEIS incorrectly drew the one hundred mile swamp in the SDEIS maps. I also learned that the mine site is just south of the one hundred mile swamp that drains to the boundary waters. I am writing to you today because first of all people do notice the error on the SDEIS maps, because people really do care about the one hundred mile map and the boundary waters. And because it is not okay for the SDEIS to draw the map incorrectly. It is also not okay for the mines to contaminate the boundary waters. The boundary waters are important because they are clean and there are only a few of those left. We need to leave clean water for our future generations. Please take this into consideration because it is important for many people. Thank you. Dureti Doto 1605 Case Ave St. Paul, MN 55106

Dustin Bower

40623

This comment is from: Dustin Bower 8865 Branson Drive, Inver Grove Heights, MN 55076- I am emailed to express my complete disagreement with the proposed PolyMet mining project, specifically on environmental grounds. If the tachonite seepage is already exceeding water quality standards for the holding ponds, and the PolyMet things the solution is to add even more pollution to the mix and create a few more massive holding ponds, and then use an unproven reverse osmosis system in an attempt to decontaminate the water, I just don't know how the DNR can approve such a plan. Minnesotan's pride ourselves on our clean water and beautiful nature. Please don't allow PolyMet to destroy an area in Minnesota that hasn't even recovered from the last mining operation. Sincerely, Dustin Bower

Dustin Cloyes

40420

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Dustin Cloyes 4485 3rd Street Columbiaville, MI 48421 US

I understand that the public can comment on the Proposed Poly Met project. I highly object to this project, it throws years of conservation by people like Earnest C. Oberholtzer and others. Poly Met is NOT ready to be given such an enormous responsibility by the public. Should there be any damage to this area it would be long-lasting and potentially crippling to an already fragile eco-system. My heart and soul belongs to this place which I feel is now threatened. Please do something to stop Poly Met. Dustin M. We need the Polymet Jobs. In 2008 I was laid off from my heavy equipment operating job due to the housing market crash. Polymet seemed to be ready to go so I took all the mine training and bought a building site in Hoyt Lakes planning to finish out my operating career at the mine. When Polymet was put on hold, again, I had to take an out of state job. My family wants to come home. We need Polymet to open. This is life changing for us. The people who do not want change on the iron range are using distorted facts and outright fibs. The 20 years of work they keep bringing up is not true. The permit would be good for 20 years, Then they would apply for another permit. The mine may last closer to 100 years. The 500 years of water monitoring is also misleading. Is this a made up number. And technology keeps advancing. The water may very well be better than it is today. Get the facts right and let the people on the range make a decent living. It is good for the world and the right thing to do. Dwayne Myrvold 2014 Atha Woods Dr Monroe, Georgia 30566

Dwayne Trulsen 30273

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, History repeats itself. How much more health problems and environment destruction do we need or can handle. There needs to be ways to mine without the severe secondary effects to our health and especially the health of our children. Dr Dwayne and Peggy Truhlsen Sincerely, Dwayne Trulsen 25228 Redwing Ave Shafer, MN 55074-9779 (715) 338-6480

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I could just forward to you the comments prepared by others, and I do endorse them, but I just want to say that I shudder to think of the long-term consequences of this mining proposal. I first visited the Boundary Waters in 1953- I have, over the years traveled most parts of the Boundary Waters and much of the Quetico. It would be tragic to pollute those beautiful waters, as the PolyMet-proposed mine would almost certainly do. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Dwight and Ann Ericsson Dwight and Ann Ericsson 4963 W 539 N Huntington, IN 46750

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

---Original Message--- From: condor6@2z-net [mailto:condor6@2z-net] Sent: Monday, March 10, 2014 7:19 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet
Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Dwight Mcconnell 438 Buck View Rd Ely, MN 55731-8176

The environmental plan PolyMet has proposed appears detailed and comprehensive and should assure the public that this important project is environmentally responsible and sound.

Dwight Smith 6269

Dear Ms Fay, Dear Federal and State Agency Leaders: No doubt you are receiving numerous messages regarding the PolyMet Supplemental Draft Environmental Impact Statement. I have read a fair amount of the statement itself and other things written - pro and con - regarding both the statement and the advisability of non-ferrous metals mining in northern Minnesota. I don't pretend to know what the best answers are. I do know the history of such mining operations elsewhere, and it makes me very uneasy to think that authorities might proceed quickly on an issue that has potential long-term consequences. I understand the eagerness of a business like PolyMet to begin operations on what is potentially a very profitable venture, and I likewise understand the desire of many interests in the state and region to bring good jobs and prosperity to an area whose economy has suffered in recent decades. What I can't understand is how any government official, elected or appointed, should feel the need to come to a decision without a thorough consideration of all the consequences of taking this step. What is under consideration is a question that will have an impact on the land and water for literally centuries. Shouldn't this justify taking a few additional months of analysis and research before leaping into action. Additionally, is it really wise to consider something as momentous as this in the months leading up to national and state election. Certainly nobody can be so naive as to think there are no political ramifications to this matter. The real points of this message are simple: This is a major consideration with critical consequences for the entire state, regardless of the final decisions. It should therefore be given the necessary time and effort to fully understand all aspects of this matter. And all of this should be carried out in as objective a manner as possible, as free as possible from political pressures. Those minerals have been in the ground for millennia; they aren't going anywhere. They will be as available for extraction in a year or two as they are today. The Iron Range has endured decades of economic difficulties. While everyone would like to see a revival of that region's economy, some additional time taken to get it "right" isn't going to make that great a difference. If the decisions are rushed, generations of Minnesotans may be paying the consequences of hasty action. Commercial and political expedience are no excuse for compromising our treasured natural legacy. Please consider the full weight of the decision you are making, not just the short-term profit and benefits that will come from it. Respectfully, Dwight Smith
Dwight Smith 2285 Brooke Lane Hastings, MN 55033 651-983-1799

Dyces 21482

*letter below is attached in PDF format Dear Ms Fay (MN DNR), Mr Bruner (USACE), and Mr Dabney (USFS) Subject: the NorthMet SDEIS By now you have heard rivers of testimony as to the danger the PolyMet mine poses to land, water and air. You have also heard the industry bargaining line with the promise of jobs and claims that they are committed to be good stewards of the land and water. I am greatly concerned about the very real contamination of precious and finite resources of land, water and air. What good is the promise of a few jobs when the water becomes contaminated. What happens to the numerous tourist and recreation jobs that rely on clean water and undamaged wilderness. I am not willing to risk sacrificing water resources so that PolyMet can take the minerals and run. We know that PolyMet will not be around for the next 250 – 500 years to make good on their “promise” to protect the water. For reasons mentioned earlier, I need not elaborate on the testimony that you have heard I will however, ask that you remember some of the basic information you learned in high school science class. Sulfide and water is a dangerous mix. When the sulfide mining process sees sulfide and life giving water interacting, sulfuric acid is produced on a very large scale. It doesn't stop there. As the acid dissolves the rock, heavy metals are released. Heavy metals no longer trapped in rock become yet another, real and present danger to humans, fish, birds, plants and other wildlife. There goes the neighborhood. Not just decades of water contamination, but also the release of toxic metals. This surely encourages a stronger “catch and release” practice for those who dare to fish the contaminated waters; however certainly there is a better way to protect our fish and human population Although I live in southwest Minnesota, I know that the damage that comes with this mine would impact all of us in one way or another. We began our life journey surrounded with water. Please recognize how precious water is to all life on this planet. I urge you to reject the NorthMet SDEIS and deny any permits which could harm Minnesota's water quality and supply for present and future generations. Your help to stop NorthMet SDEIS will be greatly appreciated by so many. Sincerely, Darwin Dyce 1764 330th St, Ghent, MN 56239 HYPERLINK "mailto:dyce@mvtvwireless-com"dyce@mvtvwireless-com or Cell: 507-476-2042

Dyke Williams

10693

From: Dyke V. Williams 3725 Parkway Deephaven, MN 55391 NorthMet and the expanded sulfide mining it forecasts are "too far". Currently we the people have no statutes or precedents for being able to determine that a project goes "too far" beyond the qualities of life we wish to enjoy. Because of the numerous earth and water quality and safety hazards it represents, NorthMet must be stopped now - because the people of Minnesota want it stopped. The need for profit (greed) of foreign company executives to sell our resources for their gain is "way too far" Specific objections and concerns include: - Your cynically offering only three public meetings, only one of which was in the Twin Cities area and that way too far east for many of us. Clearly you are afraid of open discussion here. - That only about 90 jobs will go to local northern Minnesota residents - the rest to out-of-state experts in various arcane skills related to this most dangerous mining plan. - It is clear to most of us that the Arrowhead will be far better off economically if left relatively clean - land untrammled, water unpolluted, air unburdened with particulates, roads unclogged with huge, dangerous and impeding traffic, sound left quiet without the roar of Diesel and shock impact of drills and explosives. Like it is now where a resort or outfitter can advertise "Come north where it's clean" - NOT "come north and enjoy the dirt, mess and sulphuric acid". The Arrowhead and BWCA are the area's best assets, NOT to be spoiled for 20 years of profit but lingering on effectively in perpetuity. It is said that the only entity that has lasted for 500 years (where are those NorthMet long term funding plans.) is the Catholic Church. And that hasn't exactly kept the same form, aims and goals throughout. Why should we believe NorthMet's non-existent plans will. - No planning has been made for unintended consequences, nor for unexpected events. What happens when we get another 14" rainfall in 8 hours (July, 1988 - I was there - we paddled OVER campsites and looked DOWN at firegrates). Or the New Madrid fault becomes active. Or green fanatics try to sabotage machinery, facilities, fail-safes (for which there are already precedents). A Polymet manager told me he had never even considered the possibility of sabotage. Why in heaven's name not . - Our remaining wilderness and wild areas are irreplaceable. As a consultant in experiential education, I and we know that most kids can best learn adult roles and responsibilities through involvement in outdoor adventure/challenge experiences - Outward Bound, Menogyn, Widgiwagan, Warren, Wilderness Canoe Base, Sommers Canoe Base, scout and church trips through outfitters. Dig it up and its gone for good. And impact goes MUCH farther than you might think - I've been on Sturgeon Lake in the Quetico and could hear the dozers and Diesels in the Atikokan mine when it was still open. And the Canadian railroad Diesel engines from the Canadian National and Canadian Pacific today. - That the copper is there NO LONGER means that anyone has the automatic right to dig it up in the face of enormous, serious and scientific objections. It is the responsibility of the DNR and of the State of Minnesota to stop this before it starts. This is not a smallish group of deer hunters saying keep the deer population unnaturally at 1-2 million so we can shoot deer easily (the natural carrying capacity is said to be about 150,000). How do the 34 people killed in deer/car collisions last year feel about the DNR catering to the squeaky hunter wheel. It is time to stop accomodating, listen to the majority and make decisions based on the science available or needed and NOT on the emotions or need for extra department funding. Please, please listen to all of us who are saying 20 years' profits for 500 years pollution is going "too far". You have the chance to be leaders and heros, or to be followers and fools. Please choose well for all of us. Dyke Williams

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs E Blankers PleaseUseEmail Chanhassen, MN 553170001 (952) 361-6670

Dear Ms Fay, I am concerned about the pollution that is left behind for hundreds of years after the mining ceases, especially water pollution. I am also concerned about lingering threats to human health that have not been adequately assessed. The technology required to preserve the safety of our water is not adequate. We should not extend mining rights to an outside corporation that cannot realistically provide stewardship for our water nor our environment. Kathryn Hoffman, staff attorney with the Minnesota Center for Environmental Advocacy, said “the process to treat the water is complex, requiring multiple systems to work successfully and a mine in Michigan using a state-of-the-art reverse osmosis plant to do just that has already had more than 40 permit violations for not meeting water quality standards.” While jobs are important, we may be talking about as few as 90 local jobs compared to 500 years of ongoing water treatment. I support jobs in northern Minnesota that are sustainable to all life in the area, and I encourage the Minnesota Department of Natural Resources to take a leadership role in promoting sustainable industry. However, Hoffman estimated that while “PolyMet project is expected to create 360 jobs after experts in the mining field are imported the site will create about 90 local hires.” Thank you for taking public comment on this important issue that affects the health of us all, and our environment, for generations to come.. Let us be good stewards of the resources we have Sincerely, Betsy Lane-Getaz, MS, RN 32293 Alta Avenue Northfield, Mn 55057

Dear Ms Fay, Dear Ms Fay, Mr Bruner, and Mr Dabney: I am writing to ask that you reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. (I'm also sending a copy of my letter to the US Environmental Protection Agency). In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on sound science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish, and human health. The SDEIS must be redone, because its unjustifiably optimistic predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin, and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not an objective and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely, Earl Rook Stillwater, MN Earl Rook 11550 Irish Avenue North

I don't buy it!! [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Eben Spencer 39496

I am very concerned about both the short and long term consequences of proposed sulfide mining in NE Minnesota. While I understand the need for meaningful employment in the region, the potential environmental degradation inherent with such mining must be avoided at all costs. I am not completely opposed to such mining, but I urge the Minnesota DNR, MPCA, and the USA EPA to require the strictest of standards and to protect our national heritage – our waters, forests, and wetlands – first and foremost. I do not feel that PolyMet has provided such assurances yet, and strongly feel that permits should not be issued at this point, nor should permits be issued until further studies and guarantees are in place and 100% foolproof. I live on lake Vermilion. We do not have a well, we have a lake water system and use the water from lake Vermilion for everything in our house including the drinking water with minimal filtration. I would be able to see the head frame from the Sudan underground mine if the small hill between the lake and the mine were not there. This mine started as an open pit mine as well as numerous test pits. Some will say the rock that was drilled and blasted for this mine and the rock cuts for Hwy. 169 and 135 contain sulfur bearing rock. This rock has had no mitigation and has been leaching into the waters that supply lake Vermilion for over 100 years with no measurable adverse effects. It's time to move the PolyMet project foreword and show the world we can mine safely in Minnesota. Best regards, Ed Borchardt Area Manager _____ Atlas Copco Construction Mining Technique USA LLC 4359 Isle of Pines Drive Tower, MN 55790 USA Cell: +1 (218) 929-2540 E-mail: HYPERLINK "mailto:ed.borchardt@us.atlascopco-com"ed.borchardt@us.atlascopco-com Visit Atlas Copco at: www.atlascopco.us Read about our products in action atwww.miningandconstruction-comandwww.deepholedriller-com _____ Committed to sustainable productivity

There is no evidence that Polymet will not cause serious damage to the environment. Also, there is no way to ensure that Polymet will be able or willing to pay for restoration of land/water areas destroyed by pollution. Polymet must not be given a permit to mine in Minnesota. Thank you. Ed Verzal 2512 16th Ave E. Hibbing, MN 55746

45275

I live on the Iron Range, and I strongly oppose the PolyMet copper nickel mining project. My husband and I love traveling and staying on the North Shore of Lake Superior, and I do not want to see sulfuric acid waste from this project destroy the wetlands, rivers, streams, and trees in the Superior National Forest and Boundary Waters Canoe Area. Tourism is an important and viable industry in this part of the state and should not be compromised by a risky mining project. Copper nickel mining leaves the land and water polluted wherever it occurs. We as a state cannot afford to clean up this pollution for hundreds of years. Mary Verzal 2512 16th Ave East Hibbing, MN

Eddie Harrison

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Eddie Harrison 2425 County Road C2 W Roseville, MN 55113-1054

I am writing to express my opposition to the copper mining that Polymet proposes be carried out in northeastern Minnesota. My concern centers on the potential for irreversible damage to the environment, water pollution, industrialization and limited access to a large natural area, and economic loss for residents of the area due to lost recreational revenue. Foremost among these is water pollution, which is estimated to take hundreds of years-many generations-and billions of dollars to clean up. I share these quotes with you. "If you need a horror story, go online to the Berkley Pit story. The Pit is in Butte Montana and the copper mine company long gone. So the city, state and the EPA have had to build a very expensive water treatment plant to deal with the sulfuric acid lake that is threatening to overflow any year now, poisoning the area water. I have a niece who works for the regional energy company in Montana and South Dakota." One of the greatest dignities of humankind is that each successive generation is invested in the welfare of each new generation. ~ Fred McFeely Rogers Edi Thorstensson 809 S. 7th Street St Peter, MN 56082

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

19977

I am a native of Duluth and I have seen what mining operations do to our northern wilderness. I believe that if the people of that area are conflicted about the mines presence, that they have a more definitive opinion about the impact of this mine on their livelihoods. Right now in this country, we are on the verge of a Keystone pipeline going through the mid-section of this beautiful country, we have the drought-causing practice of fracking snapping at our heels, we have the coal orientated disasters of West Virginia and North Carolina, the serial poison spills nationwide, the oil train derailments and the entire practice of having the oil industry write it's own regulations so as they can do as they please. We're a on a run away train heading for the docks with no breaks..so you people better be pretty damn sure that this mine isn't going to contribute to the already down turn of this planet because when the ocean comes it will take no prisoners rich or poor..and no one will be left to say that the human species that was given their capacity to think, to create and project reason took this beautiful planet, this wonderful wilderness ecosystem and the pure air that we breath acted instead like a bunch of morons. Sincerely, Edith S. Glass-Englund

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Edward Johnson Eden Prairie, Minnesota

Edward Martell 43111

Dear Ms Fay, Dear Federal and State Agency Leaders: I am strongly against the PolyMet sulfide mine plan. Sincerely Edward Martell 2149 Goodrich Av St Paul, MN 55105 651-231-1179

Edward Pajunen 41270

An outstanding effort has been put forth by the 3 agencies and the company. It is time to allow the company to move forwaRd The region, the state, the US and the world will all benefit economically and environmentally. Edward L. Pajunen 168 E 6th St #4002 St Paul, MN 55101

Edwin Wintermute 27592

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Unless there is an over-riding need for the sulfides that would be produced, this proposal should be rejected. The need for untrammled natural spaces should take precedence. Sincerely, Edwin Wintermute 182 Dividing Ct Arnold, MD 21012-1026 (410) 544-1155

Edwina Hertzberg 6160

Gentlepeople: We write to ask that the possibility of Polymet Mining Corp. mining in this region be fully and thoroughly studied, that no permit be granted until such studies are complete, and then only if Polymet can assure an escrow account that would pay for cleanup for the 500 years that the region would be affected. Short-term jobs that risk long -term pollution would be a short-sided and foolish decision, risking the beauty of this precious part of the globe. It is impossible for Polymet to assure that no accident can happen, no mistake made that would jeopardize the safety and beauty of this corner of the earth. The risk of pollution of the streams and lakes, small and large, is too great. No amount of money can buy the purity of this environment. Sincerely, Edwina and Robert Hertzberg 7090 E. Hwy. 61 Grand Portage, MN 55605

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, ela crutchley 25 miller rd christchurch, None 07672

I was too upset to listen to the entire public forum in St Paul last evening, so I left. This morning, I watched the entire public hearing online. After listening to what people said, I have formed my opinion. I do not think this mining project should be allowed. I have never believed this project as environmentally sound for this part of Minnesota. On the other hand, I have battled with the idea of job creation. I do understand the people that live on the Iron Range need sustainable employment. The key word being sustainable. I believed what I heard when individuals spoke of a need to boost their economy. However, I do not think mining can ever offer sustainable employment. After all, isn't that what is most upsetting to the former miners living on the range. Most spoke proudly of their heritage, as sons and daughters of miners and a desire to carry that forward to their children. I will be harsh in my judgement, in my opinion, you can not have mining a non renewal natural resource as a sustainable career. The people living there today are the end result of an economy unable to sustain itself. Mining is an economy build on a boom to bust cycle. How many mines will it take to sustain employment for Northeastern Minnesota generations to come. At what eventual cost to the environment. As to my environmental concerns I heard one pro mining gentleman say mining forever changes the land. He went on to say he strongly felt in today's world Polymet could somehow do it better, that is, with less destruction. He is clearly a hopeful gentleman. I do agree that mining is destructive to the environment, but I can not see clearly that Polymet can promise less destruction. I find it highly doubtful when Polymet makes such bold claims it is my understanding, the pro mining gentleman was suggesting there has to be a trade off. I agree. I am just not in favor of the trade off. The risk is just too great. I do not believe the science is there to prove it can be done. A classic example of science gone wrong is what is currently happening in Washington state at the Hanford Nuclear Waste Treatment Site. It is leaking, an unbelievable amount of money has been and continues to be spent, the Governor of Washington is seeking a fix, and a resolution is not forth coming. I do not believe it was the intention of anyone in the Pacific Northwest to contaminate the Columbia River Gorge, but that is what they are left with some seventy years after the construction of the site. It makes me wonder how predictions upwards of 500 years could possibly seem reliable. It would be unwise to create the potential for such misfortune in Minnesota. Polymet is not here to help the people of the Iron Range find sustainable employment, nor is it their goal to build the local economy. They are corporation with world wide corporate interests and investments. Approval or not, they will at some point fold the tent and move on, leaving another generation of Iron Rangers looking for sustainable employment. In my opinion, let them leave now, and we will continue to sustain the wilderness areas of Minnesota for future generations of Minnesotans and our global tourists. Elaine Brown 15761 Rivers Edge Drive Milaca, MN 56353

