Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. To whom it may concern, which in my opinion is the entire state of Minnesota and its future citizens. I have carefully examined the available evidence both for and against the Polymet proposal for a copper sulfide mine in Northeastern Minnesota. It is my opinion that at this time this project should absolutely not go forwaRd We as a state are not in a good position to trust that Polymet and its associates will be able to provide us with the environmental and financial assurances that we absolutely need to have before a permit to Mine is granted. One question that has been asked over and over and has gone unanswered is "Please give us an example of this type of mining that has not contaminated the watershed." No one has been able to show an example. Saying that this will be the first copper sulfide mine that won't contaminate the watershed and pollute the air is unacceptable. We have never mined copper in Minnesota and based on the fact that there is currently a global surplus of copper and nickel right now tells me that the risk isn't worth the rewaRd Particularly when it comes to who will actually capitalize the most on this project if it were to go forwaRd There is little in this for the state of Minnesota or its workforce. I know people on the range need jobs but this will not change the economy on the range based on the number of jobs it would create. This is also not a typical range project so it is very likely that many of the jobs created wouldn't be filled by locals. It is well known that Polymet has never operated a mine before but their largest shareholder Glencore has with a very bad history of contaminating the communities that it has mined. I think that they will not be able to guarantee 200-500 years of financing for monitoring and treating the water at both the plant and mine sites. The only thing I would consider guaranteed by them as that they will maximize profits for their shareholders, which is the primary mission of any for profit corporation. Jobs will be kept at an absolute minimum. I have yet to see an economic impact statement that wasn't created by the company itself in a best case scena

To whom it may concern, which in my opinion is the entire state of Minnesota and its future citizens. I have carefully examined the available evidence both for and against the Polymet proposal for a copper sulfide mine in Northeastern Minnesota. It is my opinion that at this time this project should absolutely not go forward. We as a state are not in a good position to trust that Polymet and its associates will be able to provide us with the environmental and financial assurances that we absolutely need to have before a permit to Mine is granted. One question that has been asked over and over and has gone unanswered is "Please give us an example of this type of mining that has not contaminated the watershed." No one has been able to show an example. Saying that this will be the first copper sulfide mine that won't contaminate the watershed and pollute the air is unacceptable. We have never mined copper in Minnesota and based on the fact that there is currently a global surplus of copper and nickel right now tells me that the risk isn't worth the reward. Particularly when it comes to who will actually capitalize the most on this project if it were to go forward. There is little in this for the state of Minnesota or its workforce. I know people on the range need jobs but this will not change the economy on the range based on the number of jobs it would create. This is also not a typical range project so it is very likely that many of the jobs created wouldn't be filled by locals. It is well known that Polymet has never operated a mine before but their largest shareholder Glencore has with a very bad history of contaminating the communities that it has mined. I think that they will not be able to guarantee 200-500 years of financing for monitoring and treating the water at both the plant and mine sites. The only thing I would consider guaranteed by them is that they will maximize profits for their shareholders, which is the primary mission of any for profit corporation. Jobs will be kept at an absolute minimum. I have yet to see an economic impact statement that wasn't created by the company itself in a best case scenario sensibility. There seem to be a great number of questions that have to be answered before a permit to mine is granted. These questions remain unanswered up to this point and therefore a permit should not be issued. If you can expect technology to change significantly in the years to come than let's wait until technology is advanced enough to do this safely. Copper will undoubtedly be worth more in the future and perhaps we can get a US company to do this so it's better for all of us in terms of economics as well as environmental and public health. These are the most obvious problems within the current SDEIS. "The PolyMet mine plan is riddled with problems that must be fixed: PolyMet would require hundreds of years of expensive treatment of polluted water. PolyMet would destroy thousands of acres of habitat used by threatened moose and lynx. PolyMet's mine plan lacks analysis of human health impacts from mercury and asbestos-like fibers. PolyMet's studies contain inaccurate water data that need to be corrected. There are many more problems with PolyMet's mine plan. All we want is to make sure that any sulfide mines opened in Northern Minnesota are safe, clean, and don't leave taxpayers with a bill. If we don't get this right the first time, the next 17 generations of Minnesotans will have to live with the consequences." The world keeps getting smaller and I think most of us Minnesotans feel that this is in our backyards. I'll ask again to find an example of this type of mining that hasn't contaminated the watershed. It's a simple question that no one has been able to provide an answer to. The risk must not outweigh the reward. Right now it's not worth it. We need absolute guarantees that they will finance and clean up the mess that this WILL create. In the not too distant future good, clean water will

Paul Neslund

9715

I would like to state my support for the mining project Polymet is attempting to get started. I grew up in the area, my Father worked as a machinist at the Erie location, I wish I would have had the same opportunity to stay in the area. The beauty of the area was compromised 150 years ago by open pit mining, but the area has recovered and is still some of the best the state has to offer. If Iron ore had not been allowed the outcome of two world wars would have been in question. The lessons learned through open pit mining in the past is only going to achieve success without hurting the environment. The jobs created, and the product produced are both critical to the area and to the world. The people of the area should have the most influence, not the Metro area, not the State politicians, or Politicians in general. Let the local people decide, not the environmentalist who don't live in the area. Thank you, Paul D. Neslund 16787 100th St Oak Park, MN. 56357

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Sirs/Madams, I am against the proposed PolyMet mine near Babbitt. Preserving and protecting Minnesota's natural environment is more important than the profits of a mining company. Clearly, no one knows what will need to be done, and how many hundreds of years it will need to be done, to keep the witch's brew of effluent from poisoning water, soil, and air. It's as if the mining company proposes to dump radioactive waste on the ground and hopes the state will let them figure out later exactly how to contain it. The mining company will cease to exist long before the site loses toxicity and the ability to ruin the environment. The state of Minnesota will be left with an environmental train wreck, and the citizens of the state will have no choice but to pay for containment and remediation. Please do not allow this project to happen. Sincerely, Paul Roth 3985 Balsam Lane N. Plymouth, MN 55441

Greetings, I support proceeding with the environmental impact study approval for Polymet. From what I see they have gone above and beyond expectations by making superb efforts to control risk of environmental danger. The sooner we get the Polymet project going the sooner we are not dependent on foreign powers for our badly needed copper used in clean energy production. Thank you Paul Sanford MD 3112 E 1st St Duluth, MN 55812 This St Lukes communication is intended for the use of the person or entity to whom it is addressed and may contain information that is privileged and confidential, the disclosure of which is governed by applicable law. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Paul Sasik Minnetonka, Minnesota

Paul Schlaefer

39726

To whom it may concern, I am strongly opposed to the polymet mining proposal. It is my opinion that mining in this area with present technology is risky to the water quality. Clean water is the states most important asset and we need to be assured that future generations can drink it safely. More work needs to be done on the environmental impact of storing polluted waste safely in this fragile area. Like any big corporation, Polymet's primary concern is profit for it's shareholders. // Please see that my great great grandchildren are not effected by unwise decisions. Sincerely, Dr Paul Schlaefer