Dear Federal and State Agency Leaders: In 2010, the U.S. Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory. The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Federal and State Agency Leaders: The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands and waterways. 500 Years of monitoring is not a realistic plan. Jobs for a short time will not balance out the extreme risk current mining operations pose to the area. It would be cheaper to pay those workers for twenty years to stay home and not take on the mining risk. We are not the only generation. Future mining methods will hopefully be created that don't pose so great a risk. The minerals will still be there, and future technology will hopefully be discovered that mitigate some of the extreme environmental risk we currently are considering. A realistic plan would lay out years to mine, years to close down the mine, and years to monitor the plan, with a timeline completed within a human lifetime. That would be a plan that could be considered for permitting responsibly by today's agencies. Please reject the PolyMet SDEIS and deny permits. The known risks are too great. Sincerely Elaine Loeffler 7197 Highway 1 Finland, MN 55603 2182268623

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years. The SDEIS must be redone, because its predictions are unreliable and its methods conceal environmental impacts. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. Sincerely yours, Elaine Mayer 1432 20th St NW Rochester, MN 55901

Dear Ms Fay, Dear Federal and State Agency Leaders: NO AMOUNT of "progress" or "economic advancement" or "more jobs" or corporate gain, or more tax revenue is worth the price of polluting our land and water, destroying wetlands, poisoning our children (and adults, and livestock, and pets, and wildlife), killing fish, poisoning rivers and groundwater used for drinking water and irrigation, and negatively affecting our entire food chain and living habitat in this part of our beautiful and otherwise mostly healthy state. We all live downstream. Please reject the PolyMet SDEIS and deny ALL permits for proposed activities that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Elaine M. Thruene Elaine Thruene 708 Riverside Ave S Sartell, MN 56377

Elaine Tucker

57876

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Elanne Palcich

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 NorthMetSDEIS.dnr@state.mn.us Tamara Cameron US Army Corps of Engineers St Paul District, Regulatory Branch 180 5th Street E, Suite 700 Saint Paul, MN 55101 tamara.e.cameron@usace.army.mil Tim Dabney USDA-Forest Service Superior National Forest 8901 Grand Ave Place Duluth, MN 55606 tdabney@fs.fed.us March 13, 2014 RE: PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) I am submitting these comments as a life-long resident of the Iron Range. The impacts of taconite mining upon the landscape and the watershed are becoming increasingly apparent, and the severity of those impacts are gradually being made known to the public. I believe that we are entering an age that will demand more transparency from our governmental agencies, as individual citizens take it upon themselves to become more informed. My comments are as follows: Problems Concerning the Proposed US Forest Service Land Exchange, Loss of Wetlands The US Forest Service Land Exchange, as part of the PolyMet SDEIS, is lacking in several significant areas. (1) The Land Exchange bypasses the most important obligation of the US Forest Service, which is that of protecting the surface area of land purchased under the Weeks Act. (2) The Forest Service omitted an underground mine option as the only legal alternative; because it was omitted, the plan was never analyzed. As a result, the Forest Service has wasted tax payer money and agency time on the preparation of an open pit proposal that cannot meet the obligations belonging to the Forest Service. (3) The rationale for choosing the proposed parcels to be exchanged fails to demonstrate that this would be an equal exchange. (4) The Forest Service fails to adequately analyze the loss of wetlands and Aquatic Resources of National Importance (ARNI). The loss of wetlands in acreage would be significant and the quality of the wetlands irreplaceable. (5) The Forest Service fails to adequately analyze the loss of wildlife, bird and migratory bird habitat, and the loss of wildlife corridors. Of great concern is the lack of analysis on impacts to threatened or endangered wildlife species or Regional Forester Sensitive Species (RFSS) of plants. In addition, the concept of a land exchange as put forth by the Forest Service presents a precedence that would greatly facilitate the opening of a sulfide mine district in what is now Superior National Forest The Forest Service is thus removing itself from its over-riding obligation to the citizens of this state and nation, in which land was put aside in order to protect the watershed and preserve the natural quality and character of the land for all generations. This land exchange instead amounts to a give-away of public land to a Canadian mining company with global ties, and in which any metals would be directly sold on the global market, most likely to China (based upon an agreement with main investor Glencore-Xstrata). The Forest Service also fails to adequately analyze the economic impact of copper-nickel sulfide mining in northeast Minnesota, by neglecting to analyze the costs of degradation to the environment over a time frame of 500 years or more, and by not considering the loss of current and potential jobs that are based on a clean environment. Nor is there any analysis of actual loss of these metals as a domestic source. The loss of 6,000 acres of Superior National Forest for a large scale mining operation is unacceptable. But to make matters worse, the Forest Service has neglected to adequately analyze cumulative impacts to the Forest, including continued mineral exploration, taconite mine expansion, and potential copper-nickel mining proposals from Teck Cominco and Twin Metals. The Forest Service has failed to fulfil

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Elayne Lappi Virginia, Minnesota

Dear Ms Fay, Dear Ms Fay and Mr Bruner, There are so many problems with the PolyMet NorthMet SDEIS that it's hard to know where to start. Minnesota has always been a leader in preserving the environment and providing a beautiful state for those who want to enjoy unspoiled nature. Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential imp

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project. The jobs gained are not worth the damage.

58077

I am strongly opposed to the NorthMet mining project. Even though it would create some jobs, the damage to our environment more than offsets the benefit of the jobs. I believe if the project goes through, tourism jobs would be lost. We need to preserve our environment and increase jobs not by mining but by developing alternative energy sources. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Elena Willmot 45104

Hello, My name is Elena Willmot, and I'm a graduate student at the University of Wisconsin-Madison. I am asking that you please reject the PolyMet Mining Inc. Project (SDEIS) which plans to exchange 6,650 acres of national forests to create an open-pit sulfide mine in northern Minnesota. The Fact Sheets provided by the Minnesota DNR suggest that "There would be few cumulative effects from the [PolyMet Project] The affected resources included water quantity and quality, air quality, wetlands, and vegetation." While the number of resources affected may seem small, their impacts are overwhelmingly important in the regional and global climate. Air quality, especially, does not have simple local effects but can affect neighboring communities, states, or countries. Not to mention that increases in CO2 emissions on the order of 200,000 metric tons per year is the last thing this planet needs. The mining technology is outdated and no longer suited for this environment if we hope to maintain the beauty of our national parks. Many people in Wisconsin speak about northern Minnesota as their sacred place: the place to which they retreat to find peace, comfort, and pleasure. I, personally, have not yet been to northern Minnesota, but I would hate my first trip to include dirty water, foul air, and no wildlife. I have every intention to visit this summer, and I sure hope this project has long been rejected by then. I urge you to make the right decision and reject this project. Best Regards, Elena Willmot Mailing Address: 432 W Wilson St, #6 Madison, WI 53703

Eleni Johnson 54532

Please think about the cost, payoff & benefit. Worth the cost is the land and the water, the benefit is jobs and the payoff is both you getting to say you've created jobs and you making money. Let's think creatively in 2014., THERE ARE OTHER WAYS TO CREATE JOBS. DO THE RIGHT THING.

Dear ms. lisa fay I'd like to have a minute of your time to let you know my most unadulterated feelings towards that of the mining near the boundary waters. The mere fact that even considering mining near any pure water, untouched by chemicals and etc, is the most degrading consideration to those who care, who just want to protect the land and the water surrounding/in the boundary waters. The mining that may take place, which shouldn't, will definitely affect the BWCA. This should go without saying that this is wrong and unjust to a environment will no say, and with way off fight bad on the big machinery that will try to wiggle it's way in. Also to mention that those who are pushing the mining in the BWCA are Are blatantly putting false images of the swamp that the mining would lead into. The fact is they're falsifying facts by removing from view of citizens the connected creek of lanely to the BWCA .Only allowing you to see the river to lake superior, And people believe this!. There are two connecting waterways through the swamp;lanely creek connected to BWCA and partridge river that connects to lake superior. The thing is that this would be simple to sway people back to the side of protecting the BWCA if they knew that this were effecting the BWCA, but the mining companies are doing great at lying and just being straight up unethical. I really think that this needs to be stopped and nipped in the bud. And i think in order to justify that this won't affect the BWCA is to then place two water wells in the swamp and in Langley creek to test the transportation of dye in the run off. Then we should have a answer of how this will affect the people on the side BWCCA and the BWCA. Help in the fight to protect The boundary waters, please!Sincerely,Elexus garcia Of humboldt high school tenth grade chemistry class.

Eli Bissonett

Thank you for providing the PolyMet SDEIS for public viewing, and thank you for this opportunity to share my comments, questions, and suggestions. Though the NorthMet Project Proposed Action concisely outlines proposed environmental and economic impacts of the proposed PGE mine, please consider the following SDEIS modifications to help better inform the public about the effects of the mine if it is ultimately permitted. 1- Financial Assurance Please provide clearer parameters on what types, and what degree of environmental pollution a "damage deposit" would and would not be used for. Please describe a realistic and enduring legal framework for financial assurance that would render damage deposits bankruptcy-proof. What is the agreed definition of "bankruptcy-proof", among Polymet and all involved agencies. Please include in the SDEIS a requirement that the largest shareholder of PolyMet stock (currently Glencore, and whoever it happens to be in the future) be held legally accountable to share the financial responsibility of cleaning up any pollution from mining operations that exceeds legal levels. 2- Water Quality Please include more qualitative modeling of the effects of the proposed action on mercury in fish, flora, and fauna. Correlate a spectrum of mercury exposure to actual physical effects on these organisms Create a similar correlation with regard to lead and aluminum contamination risks mentioned in the Executive Summary. Please do the same with regard to possible manganese and arsenic pollution. Please address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. Please redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity. Please don't let the SDEIS wording underestimate the possible magnitude of ground water base flow unpredictabilities, especially those incurred by seasonal fluctuations of water levels. The 2013 SDEIS appears to be making this underestimation. 3- Public Health Please conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Organizations in communities affected by the St Louis River Watershed, such as the Duluth YMCA, have already publicly requested that this HIA be conducted. Please provide detailed descriptions or modeling of how PolyMet mining operations could strain existing health and social service infrastructure. Thank you for considering my comments. Please provide reasonably detailed responses that specifically address my bulleted concerns. Sincerely, Eli Bissonett

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. This mine is short sighted and would permanently impair the environmental quality of one of the most biologically rich areas of Minnesota. Sulfide mining has never been shown to not pollute and we can expect to be dealing with the pollution from Polymet long after Polymet has gone bankrupt. Who pays for pollution. we the tax payers of MN will be paying for it, not the mining company. The lakes of the BWCAW already have high levels of mercury pollution, making the fish in some lakes unsafe for human consumption. Polymet must not be allowed to add to the mercury load of these already threatened water bodies. Furthermore Polymet there is a good chance that Polymet would leach acid mine drainage into area lakes and streams that have inherently low buffering capacity. This could make much of the affected areas unsuitable for growing wild rice. PolyMet must show it would not increase sulfate concentrations in these areas. However, it fails to do so. The mine plan inaccurately describes wild rice waters, understating the area that supports stands of wild rice. In addition, the mine plan claims to reduce sulfates, but that assumes that expensive water treatment will continue for hundreds of years. Millions of gallons of untreated polluted water will escape every year, and the mine plan predicts an increased chance that water exceeding the sulfate standard will be released at times, years after closure. Sincerely, Mr Elias Anoszko 948 Cromwell Ave Saint Paul, MN 55114-1123

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr Elif Cingi 7659 W 14th St Minneapolis, MN 55426-2002 (952) 544-1368

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: • Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. • Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. • Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. • Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. • Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: • The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. • The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. • The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are threatened, endangered or of significance to tribes. • The SDEIS fails to study cumulative adverse impacts on moose of the PolyMet project and other activities that destroy habitat and increase global climate change. • The SDEIS fails to provide a cumulative analysis of impact

To Whom This May Concern, It is absurd that we would allow PolyMet, an international corporation that has no interest in the long term future health of our environment and it's inhabitants, to embark upon the sulfide mining project in NE Minnesota. From close inspection upon the SDEIS, it seems their study is based upon tests that stretch the truth or conveniently have performed their tests so that outcomes are falsely positive. There has never been a mining project that hasn't polluted. There is also a long list of previous mining projects that have failed to meet environmental standards, leaving the area polluted and sticking the local government and its taxpayers to pay for clean up, or more likely, to live with the pollution because clean up is too expensive and often not even possible. We must consider the long term costs of these open pit mines; the costs of the pollution of an undetermined area for an undetermined time. It seems obvious that the risks far outweigh the potential benefits of this project. Why would we sacrifice even an acre for the short term impact of a few jobs and a bump in the economy when we know the benefits (if there are any) would be temporary and the negative consequences would certainly be passed onto countless future generations. Who will be responsible for the long term management of the water and area polluted by this mine. Of course the company and its investors should be, but we know the company will try to weasel out of any clean up and long term pollution management. They have structured their corporation in a way that "legally" enables them to escape responsibility. The major investor of this project, Glencoe, a Swiss owned company has a long history of illegal activity. Responsible mining and clean up is not in their for profit interest If we could see the future, the choice would be clear. 526 acres of land on the edge of the BWCAWA turned upside down, 167 million tons of waste rock covered by black plastic, supposedly enclosed in a waste treatment system, that requires continuous monitoring and maintenance for centuries to contain the toxins, which is realistically impossible. Hundreds of miles of dusty roads traveled by loud and smelly, polluting trucks, noise, light pollution. These mines are nothing like the Taconite mines of the past If we could see the financial and societal costs of pollution seeping through bedrock, into lakes, wetlands, the atmosphere, fish, birds and finally into our bodies, we would obviously stand up and say no. No, thank you. It is not our duty to mine these minerals and we are not forced to accept the environmental damage. Our arms are being twisted by the power of money, but this is our choice and this is our future. It would be negligent of us to not question and thoroughly study the claims made by the company in the SDEIS report. Considering the impact of this project, it is logical to extend the comment period from 90 days to 180 days or more. I have moved to the north woods to be near the quiet beauty of wilderness areas. The fact that water can be sipped from a BWCA lake, that wild rice can be harvested, is invaluable and this is at stake. People travel from around the world to experience the rare purity and silence of this wilderness. Please reject the Poly-Met SDEIS and deny permits that would allow open pit sulfide mines. Please extend the comment period to allow the public fair time to investigate and comment upon the topic. Please protect our waters, the people that live here and the beauty that makes this one of Minnesota's favorite places to visit. Elise Kyllo PO Bo 71 Grand Marais MN 55604 ekyllo@hotmail-com

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I am against sulfide mining in Minnesota. It would threaten wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I've haven't been to the Boundary Waters yet - I want it to last until I get there, and for generations after me. I have grave concerns about this project's potential impacts on the region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Elise Moser 1200 Water St Sauk City, WI 53583-1658

3/13/14 Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay I am writing to request the immediate termination of PolyMet's project to implement the first open-pit copper-nickel mine in an area comprised of wetlands and water ways that could lead to the possible contamination of the Boundary Waters and Lake Superior. The reasoning behind this request is the many drastic consequences that this project will bring to that particular area, with respect to its ecology and populations. On the one hand, PolyMet claims that this project will provide 500 jobs during peak constructions periods and 360 during operations, generating substantial revenue for the state and it's people. The society we live in requires copper for many various uses, ranging from household uses to renewable energies. On the other hand, we have to take into account the consequences that a project of this magnitude will generate. Indeed, the digging of the mine will generate 533 million tons of waste rock in a 20-year span. Moreover, the mine is located on top of a sulfide-containing matrix. In contact with water and oxygen, sulfide oxides will release heavy metals in the ground and the water bodies around the mine. Decades after the mine has been closed, those heavy metals will remain in the soil and the water. That will be the same water in which many organisms have found their habitat, the same water used to grow our crops, and the same that will eventually be used for human consumption. All the other species living in that area will be put at risk as well. The birds, fish, mammals, all part of the food chain, will be contaminated, and contaminate the organisms that prey upon them. Alternatives to open-pit mining do exist, such as hydrometallurgy. A leach liquor solution is used to extract the precious metal. An extractant is then used to extract the metal out of the solution then purified for use. This process will not generate millions of tons of rock waste, cheaper and more environmentally friendly than the traditional mining processes that cause a lot of pollution. Much research is underway in order to perfect the process, but it is a step in the positive for a more sustainable way of gathering minerals that are predominant in our every day lives. Despite the intention of PolyMet to install a wastewater treatment plant, the pollution that will be caused by the mine will take far too much time and resources to clean up. There are benefits to this mining pit, namely the much needed copper. However, the cascade of drastic consequences the pollution will bring, leading up to health issues in human populations. For these reasons, I strongly urge you to put a stop to this project. Sincerely Elisee Joel Angoran 3905 Buttonwood Drive Columbia MO, 65201 ejat27@mail.missouri-edu

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Eliza Schrader 139 Saint James Place Brooklyn, NY 11238

Elizabeth A. Phyle 43954

I do not support the proposed mining project. It is not a wise investment for Minnesota's economic or ecological future. The benefits of job creation and mineral access are simply not outweighed by the heavy costs. These are the following costs that I see as most detrimental: Minnesota is lucky enough to have such a large freshwater resource, which will only increase in value as fresh water become more scarce. The estimated 500 years of water clean up that will be necessary if this project is approved, far out ways the short term benefit. If all of the real costs of this project was taken into account it would not be a profitable venture. The foreign companies should not be able to generate these externalities in Minnesota and leave with the bulk of the profit. Please consider this before starting a mining project that will harm Minnesotans for many years to come. This mining proposal is a bad idea. Elizabeth Phyle Resident of Plymouth, MN

Elizabeth Ann Fryberger 57138

Have your say on PolyMet –Minnesota is the land of 10,000 lakes – a watershed state. Water is vital to life and Minnesota must protect this dwindling vital resource. It is unconscionable to pollute Minnesota. Just say NO!Elizabeth Ann Fryberger3399 Riley RdDuluth, MN 55803

Elizabeth Bartlett 43416

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. The people whose health would be most impacted are the miners and their families, probably for generations to come, the local indigenous population, and first and foremost women and children, including fetal health. Even small doses of mercury, methylmercury, lead, arsenic at critical moments of fetal development will cause irreversible damage to internal organs, spinal development, and brain development. We pressure pregnant women to be sure not to drink alcohol, not to use drugs, not to smoke, be sure to eat healthy meals, etc, but what about all the toxins in the air we breathe, the water we drink. Would the owners of Polymet be willing to have the pregnant women among their loved ones be exposed to the toxins that will be released in this mining project. I say, that they themselves must be willing to live here, drink this water, breathe this air. This is a multinational corporation which has no stake in the local population. These are critical issues. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Elizabeth Bartlett 2215 Heather Ave Duluth, MN 55803-1431

Elizabeth Brombach 42112

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Elizabeth Brombach 2214 Goodrich Ave Saint Paul, MN 55105-1022 (651) 699-8466

39357

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Feb 18, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. Five hundred years is a very long time. Five hundred years ago Columbus had just "discovered" the New World. How can a mine whose toxic water drainage will require treatment for 500 years even be considered for a permit. What effect will a 6-foot rise in sea level from global warming have on Lake Superior's level, and on the mine area. Will the mine be underwater. What happens to all the toxic runoff if the mine is flooded. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Is all the water from those ten square miles of wetlands that will be "dewatered" going to run into the mine pit. Eleven point four square miles (the dewatered 10 plus the 1-4 of the mine itself) of prime wetlands is a lot of frogs, baby fish, herons and egrets, ducks, etc killed or made homeless. How do you dig a pit mine in a wetland, anyway. Can it be economically feasible, with constant water seepage and expensive water treatment necessary for 500 years. Or does the operator plan to simply quit treating the wastewater when they quit mining and who cares about poisoning every living thing for the rest of the 500 years. Whatever fines they are charged will probably be cheaper than treating the water would be, so they will just pay the fines and let the poison continue to run out of their pit. It's public land after all-it's not like it is theirs to care about. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Elizabeth Cerny 7728 Williams St Downers Grove, IL 60516-4408