Hi, I just want to say that I do not agree with what PolyMet wants to do in Northern Minnesota. My Family has had a cabin on McFarland Lake(proposed land swap area) for 60 years. Although it is a great Land Swap proposal to McFarland lake area. I feel the bigger picture is not worth the environmental impact that this open pit mine can do. Please say no to the mining. Thank you. My name is Paul Schurke. I'm from Ely, Minnesota and I'm very proud, especially tonight, to be an Iron Ranger; just to be here and be part of the due process and democracy is extremely heartwarming and gratifying, I'm sure, for all of us, and it speaks heartily to how seriously we're all taking this matter because we need jobs and we need water and we need the beautiful environment that we call home. And I'm very proud to be representing, I think, those issues that we all share in common, here, tonight. My wife, Susie, and I, as you may know, we operate a couple of businesses in Ely and have for some 30 years. We founded Wintergreen Northern Wear 30 years back, along with Wintergreen Dogsled Lodge on White Iron Lake. Wintergreen Northern Wear was sold to another family five years ago and it sadly has just recently gone out of business, but I'm pleased to share with you tonight that I'm hopeful to rebooting it next spring to bring those jobs back to our town, just like the jobs we were able to offer through our dogsledding lodge now. But tonight's issue is not about that, it's about our concerns about the PolyMet Project and the EIS involved, we've all had a chance to review now. And I think we all agree that water, the purity of our water and the integrity of our lakes in the future is central to that issue and my key concern in that SDEIS, is if we're relying on the scientists as our great Commissioner, Mike Forsman with you and I share with him that I rely on that science and am counting on that science to be right because our future and the integrity of this ecosystem depends on that science, and I'm here to share with you, as many of you may know now, there are some significant flaws in the science on which the SDEIS is based. Most prominently, I feel, are the graphs and tables, particularly those, if I might cite from the report, Table 4.2.2-9 and others that compare the flow into Partridge River with which they have projected through their computer modeling and it is fatally flawed and the DNR has acknowledged that and it's a significant serious error and how well this SDEIS is going to give us a picture of what's can become of the water quality in these lakes and streams in the future to come. The values used in the modeling significantly are at odds with the latest data from stream flows. It has been acknowledged by the DNR as a serious flaw. The modeling has failed -- failed to predict what is currently known for its own existing standards being flow, how can we possibly rely on the same computer modeling to predict what's going to happen in 200 or 500 years. It simply can't be done. And again, I think we agree that water quality issues are central to this issue. Furthermore, particularly disturbing to me, is the fact that tribal scientists, that's the Grand Portage Band and the Bois Forte Band, have been telling the scientists working on this project for years that the groundwater data on the flowage of the Partridge River is seriously flawed, that they're off. Nobody knows better what's going on in the ground out there than the tribal folks, but somehow their input has been disregarded right along in this process. The scientists who were putting that modeling together were wrong -- the first SDEIS, now, they've got it wrong again. How can we trust them to get it right on the third go round? If we are to rest assured that the water -- (clapping) -- the data must be measured accurately.

Lisa Fay, EIS Project Manager DNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
FR: Paul Schurke, 1101 Ringrock Road, Ely, MN 55731 RE: PolyMet SDEIS Response To whomever it may concern: I am a resident and business owner in Ely, MN. I believe the PolyMet SDEIS is inadequate and that this destructive project must not proceed as currently proposed because of the 1) widespread and severe environmental damage inherent in the PolyMet project and 2) the failure of the SDEIS to include a cost/benefit analysis and specific provisions regarding amounts and sources of financial assurance. I believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: 1) Economic Impacts -The SDEIS contains no cost/benefit analysis of the PolyMet mine. - The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. - The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. - What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. 2) Permanent Water Pollution -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. -The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. 3) Absence of Planning for Inevitable Accidents and Failures -The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate (see below), the SDEIS does not tell us how the costs of responding to such failures will be covered. -The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The Mine Plan Requires an Absurd and Unachievable Level of Monitoring and Maintenance for Many Centuries -Minnesota

Paul Smith

22028

I have owned Polymet shares for over 4 years. I believe in the project, domestic material resourcing and creating jobs. Polymet has patiently responded to all the requirements set before them for the environment. The company will be a good steward I am certain. Damage to the environment is always a sensate issue. Though the years we have witnessed so many damaging events whether caused by man or nature. I am always amazed how well we are able to respond and improve for the future when these occur. Hopefully, not a problem in the case of Polymet, but should issues arise, their sensitivity to the issue will minimize damage and expedite repairation. More can not be asked of them than that. Sincerely, Paul Smith, MAS Chairman, Calconix, Inc. 821 Aubrey Ave, Ardmore PA 19003 USA 610 642 5921 Fax 610 642 5928

Attached are our comments on the NorthMet SDEIS. Sherry Phillips Paul Tine' 2102 Elo Road Brimson, MN 55602

Paul Underland 18165

My name is Richard O'Brien. I'm a 40-year member with Local 49 Operating Engineers. I would like to cede my time to Paul Underland who is with Minnesota Power. Paul. Good evening. My name is Paul Underland; and I'm from Aurora, Minnesota. I care about the environment and I support the PolyMet project. I also own land that is in the Partridge River Watershed where I have enjoyed outdoor activities with my friends and family. This land has been in our family for generations. It holds a very special place in our hearts. It's where my dad took me hunting and fishing when I was growing up; and it is where I have taken my kids to enjoy the same outdoor activities; and where I plan to introduce my grandkids to the outdoors. It's unacceptable to me to have this pristine area impacted. I'm also an engineer, and I believe in technology and the benefits of it. PolyMet is using proven mining technology and proven water treatment technology in their processes. The SDEIS also uses proven technology in developing the models used to determine if there will be any environmental impacts because of this project. The SDEIS is adequate and covers all impacts. Thank you to the DNR, Army Corps of Engineers, and the US Forest Service for doing a thorough job. There's a couple items from the SDEIS that have been taken out of context by opponents of this project. First, part of the SDEIS modeling has recently been challenged. The amount of groundwater flow that has been added to the Partridge River this was originally measured at .5 cubic feet per second. New data now shows that (inaudible) between 1.3 and 1.6 cubic feet per second. This does not mean the SDEIS is wrong, because part of modeling is using a band of flow ranges. In doing so scientists plug in lower numbers than .5 cubic feet per second and numbers as high as 2.4 cubic feet per second. And even at the higher level, the model showed no negative impacts. In other words, this new data is not likely to change the assessment of the project relative to the project's ability to meet water-quality standards. Second, others who do not want mining in our state are trying to create fear and doubt by saying the mine is going to require water treatment for 500 years. That's not what the SDEIS says. The models weren't designed to accomplish this, nor is it what they indicate. The models were actually designed to determine the impacts to water quality at key reference points in the watershed, not the length of water treatment. This SDEIS is clear on this matter, and it shows that even 500 years from now water-quality standards will be met. Because of the diligence of PolyMet and the sound application of science and engineering it has been proven that there will be no environmental impact to the area that I and others cherish. Thank you.

Paul Vonharnish 17020

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Let's just face it: The proposals to further degrade the environment for ANY mining operations is patently insane and suicidal. It is obvious that the water tables in Minnesota and Wisconsin are both extremely vulnerable to pollutants spreading through ancient underground aquifers. Permanent moratoriums on all mining operations should become mandatory. Further studies are a waste of money, and you know it. The majority of citizens in Northern Minnesota are firmly against this process. Why should you or any other agency have the power to supercede the will of the people you supposedly serve. It is also obvious that any profits derived by these environmentally exploitive enterprises, will never be seen by the citizens of Minnesota, much less the American people. These profits are leached out of our economy and go right into the coffers of international banking cartels. These cartels don't give a damn about clean water or the rights of States to reject these activities. Put an end to this planetary rape, and quit flogging a dead horse. Sincerely yours, Paul Vonharnish Paul Vonharnish 11 E 3rd ST Grand Marais, MN 55604

I am writing to voice my strongest possible support for the proposed PolyMet mining project. As Chairman and CEO of a thriving, high-technology Minnesota firm, I speak from first-hand experience regarding the significant challenges - and opportunities - our state faces with regard to sustaining a healthy competitive economy in a globally-competitive market. I have toured the Poly Met facility and understand the rich history and suggested changes. Leadership is in place to secure strict adherence to environmental concerns. I have participated in many trips deep into the BWCA and have a sincere appreciation for passing this virgin wilderness on to my five kids. I look forward to a more vibrant north-woods that PolyMet will bring. The PolyMet project represents an opportunity to not only help the state remain competitive, but to lead. Minnesota Wire truly understands leadership in the technology sector: the company has no equal in obtaining federal R&D contracts, achieving a capture rate on proposals eight times the national average; and operating one of only three Advanced Defense Technology Clusters in the nation, funded by the U.S. Small Business Administration (SBA). We understand that a vibrant economy demands constant, aggressive pursuit of opportunities like the PolyMet mining project. This type of mining will help to broaden a state economy that has lost much of its technology diversity over the past generation. Not only will the mines be a source of critically-needed metals to growing and emerging industries; but they will also help to create jobs in a region that has struggled to contribute to the economy, but remains eager to do so. We cannot afford to let this level of opportunity pass us by- especially given that the exhaustive environmental review has led to overwhelmingly positive results. Our company respects, and in fact is an integral part of the state's proud history of environmentalism; but in this case the economic development benefits derived far outweigh any of the concerns for negative outcomes, as the review makes clear. Minnesota needs to be aggressive with its economic development efforts given the relentless acceleration of a global technology market. This company has certainly done so, and we expect that the rest of the state would follow our example and move ahead with the Poly Met mining project. We stand ready to support the effort in any way we can.

Paul Walker

11333

Dear Ms Fay, Statement of Dr Paul O. Walker My name is Paul Walker. I live at 4115 Reiland Lane in Shoreview for about half the year and the other half I live at 1372 Trygg Road in Eagles Nest Township on Eagles Nest Lake. At the last DFL Convention in 2012, the session opened with a prayer from an Anishinaabe leader. However, shortly afterwards, the candidates quickly abandoned any consideration of Mother Earth and began kowtowing for the support of the loudest Iron Range clique. Although in and around Ely, the local support seems to running in favor of those who are willing to sacrifice Mother Earth in favor of 200-300 short term, twenty-year jobs many of which will be filled by non-Minnesotans, there are plenty of us that view this proposal for mining as a dangerous and foolhardy operation, especially when the usable yield is only 1%, leaving 99% as contaminated waste. Nowhere on this planet has copper-nickel, sulfide mining been done without contaminating the waters. And this contamination is eternal, or if you believe the EIS requiring reverse osmosis for "only" for 200- 500 years. I might offer a reminder that Minnesota has only been a state since 1858, that is 156 years. How can any reasonably bright person believe that PolyMet or whom-ever their real owners are, will carry out reverse osmosis in this fragile eco-system, for 200 years at the mine and 500 years at the plant. It is unfortunate that this debate is taking place during an election year when Klobuchar, Franken, Nolen and Dayton are all playing politics with the environment. If PolyMet is allowed to sulfide-mine, the aquifers and watersheds of the Ely area will be eternally polluted and thus, sadly cause the eventual demise of the BWCAW and the tourism industry. This will be the legacy of Klobuchar, Franken, Nolen and Dayton. They truly should be ashamed. Glencore, a company headquartered in Switzerland funds Polymet. Glencore's history of world-wide wanton disregard for the environment and human rights atrocities, including child labor, are well documented. Does Minnesota want to get in bed with a company such as Glencore. I urge Governor Dayton, the Department of Natural Resources and the US Army Corps of Engineers to protect Minnesota's fresh water and the BWCAW by rejecting Polymet's proposal. My hope is that someone in the Department of Natural Resources will demonstrate an environmental ethos and compass and will see the foolhardiness of this proposal and not allow it to proceed. If I had confidence that the DNR was infallible, I'd be a bit more comfortable, but I don't. There have been too many bad decisions over the years. Paul Walker 4115 Reiland Lane Shoreview, MN 55126 651-484-8789

Paul Winslow 38250

Paul Winslow 237 7th Ave N. Hopkins, MN 55343 I am writing to express my concern about moving forward with the PolyMet mining proposal. The proximity to the BWCA is one of my primary issues. I value the pristine environment of the BWCA above the temporary nature of the proposed mine. Twenty of years of mining will have long lasting effects on the environment of the BWCA as run off from the mine finds its way to the watershed, and adds acid to the water flowing to the BWCA. I want the BWCA to last forever, and the short term nature of 20 years of mining and 500 years of clean up. Please consider these issues when deciding on the PolyMet mining proposal. Paul Winslow

Paula Allmaras 7149

I am adamantly opposed to a copper mine in Superior National Forest Lands. Acid mine drainage would pollute surrounding water. ADM's leach out heavy metals toxic to fish and humans. I am not willing to risk the boundary waters, Lake Superior or any ground water close to the proposed copper mine for a million jobs. Paula Allmaras

Paula and Jim Nessa 39797

As a grandmother I think about our grandchildren's future. Worry that the pristine sanctity of our northern Minnesota is being traded away for a few jobs. Our son and his friend canoed the boundary waters improvising a surf and turf menu for their first meal. They brought in steak and caught some crawfish. Will his children ever be able to do that. We have to think long term, not just 20 years. Will the mine owners be there to continue the clean up when the mine closes and there is no income from the copper ore. They have failed to do this in other operations. We need to know how much income the state will receive in exchange for the ore. Sincerely, Paula J. Nessa 588 Mt. Curve Blvd. St Paul, Minnesota 55116

Paula Angela 21612

Paula Angela, 8279 560th St, Pine City, .MN 55063

21614

No mining should be permitted as high risk of environmental damage. Minnesota needs to protect our natural resources and not give way to corporate interests and the flimsy guise of job creation. Thank you.

Paula Bidle 48479

PolyMet Mining Corp. has proposed large open-pit mines on 67,000 acres of Superior National Forest. If permitted, these mines would leave behind sulfide-bearing waste rock that could result in sulfuric acid mine drainage and would require treatment of polluted water for hundreds of years. While PolyMet will provide a few jobs for a few years, the overall deal is that they will profit immensely from the project, while leaving the people of the state of Minnesota to deal with clean-up and healthcare costs due to water pollution for years after PolyMet is no longer in existence. This is not a viable project. Please use your influence to "just say no" to it on both moral and economic grounds. Sincerely, Rev. Paula Bidle Minneapolis

Paula Connolly 42478

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Paula Connolly 3338 Bryant Ave Anoka, MN 55303-1453

Paula Frakes

15907

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Paula Frakes 529 84th LN NW Coon Rapids, MN 55433

Paula Gregg

4533

Dear Sirs, I am a resident of Minnesota and a voter. I want specifics on how PolyMet will pay the costs of treatment in the centuries to come, for the residual rock and water contamination. This is something I do not want the MDNP and the federal agencies to delay in getting; the specifics for the financial assurances of how PolyMet will pay the costs of treatment in the centuries to come. Minnesota law prohibits permits to mines that require perpetual maintenance after closure. Perhaps the mine itself will not require treatment for undisclosed centuries, but the treatment plant and its rock and water residue will go on in perpetuity. How many other mines will send their rock to be treated at this treatment plant. Yes, it is better to only have one treatment plant, but what will be the result to Minnesota in the centuries to come. You can't be naïve enough to think they are putting all this money into the treatment plant to only treat the rock from one mine. Get the financial specifics before this goes any further. Thank you. Paula B. Gregg 13517 315th Street Cannon Falls, MN 55009 651-258-4170

Paula Kay Pettit

Dec 10, 2013 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Paula Nelson

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Michael Okerstrom Paula Okerstrom 2537 34th Av. So. Minneapolis, MN 55406 612-724-2729

Paula Slomer

39774

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Paula Slomer 103 Windsor Dr Butler, PA 16002-3832 (724) 282-7504

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I am from Australia. I am highly concerned about this habitat being compromised. We only have one world. We need to care for it and it's inhabitants. Once gone there is no getting it back. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Pauline Gowing Sincerely, Pauline Gowing 69 Wharf Road Johns River, None 02443

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Stop your profit machine from destroying our planet. Note these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. It is sickening to see what power corporations have to destroy our planet. All for PROFIT and GREED. Too many risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Pauline Laybourn PO Box 205 Bagdad, FL 32530-0205

Pauline Wahlquist

39368

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Pauline Wahlquist 10979 State Highway 23 Brook Park, MN 55007-4726 (320) 679-0879

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Paulissa Jirik 222 Wentworth Ave W Apt 203 Saint Paul, MN 55118-3858 (651) 450-9012