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. This also threatens the entire economy of the region, which depends heavily on tourism, hunting and fishing and guide services for canoe trips into these waterways. Fishing will certainly end when the fish are no longer safe to eat, if the fish manage to survive in the polluted water. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The mining company admits that the wastewater would need treatment for at least 500 years. Will they be there treating it 500 years into the future. Five hundred years ago, Columbus had just bumped into this unexpected land mass between Spain and India-how can any company possibly say what they will do for the next 500 years; but we know what the acidic, poisonous runoff water will be doing throughout that half-millennium: continuing to pollute everything downstream of the played-out mine. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Doesn't an "open pit" mine automatically mean cutting down and digging up a large area of forest Plus all the surrounding trees that need to be cut for access roads, our truck heavy roads, waste storage, water retention ponds, and whatever else such a desecration of the entire forest environment would entail. The noise pollution of the forest silence alone would scare off every animal for miles around. You can not plunk such an operation down in the middle of a forest and pretend there will be no effect on the surrounding forest, even in the areas where the trees remain standing. Sincerely, Elizabeth Cerny 7728 Williams St Downers Grove, IL 60516-4408 (630) 971-3891

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Elizabeth Dokken 4201 Parklawn #301 Edina, MN 55435

To Whom it May Concern, My name is Betsy Watson and I am a senior at the College of St Benedict, graduating this May. Although I didn't grow up near Lake Superior or the Boundary Waters, I have made numerous trips to those areas since coming to college and I have determined that they are some of my favorite places to be. As a Minnesotan I have become extremely proud of these waters and feel that they make up a huge part of our state. No sulfide mine has ever operated without polluting nearby waters- and the rivers near the PolyMet mining proposed area flow into Lake Superior and are dangerously close to the BWCA. I can't see how these waters would not be affected and contaminated by the sulfide mining. PolyMet's model even shows that there will be need for water treatment of 500 years in order to fully decontaminate the water. Water is something that we are proud of in Minnesota, and I would hate to see that pride destroyed for 20 years of sulfide mining. I would be extremely upset and disappointed if the Minnesota DNR decided to accept PolyMet's proposal. Sincerely, Betsy Watson College of St Benedict 37 S. College Avenue St Joseph, MN 56374

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Dear Governor Dayton and Minnesota Department of Natural Resources: , My husband and I have lived on the South shore of Gunflint Lake, Minnesota for twenty years. We have always been thankful. for the priceless gift of clean water not only for the people who live and visit here as tourists, but also for the animals and birds. And I am very grateful to the Audubon Society for helping me to express my concerns about the PolyMet Mining plans. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Although I am not a scientist I am deeply concerned about this problem. Sincerely, Elizabeth Ann Edinger 483 South Gunflint Lake Grand Marais, Minnesota 55604 Sincerely, Mrs Elizabeth Edinger 483 S Gunflint Lk Grand Marais, MN 55604-2062

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Elizabeth Hope 10134 170th St E. Nerstrand, MN 55053

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are there

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Elizabeth Lempp 36365 Pine Grove Lane Sturgeon Lake, MN 55783

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. This mine sends us in the wrong direction for caring for our state and it's beautiful lands, which belong to ALL Minnesotans. I hiked in Superior National Forest last year and I don't want it to be the last time. That mine benefits Minnesota in no way whatsoever. We need to follow Wisconsin's lead and ban this type of mining forever. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Elizabeth Maus 9148 Upton Ave S Bloomington, MN 55431-2150

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Elizabeth Merz 111 W. Lincoln Ave, #305 #305 Fergus Falls, MN 56537 218-998-3145

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

A state that prides itself in its lakes - the PolyMets Toxic Sulfide Mine will DEFINETLY endanger this resource. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear agency officials now considering PolyMet's North Met SDEIS, My overall concern about the SDEIS is that it fails to show to how toxins will be kept out of the water systems leading to Lake Superior. The water "treatment" and collection systems under rock waste piles being managed by pumps at the end of 2 mile long rock piles 25 stories high seem inadequate to keep leaching toxins from entering the water ways. With the many possibilities and probabilities that those systems could fail in their goal to prevent water pollution, I believe that PolyMet's plan is inadequate. Planning to pile sulfide bearing tailings on an old LTV pit storage area (originally meant for iron tailings to drain into streams) is irresponsible. What bothers me is the unfounded claims by PolyMet to be able to collect the rain run off for treatment in a wetland rich area, to somehow "contain" the toxins and then treat them sufficiently with pumps and treatment systems that would need to be in place for as much as 200-500 years, their models and graphs showing that the toxins will increase as these tailings piles age- leaching more toxins by many times as much in about 40 years' time and long after companies could be held accountable all of the floods and accidents that could occur, and the fact that the SDEIS is inadequate in addressing such probable accidents or floods. Besides those flaws, there are fractures in the earth below the PolyMet site, and new fractures would no doubt be created by the several times a week mine blasting. I don't believe PolyMet's plan to build a 5 mile long cement wall to bed rock would be sufficient to "hold" toxins from leaching into water systems. I can't imagine how the geological evidence showing such a water rich landscape could possibly kept out of harm's way during such an enormous mining operation. I have trouble believing that 32,000 tons of waste rock produced every day, hauled in trucks, dumped on wetlands- every day for 20 or so years, will not have ample opportunity to leach devastating amounts of sulfide content, mercury, cobalt etc. There are not sufficient safeguards in case of flooding, or accidents or spills addressed in the SDEIS. PolyMet's SDEIS shows more "hopeful" predictions of water flow than are even realistic. Since the water flow data in the models used by PolyMet are now shown to be inaccurate, I have less faith in claims of "safe levels of toxins" to be emitted by PolyMet's mine operation. PolyMet has not shown us a feasible or plausible way to both mine copper/nickel, and keep the water from getting contaminated. Already we have exceeded standards of water quality in mercury and sulfates in the St. Louis River, and I believe it is absolutely irresponsible to open the gate for one more mining operation- to tolerate any more mercury, no matter if it abides by current laws. PolyMet, no matter if it complies with the law, WILL add to the mercury content that already exists in the St Louis River and Lake Superior. In Minnesota the other mining operations have hardly been held accountable to clean up their act, and the former LTV site that PolyMet will use already and still exceeds water quality standards based on the old mining operation. The StLouis River still has high enough mercury content to issue health warnings of fish consumption. The Fond du Lac Tribes have been constantly having to bring lawsuits to keep the iron mining companies in compliance, or to try and get them to clean up their act already and this is at a very high cost to a community that has very little financial infrastructure to keep having to fight these mining corporations in order to force compliance. One in ten children born in this part of the state have higher mercury levels, levels that are known to significantly impair cognitive function. According to the Minnesota Environmental Rights Act, each person is entitled by right to the protection, preservations and enhancement of air, water, land, and other na

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest As someone who spends part of the summer near Lake Superior in the Upper Peninsula of Michigan, the purity of Lake Superior is of great interest to us. It's one of the few fresh water lakes that still has relatively clear water, relatively non-toxic fish and wildlife that is not seen in other areas of the country and that is threatened by environmental pollution. Please consider the long-term health of the region in preference to a short-term economic gain. Sincerely, Elizabeth Swarhout 6739 Richmond Ave Richmond, CA 94805-2079 (510) 215-1647

The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest I just know, that Lake Superior is one of the most beautiful and natural places left in our province. It is a place where there is still a home for the animals we love. It is a place we can go to and get back to a peaceful, healthy environment. Don't destroy such a beautiful spot. Sincerely, Elizabeth Vance, P.O. Box 275, Flesherton, Ontario. N0C 1E0 Canada Sincerely, Elizabeth Vance P.O. Box 275 Flesherton, ON N0C 1E0 (519) 922-3118

Elizabeth Yoder 37881

Polymet's proposed NorthMet mine project should not be permitted because the risk to the environment is so great. The SDEIS admits this and proposes to deal with the results, but I, along with many others, do not believe either that it can be done or that Polymet has the financial resources to do it. My husband and I bought property here almost 20 years ago and retired here 10 years ago because we thought it was one of the few unspoiled places left in the country. Mining for precious metals in this water-rich environment could destroy it-as it has destroyed many other places on the planet. Elizabeth Yoder 1772 Hwy 120 Ely, MN 55731

Ellen Brown 9539

Please don't risk the environmental health of northern Minnesota and Lake Superior by permitting sulfide mining in the region. Thank you for accepting my comment. Ellen T Brown 874 Fairmount Avenue Saint Paul MN 55105 651-225-5650

Jan 28, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. This does not seem to be such a difficult decision. How can it possibly make sense to burden future generations with treating water. How will wildlife survive with polluted water. Who cares if there were jobs in this decade if the area is toxic in the next decade. The benefits of a few hundred jobs are simply just not worth these costs. Sincerely, Ms Ellen Jones 5261 Lochloy Dr Edina, MN 55436-2023 (952) 924-9048

Ellen Kent

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Ellen Kent 107 Hill Valley Dr Winchester, VA 22602-6108

Ellen Lafans

To whom it may concern, We have to tell you that our family will be very disappointed in the MINNESOTA DNR if they allow for the dirty mine up near our beloved Boundary Waters. We have been going to the BWCA for all of our lives and love Ely and that entire area. The sulfur can cause too many problems for too long to allow this to happen and truly, don't expect PolyMet to clean it up .. The contamination that occurs may in several decades. JUST SAY NO MINE. There must be another way to get some jobs up there. You will loose the tourism industry if something happens. Ellen Lafans, RN, MSN Dr Richard Lafans William Lafans Katie Lafans 3967 Worchester Drive Eagan, MN Cell 651-353-2741

Ellen Lease

47780

Dear Gentlepersons: I urge you to reject the Polymet Mining proposal. If it is true that this effort will produce only 90 highly technical jobs that locals will likely not be prepared to fill, it does not significantly decrease levels of unemployment in that county. If the estimates that water quality could be negatively impacted for as long as 500 years is accurate, there is no benefit to Minnesotans for allowing this to proceed. There is, in fact, great detriment. A despoiled ecosystem is never truly recovered. Please do not allow Polymet to establish a mine. Thank you, Ellen Lease

Ms Fey, My name is Ellen E. Mork. I live at 1013 Borgert Ave, St Cloud, MN 56303- I am responding to the request for public input on the PolyMet Copper-Nickel Mine. I am opposed to this mine. My background includes a MA in biology with a minor in chemistry. I understand the chemistry involved with sulfide exposure to water. I understand the consequences for water pollution and destruction of habitat for the animals and people of northern Minnesota. Moreover, I understand the consequences polluting that largest fresh-water body of water in America, if not the world – the Great Lakes. We simply cannot afford to fill them with mercury and acid mine drainage for the sake of a few jobs for 20 years max – that is a suicidal trade-off. Now to the specifics: Ø I am against selling off part of the Superior National Forest to a Canadian firm that has no experience in operating such a mine and requires the assistance of a Swiss firm (Glencore Xstrata) which has an abysmal record of environmental breaches. How can the DNR or the state of Minnesota pretend to control such a firm. Ø This mine would destroy over 900 acres of high quality wetlands and indirectly harm up to 8,264 acres. As you know, wetlands provide several positive functions for the health of our water: they help to filter and purify water to aid in local and downstream water quality. How can the DNR do anything but abide by the state laws regarding wetland preservation. Ø It is my understanding that there has been no plan produced for the mitigation of the loss of these wetlands, according to Minnesota law. Ø I have also learned that PolyMet plans to use the existing unlined tailings basin used for iron ore to hold the tailings from the sulfide ores. This is a plan for distribution of the sulfuric acid into the local streams, lakes and underground water supplies. It would be dangerous for those living within the range of these waters, as well as the fauna and flora in the vicinity. At the very least, they must be required to line that basin. Ø Since there are rivers near the mine and plant sites that flow into the St Louis River, it is obvious that these rivers will all be polluted with acid mine drainage. I have read that the St Louis River is already heavily polluted. How can we allow even more to occur. Ø Regardless of the inflated figures provided by PolyMet for new jobs in the region, experts know that the numbers are more like 350-400, many of whom would be “imported” from Canada and other regions where similar mines have been operating. Mining equipment has greatly changed since the iron mines were at their peak, according to those reporting on this aspect of the plan. PolyMet will want experienced workers to run these expensive machines. The number of jobs available to Minnesotans of the Range will be minimal. Ø I read everything written about PolyMet in the news. I understand that this SDEIS still does not contain financial assurances of funding to cover the 200-500 years of required clean-up that will continue to be needed to ensure that Minnesota taxpayers are not left holding the bag. This is one of the most egregious faults of mining firms everywhere. They all remove saleable product while there is ore in the ground and leave it to others to do their clean-up. Without financial assurance, Minnesota has nothing – no ore, no jobs, no income and a lot of outgo. Please reject this SDEIS on this factor alone.. Ø Geologists have reported the existence of underground fractures that could increase in number by the blasting that would occur to break up the sulfide ores. Each fracture would have the possibility of transporting pollution into the ground water. I can see no mitigation from this problem. Ø I have already alluded to the probability of mercury contamination in the waters of the north, already so high that babies born in the NE are exhibiting very hi

Comment Submitted by: Ellen Peterson 1990 Skillman Ave West Roseville, MN 55113 Attn: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Please see my comment below: The Poly Met NorthMet SDEIS does not fully consider all potential environmental impacts that this mine could have. My understanding of the purpose of environmental review is to investigate all areas in order to make certain the impact a project will have on its surrounding environment. In its current state, the Poly Met NorthMet SDEIS is erroneous, contradictory, and incomplete. My main concerns with the Poly Met NorthMet SDEIS are with the issue of protecting our water. As a citizen of the state of Minnesota who recognizes the significance of our geographic location – our proximity to an incredible source of fresh water, not to mention our Boundary Waters Canoe Area Wilderness, it is entirely unacceptable that my government – in this instance the DNR who is responsible for completing the environmental review process as well as for issuing the permits, would even consider taking such a massive risk without knowing for certain the outcomes. Please see, record and take action on the comments below pertaining to the specific issues found within the SDEIS itself: Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard. The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds

To Whomever It May Concern: I own property and reside in Babbitt, Minnesota. I am concerned that the PolyMet SDEIS is inadequate and fails to consider or address several important considerations regarding PolyMet's proposed NorthMet mine. I believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: Water Resources: Tribal hydrologists and MDNR staff have determined that the base flow rate of water in the Partridge River is two to three times higher than the number used in the SDEIS. The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Cumulative Effects of the Mine: Minnesota Rules 6132-3200 requires that the mine site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment. The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The SDEIS must be redone to include detailed financial assurances of how Polymet will continue to monitor and maintain its water treatment system over this 500-year span. The SDEIS also fails to assess the impacts of possible slope and dam failure at the mine site waste rock piles and the tailings piles. The SDEIS must be redone to include assessments of possible pollution and other impacts resulting from failures at either of these sites. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS must be redone to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment at the mine. Please reject the current SDEIS and require further investigation of these unaddressed issues. After weighing the proposed benefits of the mine against the many risks to water resources, wildlife, cultural resources, and community members who live near the mine that are outlined in detail in the SDEIS, I ask that you reject Polymet's proposed project in favor of other projects that carry lower pollution and health risks. Sincerely Yours, Ellen Root 3298 Lenont Road Babbitt, MN 55706

Ellen Segal

40348

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Ellen Segal 1066 San Jacinto Way Palm Springs, CA 92262 US

I am from a family that has had a summer home in Northern Minnesota since 1950- Over the years, we have spent nearly every summer there, and some winter breaks. We come because of the pristine wilderness and clean water of the BWCAW, and often eat meals and visit tourist sites along Lake Superior's North Shore. Our wonderful experience is one of the reasons that both of our children have looked at Minnesota for college. Our daughter is currently a freshman at Carleton College, and our son has applied to the University of Minnesota. Businesses in the state of Minnesota are getting a very high percentage of our family's money at the present time. Over the years, we have introduced many people to the beautiful North Woods, and often they have returned again on their own for additional vacations. Minnesota wouldn't have much to offer without the pristine wilderness-I can't think of any other reason we would routinely drive hundreds of miles to come to your state. This must be true for hundreds of thousands of tourists. The proposed copper/nickel sulfide mine is putting all of that at risk. It is virtually certain to pollute vast areas of wetlands-wetlands which are disappearing all over the country, and with them important habitat, water filtration, and other ecological services. Furthermore, the history of this industry is one of making big messes, declaring bankruptcy, and then letting the taxpayers take on the clean-up bill. I urge you to reject this proposal. Ellen Thomas 2616 Hillshire Drive Columbia, MO 65203

Elli King

Hello. My name is Elli King. I live with my family in the woods outside of Finland, Minnesota. We have lived there for ten years. The main concern that I want to express today is the rise in sulfate levels (inaudible) PolyMet's draft EIS predicts. My family is practicing subsistence living. We currently harvest or grow 80 percent of our food and are also in the process of two initiatives, wilderness guiding and wilderness education for most financial sustenance and in community service. Our harvest takes (inaudible) all around the county. And I have neighbors and friends from Hoyt Lakes. My understanding is that any significant increase in sulfates in our water will inhibit the growth of wild rice. And that sulfates are a key component in the accumulation of you mercury in fish. Fish and wild rice and ducks who live on rice as they migrate in the fall are food staples of my family as well as that of many others in my community. I have a real founded fear of not being available to us anymore. And they are secondarily also important to our economy. While the EIS does speak to this issue as being controlling sulfate, the EIS is incomplete. At best I feel that further hydrological research and more developed refined filtration systems need to be explored. Also, I have intimate information that the base flow of the Partridge River was miscalculated for this EIS. And I don't think there's been time to investigate that yet, but I would ask of you that you investigate that, please. The acknowledged time span of hundreds of year of water treatment (inaudible). I don't see how anyone can submit to that. And it seems (inaudible) for taxpayer expense. I am also worried about the precedent that this project would set because there is a much larger similar project being explored. So if this is approved on a small level, I'm worried about that transferring over. So in summary, I guess I'm fearing that our community over time will lose major food sources and a good slice of our economic potential. To me those would be unacceptable in fact for any project. Please consider the value of these resources to our community and the risks they will undertake if this project is approved.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Eleanor King-Gallagher Elli King P.O. Box 526 Finland, MN 55603 218 220 8997

Ellie Hofman

Dear DNR- I am a 15 year old who lives on Lake Superior. I have a cabin near the BWCAW and each year take at least two camping trips into the BWCAW. I am concerned about the sulfide mining polluting our lakes. As I grow up I hope to be able to enjoy the natural wilderness as I do today. I won't be able to if we start sulfide mining. There have been no sulfide mining attempts that have not polluted water systems This would be a permanent pollution that could harm our entire ecosystem. The pollution is the biggest concern of mine but the cleanup could be left to all the taxpayers. Companies like Polymet have reputations of running out of money on the mining then leaving the cleanup to the taxpayers. So what are we going to get out of the mining. The metal and jobs. To me ruining our water systems and ecosystem is not worth the temporary jobs and metals. Please stop the sulfide mining and let the younger generations enjoy the natural beauty that northern Minnesota has to offer. Thank You Ellie Hoffman

I'm fully behind the Polymet project. I've attended the meeting in St Paul, listened to all the arguments (both pro and con), and was privileged to tour the entire site. I feel the benefits of this project are enormous. I have friends and relatives that live in the area, and they are all wholeheartedly behind the project. These are people who have been involved in mining in the area for generations, but are also a part of the land and want it to remain clean. They don't feel that there's a risk that they will have their backyards polluted. I have also been an ardent fan and user of the Boundary Waters, camping and canoeing for over 40 years. I see no evidence that this project will change the nature of the surrounding area. I fully support the project. Elliot Nordquist 2424 Flag Ave So. St Louis Park, Mn. 55426

Feb 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: As someone who cares a great deal about the natural environment in northern Minnesota, I ask you to please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Elly Huston Minnesota resident Elly Huston 200 Cheyenne Trail Wayzata, MN 55391

There has never been a non-polluting copper/nickel mine such as Polymet proposes. Let's recycle instead! Stop the mine! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnninage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Elsie Dyke