Peder Otterson

14888

7113 Muirfield Lane Eden Prairie, MN 55346 □ February 2014 I'm sorry I wasn't able to attend any of the public meetings, but have the following comments that I wish you to consider. I am a retired DNR hydrologist who began his work with the State of Minnesota on the Regional Copper Nickel Study in the mid-1970's when I was hired as a research scientist to do field studies in the Babbitt area where USS and Minnamax had some interest in copper nickel mining. Much of my work centered on the waste rock stockpile at the Dunka Pit of Erie Mining Company where the copper sulfide bearing rock of the Duluth Gabbro was stripped to access the underneath taconite. We monitored the leachate coming from the waste rock stockpile that was high in dissolved metals and sulfate. We tracked it through surface flow and subsurface flow through an adjacent bog to Bob Bay in Birch Lake. We monitored other sites including the Minnamax test site. We also put in groundwater observation wells and collected lake sediment samples and tested them for trace metals. This was all part of a much broader study that included field sampling of biota, flora, air and water quality, mining, sociology, etc If done now, it would probably be called a "generic EIS." DNR Minerals under the leadership of Paul Eger led the work that I was involved in. Bruce Johnson up at Ely did most of the extensive field monitoring. The UM School of Civil Engineering under professors Eisenreich and Hoffmann conducted bench studies of bog samples to determine the adsorption capability of the peat to take up the trace metals found in the leachate. My point in mentioning all of this is that there is a wealth of base line information that was gathered nearly 50 years ago that might help answer some of the questions that the current proposal to mine leave hanging. I would like some assurance that all the good work done on the Regional Copper Study was not in vain. Secondly, as a former Area Hydrologist for NE Minnesota and a person who was born in Duluth and spent much of his youth in NE Minnesota and the area that later became the BWCA, I have my own personal and professional observations that I wish to share based on my work with the Regional Copper Nickel Study, review of the Reserve Mining Company court case and general love for NE Minnesota. I can remember when Silver Bay and its islets were all that was to be seen there. I also remember the effects that the dumping of tailings had upon Lake Superior. Anyone could easily see the effect as much of the lake became a turquoise color because of the suspension of the fine sediment in the water. As a geologist, I would say the closest parallel would be in the small lakes and streams that are fed by glacial meltwater. "Rock flour" we called it. Who knows what effect it had upon the habitat and biota of Lake Superior. However, that alone would not have prevented Reserve Mining from continuing to dump its tailings into Lake Superior. It took the added health risk of the asbestiform fibers found in the tailings to finally force Reserve to move to an inland site at Milepost Seven to dump its tailings. How does that relate to the PolyMet proposal. Unforeseen consequences. A casual reading of the reports and discussions around them suggest to me that much is still unknown to allow this new and potentially hazardous operation to proceed without a strict set of checks and balances to guard against unexpected consequences that might topple the fragile ecology of the area that is already stressed by global climate change. While on the Copper Nickel Study, I also reviewed studies of other northern sites where mining of sulfide ore was either proposed or had taken place. Sudbury, Ontario, stands out as a worst case example of what a smelter can do to the surrounding countryside. One begins to see the effects on the vegetation hundreds of miles from the smelter. Closer

Dear DNR and anyone else who will listen What is the percentage of the world's fresh water through and from the Boundary Waters. Over the years I have heard percentages from 15 percent to 20 percent. Does any of that water flow into Lake Superior. And how much of the fresh water is contained in Lake Superior 15%, 25% more. How could we even think of having a project in Minnesota that would take a chance on polluting a third or more of the world's fresh water. I do not believe it is possible to proceed with this mining project and not cause pollution. And I do not understand how a mining company would have the resources to provide for clean up costs for 500 years. If they had that kind of money up front why don't they put it into research to find alternatives to these precious metals so we would not have to mine so close to our clean water. And if Polymet did have the money to cover costs for 500 years, does anyone really believe that it is really possible to clean up all the lakes and shorelines that would be affected. It is not logical that this could be done. One could imagine it on paper, but the physical reality of the magnitude of such a clean up paints a different picture. Is the DNR not supposed to help us protect our natural resources and use them wisely. Please help us out and do what is necessary to prevent this mining. Thank you Peg Apka 7940 Pequaywan Lake Road Duluth MN 55803

Peggy and Larry Smith

54567

In a few short years our water will be worth more than any mineral mined from the earth. If mining, FRACKING and drilling equals water pollution—we are against it. We won't be here to see the destruction, however, our children & grandchildren will.

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Money: even the hogs won't eat it. What we do affects everyone's ability to live on the earth. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Peggy Endres 943 Wilder St S Saint Paul, MN 55116-2026

Peggy Knapp 46527

Dear Lisa, and others making the decision on the PolyMet proposal- What is more important than water. Nothing. This is not a trick question. The proposal by Polymet puts water at risk, now and in the future. There is no good example anywhere on this planet of a facility such as the one proposed by Polymet that has not left a legacy of pollution behind. At a time when water resources are being depleted, when the state of MN is already struggling to reduce nitrogen, phosphorus, sediments and other system-wide pollutants, it is sheer lunacy to permit mining on this scale, and in such a fragile area. I urge you in the strongest possible terms to deny the Polymet project to proceed. Respectfully submitted, Peggy Knapp

Peggy Rae Hodil 57144

DO NOT ALLOW POLYMET MINING IN MINNESOTA

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

7737

To Whom It May Concern: I appreciate being able to register my grave concerns regarding the environmental damage that Minnesota is risking if the Polymet mine is allowed to proceed. The fact that water treatment will need to continue for many years post-mining reflects the gravity of the risks to our watershed and the health of human beings. I do not believe that increased jobs for a couple of decades can offset hundreds of years (maybe longer) of damage to the environment. I was born on the Iron Range. My family was in mining for generations. I have seen the ups and downs of the economic health of the Range over the last 50 years. And, I still believe that the short term uptick in jobs is just not worth the very high risk of long term grave environmental damage. Peggy Trezona

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Our water is far too precious. I want my grandchildren and future generations to be able to enjoy safe water. Sincerely, Ms Penny Cragun 927 N 8th Ave E Duluth, MN 55805-1425

Mar 1, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. Historically there has never been safe operation of the mines in the sense of how the environment is impacted (aside from the safety of workers). Furthermore those financially benefitting from the mining are never held accountable in a meaningful way (equal recompense when the inevitable contamination occurs). There is no evidence that this would be any different. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Please don't give in to the pressures from those who stand only to benefit from this move. Protect our lands and water. Sincerely, Mrs Penny Fuller 4106 Burton Ln Minneapolis, MN 55406-3638

pepe

45088

It is absolutely *SHOCKING* that Minnesota is even considering allowing the PolyMet mining project. Even a cursory review of the facts-and of history-show clearly that it is likely to result in environmental catastrophe. And to take such a long term, high stakes gamble for so few jobs created. It is truly beyond comprehension. There are other states I would expect to cave to narrow private interests, veiled in supposed "job creation", but Minnesota is not one of them. - Stephen Pepe pepe@alumni.brown-edu

Lisa, The state of Minnesota does not have the right to gamble with our health. As everybody knows, sulfide mining causes long lasting water pollution that can cause serious health probleMs Given the agency for whom you work, you might also know that tourism is the leading economic industry in our state. And people aren't vacationing here because of our dirty, polluted waters, but rather to escape the filth they probably live in in their home state. Maybe you and your supporters should reread the fable, The Goose That Laid The Golden Egg. There is a good lesson in there for you. Do your grandkids proud and stop PolyMet, Dan Roberts Sent from my iPad

Pete Pellinen

40817

My name is Pete Pellinen, 724 16th Street North, Virginia, MN 55792- There seem to be inconsistencies between agencies regarding acceptable levels of metals and chemicals in water systems, and what is acceptable. Regardless, I believe that levels are being researched, and will be controlled. With the State requirements imposed in Minnesota, and developing techniques for mining, I trust that a system can and will be created that will successfully extract the metals, while protecting our waters and air. If such a process can be developed, it will probably only happen here, in Minnesota, but, it can then be used by operations in other parts of the world so that they can clean up their act. As a resident of this region, owning land on the Embarrass River, and a frequent visitor to what is now known as the Boundary Waters Canoe Area Wilderness, I am concerned that these resources be protected. I believe they can. Thank you.

Pete Seng

39337

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. We don't need a future "SuperFund" site in Minnesota. Northeast MN is blessed with pure clean water that flows north to Canada and east to Lake Superior and beyond, and I would like to keep it clean and safe for future generations. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Pete Seng 4522 Drexel Ave Minneapolis, MN 55424-1130 (952) 915-9030

Pete Stauber

18111

My name is Pete Stauber, S-T-A-U-B-E-R. I live in Hermantown, Minnesota. I'm a married father of four. And I'm a St. Louis County Commissioner. Thank you for bringing your delegation here to allow us to have this civil process. I'm tired of hearing the untruths from the anti-mining crowd that the water treatment will be required for 100 years and cost billions of dollars. From what I read in the SDEIS that is a gross exaggeration. On pages three and four of the SDEIS it states, "It is uncertain how long the NorthMet project proposed action would require water treatment, but it is expected to be long term. Actual treatment requirement will be based on measured rather than modeled NorthMet project water quality performance as determined through monitoring requirements. PolyMet will be held accountable to maintenance and monitoring requirements and would not be released until all conditions have been met." It does not say, "treatment will be required for 500 years." It says "treatment will be determined using measured results." Which is the way the law is designed to responsibly handle it. Isn't that logical? The SDEIS shows that PolyMet built and operated a piling reverse osmosis water treatment plan to show that it can successfully treat the kind of water it will have on the project. The plan worked. It's proven technology that's been used in lots of other municipalities and industrial applications. PolyMet has been working with regulators for nearly 10 years to ensure compliance. Any holes that were discovered during the EIS have been addressed in the SDEIS. The SDEIS is a clear reflection of PolyMet's and the agency's work to develop a successful copper-nickel mine bringing an important investment to St. Louis County. I'm confident based on the SDEIS that water quality standards will be met for many generations of the mine and plant site; and that mining will not compromise the beauty of the area or our natural resources. I hope the DNR will listen to its own scientists and not the fabrications from the anti-mining crowd. I have confidence in the environmental review process and faith in the regulations and regulators to hold the company accountable. Mr. Commissioner, the good Lord has blessed this region with these precious metals. They are ready to be mined by our working men and women of Northeastern Minnesota. Our men and women need the jobs. The range delegation of the building and trades, the Duluth area of trades are the best men and women to work it. Thank you.

Pete Vanderlinden

21533

My name is Peter Vanderlinden. I am strongly opposed to Polymet or any other mining near our precious wet lands and water resources here in MN. If you have any other information for me as a Minnesotan in love with our state parks and wetlands as far as how to better oppose this I am all ears. Thanks for your time, Peter Vanderlinden, RN, BSN

Peter Alan Haugan 57233

I remember a sense of toxicity in the people from its northern industrial cities. Those cities have been cleaning up and hopefully the next generation will be healthier. Heavy metal contamination makes a real and negative effect in people's lives. To create a situation of long term heavy metal pollution costs a lot in people's pain and suffering. Have the company pay more or better yet, only allow that kind of toxic mining.If the government does it and the profit goes to the people – perhaps for the U.S. debt?Peter Alan Haugan1161 Oakcrest Roseville, MN 55113

Peter Berridge 40615

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I know the message contains a lot of technical information. Bottom line, regardless of the specifics above, this type of mining is unsafe, detrimental to our ecology - which we value highly in Minnesota - and is not worth the small number of jobs that are produced for such a limited period of time. You'll be remembered for the actions you take now. Sincerely, Mr Peter Berridge 2522 Lost Lake Rd Mound, MN 55364-1679 (952) 472-2386

Peter Borchard 24547

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Attention Polymet Corporation: Whoever it was that originally came up with the whole idea about Murphy's Law must have been thinking about modern industry in general and the Mining Industry more specifically. To promise the population of where they are planning to work that there won't be any accidents or harmful pollution is pure fantasy. And the purity of Lake Superior is a very fragile thing. Back in the 1960's when the pollution of Lake Erie was setting off alarm warnings all over the Midwest and adjoining Canadian region people were warning that it would take 30 or 40 years to clean up, and they were right. But it was only possible because Lake Erie had three bigger lakes with 8 or 9 times more water upstream to clean it out . We won't get that kind of chance with Lake Superior. Lake Superior it at the "headwater" of the Great Lakes system of our water supply and would take over a hundred years for Mother Nature to clean out. My children and grandchildren don't have that kind of time to spare; and I'm sure they don't want to risk the possibility of developing cancer or some other hideous health problem. How about you people at Polymet . Do you or your families want to risk your good health by digging up some more strong chemicals out of our earth. I think the price of a loved one's health is higher than I would want to risk. Sincerely, Peter Borchard 1420 E Lowden Ln Mt Prospect, IL 60056-2608 (847) 921-0037

Dear DNR Please accept the attached document as my public comments on the proposed NorthMet Mine and SDEIS I would like verification that you received this document and that it is being included in your file. Peter Bormuth

Peter Branca 54165

I do not support this mining. This is a mass mailing by MPL CEO Alan Hodnik who is also on the board of directors for PolyMet. This mining is not safe and this company has no financial backbone to mine safe or for cleanup cost. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

57342

My name is Peter Branca. I am from Duluth, Minnesota. My concern is twofold: One is the financial stability of PolyMet. I happened to look at PolyMet's stock today and it is selling for 1.01, or just over a dollar a share. My other names, like Apple, is 500 some dollars and Google is well over a thousand. I checked the financials of PolyMet and over the last ten years, their stock has been only as high as \$4.50. Since I'm not a financial analyst, I'm not sure what this all means. But common sense would tell me it has very little financial stability. Especially for the long term. As well as how can they meet the cost of a consequence, a negative consequence or pending lawsuits? Since this is a very risky and expensive operation and has inherent dangers over the years, I feel very uncomfortable having a company come in to -- since I am a stockholder in the State of Minnesota -- come into my state, with little or no financial reserves to back them up. Also, I've been to Utah and Arizona, where the vast majority of copper mines are in this country, and they're three-quarters of a mile to a mile and a half deep, and the reason why is they don't have a water issue. Their water table is not a factor. In Minnesota, where PolyMet will be mining in a literal swamp, with literally no water table, and my feeling is the consequences will be severe to this, regardless of the amount of osmosis and filtration or holding ponds and pits. Fine metals will seep through the ground, into the water table, into the rivers, and eventually into Lake Superior. Since I'm a stockholder in the State of Minnesota, I feel the consequences well outweigh the gain.

Here is a copy of a note I sent to the people opposing the Polymet expansion. I FIRMLY believe in approving the copper/nickel expansion at Polymet. Thanks for allowing me to comment. Here is the link I responded to <http://www.miningtruth-org/thank-you/#.UsiZTRx7QwY> My Note .. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine SHOULD be built as described. This mine SHOULD be allowed to be built and expanded. Just remember, EVERYTHING we have in our advanced society is either mined or grown. We need both. Once we allow special interest groups to influence major decisions, just as this, we are doomed to become a third world country. If we didn't mine the iron ore, resources from northern Minnesota in the early 1900's, we would not have been able to build the ships and planes that allowed us to win WW-1 and WW-2- The copper and nickel resources in northern Minnesota are still a very important resource to our entire country - not detrimental to a few environmentalists that think the project that would ruin the northland. The small number of environmentalists should not be allowed to influence the rest of the residents, workers, and support infrastructure that is in place to ensure that the mining is done safely and in compliance with our guidelines and laws. Just look at Minntac . 1400+ jobs and they are on the road to expansion. Polymet would provide jobs and tax revenue with the copper/ nickel expansion and contribute, not deter from tax revenue. I am not an "Iron Ranger". I am just an informed realist that understands the impact to our future and economy. Bottom line When Polymet gets to expand, we MUST ensure we have procedures in place to ensure they comply with our pollution guidelines. Thank You for allowing me to express my opinion.. Best Regards, Peter Brask Peter Brask Minnetrista, Minnesota

Thanks for your continued efforts to bring a final date for conclusion. Please stay the course and approve the Polymet project. Sent from my iPhone Kindest Regards. Pete Gemuenden 1202 W 8th St Duluth, Mn 55806

Peter Gesell 18371

I'm Peter Gesell. I live in Duluth. And I'm going to cede my time to Michael Dahl.