MY COMMENTS ON THE INADEQUACY OF THE POLYMET SDEIS 1) THE ONLY REASON TO PERMIT POLYMET IS FINANCIAL: + The Minnesota Environmental Rights Act states that economic considerations alone cannot justify the destruction of our precious natural resources. Clearly the PolyMet plan will result in environmental destruction and degradation (loss of valuable wetlands, loss of an important wildlife corridor, the huge amount of electrical energy needed, and the seemingly-inevitable long-term leakage of heavy metals and toxic water). Given that these metals (especially copper) are readily found elsewhere in less water-rich parts of the planet, it would seem that the main reason to permit the PolyMet mining plan is, in fact, financial. + But the PolyMet SDEIS is quite vague on specifics about how the operation will benefit the Minnesota economy. Where are the company's assurances of wage levels and benefits. Should there not be a realistic analysis of how many jobs will be offered to Iron Rangers (rather than commuters who are apt to spend most of their income elsewhere). Further, is there any way to hold PolyMet (and its parent corporation) legally obliged to fulfill its promised local hires and wage levels. If the reason to permit this project is local jobs, should not the SDEIS offer us a detailed description of the types and number of jobs that will be available for local hires. 2) INCREASE THE PRODUCTION TAX: + As Aaron Brown ("MinnesotaBrown") wrote, "We enter into a negotiation, not a pep rally. The mining company will protect its interests; the community must do the same. Communities that fail to do this are exploited." Of course PolyMet and its parent corporation are mainly interested in maximizing their profits. If we permit this industry for the benefit not of the corporation but of the people of Minnesota, should we not raise the meager percent of taxes they will return to the state. An investigative journalism article in the Ely Timberjay (Jan. 17, 2014) reveals that local tax revenues generated by area taconite mines have been falling behind inflation, even as taconite prices have soared. It makes no sense to sell off these world-class non-renewable resources so cheaply. After all, these mineral deposits are not going anywhere until we decide to sell them, and as time goes on the value will only increase and, hopefully, the techniques for safe extraction will improve - and be proven foolproof elsewhere firSt 3) FINANCIAL ASSURANCE: + And then there is the matter of financial assurance for future treatment and mitigation of contaminants that could escape into our surface and ground waterways for generations. Will PolyMet be willing to set aside enough money to completely pay for the monitoring of containment barriers, the quick repair of leaks caused, say, by some unexpected flood or earthquake of the century, the maintenance (and eventual replacement) of reverse osmosis installations, etc + Should not the public be told now how this huge sum of money will be paid and held safely in escrow for future maintenance and clean-up. Why is the SDEIS so vague on this critical and thorny issue. Any short-term financial benefits to Minnesotans will be more than negated in the long run if clean-up costs fall yet again on taxpayers. + I also wonder if there is a way to hold the parent corporation legally responsible for future clean-up costs once the PolyMet subsidiary declares bankruptcy or simply dissolves when the North Met project is no longer profitable. 4) NEGATIVE IMPACT ON LOCAL ECONOMY: + The PolyMet PDEIS is inadequate in its failure to include an analysis of the costs of this mining proposal to the local economy. Is there a realistic estimate of lost income from tourism, fishing and hunting licenses, etc, should a large hunk of the Superior National Forest be lost to heavy industry. Local realtors tell me that property values, and buyers, in the vicinity are already decreasing. + Also, what protections and compensations are in p

To whom it may concern, As someone who knows many at Polymet and many in the communities they will be impacting, I continue to be impressed by the level of care and concern they take in doing what's right for the community and the state as a whole. The economic development they will bring, while paving the way as the benchmark for clean, environmentally friendly mining, shows that collaboration is key to moving our state forward as an economic, industrial, and conservationist leader in the US. I grew up on the Canadian Border of Minnesota in a small town called Baudette. Through my time in that community and my last 15 years in the urban parts of this state, I have a unique perspective. I have seen what happens when small towns lose their primary sources of employment. I have seen the small town values that bind people together and create excellent school systems, communities, and cultural centers, but I have also driven through northern MN to see abandoned homes, dilapidated farms, and far too many people living without the necessary heating and provisions to raise their families appropriately. I have lived through and seen the sad decline of my hometown and many others on the iron range. I have also experienced the perception of what "northern MN" is and those opinions held by the majority of our population that dwell in the city. Everyone is entitled to their own opinions and comes from different backgrounds, but Polymet has shown that they are committed to meeting and have met every environmental standard that has been set forth by the state of MN and the many professionals and academics who are charged with caring for and regulating the mining industry and so many more. I hope you will remember this when you make your final decisions around the permitting of this project. The futures of many Minnesotans are at stake. Hi, everyone. My name is Elyse Dornhecker. I need to spell that. D-O-R-N-H-E-C-K-E-R. I grew up in Northern Minnesota. I know we have already talked about that. It is actually on the Canadian border. I was raised near the river and had a lot of recreation activity (phonetic) and we can talk about eating fish and whatnot and, you know, the impact on the communities. I also had one of my closest friends who went to the U of M and she studied and she has got her Ph.D. in large mammal ecology (phonetic). And I say that because I spent the last four years of my life, since I've practically known her, listening about the moose population and how that has been negatively impacted and what is going on there. But I say that because I put my faith in the fact that (inaudible) knows a heck of a lot more about that stuff than I do. And the regulatory agency that put this together and have been working closely with PolyMet in the last year, and they have studied this more than I have, and they have told us that they think they can safely operate within the environmental laws of the State of Minnesota, and they can do so while raising tens of millions of dollars of tax revenue that will come back to us and educate us and allow us to do everything needed in the State of Minnesota. So, I am getting up here today to express my support. It says St. Paul, that my name's from, but I went to school in Duluth and I'm from the northern part of the state, not far from there. And I put my faith in the fact that the regulatory agencies, no other (inaudible) has more people involved and who are far more knowledgeable than I am, and have put together the SDEIS, and will prove that PolyMet can operate within the parameters and they are going to do so by bringing mining back to the range.

Mar 13, 2014 Ms Lisa Fay MN Dear Ms Fay, The plans of PolyMet to mine sulfide ore in northeastern Minnesota seem completely unsound. They plan to mine for a short period of time, but in so doing cause nearly irreparable damage to a critical environment. Clean water, healthy wildlife, and a non-toxic environment are very important to me. The PolyMet mine would jeopardize all of them. I understand that the creation of jobs is very important right now, but the environmental and monetary cost of this project is not worth it. The massive funds that would be necessary to clean up the environment in the wake of this mining could even be used to much greater effect on public works projects to employ Minnesotans in more productive ways. I urge you, as decision-makers on this issue, to reject PolyMet's sulfide ore mining proposal. Please don't choose a short-term financial gain over the long-term health of our environment. I'm counting on you, as my elected officials, to make the right choice for Minnesota's future. Sincerely, Miss Emily Barter 3208 Lyndale Ave S Minneapolis, MN 55408-3633 (617) 899-7307

Emily Brown

36464

My Response to the PolyMet SDEIS Regarding wetland destruction PolyMet's open pit form of copper/sulfide mining involves destroying hundreds of acres of wetlands in the Partridge River headwaters. Most of these wooded wetlands are of high quality and are key to providing mitigation for flooding, food for fish downstream, and maintaining water quality downstream. Also, these wetlands are an important habitat for waterfowl, moose and other wildlife. The US EPA notes that these wetlands may qualify as "aquatic resources of a national importance". That designation would require a higher level of protection than is currently planned. Thousands more acres would be indirectly harmed by air and water pollution and by the redirecting of water that is needed to support wetlands. PolyMet does not plan to include compensation for these thousands of acres that would be indirectly harmed. Their "wait and see" approach means agencies may or may not mitigate later. Since PolyMet's mine plan did not consider any alternatives to reduce wetland destruction and water pollution, it is doubtful that any such solutions would be found. Taking Climate Change Seriously The widespread contamination of water in West Virginia, the current catastrophic drought in California, and even the ongoing shortage of water for agriculture in southern Minnesota are red flags to a changing climate where water is an increasingly valuable resource that must be protected above all. All reputable climate scientists tell us that extreme weather, long periods of drought, and events such as Duluth's dramatic flooding two years ago are the new normal. Therefore, I submit that new public policy should place an ever higher value on clean water, which is our greatest natural resource here in northern Minnesota. Any plan such as PolyMet's needs to take a more serious approach to accommodate extreme weather and inform the public on how they will prevent torrential rainfall from bursting dams and overflowing waste storage basins. Stop Reliance on Dirty Energy As a society, we must stop the growing reality of climate change. The increase in CO2 parts per million pertains to the larger amounts of electrical energy that this kind of mining requires. At this point that energy source would be mostly coal. In addition, the fuel used by the huge trucks and heavy equipment proposed would add even more CO2 to the air we breathe. PolyMet's project should be postponed until we have energy sources that are not dependent on coal and gas. There is already an issue of haze in the BWCAW. The problem of clean energy needs to be solved before PolyMet adds to the current level of pollution. The SDEIS needs to address this aspect of the project's environmental impact. Conclusion In summary, an environmental impact statement that is responsible to future generations of Minnesotans needs to take into account the big picture of climate change and the long-term effects of adding an intensive industrial operation to our already-endangered waters, forests, and air. Sincerely, Emily M. Brown 1603 Hanson Road Ely, MN 55731

I am very concerned about the effects of the proposed PolyMet mine on our environment. No matter how you slice it there will be destruction of acres & acres of wilderness to begin with and extensive lasting negative effects for years afterward. We (and all of nature) depend on pure water for our health and lives. Tall trees and wetlands are not just decoration. My husband and I (now 91 and 84) have visited the BWCA at least 20 times in the past and our canoe trips have fed our souls as well as our bodies. As for jobs, we have enough smart people to figure out how to provide employment that is constructive rather than destructive.

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Emily Fleissner 3515 Chambersburg Ave Duluth, MN 55811-3046

Emily Gardner

Feb 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

I find it beyond belief that Minnesota is contemplating such a disastrous mining scheme when all of our waters and natural resources are under siege from zebra mussels in Mille Lac and Superior to Asian carp moving up river to moose die-off due to global warming. There is no scientific question that this type of mining is always extremely damaging to the environment. When the costs of maintenance and recovery have to be figured over centuries, this should be a signal that we are talking about the tooth fairy. This mine would be planted on top of the Superior watershed, a body of water already damaged by earlier economic exploitation. 350 jobs would not justify this failure of stewardship nor would 35,000 jobs. At any rate, the alleged jobs are temporary and, as always when the job argument is used, it is a fig leaf for the millions, conceivably billions of dollars which will flow into the pockets of foreign investors and perhaps a few adroit members of the iron range mafia. I know this thing will go forward and I know there will be a catastrophe and that taxpayers will pay for it while the decision makers act surprised. We are placing a curse on our own children and need to call it for what it is. Emily Gherity 3328 10th Ave S Mpls MN 55407

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Emily Hegland Mounds View, Minnesota

To whom it may concern: Please think about the long term consequences of allowing mining. Too many decisions are made with only the short term benefits in mind- economic gains, increased employment etc What about the children who will be born in 25 years. 50 years. 75 years. 200 years. What will be left for them. What do we want to leave for them to ensure their success and survival. Peace, Emily Kindelspire VISION Student Co-Director Adventure Seeker Story Collector kind1157@stthomas-edu<mailto:kind1157@stthomas-edu> "Humans are vulnerable and rely on the kindness of the earth and the sun. Jan 18, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in MN and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the BWCAW. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I love the Boundary Waters and the wildness and purity it represents, and I'd hate to see that ruined that so we can make more iPHONES and cheap electronics. Some things are just more important than other things in life, and safe clean lasting water is much more important than making more DVD players and cell phones. Which people don't really "need", but are convinced they want and should have because of advertising. I do not approve of this mining at all, and I think it should not happen here in MN (or anywhere for that matter). Metals like: copper and nickel, etc are notoriously good materials for recycling and they maintain their integrity very well, even after being recycled many times. That option (recycling) should be the one we all start turning to, to get these metals Polymet (and manufacturers) want. Instead of constantly digging up virgin materials, when we already have the materials needed (to make a lot of things) wasting away in landfills. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. I am a practicing Family Physician and medical educator. I believe that the impact on human beings must be clearly outlined before proceeding further. Sincerely, Dr Emily Onello 2817 E Superior St Duluth, MN 55812-2353 (218) 724-1269

There do not seem to be enough facts presented along with a listing of the issues such as on the bottom of page 5-6 and into 5-7 where there is discussion of how to treat groundwater as needed on an extended basis. It seems to say all that will be determined by the needs at that point. But page 5-6 also says a certain mechanical treatment process will only be used the first forty years, what happens after that is not made clear except to say treatment would shift to some non-mechanical form to be determined at that time with no definitive statement that mechanical treatment will not be needed longer. Page 5-7 then goes on to say there will then be a 200 to 500 year period that some sort of treatment will need to continue. That is too big a window and too long a time period to lay out at this point. It suggests that what will happen is not known and will be determined and addressed as the years roll along. The mining company is not mentioned as having any responsibility for this though it is likely the company will not exist at that point. I don't think this project should proceed given this huge uncertainty. It suggests the technology is not in existence yet. It is likely the project will proceed in the future as mining techniques catch up. The way to proceed at this point would seem to be to dump category one tailings into the west pit as is being done with east pit. This would answer what I see as the big hole in this proposed project. Thank you for your consideration of this. Ken Steil 301 East Anoka St Duluth, MN 55803 218-728-2551 ste190@aol-com February 2, 2014

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are there

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Dear Ms Fay, Attached is a letter from Freshwater Future and other fellow organizations working to protect the Great Lakes. The letter is requesting that the MDNR deem the current version of the Supplemental Draft Environmental Impact Statement as inadequate. It is imperative to have a sound EIS in order to make proper decisions regarding our resources. If you have any questions, please contact me. Thank you for the opportunity to comment. Emily Whittaker Policy Specialist Freshwater Future (231)-373-3670 [HYPERLINK "mailto:emily@freshwaterfuture-org"](mailto:emily@freshwaterfuture-org)emily@freshwaterfuture-org [HYPERLINK "https://www.facebook.com/pages/Freshwater-Future/10150104189620648"](https://www.facebook.com/pages/Freshwater-Future/10150104189620648)Like Us on Facebook

I am a high school senior from Minnesota and I am concerned for the condition of the boundary waters after the mining project. These waters are the purest waters that we have and they are the perfect destination for camping and canoeing. People from all over the US come to enjoy the boundary waters. There are so many things that are going to negatively affect the boundary waters and animals near this area. 99% waste is ridiculous and it is not worth mining for the 1%. You will directly be killing many animals, fish, and polluting the beautiful waters. I am not an environmentalist at all but this is dear to my heart because of all of this nature that will be ruined.

Emma Radke

15906

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Emma Radke 1712 Pleasant St Lauderdale, MN 55113

Emmalee Breth

42003

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Emmalee Breth Elk River, Minnesota

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness, in addition to damaging the wilderness itself through sulfide pollution. Moreover, because the mechanization of mining has reduced the number of jobs that the industry creates as well as lead to a workforce that tends to be more non-local and thus less stimulating to the economy, and because the environmental impacts of this mine could harm the tourism and recreation industries that are northern MN's inevitable future, this mine is economically the wrong choice for Minnesotan workers. Finally, the mine is roundly opposed by the indigenous community for its potential impacts on manoomin and the wider north woods ecosystem, and the wishes of the indigenous community should bear a degree of special consideration given the historical context of our state. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Emmett Doyle 4315 45th Ave S Minneapolis, MN 55406-4062

Emmett Ramstad 10763

Hello, I am writing to strongly oppose the proposed PolyMet Northmet copper-nickel mining plan. I am not at all convinced that the short term goal of mining is at all worth the inevitable pollution it will cause. Nor am I convinced that PolyMet will be able to reverse the damage to water and land to it's original healthy state. I vacation every year on Lake Superior, the largest body of water in the world. I cherish it and am proud to live in a state that boasts this gorgeous treasure of a lake. I am afraid the pollution will inevitably enter the near by Embarrass River and Partridge River which flows into the St Louis River that then flows into Lake Superior. Not good. A resident in Bisbee, AZ. became ill from his garden produce, due to the toxins leaching into the soil from that copper mine. Please think of what is good for the earth and its people and stop this dangerous plan. Thank you for reading this. Sincerely, Emmett Ramstad 2420 31st Ave So Minneapolis, MN 55406

Emmy White 20147

I simply can not understand how the DNR could stand by a consider copper mining in our watershed area. To contaminate the waters for our generations to come is unthinkable. Please stop this from happening. Emmy White

Emrys Stramer 18192

So I have been participating in the harvest of wild rice for about seven years with a group of friends. Wild rice has become a staple food in my diet. It's not only nutrients that I gain during this seasonal harvest, but an incredible time of community-building among my friends. It's an empowering practice to know that we can all feed ourselves and each other in ways that don't exploit the natural environment or people -- yeah, numerous intangible and tangible benefits from doing this. So concerns: Arsenic causes cancer in human beings. The PolyMet project would increase arsenic in Colby Lake by 38.5 percent. That is the drinking water for Hoyt Lakes. Arsenic also accumulates in fish and wild rice. Low-income people who fish and rice for food have the most cumulative risk, and this does proportionately negatively affects poor people and poisons our food supply. The SDEIS must be redone to make a cumulative assessment of arsenic and cancer risks for people in Hoyt Lakes, including people who rely on fish and rice for food. I think that my friends and my community endeavors to provide food in this way for ourselves and enjoy this bounty that is out there that needs to be respected and honored. Like special movement of people of my generation and in lots of, like, to make sustainable food systems that are just food systems. So yeah, I see that as an environmental justice issue. The proposed mine is located within the 1854 Treaty on Ceded Territory, and three sovereign nations retain, never gave away, their hunting, fishing, gathering rights. Under federal case law, these rights are for the welfare and well-being of tribes, and federal caselaw provides that the ceded land must remain productive for the exercise of those rights. So 48,000 of the 64,000 acres of wild rice in Minnesota are within tribal-ceded land, 1,800 just in the Hoyt Lakes area. Destroying damaging, poisoning the plants and other, you know, other important resources in the 1854 Territory is -- you know, this is part of the cumulative effects that aren't entirely addressed by the Impact Statement. Continued genocidal policies and actions towards the indigenous people, towards these lands is unacceptable. So I would ask, in addition to the rare and endangered species, the EIS must analyze fully the impact of the PolyMet proposal on any animal or plant species relevant to any tribal property. Thank you.

To Agree with everyone who is concerned, I am writing to express my feelings about what a terrible idea this is to allow copper nickel mining in one of the most pristine locations in Minnesota/the USA. This is an extremely dirty process and a very disruptive method of mining. The tailings that are produced are full of toxic elements. The number of jobs created is negligible, certainly we have high levels of unemployment in the area and I appreciate the desire to create jobs. But to be saddled with the environmental damage barely seems worth it. It is extremely short sighted to think that the jobs created would be worth the risk. In light of the recent spill in Kentucky by Freedom industries, please do not allow this mining operation to happen. Freedom industries declares bankruptcy after the spill and now the state and the federal government are responsible for the clean up. To believe that the state will be able to escrow enough money for 200+ years of water cleanup is ridiculous. And what if there is a release, what happens to the jobs that are created by fishing/recreation in the area. The area is now ruined forever, do not think that it will rebound, once a natural area is damaged it does not return to the pristine condition that it was once in. Look at the push for mountain top mining in the south. The effort to create jobs only creates wealth for a few at the cost of future generations. We expect more from the people who are supposed to protect our environment for future generations. It is not work the risk for a few jobs. Please do not allow this mine to proceed. Thank you and please protect what we are leaving for the generations to come, please do not let this become our legacy. Eric Baldus, CNLP Owner/Designer HYPERLINK "<http://www.TerraVistaMN-com>"www.TerraVistaMN-com Cellular: 612-227-0107 Office : 612-788-7500 Fax : 612-781-3260 3009 Central Ave NE Minneapolis MN 55418

Eric Bergstrom 39386

DNR: PolyMet would be a huge consumer of electricity, much of it coming from the dirtiest coal power plants in Minnesota. PolyMet's electricity supplier, Minnesota Power, got 85% of their power from coal in 2013- PolyMet would emit 707,342 metric tons of carbon dioxide into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. Finally, Minnesota law requires that a closed mine site be "maintenance free," but PolyMet's mine plan calls for hundreds of years of monitoring and expensive water treatment. Worse, these models don't even show that the pollution stops after 500 years. They just stopped modeling at 500 years. This is not acceptable and we should be provided with information that is accurate. I ask that the DNR reject the Polymet mine plan by requiring use of clean energy to reduce impacts of pollution and we be provided with accurate information to proposed treatment and 500 years is not acceptable. Thank you- Eric Bergstrom 1362 Sargent Avenue Saint Paul, MN 55105

Eric Erkkila 46278

Please enter these comments into the record for this project. As a native of Northern Minnesota I have lived with and seen the economic booms and busts. A project of this type will stabilize the economy. Adding this operation to the area will provide the following to the economy: - Much needed construction jobs to build the new mine and rehabilitate the existing processing plant. - Increased sales activity for suppliers of construction commodities and services. - Increased sales for mining vendors for supplies during the mine operation. This will provide 2 jobs for every job at the mine. - Provide additional revenue for the state and local economies. - Long term employment for both miners and suppliers. - The national economy needs these raw materials to provide for the necessities and luxuries of life. On the environmental side of the issue: - The re- use of an existing processing facility and tailings basin. - Stringent controls in place for protection of the environment. - Raw materials to feed the "green economy" of windmills and hybrid automobiles. Thank you for your consideration. Eric C. Erkkila 2909 Parkwood Lane Duluth, MN 55811

Polymet, along with all the government agencies that provided input, have shown in the SDEIS that the proposed mining operations will not negatively impact the State of Minnesota. Mining has been, is currently, and will always be a vital part of the State of Minnesota. Through government regulations we can make mining a safe industry, and this SDEIS is proving that it can happen. I am an avid outdoorsman and have been to Northern Minnesota and the Boundary Waters multiple times, so I understand the concern and the beauty of the area. What this SDEIS proves is that mining and nature can co-exist if done right. Eric Haefner, P.E. 47068 Shanaska Creek Road Kasota, MN 56050 Eric Haefner, P.E. Bolton and Menk, Inc. I write to urge you to deny the permit for the PolyMet copper-nickel mine proposal. The signs read “We support Mining; Mining supports us.” The second half of the catch phrase certainly applies to me and my family. Dad worked for US Steel and helped develop the taconite industry starting in 1951- Mom still gets a pension from his employment. The family lake cabin they were able to build in 1959 is within the drainage area that PolyMet would impact. My sister and I worked in the mines and I worked four summers on the ore boats which put me through college. I was an enthusiastic rider on the Taconite Train to a Vikings game that promoted passage of the taconite amendment in 1964- If mining was so beneficial to us, why then don't I support Polymet's application. The answer is that the issue is much more complex than a quid pro quo of “We support Mining”. Comparing ferrous mining with sulfide mining is an apples and oranges proposition. On the Range we played on the ore dumps as kids, housing developments and trees have sprung up on them, ATV parks use them, all with no ill effects. While iron mining has caused some environmental damage, most notably Reserve Mining's dumping of tailings into Lake Superior, it has been remediable and not long term. The track record of sulfide mining is disturbingly different. I was born in Flin Flon, Manitoba where Dad worked for Hudson Bay Mining and Smelting, a copper nickel operation. Despite a 600 foot smokestack, when the wind blew in a certain direction, Mom would rush out to cover her garden with sheets so they wouldn't die from the fumes from the smelter. Ross Lake in the center of town quickly became and remains to this day a dead body of water. We are told that new technology will obviate this kind of problem. As I understand the data, this confidence in “new technology” is misplaced. As we perform our due diligence in vetting the assurances of the companies, we will be well served to err on the side of caution. I taught high school social studies for 30 years and think about the historical context of this issue. My students found it hard to believe that 400 years ago wars were fought and empires won and lost over spices. Four hundred years from now, students may well wonder the same thing about oil and minerals. A foreign company whose stock share price hovers around a dollar is a fool's bet for long term accountability. It is not the company but citizens who will be dealing with PolyMet's toxic legacy. We need look no further than the American West to see what a precious resource our water is. We need to take the long view; be statesmen, not politicians. Chief Seattle said “We do not inherit the earth from our ancestors; we borrow it from our children”. Let's not be the man in the Bible who sells his birthright for a bowl of pottage. Three hundred fifty jobs for 20 years is not worth the risk. Eric R. Hendrickson 1813 Juliet Avenue St Paul, MN 55105

Eric J Simso

58151

Has there been a jobs trade-off analysis, mining/construction vs recreation/construction. As a Minneapolis resident and lake County taxpayer and summer resident, the relative jobs and revenue contribution of no-residents doesn't seem to be accounted for.

Eric Kemp

44836

To: Ms Lisa Fay, EIS Project Manager, MDNR Division of Ecological and Water Resources From: Eric Kemp, concerned citizen Dear Ms Fay- I am writing to you out of concern that the Environmental Impact Study pertaining to the proposed PolyMet Mine is lacking, insufficient or possibly misleading. I don't believe it deals with ground water contamination to the extent that is necessary to protect this precious resource. Of the many instances where this mine, if it were allowed to go forward, will pose a threat to the environment and the waters of Northern Minnesota, there is no threat so great as that effecting ground water. Ground water may be our most precious resource. In materials produced by PolyMet, they state that they can capture and prevent 90% of surface water from seeping into the ground. This statement should read that they think they can capture up to 90% of surface water because this mine proposal is really a scientific experiment. In any scientific experiment there is an inherent margin of error. Undoubtedly PolyMet and there Lawyers have an interest in releasing the most positive data regarding there plans to the public. Even if the mine were able to capture 90% of it's waste water from entering the ground water supply, the remaining 10% entering ground water represents hundreds of millions of gallons of contaminated water entering the aquifer. I hope the MDNR sees this as the problem that it is. We have seen in this country and even in this State contamination of our surface water. In the cases of the Great Lakes, the Mississippi River and the Cuyahoga River, just as examples, legislation and time have helped to make these water bodies more healthy. We have NEVER witnessed the same regarding contamination of ground water aquifers. Once an aquifer is contaminated it will remain so, so far as our science has shown us to date. As bad as it would be for the proposed mine to contaminate surface and run-off waters surrounding the PolyMet mine site, it would truly be a tragedy to let hundreds of millions of gallons of water with toxic fibers and heavy metals contaminate our most precious resource, our ground water. Thank you. Sincerely, Eric Kemp Duluth

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: It is critical that you responsibly reject the inaccurate PolyMet NorthMet SDEIS and acknowledge that PolyMet's open-pit sulfide mine plan would have enduring negative environmental impacts on surface and ground water quality past the lives of your great great great grandchildren. I'm also sending a copy of my letter to the US Environmental Protection Agency. In absolute fact, the PolyMet SDEIS and the PolyMet sulfide mine plan still represent unacceptable risk to the incredible current and future asset of clean water that the world will value incredibly highly until well past the lives of your great great great grandchildren. To take any risk with this, much less a high risk, demands your action to reject it. Recent news of internal DNR documents showing that the groundwater base flow at the mine site was seriously underestimated confirms my assessment. Neither the SDEIS nor the sulfide mine project are based on acceptable use of known science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be rejected and be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. You must act to protect the environment from the money and political pressure that should not influence a thorough scientific assessment and conclusion. Your actions will have more long term impact that virtually any decision facing the state. Sincerely yours, Eric Larson Resident on Burntside Lake in Ely Eric Larson 2835 Schaeffer Road Ely, MN 55731

Eric Marleau

20048

Good afternoon, I just wanted to make a few comments on the proposed copper nickel mining around the BWCA. Number one, I am for starting mining operations in this area. In the late '60s and early '70s I worked for Longyear Drilling Company on the Core Drilling rigs in the areas that the Mining Companies are now planning on working. I also retired as a Heavy Equipment and Shovel Operator for the US Steel Mintac Mine, and know how mining is done. Regulated correctly, there is no reason not to mine this resource. This issue has been gone through over and over again sense I worked on the Core Drilling Rigs long ago. All results have been the same, that done correctly, the environmental impact is negligible. I grew up in Ely, and have had a life long love of the woods. If in anyway I thought that this mining would hurt the woods that I have used my entire life, I would be against it. However, with the first hand knowledge that I have on this issue, I believe the Copper Nickel Mining is long overdue. Regards, Eric Marleau

Dec 22, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The SDEIS for the Polymet project on the Babbitt site is incomplete and omits important information. There is insufficient consideration of watershed information. The proposed mine site is uphill from a body of water (One Hundred Mile Swamp) that straddles the Laurentian divide and feeds both the St Louis River and Rainy Lake (via the Dunka River) watersheds. Mention of both the One Hundred Mile Swamp and the Dunka River as it relates to hydrology of the mine site is completely absent from the SDEIS and may be intended to obscure the impact of the proposed mining on the BWCAW wilderness area. The waste water treatment discussion is inadequate. Reverse osmosis its likely to be completely impractical because of short membrane lifetimes and other maintenance issues and the non mechanical treatment methods proposed for the 200 to 500 year treatment are not only unproven, they do not exist today. There are other omissions and questionable conclusions in the SDEIS and it is unreasonable to allow the project to move forward before the SDEIS is corrected. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Eric Morrison 1202 Cherokee Ave West Saint Paul, MN 55118-2004 (651) 334-8399

18177

I'm speaking on behalf Jim Rock who concedes his time to Eric Morrison who speaks for a lot of us who are not getting paid to be here. Good evening. My name is Eric Morrison. And I have Ph.D. in chemistry from Penn State. I would like to address the Clean Water Act Section 404, which allows the US Army Corps of Engineers to authorize discharge into and destruction of wetland by allowing land exchange. The wetland that PolyMet is seeking a permanent discharge into is called the 100-mile Swamp. Shortly before its release the following land was added to the wetland section of the Environmental Impact Statement. And I quote, "However, no delineated boundary exists for the 100-mile Swamp," end quote. This statement is in fact completely incorrect. Delineated boundaries for the 100-mile Swamp do exist and they are available at the US Government National Atlas at www.NationalAtlas.gov/streamer. The US Government National Atlas shows that the 100-mile Swamp is drained by Langley Creek, which is a tributary to the Dunka River, which is in turn a tributary to the Kwishiwi River which runs straight to the Boundary Waters. It is an inconvenient fact that the authors of the Environmental Impact Statement simply do not want recognized that mining waste will flow to the Boundary Waters by way of the 100-mile Swamp and the Dunka River. Worse than just having the statement about the delineation of the 100-mile Swamp, they redo the maps of the 100-mile Swamp solely as to omit the part of the swamp that drains to the Dunka River. (Inaudible) this appears on page 472 of the SDEIS and at least five other maps. On the basis of the redrawn map attention has been diverted from the Boundary Waters. No baseline water testing was done in Langley Creek or in the Dunka River or any other part of the Boundary Waters Watershed. And nor would any testing be done if mining were allowed. This leaves the Dunka River and the BWCA completely and utterly unprotected. The Boundary Waters are a national treasure. And what I request is a federal-level environmental impact evaluation. I'm concerned that local and even state officials would (inaudible) of the BWCA for the proverbial nickel on the promise of a kickback or trickle-back penny. This is shortsighted and it violates the public trust of American citizens and future generations. At a minimum I'm requesting Governor Dayton compel a bonded public review period of 180 days for this SDEIS; and compel a subsequent SDEIS, which has the correct geographical features in it and requires water testing for the Dunka River and the Boundary Waters.

Eric Morrison 1202 Cherokee Ave West Saint Paul, MN 55118 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay The PolyMet Supplemental Draft Environmental Impact Statement requires information on financial assurance. Less than three pages devoted to finances required for centuries of treatment projects to protect the environment is absurd. The amount and type of financial instruments which are required for mine and plant site closure and ongoing water treatment are as essential to the environmental impact statement as technical details and need to be subject to public review. For the Minnesota Department of Natural Resources to negotiate financial assurance with PolyMet without public or legislative oversight is a severe violation of the public trust. PolyMet exists only for the exploitation of minerals in the NorthMet site and it is a serious concern that PolyMet lacks the assets required to provide a level of financial assurance commensurate with the scope of the proposed project. Glencore, which owns 40% of PolyMet, has the financial resources but Glencore's involvement is cause for alarm. Glencore is a ruthless trading company founded by FBI Ten Most Wanted fugitive Marc Rich, is currently lead by Rich protégé Ivan Glasenburg and ousted British Petroleum CEO Tony Hayward, and has a very poor track record of environmental, ethical, human rights, and labor violations which includes bribery. It is completely unethical to negotiate with PolyMet as a substantially owned subsidiary of Glencore behind closed doors. The need to carefully manage financial assurance for mining is greatly exacerbated for the NorthMet project by PolyMet's finances, ownership, and the extreme risk to the environment from sulfide ore mining. An addendum to the NorthMet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement is required that includes substantial details of the reclamation bond including the dollar amount, the nature of the trust, and the financial instruments for funding it.

Sincerely, Eric Morrison

Eric Morrison 1202 Cherokee Ave West St Paul, MN 55118 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay The safety of the Boundary Waters Canoe Area from mine drainage that will be created by PolyMet's proposed NorthMet mine has not been established. The NorthMet Mining Project Supplemental Draft Environmental Impact Statement of November 2013 makes no adequate statement about whether water discharged from the mine site can possibly enter the Boundary Waters Canoe Area Wilderness and provides no satisfactory evidence relevant to this critical issue. Without a definitive statement and data about mine waste and the BWCA, the NorthMet Project SDEIS is inadequate. Determining the relationship of the proposed NorthMet mine and the BWCA requires information about the extent to which the mine site is geologically and hydrologically connected to the Rainy Lake watershed. The proposed mine site is just south of and uphill from a wetland area named the One Hundred Mile Swamp which drains to both the Saint Louis River watershed and the Rainy Lake (BWCA) watershed. Because the mine site drains to the One Hundred Mile Swamp and the One Hundred Mile Swamp is geographically connected to the BWCA, the mine cannot possibly be isolated geographically from the BWCA. Hydrologically, the SDEIS includes no hydraulic conductivity testing for the One Hundred Mile Swamp which would indicate the extent to which the mine is hydrologically isolated from the BWCA. In US Government maps, the One Hundred Mile Swamp is a 10-4 mile long depression straddling the Laurentian Divide that drains to both the Partridge River which is a tributary to the St Louis River and Langley Creek which is a tributary to the Rainy Lake (BWCA) watershed [1]. Groundwater contours for the swamp are easterly descending towards Langley Creek [2] which promotes movement of mine waste to the BWCA watershed while the closer proximity of the mine to the Partridge River drainage site would minimize flow to the BWCA. The balance of the competing effects has not been measured and the division of waste water between the two watersheds is unknown. Estimating the proportion of mine waste that flows to the two watersheds requires lateral hydraulic conductivity testing in the One Hundred Mile Swamp. Over the time scale that mine site drainage will leach pollutants and furthermore considering likely excursions in weather and water levels, flow to the BWCA is almost certainly not zero. Not only does the environmental impact study fail to properly consider hydrology around the mine site, it includes incorrect information. A misleading statement was inserted into the Wetlands Section (4-3-3) of the SDEIS late in the drafting process [3] regarding the unavailability of geographical information for the One Hundred Mile Swamp. The statement "however, no delineated boundary exists for the One Hundred Mile Swamp" on page 4-429 is false. Delineated boundaries for the One Hundred Mile Swamp do exist and are available at HYPERLINK "<http://www.nationalatlas.gov/streamer>"www.nationalatlas.gov/streamer [2]. Accompanying the misleading statement in Wetlands Section of the SDEIS are maps that represent the One Hundred Mile Swamp in a way that is contradictory to the US National Atlas. The portion of the One Hundred Mile Swamp that drains to the BWCA watershed is missing in SDEIS maps. Contradictory maps in the SDEIS support the implication that seepage of mine waste water to the BWCA watershed will not occur. In SDEIS maps, the One Hundred Mile Swamp is depicted as a 5-5 mile long body of water that exists only on the St Louis River watershed side of the Laurentian divide as compared to the 10-4 mile long wetland in the National Atlas that exists as a depression straddling the divide and drains to both the St Louis River and Rainy Lake Watersheds.

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Eric Norgaarden 634 Randy Ave Shoreview, MN 55126-7013 (651) 482-9987

Eric Olson 18256

My name is Eric Olson from Minneapolis, Minnesota. My comment is on the SDEIS in regards to indirect emissions from land use, from Section 5-404, or 5/404 and 5/406. In that section they list off indirect emissions, air emissions, and the results from the project, indirect emissions from the project, in which they list off terrestrial carbon loss, which would be considered carbon loss from trees and different living things on the land, which would be turned into mine; however, they do not include carbon sequestration loss or rates of carbon emissions that would occur from changing the land use from the peat -- what do you call it? Peat swamp to the mining area. The agencies should look into emission factors for calculating out the amount of carbon dioxide or carbon dioxide equivalent losses during the transition of this land use to the mining land use. And in doing that, using some -- given emission factors of 750 pounds of carbon dioxide, 750 tons of carbon dioxide sequestered per acre, that is a significant source of emissions that could be emitted into the atmosphere. That's it. Thank you.

Eric Paul Jacobsen 41971

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Eric Paul Jacobsen 247 Winona St W West Saint Paul, MN 55118-5707 (651) 228-1282

Eric Ruhland 42110

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. As a medical and environmental professional I am embarrassed that the State would allow this company to jeopardize our water supply, our most precious natural resource. This mistake we will look upon in the coming decades as a short sided decision that put our children, environment, and economy in a worse place. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Eric Ruhland 635 Summit Ave # 1 Saint Paul, MN 55105-3434 (651) 238-6815

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down.
- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Eric Snyder 215 Oak Grove St, #1802 Minneapolis, MN 55403

Dear MN DNR Representative: I am writing to let you know that I'm deeply concerned about the possibility of a copper-nickel mine being opened in Minnesota and then causing irreparable harm and cost to generations of Minnesotans to come and our precious natural environment. The mining should only be allowed if it can be shown that the water and air quality off the land used to mine is not impacted long after the corporation that mined the land ceases to exist. A method for mining must be first found to prevent the dangerous contaminants from leaking out and dispersing off of the mine site and not to rely on continuous filtering and maintenance of water flowing off site. We are essentially taking a piece of land and converting it to a contaminated waste dump that won't be useable for other purposes for many generations as well as hurt the surrounding lands downstream and downwind if the pollution can't be contained long term. The mining should only be allowed if an endowment fund of enough funds is able to be setup before mining commences to ensure that the site cleaning and containment system can be maintained for perpetuity until the site is longer a source of pollution (ie, 500+ years). The lost tax revenue and utility of the land after the mine ceases to operate needs to be considered because it will become a liability once the mine is used up and is no longer useable and long term will be a drag on the local economies. I think the external costs that will be born by future generations will far outweigh the short term benefits in jobs that are made during the life of the mine. There are plenty of similar mines that have been environmental problems and none that have been shown to be good examples of environmental stewardship. Minnesota's water rich environment will be even more challenging to maintain the mine long after it has closed than other states with less challenging conditions that have failed. If this mine were to move forward, which I think is a very bad idea, we need to make sure we are covered for the long term costs of maintaining the pollution control systems, lost value of the mine land and neighboring lands, and long term costs to the local economies which need to more than offset the short term benefits the mine will be bring to the local economy. Regards, Eric S. In light of today's exposure of the DNR's ignorance of accurate water flow analysis, I have difficulty trusting the other data compiled in the SDEIS. The DNR should go back to the drawing board to analyze water flow in a model that includes predictions for climate change as well. Another major concern I have is the lack of consideration for the type of construction materials to be used for piping sulfate-containing water 7 miles between mine and plant. Nobody from the DNR at the recent Aurora public informational session could tell me anything about pipe construction. What happens when the temperature drops to -50 F. Finally, how can anyone predict the financial responsibility required to continue monitoring and treating pollution for 200 and 500 years. Mining corporations will not likely exist that long, banks holding reserve trusts to fund it may go belly-up, and taxpayers may not care. I thought that when I moved to Minnesota, the DNR would be more conscientious and comprehensive in protecting our environment than Missouri, where I am from. It appears that you are more interested in corporate profit than environmental protection. I fear that NorthMet pollution will be in news headlines in the future, following in line with West Virginia, North Dakota, and Gulf of Mexico disasters. Eric Willms 1901 Southern Drive Virginia, MN 55792