Peter Harle 41912

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Peter Harle Minneapolis, Minnesota

Peter Krause 18382

Thank you to the regulators for bringing this hearing to Duluth. And thank you to the members of the Northland communities for coming and attending here today and staying along. My name is Peter Krause. I'm from the Duluth area. My concerns are not based on hard science, like parts per billion of water purity. Rather I am concerned with the social and historical factors. 500 years. Even if it's only 200 years, future generations are not going to be pleased to be committed to cleaning up this mess. As in the past, great changes are bound to happen. Wars, changes of government, climate change, civil collapse. Future generations may not even be able to maintain the system nor schedule of monitoring and repair. Failures and accidents happen. Just this last week in West Virginia and before that the BP spill in the Gulf, Exxon in Alaska, Three Mile Island, Chernobyl. The list is endless and inevitable. Copper-nickel has had nearly 100 percent failure rate in Montana, Canada, and around this globe. This is a great risk and the Boundary Waters we are gambling with. We are playing with high stakes for short-term gain. I strongly encourage rejection of this plan. Thank you. Good night.

Peter L. Gove 9618

I attended the St Paul hearing last evening and picked up a copy of the executive summary. I noticed on the Figure I map, there is a category for "national park" and a portion of Voyageurs National Park is noted on that map. However, Isle Royale National Park is not on the Lake Superior map and while several of the Apostle Islands are on this map, the Apostle Islands National Lakeshore is not noted. While the Grand Portage reservation is on the map, Grand Portage National Historic Site is not. I also question why the several state parks located on Lake Superior are not on this map. Perhaps in the full document there is a map with these key federal and state natural resources located in the impact area from this project included. However, given the potential impact to Lake Superior from surface and groundwater sulfide pollution from this project, I suggest these designated federal and state protected areas be included. Thank you. Peter L. Gove 14 Pearson Place North Oaks, MN 55127 P 6513408080 F 6513408081 C 6512465939 pmgove@comcaStnet

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I grew up in a hard-rock underground mining area in Upper Michigan. There is still acid mine water from several mines closed 100 or so years ago discharging into the Iron River, which ends up in Lake Michigan. The mining companies are long gone. That story is repeated in every location where sulfide mining is done. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Peter Mattson 28072 550th Ave Austin, MN 55912-6580 (507) 567-2570

Peter Molenda 44640

To Whom it May Concern, I forgot to include our contact information on the email I just sent. Peter and Rosalise Molenda 5209 Drew Ave S. Minneapolis, Mn. 55410

44668

To Whom it May Concern, We are deeply concerned about the damage to Northern Minnesota that would probably occur if PolyMet is allowed to mine various minerals. That area of our beautiful State is a National treasure, allowing both Minnesotans and citizens from across our country a chance to experience a true wilderness experience, with clean water and air a gift to all. We believe that allowing PolyMet and others to mine in Minnesota, creating a limited number of local jobs for a limited period of time, is not nearly enough to counterbalance the long term negative environmental impact such mining would have on that area. In addition, such mining would probably have a detrimental effect on the tourist trade that Northern Minnesota relies upon to help keep the area economically viable for those who currently live there. We ask that the DNR reject such mining in Northern Minnesota for the good of all Minnesotans, those here now and future generations. Sincerely, Rosalise and Peter Molenda

Peter Murphy 42475

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, It would extremely reckless to allow a mine such as this to threaten the pristine environment of the North Shore. I have vacationed up there for 30 years and appreciate the area's unique offerings. There has never been a mine of this size that has not caused damage. They can not assure that THIS ONE IS DIFFERENT. It is folly to think so. The gamble is not worth it. There won't even be that many jobs in automated operations like this. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Peter Murphy 4851 5th Ave S Minneapolis, MN 55419-5642

Peter O'Gorman 40618

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Peter O'Gorman 2224 3rd St White Bear Lake, MN 55110-3211

Peter Oja 38356

To Whom it May Concern, My name is Peter Oja and I just wanted to email my support of Polymet Mining. I grew up in northern Minnesota and know how important mining is to the north. I know that area is in a great need for jobs and this provides that opportunity. I know that with mining there is negatives, but in this case I feel that the positives are what we should concentrate on. Thanks for your time, Peter

peter pawlowski 39909

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr peter pawlowski 1209 E. Hennepin Ave Minneapolis, MN 55413

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, I was born and raised in Ely, Minnesota and I am a biology student at the College of St Scholastica in Duluth. I am very concerned about the effects this proposed Copper Sulfide mining project will have on the waters near my home. Ely is not very far away from PolyMet's mining site. It is expected that lead in PolyMet's tailing basin seeps will be 5 times or more higher in groundwater than the levels currently are. At the LTV tailings basin manganese is already far above Minnesota's health risk limit, but that is also expected to increase by 45 percent. All of this is in the SDEIS pg 169 of Chapter 5- Lead in drinking water is known to cause brain damage. Manganese in drinking water causes neurological damage and can reduce IQ in children. This is very concerning to my family and me as PolyMet's SDEIS reports of 27 residential wells downstream of the tailings basin. Citizens just downstream of the tailings basin will be drinking this water; some of the wells already have high levels of toxic metals. SDEIS Chapter 4- The SDEIS does not contain any analysis of whether or not pollution from the tailings basin could affect these wells. The SDEIS must be redone to analyze the potential impacts of tailing basin seeps to groundwater of the wells that my family and friends drink from. Why has there not been an analysis of this dangerous pollution to the drinking wells of Minnesotan citizens just downstream from the tailings basin. What is protecting the water that my family, friends, and I drink, year round day after day. Peter Schurke 1101 Ring Rock Road Ely, MN 55731 2183656022

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The fact that PolyMet needed to underwrite the high school hockey tournament as a PR move tells me this is not a good deal for Minnesota. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Peter Smead 4704 Hibiscus Ave Minneapolis, MN 55435-4002 (612) 226-8213

Peter Spooner

39615

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

To whom it may concern I am writing to oppose the proposed copper-nickel mine as it is planned. I am a Minnesota resident and previously lived in Ely, MN. Any potential benefits of this project, which will be largely captured by the PolyMet corporation, simply do not justify potential environmental impacts whose cost will be borne by the residents of Minnesota as well as the surrounding US and Canadian regions. I am concerned that the changes to air quality and the watershed do not seem to have enough safeguards to protect myself, my neighbors and our natural resources. Please do not allow this regulatory capture by the narrow interests of PolyMet. Thank you. Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Its not a moment to rush when a project such as this that can have an environmental impact for centuries- long after you and I will be dead. I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Peter M. Dziuk Petyer Dziuk 1590 Long Lake Road New, MN 55112 651-262-8654

Phil Hogan 45263

To: Lisa Fay, MDNR Project Manager, There has been considerable hope placed on reverse osmosis to control sulfide mining pollution. Reverse osmosis is not a filter process, it is essentially a separation process. It separates an input stream of polluted water into two output streams, one being almost pure water, and the other being a stream of water in which the pollutant is more concentrated. The total amount of water contained in the two output streams is the same as that contained in the input stream, and, more importantly, the total amount of pollutant contained in the concentrate output stream is that same as that contained in the input stream. The reverse osmosis process does not reduce the total amount of pollutant. Of course the output of the pollutant concentrate stream could be further concentrated by further passing it through a second reverse osmosis process, but the total amount of pollutant remains the same, just further concentrated. So the important question is what happens to the pollutant contained in the final concentrate stream in which the total amount of pollutant has been concentrated but not reduced, . How is the concentrate stream processed. In what form will it be. How much will there be. How will it be handled, used or stored, and where will its final resting place be. Who will be responsible to perform this task of processing the output concentrate stream, and for how long. What will be the total operation, maintenance, and replacement costs for the life of the need for pollution mitigation. Respectively submitted, Philip A. Hogan 1902 Pine Tree Trail Ely, MN 55731

Phil Larson

18323

Hello. My name is Phil Larson. I reside in the City of Duluth. I am a fifth generation resident of Northeastern Minnesota. And many of my – in all five generations we have worked in the resource industry. I work in the resource industry today. So I understand how important the resource industry, mining, and logging, are to our way of life. I'm proud to live in the state of Minnesota, which has adapted some of the most stringent environmental laws and regulations in the world, in particular with regards to mining. A lot of comments have been directed toward the environmental consequences of this project. And that is part of this SDEIS. However, there is also an aspect of the need of the project. And the only thing I have to say about that is this: Since PolyMet initially submitted their environmental scoping document in 2004 -- they've been in some form of environmental review for 10 years now -- the population of the US has grown by 24 million. We know that per capita copper consumption in the United States is about 12 pounds per person. PolyMet is projected to produce -- just doing the calculations on my calculator, so correct me if I'm wrong; but they are projected to produce about 72 million pounds of copper a year. The number of people who have come into our country in the last 10 years, more than -- will more than consume the additional production that PolyMet will bring to the market. And the reason I say this is it's important to understand that we need -- we are global citizens. We live in a world where we consume resources. And we can consume them from here at home where we control the process. And we have control over how things are done. And we can step in and correct things when there are problems or we can consume these resources from a global market where we have no control over that. And I think it's our responsibility to take this into consideration in this EIS. Thank you.

Dear Ms Fay, Dear DNR, From a relatively uninformed but interested citizen, the SDEIS does not sound well done. How can an accurate prediction of long term impact be made when the science does not seem sound. I am very concerned that long term impacts are addressed now not 20-30 years from now. On the other hand I understand the need to gather materials for our industries and provide good jobs. Please reject the PolyMet NorthMet SDEIS as inadequate and require the study to be re-done with more realistic and recent data. Sincerely yours, Phil Ledermann Phil Ledermann 534 Saratoga St S St Paul, MN 55116

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I have my entire life traveled to the North Shore of Superior on vacations and believe it is one of the most beautiful and pristine places on our planet. The PolyMet mining project is unacceptably dangerous to the environment environmental risks and should be stopped. In a state known for its lakes we already have countless that are polluted and damaged by chemicals to an unacceptable level. PolyMet will do the same I have little doubt. And even with substantial 'protections' in place and 'allowable and non-harmful levels' of the pollution they will inevitably produce, it only takes one accident to damage the lake and surrounding areas for hundreds even thousands of years. Please do not allow this in our state. It is in the welfare of all the animals, the health of the boundary waters and the ever growing tourism industry to that area that you block PolyMet. Sincerely Phil Martens 3401 NE Lincoln St Mpls 55418 Sincerely, Dr Phil Martens 3401 NE Mpls, MN 55418

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. An open pit sulfide mine will release toxic metals into our rivers and groundwater for hundreds of years - long after the products are spent and buried in landfills. PolyMet's own study says that the water from the mine site would need at least 500 years of treatment.[Marcotty, Josephine, "Iron Range mine could pollute water for up to 500 years," StarTribune. 7 October 2013-] I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Philip Hult 401a County Road 2425 N Mahomet, IL 61853-9704

Philip Rampi

16792

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Philip Rampi 2150 Jefferson Avenue Saint Paul, MN 55105

---Original Message--- From: pvrogo@gmail-com [mailto:pvrogo@gmail-com] Sent: Tuesday, March 11, 2014 12:03 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Philip Rogosheske 517 9th Ave S Saint Cloud, MN 56301-4238

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Philipp Gross 666 Hague Ave, Apt 1 Saint Paul, MN 55104 USA [HYPERLINK "mailto:philipp@theneighborhoodwoodshop-com"](mailto:philipp@theneighborhoodwoodshop-com)philipp@theneighborhoodwoodshop-com (651) 233-0242 To whom it may concern, I am, as many, deeply concerned with the proposed sulfide mining project of Polymet. Following are my comments regarding the SDEIS: 1) Water quality The SDEIS states: "Both mechanical and non- mechanical treatment would require periodic maintenance and monitoring activities. Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site). The duration of the simulations was determined based on capturing the highest predicted concentrations of the modeled NorthMet Project Proposed Action. It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modelled" My concern is that all this is just based on modelling software and does not state any real world experiences. Who ran those models and how reliable are they. How is Polymet held responsible to the long term water treatment. Is it not true that Polymet has formed recently and actually has not earned any money yet and is likely to file bankruptcy after the proposed mine site closes (no more income). How much money do they put aside for the clean up and if any where are the estimates that this money is enough for the worst case scenario cleanup needs. What does long term water treatment mean, 10 yr, 50 yr, 500 yr. If we don't know that should we not figure this out first. 2) Jobs/ profit The SDEIS states: "According to PolyMet, the NorthMet Project Proposed Action would create up to 500 direct jobs during peak construction and 360 direct jobs during operations. These direct jobs would generate additional indirect and induced employment, estimated to be 332 additional construction-phase jobs and 631 additional operations-phase jobs. Indirect and induced effect employment numbers are calculated by IMPLAN and may include temporary, part-time, full-time, long-term, or short-term jobs. While some skilled workers would be involved only temporarily and would possibly relocate from outside the region, the majority of the NorthMet Project Proposed Action-related jobs are expected to be filled by those currently residing in the Arrowhead region." Besides the point that I do not think that this is even close to the number of jobs that would justify the risk I would like to see what those jobs are, how well they are getting paid (each position). It mentions further: "Federal, state, and local taxes would total an estimated \$80 million annually. During operations, there would be approximately \$231 million per year in direct value added through wages and rents and \$332 million per year in direct output related to the value of the extracted minerals. As with employment, these direct economic contributions would create indirect and induced contributions, estimated at \$99 million in value added and \$182 million in output." These numbers mean to me that the profit margin of Polymet is huge for only so few workers. If the argument is that we need these minerals for survival/ green energy etc should we not figure out a way how Minnesotans profit the most of these minerals. And maybe this means that the operation should be run by a non-for profit company or even the state and all the theoretical "profit" should be put in a trust fund until clean up is completed. I would still be very critical of any copper mining in Minnesota but at least I would know that the business is not just ran by the principle of maximising profit for share holders. 3) Policy Last but not least I would like to propose that a decision like this (permit or not) should be made by the majority in a voting procedure. In addition to this we need to make sure that the voters ar

Phillip A. Lermon

MN DNR Please accept this comment on the proposed copper/nickel mine. This proposal reminds me of the runnup to the Hinkley fire and disaster when large corporations came to take all available lumber resources without thought for the future. The companies came in and gave no thought to the slash left behind as long as production and profits flowed. Then when the trees were gone and the slash started burning the lumber companies were long gone, leaving destruction and death to the local population. Freedom Industries in West Virginia is recent example of private companies not able to ever pay for the destruction they cause when poisoning the environment. This proposal is not economically feasible when the future costs are added to the picture. Once it is up and running there will be ways for Poly-Met to pay off regulators. Phil Lermon

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Phillip Sterner 7373 147th Street West, #158 Apple Valley, MN 55124 6127512973

I think it's a bad idea to mine near the boundary waters because the boundary waters is our only protected wilderness. Mining near it will be bad because the water will be contaminated with acid and will kill all the animals there. We've killed many animals and destroyed many of their homes. Why would we keep destroying more? Why do we want so much that we can't think of nature. If the acids go into the rivers then it would go to Lake Superior which has the most fresh water of all the great lakes. If we keep destroying the homes of these animals, where would they go? There are many places to go to but you always have to realize that, there's no place like home. Let's keep our waters and rivers clean so that we can be good to nature. We could also prevent global warming which is also a worldwide problem for us.