Good evening and thank you for taking my comments on the PolyMet Mining, Inc. proposal and environmental impact report. I am opposed to the PolyMet Mining, Inc. project and feel that it is a bad investment for Minnesota and urge the DNR to forgo the permitting process. Minnesota is unique among ecosystems, not only within Minnesota but within the globe for its maintenance of close-to-pristine wilderness and raw natural resources. Unique due to the sensitive balance of our bogs, forests, Great Lake, international watershed, and the hundreds of thousands of living species that depend on those interconnected systems to survive. PolyMet Mining, Inc. claims that their production facility will be safe, but there is NO GUARENTEE of that truth. To allow them to mine in Minnesota is playing Russian Roulette with a loaded pistol. Allowing them to mine puts the taxpayer a risk for millions, if not billions, of dollars in cleanup funds for decade after decade. We see Federal Superfund sites that STILL are not clean all across the State. The PolyMet mine would become the largest superfund site in the Nation with no clear understanding of how their mine would impact our delicate watersheds and ecosystems. Allowing the mine to move forward would be irresponsible, selfish and a risky gamble for the DNR. Is the DNR that desperate for cash that it would sell the very soul of Minnesota for a few years of cash flow. Is the risk of poisoning our very water worth it. With climate change in play; more severe weather pattern swings (droughts, extreme heat, fires, extreme cold, etc) now is not the time to allow a risky venture further to anchor itself in the State on a set of loosely conceived 'what-if's'. Yes, what IF we have sustained water replenishment to flush out the mining chemicals from the watershed. What if we enter several years of drought. What then. What if the weather causes something to happen at the mine which will cause the leaching of chemicals into the very aquifer. How will that watershed be cleaned 100% back to its former safe standards. Mining is by its nature an intrusive, messy business. Of course our environment will be altered by its presence. That is the nature of mining. That fact alone should be enough for the DNR to say NO to such a project: A Disaster Waiting to Happen. Just say No to the PolyMet Mine. Thank you, Erica Johnson 1332 N. 4th Street Mankato, MN 56001 (507)-720-7768 Sent from Windows Mail

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Thank you for your time and for the opportunity to provide input on the PolyMet SDEIS plan. For all the reasons stated by those who oppose the Copper and Nickel mine in St Louis County, we should say a resounding "no" to this plan. Not only is 200-500 years of environmental distress enough to make a decision, but the fact that we will put increasing stress on an already shrinking area of natural habitat. It is certainly true that we all use products that require minerals obtained from mining. Nevertheless, the location of this mine and the potentially large environmental impact should make this an obvious choice. It is sad that the population has grown to levels where we are losing so much of the undeveloped land (all over the world) that actually protects our health in so many ways. As the world continues to grow, and demand for materials grows, we will continue to push the natural world into smaller and smaller spaces. In the end this will undoubtedly harm our way of life. In my opinion, it has already started to do just that. We need a complex and widespread web of life to keep the world healthy and bountiful. Better to draw some hard lines now and work on developing alternatives while we are still able to protect the small number of remaining spaces. Please consider that Minnesota's prime jewels are within the natural world. We are so lucky. There aren't many states that have such beautiful and bio-diverse areas that have remained "healthy". I have watched through the years as the once awe-strikingly beautiful and biologically healthy Canada (eg, British Columbia) has allowed the mining industry to flourish. Areas under pressure from mining that were once so astounding in natural beauty now look much different. Dirtier on the surface, and probably much worse if one were to look deeper. You have the power to prevent this from happening here in Minnesota. I know that this is a complex issue. But there comes a time to just say no. We can look harder for alternatives, and I think if we put our minds to it, we'll find better answers. Warm regards, Erica TenBroek Minnesota resident "Our intelligence, however prodigious we like to think it, is trivial compared to the accumulated wisdom of the hundred million species that make up Earth's biosphere. Since each microbe, animal, and plant possesses some minute portion of the know-how that makes the whole earth work, the loss of any species erases some portion of organic intelligence, and leaves the land more stupid." -Sara Stein

To: Lisa Fay, EIS Project Manager, Minnesota Department of Natural Resources From: MN resident -Biologist with 11 years corporate research experience Topic: Comments PolyMet Open Pit Copper Mine Proposal EIS 1) Minnesota Environmental Loss The estimated loss and predicted damage to native ecosystems will be huge in the area planned for the mine and mining operations as well as the predicted serious indirect effects to the watershed. As stated by several environmental groups and law firms, PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. This alone should raise red flags. PolyMet, if allowed, will dig up nearly 1,000 acres of high value peat bogs, and damage a large part of the 100 Mile Swamp, a critical habitat for many plants and animals. This wetland has been designated an Area of High Biodiversity Significance in the Minnesota Biological Survey. Although said to be less, over 6,000 acres of wetlands could be damaged or destroyed by PolyMet changing the flow of some of these waters. Wetlands will dry up, animals and plants will die. The damage is almost always more than we can predict, and the suffering to individual animals has been glossed over or completely ignored. So much is unseen and subtle that we cannot calculate the true cost until the damage is done. We can't get back the organisms from these key habitats once they become extinct. It goes without saying that such areas of high biodiversity are the most critical to preserve as the world continues to develop. In my opinion, it's time that we stand firmly behind what we say is important. As a poor analogy, the car won't run at all once even half the spark plugs are gone. 2) Copper and Nickel and Modern Living It has been argued that Copper and Nickel are particularly fundamental to modern living. These are materials used in power lines, stainless steel, rechargeable batteries, etc It has been said that these minerals are necessary for many green technologies. And this is true - but I also think naïve. It is my understanding that copper and/or nickel are NOT the limiting materials in many critical electronics that have been thrown around as examples. People may be unaware that the same "green" products are dependent upon more limited supplies of scarce rare earth metals. These rare earth metals are mined in other parts of the world (eg China) and we will run out of these long before copper and nickel supplies are gone. An MIT site on strategic use of resources quotes that an average wind turbine can use up to 500 kg of neodymium and dysprosium per kilowatt generated (Department of Energy, 2011). Rare earth metal needs are similarly associated with green energy for cars. Certainly green energy and other forms of energy rely on conducting materials, but it is oxymoronic if a "green" technology ultimately creates more ecological damage and/or pollution than it prevents. Something seems wrong with our cost/benefit analysis. Do we really need more copper or will providing more copper merely increase use. If the international demand for copper is high as a result of population growth worldwide, is it our duty to make sure that supply is met. At what coSt How much of the copper/nickel market is one that is created by availability. How much of this is out of true need. I can tell you this – I wouldn't have bought stainless steel appliances if I knew the environmental coSt There is no debate that copper is currently used in many products, but does it need to be. 3) Other environmental costs omitted from consideration As pointed out by the MN Center for Environmental Advocacy, "PolyMet would emit 707,342 metric tons of carbon dioxide into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- Minnesota is uniquely vulnerable to clima

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I hope this project does not proceed. The risk of permanent damage to the environment is not worth the price of shipping Minnesota copper to China. The resulting jobs are a blink of an eye compared to centuries of poisoned waters. How many businesses last 500 years. When Hennepin Paper went broke the taxpayers paid for the cleanup in Little Falls and the odds on 500 years of follow up is unrealistic. Please don't allow this debacle to proceed. Sincerely, Gary Erickson 1132 Lindbergh Drive South Little Falls, Mn 56345

To: Minnesota DNR As a Minnesotan, I am deeply concerned about this project and it's potential to damage what I love about this state - it's lakes, waterways, and the aquatic life in seemingly pristine wilderness areas like the BWCA. I am unwilling to risk the health of those areas on the basis of reports that assume flawless operation of an industry that cannot demonstrate such perfection at any other location and where the only stated benefit is 350 jobs. Clearly, the profits from this mine will be enormous, if the Canadian company asking to mine in our state has expressed willingness to pay cleanup costs for centuries. Clearly, the risks of this project are real and significant given the public debate. Minnesota is known as the land of 10,000 lakes - how many should we be willing to sacrifice for 350 jobs. What recourse do we have if it becomes evident that the operation of the mine is not in accordance with predictions associated with minimal environmental impact. It seems that there would be far less risky ways for the state to encourage just about any other industry to create 350 jobs, if that is the main benefit cited for the state. I find it hard to believe that a mining company would not behave as any other company and try to find ways to maximize its profit and minimize its costs. What guarantee do we have that this company or its investors will honor any promise to pay for future cleanup. If the assumption is that little cleanup will be needed, how is the amount of money set aside by the company determined. What happens if the amount of pollution is demonstrated to be greater than predicted - will additional money be required from the company in the present to pay for the greater than predicted cleanup. Will it be written into the permit that projected levels of pollution must be realized or the permit will be revoked. How will the levels of pollution be monitored, both on site to assure that contaminants are not escaping and elsewhere to be ensure that nearby water and aquatic life is not affected. Will the company pay for all monitoring and testing performed by state and national environmental agencies. PolyMet owns the mineral rights, but I have read that the US Forest service considers surface mining to be illegal in this area. I do not agree that swapping land is a reasonable solution to this issue. I have read that other copper mines are more safely operated as underground mines. Why isn't underground mining part of the proposal. Isn't open pit mining inherently more risky to the environment. I have read that it is a given that the company will need to treat water at the site by reverse osmosis. I have also read that it is considered difficult to assume that all water used on site will make it to and through the treatment facility, due to cracks in bedrock, etc If it is admitted that the process creates water that should not be reintroduced into the environment "as-is", how will the DNR monitor and assure state residents that absolutely no untreated water is escaping into the environment without treatment. If untreated water is found to be entering the environment, will the permit be revoked and mining operations ceased. Nothing about this project sits well with me, and I strongly request that the DNR deny PolyMet a permit to mine in the state. It is impossible to believe that the mining industry will provide it's first case of leaving a site without long term environmental devastation for which the public will eventually have to foot the bill. There are many other projects that could provide 350 jobs, and I don't feel that the DNR should even evaluate this project on the basis of the jobs it may create. The project should only be evaluated on the basis of its potential damage to our state and the costs of that damage. Please do not issue a permit for this mine as proposed. Thank you, Erik Helgen, AIA 760 Nebraska Ave W. St Paul, MN 55117

Erik and Larissa Mottl 44189

Please choose the "No Action Alternative." Finding out that Polymet doesn't actually own the land it would like to mine and that public lands would be sacrificed for this proposal is disturbing. Mining and gas extraction have a long history of environmental disturbance beyond what they or other experts initially expected. We cannot out engineer mother nature and we cannot control the weather. If there are no plans for Polymet to treat the contaminated water there should be NO mine at this time. Recently we have seen what happens with lax government inspection and decisions made by companies to save money- rivers contaminated and towns without drinkable water. This mine would provide short term employment opportunities for a few residents. It is simply not worth the risk to ruin another park of Minnesota's natural heritage for short term extraction and financial gains to an industrial intereSt Please choose the "No Action Alternative." Sincerely, Erik C. Mottl 23113 Hilo Ave N Forest Lake, MN 55025

Erik Hinderlie 28150

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I have a cabin downstream from the proposed mining site, and am terrified at the havoc it would do to the marvelous jewel that is the Boundary Waters Canoe Area Wilderness, and what it could do to Lake Superior if leaks and drainage got out of control. I also do not trust Polymet's parent company, Glencore, with its abhorrent human rights and environmental violations abroad. I am sure as decision makers you have seen Glencore's terrible history, though handsome profits because environmental destruction, topsoil depletion and freshwater contamination is never calculated in GDP or economic indexes. But you will feel its terrible power if sulfide mining contaminates the North Woods, in polluted lakes, rivers and streams, massive deforestation and habitat fragmenting, reduced employment in tourism, outfitting, recreational hunting and angling and second home properties-it will be chaos for short-term economic goodness for one company, not the area. Please consider where you live, what a beautiful, bountiful and life-giving wilderness. The ample opportunities for outdoor enjoyment, provided by the North Woods-the peace, tranquility, pollution free environs. Think about our children, what world they would inherit with a massive open pit mine, with pollution controls that MUST LAST for at least 500 years after Polymet extracts everything-indeed, long past the likely life of that company. The EIS had to be re-jiggered already because Glencore is known for shortcuts and silencing critics and a key error was found in how it pollutes. Let us not give away one of Minnesota's most critical assets-a billion dollar tourism, recreational and private property industry to one quick burst of mining metals. There are many other appropriate places to do sulfide mining. The North Woods wilderness, Great Lakes basin is definitely not one of them. Thank you, Erik Hinderlie Sincerely, Erik Hinderlie 7 Commonwealth Ave Fl 2 Gloucester, MA 01930-3441 (763) 222-6668

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, erik pederson Glenwood, MN, Minnesota

After reading the Polymet SDEIS there are many crucial unanswered questions. One of which are the details surrounding the “West Equalization Basin”. It is clear from the report that this basin will receive the “reject concentrate” from the plant that takes pollution from the tailings. What isn’t clear in the SDEIS is exactly how polluted this basin will be. The only document that offers any indication as to these figures is the 2012 Mine Site Waste Water Treatment Facility Design Plan and this plan is neither listed nor referenced in the SDEIS. In that plan it says this basin could have 8,700 milligrams per liter of sulfate and nickel concentrations that are 10,999 times what the Minnesota water quality standards would allow. Not only does the SDEIS fail to describe the predicted levels of pollution in this basin, it offers little in the way of contingency plans for what would happen in the results of a catastrophic weather event. The extent of their existing contingency plan is that any overflow from this basin would simply flow into the mine pits, which are in no way designed to deal with the high levels of concentrated pollution present in the basin. In the end it comes down to this, the project as laid out in the SDEIS poses far too many risks and brings little in the way of benefits to the state and to the regions. We have seen over and over how these projects can go bad and then we the tax payers will be left to clean up the mess. If we are to learn anything from recent history, it is that these corporations are ethically corrupt and not bound by the legal framework as individuals. They purposefully structure themselves legally so as to minimize or outright avoid any liability in the event that anything goes wrong. There is no reason to believe that Polymet or its investors would be any different. Therefore, there are no conditions or restrictions you could put on this project that these companies couldn’t find a way to weasel out of and that is why I ask you to reject this SDEIS. Thank you. I yield the rest of my time.

Erik Riesenberg 18229

My name is Erik Riesenberg, E-R-I-K, R-I-E-S-E-N-B-E-R-G. Erik Roth 43482

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Erik Roth 225 W. 15th St #412 Minneapolis, MN 55403

Thank you for the opportunity to comment on the Northmet Supplemental Draft Environmental Impact Statement. My legislative district is bordered by Lake Superior, the St Louis River Estuary, and the St Louis River. Naturally my constituents are concerned with the water quality of the river. I have reviewed the summary document and understand the proposed mercury discharge is to be within current state law, at least with respect to net effect. My particular concern is with the future quality of the river and the estuary with respect to excessive mercury content. Currently, there remains a fish consumption advisory in effect for game fish taken from the river and estuary. MPCA is in the midst of a multi-year effort to determine, through science, why these mercury levels remain unusually high, especially given the reduction in airborne emissions over the past years. While it is unknown what the end result of this study will reveal, it should at the very least be considered as you review this proposal for compliance. I understand you must consider current law, but it is entirely possible that the mercury standard may change in the near future. I ask you to consider the possibility that the proposal may have to be adjusted to a lesser discharge of mercury, and can the proposal be adjusted to meet that in the future. Thank you for your time and consideration. Representative Erik Simonson Room 429 State Office Building 100 Rev. Dr Martin Luther King Jr. Blvd. Saint Paul, Minnesota 55155 651-296-4246 Follow me via e-mail updates at: <http://www.house.leg.state.mn.us/members/join.asp.id=15417>

Erik Solberg 42466

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr Erik Solberg 6433 2nd Ave S Richfield, MN 55423-1622

The land up here is beautiful, since it is not largely deforested and converted into farm land. So we are lucky here in Northern Minnesota. Nobody wants to see the land hurt, especially the people that choose to live in the area around the PolyMet mine, where I live. And lots of thought has gone into decreasing the environmental impact of the PolyMet project on the local environment. However, I am concerned about some of the risks we may face from the PolyMet mine. What is the existing water quality in our area due to prior mining activity. The water tastes like it already has a lot in it. I would like to know what amount of water pollution from the PolyMet mine would cause our already poor quality water to change to unhealthy and to unpotable water. Is the current water quality in the area linked to problems such as cancer or other health issues. And how would cancer rates and other health problems be affected by the mine. What health problems could be caused by the chemicals used in the mining process. Would pregnant mothers be more strongly impacted by water quality problems. Would the increased rate of mercury pollution in the Embarrass river effect any people or other organisms. How would the levels change in the case of a small leak, or in the case of a large leak. How much leaching is predicted from this mine. How much leaching is predicted from the average mine. What is the probability of having a mining accident like the one in Virginia which cause the water to be completely undrinkable. How would the health of the workers in the mine be impacted by the air pollutants they will be exposed to while they are working, including mercury pollution. How would such air pollution effect the people in the towns near the mining operation. If the speed with which copper is extracted is slowed down, could workers keep their jobs for a longer period of time, and could this reduce the pollution rates and possibly the impact of pollution. How many jobs will be provided as a result of the need to monitor the environmental impacts on the project area. What emergency equipment is needed for clean up in the case of an accidental large scale leaking or other pollution event. Will this equipment be stored in an area that is easy to access in an emergency. Will personnel be trained on how to operate such equipment. Is there a guarantee that the quality of water will be monitored on an hourly basis. If not, how frequently will the water quality be monitored. Does the job security of a few hundred people for 20 years outweigh the safety of several thousand people over hundreds of years. How much will water treatment cost in the worst case scenario. What are the legal mechanisms mining companies may use to dump responsibility onto Minnesota tax payers. Since the treatment of the water will need to continue for up to 500 years, how will we guarantee that there is enough money to keep treating the water. How do we know that the company responsible for the mine will be a viable, responsible company in 500 years. Will a substantial enough portion of the profits be set aside for clean up efforts, especially in the case of a major mining pollution accident. Will this money be kept in a place where it can not be removed for other purposes in the case that the company goes bankrupt. How is climate change likely to impact the PolyMet mine. Will the predicted increased intensity of storms cause any difficulties in keeping the mining area safe. I am especially concerned about increased flooding events. Are there plans in place for natural disasters such as earthquakes, or for the possibility of tornadoes up here. (Tornadoes may sound like a strange thing to inquire about. However, the climate in this area is predicted to become like the climate of the Twin Cities well before 500 years are finished.) I have questions about the i

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Erin Beeson Spring Lake Park, Minnesota

Erin DeWitt

We have a responsibility to ensure safe and accessible drinking water for now and into the future. Mining – the PolyMet project would be environmentally irresponsible – jeopardizing the quality of water not only for our region, but the whole state as this region is a major watershed! We cannot and must not ignore that fact. The damage this project would cause is irreversible; we have witnessed this in other projects. Land that becomes unfarmable and water impure. Please, it is our responsibility to our fellow humanity, our grandchildren, the animals and the earth. Thank you for hearing me. Erin DeWitt 1512 Jefferson St Duluth, MN 55812

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Erin Goetz Gladstone Duluth, MN 55804

March 11, 2014 Lisa Fay Minnesota DNR Division of Ecological and Water Resources Tim Dabney US Forest Service Douglas Bruner US Army Corps of Engineers Dear Ms Fay, Mr Dabney, and Mr Bruner, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement (SDEIS). In my view, the SDEIS is inadequate and the proposed mine plan, as well as the proposed exchange of 6,650 acres of Superior National Forest lands, would have unacceptable environmental impacts. I'm writing on behalf of my three year old and her little sister or brother who is expected in June, as well as other future generations of Minnesotans - because they can't speak up now to voice their concerns about a project that will affect the future of the water they drink, the outdoor places in which they recreate, the wildlife they admire, and the taxes and clean up costs they pay. I live in St Anthony Village now, but I was born in northern Minnesota - a part of the state that holds a special place in my heart. I can't imagine why our state would embark on a project that poses such extreme risks to such a special place. And one that puts the future of our kids and their kids and their kids and their kids in jeopardy. I know that you aren't dealing with financial assurance in the SDEIS, but I think we need answers now about who will pay for the inevitable pollution that occurs, when the companies behind this project no longer exist. Future generations of Minnesotans will be on the hook for those costs - generations that didn't have any input into this decision. With such a poor record of operation in every other place it has been done, why do we think the pollution won't happen here. And why do we believe that the PolyMet corporation and its investors will be around to clean up the pollution. I've lived in South Dakota, a state with a history of mines that created acid mine drainage and passed the clean up costs on to the taxpayers. My husband is from Montana, another state with a history of polluting mines that the taxpayers have to clean up. I don't want Minnesota to join that group of states. Please think about the future of Minnesota and our precious water resources. Take another look at this proposal. Address the flaws in the SDEIS. Make sure that future generations of Minnesotans aren't saddled with hundreds of years of pollution and the costs to clean that up. Thank you for your consideration. Erin Jordahl Redlin 2901 30th Avenue NE St Anthony Village, MN 55418 [HYPERLINK "mailto:ejr0904@gmail-com"](mailto:ejr0904@gmail-com)

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands and wildlife habitat in the watershed of the Lake Superior Basin. I am a wildlife educator and along with many other aspects of this project that make me incredibly nervous, the lack of acknowledgement of the wildlife impacts the SDEIS is unacceptable. It does state that Minnesota moose population has declined %35 in 1 year. This is an astonishing number. Moose are a vital part of the ecology of this area. The PolyMet project would harm moose further due to loss of habitat and habitat fragmentation. It will be in a key area of moose habitat types. Moose are also a large draw for tourists to the northern Minnesota woods. Lack of tourists, which this mine would have a huge impact on in many ways, will harm our economy greatly. Many of our local businesses rely on the tourist economy. Another animal that will be greatly affected is the Canada lynx. It is federally listed under the Endangered Species Act and the SDEIS admits that the sulfide mine, vehicle and train traffic will reduce lynx habitat by two square miles and kill individual lynx. Having 200 or fewer lynx in Minnesota currently, we should be doing everything we can to protect these amazing northern Minnesota animals. The SDEIS should analyze alternatives to reduce loss of lynx habitat. These two plus many more wildlife will be negatively affected by the PolyMet mines. I was very disappointed in the SDEIS focuses on wildlife, there needs to be more studies done and alternatives proposed before this process should go forwaRd We have lost so much habitat already, why take away prime, beautiful wild lands for such a risky, short term endeavor. It is not worth the risk. It is our job to protect irreplaceable wetlands, fresh water and wild life habitat resources in the Lake Superior Basin for generations to come. If we don't do it now, what does that mean for the future of northern Minnesota. Very truly yours,
Erin Manning Northern Minnesota resident Erin Manning 6587 Park Hill Rd Finland, MN 55603

Erin Ramberg 45597

Dear Sirs, Two of Minnesota's greatest resources are water and the outdoors. Of these the North shore of Lake Superior is the best example of both. Adding a hazardous practice mine to strip a few mineral for a 20 year duration seem senseless when considering the potential to damage the quickly diminishing clean fresh water we prize and the outdoors I've personally used and loved for 40 years of my 46 years of life. Let the protection of the outdoors and clean water to enjoy for the next 1,000 years guide this decision over the short term benefits it will yield in minerals. Regards, Erin Ramberg

I very much want every effort to be made to protect our natural resources and choose not to put them at risk. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

58015

Our natural resources are too beautiful to risk. Please protect them. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

To the DNR, Please do not allow the PolyMet mining to happen. I do not believe that this project will benefit the community or the environment in a positive way that would continue over time. Yes, there are pros and cons to this however, in the end the negative effects are much more prominent than the positive ones. This project may create jobs and provide resources that are valuable to other industries. Although once the job is completed the only people that will be gaining income will be the companies that continue to get money off the land. The jobs will only last 20 about years then after that people will be back to where they were. Not to mention the environmental impact you will be making, even though the site is not on the boundary waters, you can not control mother nature. You are not God. There is no way for the company to put the environment back to the way it was. Also, from the negative impacts there will be health problems (because there always are when you mess with the environment). I would suggest that you inform the public and educate them on the projects that happen in our community, that is your job to inform the public and keep the environment and the community safe. Thank you for your time to read this

Dear Ms Fay, Dear Federal and State Agency Leaders: I am a toxicologist in a private company. My job is to assure that my company's products are safe for people and for the environment. I am proud of my work and use every available tool to assess the impact of my products now and in the future-this is appropriate management. I do not see PolyMet using the care and attention to detail that I would expect and that the people (and wildlife) of Minnesota deserve. The PolyMet SDEIS doesn't analyze the effect of pollution on workers' health or on drinking water sources. The SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years, but does not provide robust plans to remediate this pollution. PolyMet's sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals. The SDEIS does not give any reasonable assurance that this environmental damage can be addressed. In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." Their most recent study is still inadequate. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Esther Hope Esther Hope 1006 Cromwell Ave Saint Paul, MN 55114

--Original Message-- From: runningwoman5457@yahoo-com [mailto:runningwoman5457@yahoo-com] Sent: Thursday, February 27, 2014 8:32 AM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: The PolyMet Supplemental Draft Environmental Impact Statement (SDEIS) is fatally flawed, and needs to go back to the drawing board to be fixed. You should not burden the next fifteen generations with toxic water pollution and cleanup costs from a sulfide mine that hasn't been properly planned. PolyMet would operate for 20 years but, according to PolyMet's own data, would pollute water for over 500 years at the tailings basin, and over 200 years at the mine pit. The modeling results provided in the SDEIS show that PolyMet and the DNR simply did not look beyond 500 years. The fact that the SDEIS does not say when the mine pit and tailings basin will stop polluting our water is a major and apparently intentional failure that needs to be corrected by the DNR. Please run the models . or require PolyMet to run the models . long enough to show when pollution of our water by PolyMet's mine would cease. PolyMet proposes a complex mechanical system of pumps, pipelines, and filters that it says will capture and hold back the water pollution from getting into our rivers. PolyMet assumes the proposed expensive and complicated water treatment system will continue to operate effectively for long, long after the mining has stopped. It should be expected that mechanical systems like pumps, filters and pipes will eventually fail. In a 2007 report, an organization called Earthworks analyzed the records of 14 modern copper mines in five states found that 100% of these mines experienced pipeline spills or other accidental releases. 92% had failures of water collection and treatment systems that resulted in releases of contaminated mine seepage that significantly impacted water quality. But Polymet's SDEIS lacks contingency plans for predictable failures in the proposed piping, pumping, and filtration equipment. By assuming that a complicated water treatment system will function indefinitely without fail, the SDEIS has failed to take the hard look required at the proposed PolyMet sulfide mine. Please send the SDEIS and PolyMet back to the drawing board with directions to include contingency plans for predictable failures in the water pumping and treatment system, and the power supply to run that system. In addition, the SDEIS proposes to dump tailings from the mining process on top of the former LTV Steel's tailings basin, which was built in the 1950s on top of three streams, was designed to leak. In fact, the existing tailings basin is already leaking millions of gallons of untreated water, yet the chemical composition of that large volume of leaking water has not been tested and characterized. The failure to test and account for known leaks of untreated tailings basin water from the existing LTV Steel tailings basin is another major problem with the SDEIS. Moreover, the tailings basin and the dam holding it back from flowing downstream are recognized to be unstable. If the tailings basin dam were to fail, vast quantities of contaminated tailings, sulfates, and heavy metals would be released into the headwaters of the St Louis River. In other mines, such tailings basin failures have sent a flood of millions of cubic yards of toxic debris as much as hundreds of miles downstream. The failure of the SDEIS to fully consider the potential for . and the consequences of . a tailings dam failure is a deadly flaw in the SDEIS. PolyMet proposes a large open-pit mine in untouched, high-quality wetlands, that are located on public land owned by the US Forest Service. The SDEIS states that building an underground mine would have .significant environmental benefits. compared to an open-pit mine. However, the PolyMet SDEIS rejects underground mining, stating that in today's market conditions, underground mining is not

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms esther ouray 3351 Columbus Ave Minneapolis, MN 55407-2032 (612) 229-1641

ethan hogen 41959

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, ethan hogen minneapolis, Minnesota

My comment has to do with hiring Union labor, from the beginning of the project, through to the end, when the mine's resources are exhausted. I know many miners in this area are pro-union workers, I hope this project will respect the worker's right to organize and be part of a union.

44528

The profits from the industry must be kept in banks in the US They must not be allowed to hide their profits and not pay their fair share of taxes. Those who do not pay their fair share of taxes are unpatriotic. This corporation must not be allowed to bank their profits overseas.

44531

They must have a 'super fund' of their own to clean up the pollution that will be present. I have seen mines plead bankruptcy and the tax payer left to pay to clean up the pollution. The fund must be in place before they are allowed to begin. The last comment may be the most important: The profits from the industry must be kept in banks in the US They must not be allowed to hide their profits and not pay their fair share of taxes. Those who do not pay their fair share of taxes are unpatriotic.

Etta Bartholdi 57183

Please don't destroy the boundary waters. I love them very much and I feel mining for coal will [ILLEGIBLE] destroy the natural beauty and eco health of the BWCA. Thanks.Etta Bertholdi2100 26th Ave SouthMinneapolis, MN 55406

I oppose the poly met plan. I beleive that the information in the seis is un true and incomplete for many reasons. one is that the information regarding the potential impacts on wild life including fauna and flora is lacking more observent details including the pathways for moose, the breeding grounds for links, the extince of sun-dews (A rare medicine plant) in the proposed mine location. I believe that saying clean up needs to happen for more than the amount of time the mine will be run is dangrous grounds and there is no proof that poly met, glencore or any other investors would stick around for long enough to clean up any thing. There is also the issue of the tribal rights to the land. the fact that it is in the national forest should be enough to stop this plan before it starts. we need to live for generat5ions to come not just the next 20 years. there are no jobs on a dead planet. another thing lacking in the seis it the real details about what would happen if we took out that much of our current carbon sink. this plan and seis is flawed please take the time to stop this tragedy before it starts. thanks Eve Marie Glidden 4326 5th ave south Minneapolis mn 55409 612b 333 1805 The holy land is everywhere~ Black Elk

Evelyn Staus 16116

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining may have a short-term economic benefit for Minnesota but at what cost. There is clearly an environmental price to pay in the short-term but there is also there very real potential that this could turn into a massive environmental problem in the long term as a consequent of toxic metal release and Acid Mine Drainage. This possibility should not be understated - it would negate any initial financial benefit that Minnesota would experience and could leave the environment damaged for hundreds of years. It is a gamble that is simply not worth taking. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Evelyn Stillwell 1099 Chatsworth St N Saint Paul, MN 55103-1005 (651) 603-0734

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Evi Winter Heynestrassse 42 Nürnberg, ot 90443 DE

Dear Sir or Madam, My name is Erik and I am from Glenwood. I have worked a couple of springs in the Glenwood hatchery and have dear friends at the Glenwood office. I have been to 49 states and seen much wilderness in many of them. I have also been abroad a few times but I have found the BWCA to be one of the most beautiful and unique places I have been in my travels. I believe with copper sulfide mining in the BWCA watershed, there will be grave environmental impacts to the fragile ecosystem, flora and fauna. I do not support allowing a multinational corporation(s) to spoil the great area. The jobs are in no way worth destroying this treasure of nature. Mining is boom and bust and once they extract the resources of the area and possibly destroy the local environment, our children, grandchildren and beyond will inherit the legacy. I think its a terrible idea to allow this. I really hope future generations can enjoy and benefit from this vital, unique and beautiful wilderness. Thank you for your utmost consideration. "The movement of a canoe is like a reed in the wind. Silence is part of it, and the sounds of lapping water, bird songs, and wind in the trees. It is part of the medium through which it floats, the sky, the water, the shores ." Sigurd F. Olson Respectfully, Erik Pederson

Dear Head of the Minnesota DNR: These are my opinions. Receipt reply requested. The MDNR failed to respond to my twice-requested information regarding the land exchange portion of the proposal. Based upon this failure, I can only assume that the land to be sacrificed is worth more than the land that will be exchanged for public use. Why else are you trying to hide the information that is obviously needed to compare the parcels. Furthermore, mining prospectors are impacting too many areas. The impact they cause is evident across many more acres (from a visual quality perspective) than the actual damage covers. Access roads and pits are needed, encouraging sedimentation and the introduction of non-native plants. I have no more faith or trust in the Minnesota DNR than I have in the Michigan DEQ. Their managements, in my opinion, are comprised of conspirators who belong in jail cells. Curses to the MDNR for not sending me the requested information. Frank Jeff Verito 350 East Ridge Street Marquette, MI 49855

The attached maps look like they were drawn by seventh graders. No description of the parcels (type of vegetation, age, water features, etc..) was provided as requested, and the contour interval was not provided. The contour interval is the change in elevation between the contour lines. In other words, do the contour lines represent a two-foot change or a fifty-foot change in elevation. No way can a citizen compare what we're obtaining to what we're relinquishing without the federal parcels as well. TO WHOM DO YOU REPORT Mr JIMENEZ. IT'S APPARENT THAT YOU NEED TO TAKE A GEOGRAPHY COURSE, AND A PUBLIC RELATIONS COURSE SO YOU CAN VISUALIZE WHY SOMEONE WHO'S PREPARING COMMENTS WOULD NEED THIS INFORMATION. It's obvious that we're having a difficult time communicating, and that you're not prepared to be handling this NorthMet item whatsoever. Please add this comment to the comments file for this project. I am dead-set against it until the obviously-needed information is provided. Start over and do it right. FJVerito On Friday, January 24, 2014 5:15 PM, "Jimenez, Michael -FS" <mjimenez@fs.fed.us> wrote: Dear Mr Verito, I conferred with our realty specialist regarding your request for maps and information. We identified the attached maps. They are not currently in our project records for the NorthMet Mining Project and Land Exchange, however they may address your request for contour mapping on the non-federal parcels included in the proposed land exchange. Corresponding mapping for the federal parcel was not included in the files and apparently not done as it was for the non-federal parcels. If you feel that the SDEIS is missing information on the proposed land exchange that could make the environmental analysis more complete or understandable. Please include your thoughts on this potential information with any comments you may be submitting on the SDEIS. To Whom It May Concern: The proposed PolyMet project in the watershed of Lake Superior will destroy or permanently degrade thousands of acres of high-quality wetlands and cause permanent water pollution with sulfuric acid and toxic metals. Treatment would be required for at least 500 years, but more likely thousands of years. Sulfide ore mining is hard-rock mining, and every hard-rock mine in the United States pollutes the land and water. The United States Environmental Protection Agency (EPA) says that hard-rock mining is the most toxic industry in the United States. Polymet's Supplemental Draft Environmental Impact Statement is inadequate in its response to these concerns. In February 2010, the EPA gave PolyMet's Draft Environmental Impact Statement (DEIS) the lowest possible score. After almost four years, PolyMet is back with a Supplemental Draft Environmental Impact Statement (SDEIS). Despite the length of time taken to prepare the SDEIS, it fails to describe the staggering environmental, economic, and social costs of the project. We are strongly opposed to the State of Minnesota allowing PolyMet to begin production of any sort of mining near our pristine BWCA and feel it would be short-sighted and immoral to trade a few hundred relatively short term mining jobs for the future of our health and the health of our planet. New technologies should be supported/discovered to reduce the need for copper and other minerals for our cell phones, computers, ipads, cars and other devices which are driving this "need" for sulfide mining. Sincerely, Todd and Fern Peterson 5209 Chantrey Road Edina, MN 55436 and 68 Menogyn Trail Grand Marais, MN 55604

Ferolyn Angell 42048

Fione 54180

I have never been to the boundary waters but I have only ever heard wonderful things about the experiences people have while they are there. During the speech some very valid points were brought up about how mining should not be allowed in the boundary waters area such as how it will pollute the area which is known well for camping and lots of wild life. Also it is a pure watershed which is a great resource to have, especially so close to home. I do believe mining should not be allowed in this nature sanctuary.

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: Please reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. If in place, the precautionary principle would preclude this ill-conceived project that will compromise the natural resources we've come to take for granted, for generations to come. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at a

I think this is a bad idea. I think it is very possible pollution will occur that may be impossible to clean up. Furthermore, if the company declares bankruptcy at some point, there will be insufficient funds to clean up any mess. I recall the state of Minnesota giving a lot of money to Northwest airlines to assist the airline in keeping jobs in Minnesota - now Northwest is gone. I don't think we can count on a business to have environmental safety as its primary concern. This is just too dangerous. Thank you for reading this. Sincerely, Karen Flynn 16 East 10th Street Duluth MN 55805

Aloha, Please find attached work doc. with my comments for the Supplemental Draft Environmental Impact Statement Polymet Mining, Inc. NorthMet Mining Project and Land Exchange. Thank you for you time. Sincerely, Forrest Petersen

Fort JK 47327

Mar 12, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. The Supplemental Draft Environmental Impact Statement fails to adequately address the negative impact of the proposed copper sulfide mine. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. It would pollute and ruin the wild and beautiful St Louis River and watershed from it's northernmost regions all the way to Lake Superior, which is another body of water that would be so negatively impacted as well as all the groundwater in its wake, groundwater that we citizens rely on to be safe and healthy to drink. For Duluth, or any cities/towns who get their drinking water from Lake Superior, it would be a negative impact as well. But, we must also mention the terrible, direct devastating effect the pollution from the mine would cause concerning wildlife and birds who use the St Louis River and Lake Superior to drink from and obtain food from. I include the Embarrass River and any other body(ies) of water that would be harmed by the mine as well, such as the lake that is over the presumed deposit. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Therefore, in the best interests of public health and safety along with wildlife/bird and environmental health and safety, I urge you not to approve any of the environmental impact statements that favor Polymet's action to build/operate this mine they are proposing. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Fort JK 10332 Bachelor Square Rd Meadowlands, MN 55765-8103

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As a Wisconsin neighbor who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Fran Brinkman 8226 Slater Ave Mount Pleasant, WI 53406-3708

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, fran whitman 13856 ford drive L'ANSE, MI 49946

Hello. My name is Frank Frederickson. I was born and raised in International Falls and I currently reside and live and work in Grand Rapids, Minnesota, where my wife and I are raising our family of four children. My whole life I have enjoyed the beauty of the region and the opportunities it provides to hunt, fish and camp. And as a high school and college student, I was very blessed to have a summer job piloting a tour boat in Voyageurs National Park for the whole three months of the year that our tourist season was. Today I am blessed, again, to have a year-round job in northern Minnesota that is a direct result of the paper and mining industry in our region. This job enabled me and my wife to relocate back into northern Minnesota, after spending ten years in the Twin Cities, so that we could raise our family in northern Minnesota and show them the same environment that we grew up to appreciate and enjoy. With this background, I wanted to state my appreciation for the efforts of the permitting agencies and of PolyMet to work together in a diligent environmental review process that identifies necessary protections for our shared environment, while enabling the economic extraction of materials and minerals that we all use in our daily lives; in our phones, homes and cars. More specifically, I want to comment on the proposed Land Exchange in the SDEIS. As a native of International Falls, I grew up in a community that was established by a paper company and remains largely supported by the mill today. And I also enjoyed having Voyageurs National Park at my doorstep. This national park was not formed without its own controversy in the sixties and seventies. And the establishment of the park meant for an expansion of federal land protection in northern Minnesota and a reduction in private woodland for mixed-use recreation, hunting and pulpwood production. But the national park ultimately was able to co-exist with the paper industry, and it was partially enabled by a Land Exchange between the state, county, federal and paper mill. This Land Exchange my grandfather was a part of, as woodlands manager for the mill, in making that happen. I reviewed the Land Exchange proposed in the SDEIS between the U.S. Forest Service and PolyMet and believe this is a smart move for our region. As detailed in the SDEIS, the Land Exchange proposes a transfer of the surface rights of 6,650 acres of federal land that is landlocked by neighboring private ownership and basically inaccessible for public use to PolyMet for the mine operation in exchange for up to 6,722 acres located within the management area of the U.S. Forest Service. The lands of the U.S. Forest Service will gain a higher recreational value, while the lands for PolyMet unite the ownership of the subsurface mineral rights with the surface rights. I believe this is a win-win for our region and that it enables enhanced recreational opportunities for the public, while enabling the extraction of minerals in an environmentally sound manner. This is a good deal for Minnesotans and our country. I fully support it and thank you for your thorough review.

Frank Gardner

Hi, I live at 1810 Hartford Ave, St Paul, MN, 55116- The following are general comments about the draft. 1) The Audubon Society and others have suggested Polymet look at underground mining instead of open pit. I don't see that as an option in the EIS. Why not. It would cost Polymet more to mine copper nickel but the environmental damage would be far less. 2) We have one of the largest concentrations of fresh water in the world, both in our interior lakes and with Lake Superior. This seems far valuable to the country than copper nickel, especially in time when droughts have impacted different parts of the country for at least the last two decades due to global warming. This legacy is worth preserving and this mine, and others proposed, would like end it. 3) Like many Minnesotans I find it hard to imagine the monitoring of water for 500 years. Copper nickel mining has an atrocious international record so I would certainly plan on necessity for long-term monitoring. The chance for pollution due to heavy rainfall, poor planning, breached liners and unforeseen weather events seems likely. Where is the mitigation plan for worse-case scenarios. Again, the reputation of copper nickel miners hasn't been stellar. 4) What are the details of the proposed water treatment systems I can't find them. 5) Who will pay for five centuries of monitoring. If Polymet goes under, what is the liability to the taxpayer. 6) How much will Polymet put up annually to pay for cleanup in case of a disaster. 7) Are you going to correct the inaccurate water flow model. 8) Will there be more work on the impact to wetlands. Seems under-represented. 9) The land exchange basically a fraud. The mining rights are not clear at all in the swap - so those lands could be mined someday too. 10) There is significant habitat loss not well documented in the report. 11) Finally, Polymet is a small company, frankly not all that well capitalized to take on such an enormous undertaking. It is not Kennecott. I fear any kind of even minor disaster will likely put it out of business, or it may decide to put itself out of business. Of course, the taxpayer will be left with the environmental and financial damage of such a result. The strategy of going out of business is common in the copper nickel mining community. Minnesota needs a liability plan and money in the bank to guard against the inevitable. Thanks for your time. Frank Jossi

Dear Ms Fay, First, thank you for sending me the full bound copy of the Polymet EIS. As you know it is a lot to try and digest but I'm giving it my best effort. There are so many comments I'd like to make but there is one point, that is so glaringly obvious, that it alone should prevent Polymet from ever getting a favorable opinion from any involved regulating agency. Does anyone really believe that Polymet will operate the largest reverse osmosis system ever used for this purpose for at least 500 years. Seriously. That's more than twice as long as our country has been in existence. Five hundred years ago Europe was just coming out of the Dark Ages. Columbus had just made his trip to America. If we are all honest about this, there is zero chance that Polymet, or even it's primary investor Glencore, will be in existence in 500 years, much less any remediation system that they propose. Please, let's just be honest here. Either we admit that this is pure fantasy that this proposed massive reverse osmosis system will still be in existence in how ever many hundred years it takes for the Polymet mine pollution to somehow no longer be a threat, or we admit that we want the mine to happen regardless of the massive amounts of pollution that will result from it. This draft of the Polymet EIS is still "inadequate" being based upon the assumption that the pollution from the mine can and will be processed for 500 years. We all know this is not going to happen. So please let's again reject the Polymet EIS and protect the Saint Louis River Watershed and Lake Superior. Thank you. Frank Moe PO Box 863 Grand Marais, MN 55606

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Frank Peterson 424 W Main St Waconia, MN 55387-1028

Frank Trapanese

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I live in Red Wing and a few years ago committed the majority of my life savings to purchase a lake lot in St Louis county. Thus, I am both a concerned citizen and a stake holder. It is the duty and ethical responsibility of the EPA, DNR, the Corp and other governmental agencies to protect ordinary citizens and the environment. I ask that you fulfill this duty by not letting PolyMet get by with a poor quality assessment based on unrealistic data. The effect of PolyMet's likely pollution would devastate the now vital fishing and tourism industries of northeastern MN for generations. The prospect of a limited number of jobs for a limited period of time would be more than offset by the collapse of fishing, tourism, seasonal residencies etc etc etc, not to mention future decades of cleanup costs that PolyMet would undoubtedly shrink from and leave to the tax payers. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. There are critical failures. The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Frank Trapanese 4202 Wright St Red Wing, MN 55066

How can anyone even consider allowing this project to proceed. For short-term monetary gain which probably will not even provide a high percentage of benefit to Minnesota, we risk our treasure. As a user of the Boundary Waters whose extended family has enjoyed this resource for over 70 years, and a student of environmental studies, I cannot see, given the track record of such mining operations, how this will not have a serious and long-term impact on the area, changing it, irreparably, forever. Please don't let a foreign entity spoil one of the last remaining true wilderness areas in the US and leave the taxpayers holding the bag for generations. Far more money can be made in the long run by keeping the area wild and pristine and focusing on smaller projects with less negative effect. My name is Frank Wattunen, F-R-A-N-K, W-A-T-T-U-N-E-N. I've heard a lot on both sides. I do get a little emotional. "Profit" is not a nasty word. All of your income, all of your livelihoods rely on profit from somebody. Businesses don't exist without profit. PolyMet should make a profit. It doesn't matter where they're from. They're willing to invest their time and money to create jobs. Copper-nickel is not a curse; it's a blessing. Everybody talks about the BWCA. I spent more time in the BWCA before it was the BWCA than most of you people ever have or ever will. My future's home, permanent home and not a constant weekend home is on the border of the BWCA. I want everyone to enjoy the BWCA, but not turn to be a religious zealot regarding water quality. Technologies change. There's a famous place in Ely that's fished very heavily going by the name of Stinky Ditch. That's where Ely Municipal used to discharge all of their waste. That has been totally cleaned up. It's a great fishery on Shagawa Lake. Yes, mining scars the earth. It's not pretty. It never will be pretty, but it can be done right. We have the experts. Let them do their jobs. Twenty years. A lot of us -- I work there in the summertime. My folks worked there. Reserve Mining Company, huge, huge, huge plant. Yes, they did pollute Lake Superior with their discharge until they got it all straightened out. Again, thanks for listening. It can be done. Logging, mining and tourism can coexist.

Frank Wood

February 26, 2014 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit Dear Lisa Fay - Our adult lives have been lived in Minnesota. We love our entire state but the beautiful northern lake and forest country has a special place in our hearts. We spent many happy days camping and canoeing there. Now in our mid-eighties we are limited in what we can undertake but our memories are fresh and often freshened by reports from our friends and younger family members about their trips. We want to save this precious resource for them and others. We understand the desire of Minnesotans who want to live in the midst of this special place and also earn a good income. We think the time has come to plan for sustainable employment rather than relying on jobs in mining which have a limited duration. We are disappointed that anyone is ready to risk the health of the entire region for a few hundred jobs. The fact that we happen to live in a particular place does not give me the right to do anything we choose to that environment. Previous mining has already done damage. Consider the pollution of the St Louis River. Look at the isolated instances of damage where sulfide bearing ores have been mined. We do not believe there is a "safe" way to manage the poisonous residue from such mining. Concentrating the poison using the filtration process proposed does not solve the problem. Consider the history of Butte MT, particularly the Berkeley Pit. What responsible person would place such a pool of poison in the midst of a network of lakes and streams Just recently we have seen a tank leakage in West Virginia and a slurry dam failure in Georgia. In the first case, the corporation involved sought protection in bankruptcy—a move that is not unusual for firms in a tight place. Promises do not last when the profits are gone. Corporations have no heart or soul—this makes them useful for some human purposes but not for protecting the environment. We hope to be able to respect the process used in evaluation the pros and cons of this request for a license to mine. We know that there are powerful commercial interests pressing for approval. They are seeking profit. We understand the DNR's two-fold responsibility both to protect and use the natural resources of our state. In this case we believe the proposed use will cause too much damage to the environment to be permitted. Minnesotans like us want to pass something irreplaceable on to future generations without nasty scars. Sincerely – Frank H. and Raquel K. Wood 141 Bedford Street Southeast Minneapolis, MN 55414

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project SDEIS. Sulfide mining can not be performed safely without causing long term pollution and environmental damage. In the long term the tax payers will be paying for this mine with lost tourism jobs, health care costs, and clean-up costs. It would be more cost effective for the tax payers to pay the mining companies millions to just go away. Save our money, save our health, and save our environment. The Federal land exchange of protected Superior National Forest land is not in the public interest Sincerely, Fred Hickox 2705 Rockhill Dr NE Grand Rapids, MI 49525-1242 (616) 866-7638

This project is indeed a choice between jobs and the environment. What is very clear is that the jobs are relatively short term - 10-20 years - and the environmental risk and degradation are very long term - 100-500 yrs. This is a difficult choice for some, but an essential choice for all. No mine is worth it. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

58143

I oppose the proposed project and urge the State of Minnesota to reject it. Jobs are important, and so is the environment. I strongly oppose the land swap as sub [ILLEGIBLE] to avoid wetland protection. It should not be allowed. 99% of the material mined will be waste, creating unrealistic and immense, perpetual liabilities. I grew up in Pennsylvania and have been long term acid mine run-off. It is not pretty. It is a very destructive result, and Minnesota is a [ILLEGIBLE] and thus more vulnerable than Pennsylvania. There is no precedent where this damage was not the result of sulfide mining. 50% of the US copper comes from recycling. We are recycling less than half of what is thrown away. We should be mining the waste we have created and are creating – not destroying more of the planet to create, ultimately, more waste. These new jobs will also disappear and when they do, what will remain? Will our grandchildren think it was worth it! Really! Thank you.

Fred Schumacher

52278

Fred Schumacher 3460 N. Range Line Rd Gheen, MN 55771 218 787-2212 [HYPERLINK "mailto:fredschem@gmail-com"](mailto:fredschem@gmail-com)fredschum@gmail-com I oppose granting a permit for the proposed Polymet mining operation near Ely. The mining period is too short, the number of jobs created too small, the experience of the company in mining non-existent, the possibility of damage too great, and the remediation period too long. The trade offs are not worth it. Note that the EPA recently halted the permitting process for the Pebble Mine near Bristol Bay, Alaska because of concerns over environmental damage. Thank you. Sincerely, Fred Schumacher

COMMENT ON POLYMET NORTHMENT SDEIS To: Lisa Fay, EIS Project Manager, MDNR Division of Ecological and Water Resources Environmental Review Unit, St Paul, MN 55155 From: Fred and Pamela Thompson, 1223 Little Creek Road Brimson, MN 55602 Email: MWVisuals@aol-com PLEASE NOTE: The following is not a form letter regarding Polymet/Northmet's proposal to mine copper nickel and other minerals in Minnesota's Arrowhead Country: To whom it may concern: Pamela and I have been residents in northern Minnesota's Arrowhead Country for forty-four years. We are among the founders of the Iron Range Historical Society. Our business, Midwest Visuals Inc.(MWVisuals@aol-com), created dozens of educational slide shows and videos about the region's history, its environment and its nonprofit organizations and business institutions. In 1979, under contract with the State of Minnesota, we produced Iron Range Country, a 232-page book about the history and culture of Minnesota's Vermilion, Mesabi and Cuyuna Iron Ranges. Minnesota's mining history is a classic example of a boom and bust economy. Many companies came and left after they exhausted the mineral riches our region offered. What did they leave us. Ultimately, hundreds of hills of overburden too sterile to grow trees and other plants; deep holes in the ground; a holding pond contaminated with asbestos like fibers; hundreds of homes worth only a few thousand dollars and many unemployed workers. When the iron mines opened in the late 1800s and early 1900s, they provided employment for thousands of immigrants. This ended in the 1970s, a mere 80+ years after the opening of the first mines when the "natural ore" mines gave out. Another, more modest boom took place after the discovery of a means to economically produce iron from the area's abundant taconite ore deposits. This boom lasted until the price for iron plummeted and it was no longer profitable to ship ore from Minnesota. Results: more unemployment, more sterile overburden, more costs to the Minnesota taxpayer. It is only lately that we are again experiencing some modest growth given improved economies and world-wide demand. Now, Polymet and its investors, along with other mining companies, want to exploit our region's other mineral resources. This time, it's copper, nickel and other minerals that are located in a sulfide ore base. Unfortunately, unlike iron mining, the world today has much negative experience with this type of mining. We've been through this before. Does anyone remember INCO's and AMAX's efforts to obtains permits to mine Minnesota's copper nickel deposits in the 1970s. After pressure from citizen groups such as the Minnesota Copper-Nickel Coalition, Minnesota took on the task of a complex study of the long term effects of this new (for the state) type of mining. Its study came to the conclusion that there were still many questions left unanswered. And then: the price for copper and nickel plummeted making mining unprofitable. AMAX and INCO faded away. Can this happen again. Of course. What did we learn from the 1970s that's still relevant today. When it rains on the overburden from iron mining, the result is mostly rusty water. Not so with a sulfide ore body. It is well documented that the acidic runoff from sulfide mine overburden must be captured and contained, potentially for hundreds of years. And who will pay for this monitoring. Polymet. Consider the company's history. PolyMet has never operated a mine. It is dependent on Glencore, its largest investor, for much of its revenue. Glencore is the world's largest commodities company and one of the world's largest global mining companies. Unfortunately for Minnesota, however, it also has a long history of environmental pollution, human rights violations and anti-labor practices. Are we asking Glencore to be the responsible party. Given its history, is this a company that Minnesota can trust. Increased employment. Yes, initially there will be s

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Frederik de BENOIST 1 allée RAMEAU les clayes sous bois, TX 78340 FR

To whom it may concern: I have been reading about this project through the DNR website, trying to become familiar with its scope, its impact –both environmentally and financially – upon the area – and I trust that all precautions will be taken, implemented and sufficient in order to protect the watershed. My questions/concerns revolve around the duration of the environmental impact upon water quality for the next “200 years at the Mine Site and 500 years at the Plant Site”. I have been unable to read where my following questions are answered; specifically regarding money/finances/responsibility – 1- Where is the money coming from in order to support the operations that prevent any negative environmental impact for the next 200-500 years. 2- Is there going to be a reserve set up in order to support monetarily the operations that prevent any negative environmental impact for the next 200-500 years. 3- Who is responsible in supporting the operations, and watch-dogging the operations, that prevent any negative environmental impact for the next 200-500 years. While I understand that Polymet will be required to protect the environment and that the MNPCA / MN EPA will be the watchdogs along with the DNR, might I suggest the following, if isn't already in place: The DNR, MNPCA and the MN EPA, be the watchdogs for the next 200-500 years. After the appropriate annual operational budget calculations are made, that an annual fee be assessed upon Polymet and its successors that is based upon the annual volume of water contaminated and the costs necessary to support containment operations of that volume for the next 200-500 years. Finally, all monies need to be placed into a non-accessible reserve (non-accessible by any present or future State Governments) that will support all environmental operations for the next 200-500 years. Thank you for your anticipated response to my questions and suggestions. Fred Whitney Frederick R. Whitney 2768 Highway 61 Two Harbors, MN 55616 218-834-7168

I agree with the attached letter, save the land and water. It is all we have left. Lynne Grenier

G. D. 57877

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Gabe Ernst 43803

I have seen the area that this mine will damage and I am completely against this mine as well as other non-ferrous mining. The amount of damage that this will to the watersheds and their associated recreation and tourism does not add to a good decision to bring a mine here. Please push back against this corporate interest that will inevitably lead to further poverty in our region just like the last time mining collapsed. We have moved beyond this economically and there is no reason to regress back again. Thank you, Gabe Ernst

Gabriel de la Iglesia 48167

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Gabriel de la Iglesia 8930 W Flagler St Apt 108 Miami, FL 33174

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Gabriel Skelly 8937 N Minnehaha Cir Minneapolis, MN 55426-3728

Gael Zembal 15406

Hello, Please find attached my comment on the NorthMet SDEIS. Thank you for your time, Gael Zembal

Hello, Please find attached my comment on the NorthMet Sulfide Mine SDEIS. I have also sent a copy to Ms Fay of the DNR and Mr Bruner of the US Army Corps of Engineers. Thank you for your time, Gael Zembal

Gaelynn Lea 5933

Why I oppose the NorthMet Mine and thus believe the SDEIS should be rejected: My name is Gaelynn Lea Tressler. I am a musician and I am proud to call Duluth home. Two of my bands, [HYPERLINK "http://violinscratches-com/2014/01/17/why-i-oppose-sulfide-mining-in-minnesota/www.snobarnmusic-com"](http://violinscratches-com/2014/01/17/why-i-oppose-sulfide-mining-in-minnesota/www.snobarnmusic-com) Snöbarn and [HYPERLINK "http://www.lea-sparhawk-crows-com/"](http://www.lea-sparhawk-crows-com/) The Murder of Crows, recorded tracks for the [HYPERLINK "http://thearrowheadstory.bandcamp-com/"](http://thearrowheadstory.bandcamp-com/) Arrowhead Story – an album created to raise awareness about the risks of Sulfide Mining. I am against the proposed PolyMet mine for many reasons. Of course, some of my opposition stems from my spirituality – I believe that humans are supposed to protect, not destroy, the Earth that God gave us. I also believe that it is our duty to alleviate suffering whenever possible, in this case, suffering from the future harm and disease caused by toxins that will almost certainly be released by this proposed PolyMet mine. But there are other reasons to oppose Sulfide Mining, even if one is not of a religious background. First, it just seems like a bad business deal: We loan PolyMet our land for 20 years, less than one generation's time, and they will leave it polluted for 500 years. That means over 16 generations of future Minnesotans would be affected by pollution caused by the PolyMet Mine. If I tried to get a business loan and said I'd have it paid back in a speedy 500 years, I'd be laughed out of the loan office. Why are we even considering this mine as a plausible business idea. And that is if everything goes RIGHT. What if something goes wrong and we end up facing much more pollution than we were told to expect. I just can't trust a for-profit company to honestly have the environment's best interest in mind; ultimately it's about the bottom line, it has to be. So even if PolyMet tells me that this mine will have the newest safeguards in place, creating minimal damage to the environment, I still hesitate to believe them. And it appears to be for good reason: For example, one study found that, among modern mines in the US that predicted that no acid mine drainage would occur, 89% of those mines DID have acid mine drainage during operations or after closure. And just in case it's not clear, there are many reasons to fear acid mine drainage: acid mine drainage kills fish, wildlife and plants. Mining by-products such as arsenic, manganese and thallium, have been shown to increase the risk of cancer and other illnesses in humans. Make no mistake, there WILL be disease created by this mine. Are profits really worth anything if they're at the expense of human life. And, if 500 years of pollution somehow doesn't bother you, maybe the costs to the taxpayers will: Experts who have studied other mining projects across the country said even those that start with financial safeguards can end up costing taxpayers millions of dollars. In Montana, they underestimated the volume of water needing treatment after a gold mine had closed, and state taxpayers had to create a \$34 million trust fund to pay for it. Northern Minnesota cannot afford a miscalculation of that magnitude. Another study says that water treatment would cost between \$3-5 and \$6 million per year after the mine closes. Northern Minnesota cannot afford to foot that bill. Not for one year, not for 500 years. There are other, safer, better ways to grow our economy. For example, Maurices is soon expanding its corporate office, and they're slotted to create 600 jobs right here in Duluth. PolyMet will only create 360 full-time jobs, with HUGE liabilities attached. Let's focus on industries with less risk and more jobs. I vote as conscientiously as I can, I live as conscientiously as I can. My household, and my friends, regularly take actions to preserve the earth and our own health. And now a FOR-PROFIT company is hoping to come in and risk my health and the planet's vital water supply all for money I will never see. Where is the political, so

DNR I urge you NOT to accept the SDEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model In conclusion it is my opinion that the few hundred jobs and monetary gain for a corporation is not worth the perpetual damage and

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Gail Gaebe 12648 tanglewood rd audubon, MN 56511

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Acid Mine Drainage and heavy metal contamination have polluted waters in ALL other places where sulfide ore mining has occurred. Sulfide mining in Minnesota threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. And this feeds into ALL the other Great Lakes, great because they are fresh water. I have grave concerns about this project's impacts on our region's natural resources and public health, risks to water quality, risk and loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The federal land give-away to a mining company is not in the public's interest, it is not in the interest of wildlife, it is not in the interest of keeping our Great Lakes clean and fresh. Sincerely, Gail Gray 5213 Franklin Blvd Cleveland, OH 44102-3329

Gail Gray 28852

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Sulfide mining threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness and on into the rest of the Great Lakes, including my Lake Erie. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Gail Gray 5213 Franklin Blvd Cleveland, OH 44102-3329

Gail J. Hartly 6215

I urge you not to let this mine be built. It would be short term financial gain for a relative few, compared to the long term gain, on several levels, for countless individuals and businesses for the countless generations to come. Thank you, Gail Hartly 34562 Fern Rd Lanesboro, MN 55949

Gail Jacobson 40090

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action I'm grateful for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Gail Jacobson 1747 Carl St Saint Paul, MN 55113-5201 (651) 647-5019

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Gail Rosenquist 1514 N 8th Ave E Duluth, MN 55805-1115

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.