Phoebe Cushman

Dear DNR, I am strongly opposed to the PolyMet Mine. I believe that it will have an extremely detrimental and long lasting negative effect on the environment and to the overall health of people. The pollution it would bring to land and water would affect many generations to come. The damage that would occur would far outweigh any jobs that would be generated. Also, clean up of toxins would be a huge burden to bear financially. We have many environmental treasures here in Minnesota and we can't afford to do harm to our lakes and wilderness areas. We need to learn lessons from the past, as we still continue today to clean up our environment of contaminants from previous industrial sites. Minnesota also brings in a substantial income from tourism and that would be in jeopardy. We need to make sure that the health of the people and of the natural environment in our state are our priority. Sincerely, Phyllis Saliin 5309 Otsego St Duluth MN 55804 218-310-2753 prsaliin@gmail-com Sent from my iPhone

Dear DNR, Thank you for responding to my email. Would you be able to tell me what permitting requirements would need to be changed in order to stop PolyMet and others from mining in Minnesota. Also, who would be able to make the changes (Legislature, a State government committee, DNR, local government.). Thanks

Piper Donlin 39572

To whom this may concern, I am a native of Minnesota now living in Oslo, Norway, where I am a researcher at the University of Oslo. I spent much of my childhood canoeing and camping in the BWCAW. This area means a great deal to me and is a cultural and historical landmark in Minnesota. Despite my distance, I have been following this fight closely, as I care deeply about the fate of my home. It is up to the DNR, USFS, and the USACE to fulfill ethical and legal obligations and defend the natural "commons" and "public trust" that your agencies are sworn to protect on behalf of the citizens of this state. Instead, as in other places, the universal rights of both human and non-human inhabitants are being trampled to serve the property/profit interests of the rich international corporations who have lied and bribed their way into "legal personhood" and political control in Minnesota. Here is the short list associated with copper-sulfide mining operations. This is the ecological, social and economic legacy footprint that will impact OUR STATE for hundreds of years; that's a scary prospect when Polymet, Northmet and their cohorts will be long gone by the year 2040 or so, without intention or means to pay for the superfund site they leave behind for us. Their track records should be enough to convince the State of Minnesota to drive them away before they do any more damage than they already have

- Water pollution -fresh water is the world's most precious natural resource; now threatened in many places.
- Impacts to three watersheds.
- Loss of pristine wetlands and forest
- Impacts on wildlife.
- Climate change due to carbon emissions.
- Serious health threats to people including cancers and respiratory ailments.
- Mercury poisoning- people who live in the Superior Basin are already exhibiting dangerous levels.
- Loss of public lands.
- Devastating aesthetic impacts.
- Loss of wilderness.
- Loss of northeastern economy based on eco-tourism.
- Loss of wilderness jobs- thousands of people depend on ecology and wilderness for their wages (compared to three hundred jobs that will last a couple of decades—and then where will the miners go when the last traces of mineral are gone.)
- A strange lack of any cost/benefit analysis is a dangerous red flag.
- Superfund cleanup to the tune of billions of dollars for hundreds of years.

Thank you, Piper Donlin Nedre Silkestrå 18 0375, Oslo Norway

pmetcalf@tcq.net 12

My concern with the new mining facilities in N Minnesota is water use. If they are going to use water that feeds into Lake Vermilion for their production or manufacturing uses, that may reduce the lake level. In the Fall, Lake Vermilion level gets very low, and dangerous for boating in some areas. Currently the water level range seems to be about 3 feet between high water mark in the Spring and low water mark in the Fall. If water is removed from any of Lake Vermilions watershed, river sources, this may affect the level of the lake, and potentially very negatively in the Fall. Also if the company removes water out of the aquifer (or river) and cleans it then puts it back in, my concern would be if they put back less than they took out.

NO NO NO [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Quinn Kilanowski 44306

Hello, As a young Minnesotan of legal voting age who enjoys my state and it's bountiful parks, I must say I disagree that a mine very near the states crown jewel would not be ecologically or economically worth it. With not very many jobs being created, they would not last very long. The project would only last a limited amount of time, then where are those workers going to be working afterwords. Would you continue to employ them after the project is complete. Or possibly compensate them beyond their work. With methods of mining having things to do with acids, this mine could effect the aquatic life which would snowball into hundreds of problems including eagle populations, wild rice harvest, and the quality of the overall environment for tourists visiting the area. That is something that would be more sustainable, having people visit the park. While you claim the mining project would last a while, the park could last forever. FOREVER. That is definitely more economically sound than employing near a hundred people for a short amount of time. Having people with a set of work skills that are strictly for the mining industry are going to have a hard time finding employment afterwords. With Minnesota having a decently low unemployment rate, you would be putting that in jeopardy by having to eliminate the jobs when you are done. With the mine only being there for a short time, the ecosystem will (hopefully) be there for hundreds and hundreds of years. A project that will probably only last a few decades will compromise everything living there and everything that ever will. It does not matter how many steps are taken to prevent ecological damage, damage will be done. And seeing as this would be your first mining project I'm sure it will be damaging beyond what you estimate. I appreciate the time taken for the company to take the time to listen to actual Minnesotan voices fighting for their states most precious natural resource. Quinn Kilanowski

R Nicholas Rowse 58047

This proposed mine would cause severe degridation to NE MN & the BWCA. I do not want this to happen. Project our natural resources. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

To whom It May Concern, I consider myself a citizen of the world and the USA. I want the best for both: prosperous and sustainable lives for all the people and creatures, safe extrusion of precious materials from the earth, and maintenance of earth's wise and delicate balance. In regards to the proposed mining in Minnesota by PolyMet, I would like to address some things: 1- Is it worth risking polluting the environment for 500 years and the subsequent health effects in exchange for any kind of profit. 2- Is it worth risking the lives of thousands of people and mass environmental contamination for profits that are not going to remain in the USA. 3- We have been entrusted with this beautiful land. We do not have the right to use and destroy resources. We have the priviledge and responsibility to care and protect the resources entrusted to us, the human race. 4- What is going to happen when the environmental balance is severely disrupted thanks to our irresponsible contributions. 5- Who is going to protect us from the earth's wrath when there are no more natural checks and balances. I propose that the job creation and economy be geared to cleaning up the existing contamination in our lands. I also propose to promote an economy that is in synchrony with earth's balance. We need to balance environmental and economic interests, renewable technology to produce energy that is not going to take humanity and the world to self-destruction. Sincerely, Rita Caruso-Santamaria 1645 Hazelwood St St Paul, MN, 55106 Tel. 651-231-8461 HYPERLINK "mailto:rcwhitgr@smumn-edu"rcwhitgr@smumn-edu

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr R. Fitzgerald 123 Privacy Blvd. Rochester, MN 55906-4456

R. Nicholas Rowse 57356

This proposed mine would cause severe degradation to NE MN & the BWCA. I do not want this to happen. Protect our natural resources. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose, exchange of federal land within the Superior National Forest, and cumulative impacts from mining. The proposed mine poses unacceptable risks to our waters and communities, and I support the No Action Alternative.

To whom it may concern: Scientific evidence and analysis of the PolyMet project SDEIS indicates that the issues below still have NOT been satisfactorily addressed:
1- Inadequate assurance that Minnesota's water will stay safe and clean PolyMet will pollute Minnesota's waters for at least 500 years by their own estimate. Their reverse osmosis plan has never been tried on this scale and there is no proof that it will work as advertised. Is it right to put a National Park at risk just to see if this "experiment" works. 2- No strong safeguards in place for when things go wrong PolyMet's mine plan doesn't include anything for basic, common sense contingencies. Historically, things have gone wrong at these mines with dismaying regularity in nearly all cases. 3- Inadequate assurance that PolyMet will leave the site clean and maintenance free PolyMet would leave behind a site requiring very expensive maintenance for centuries. No open pit sulfide mine has left clean water and healthy, fertile land behind when they've gone, and the majority have left highly polluted and infertile sites. A cosmetic top dressing with a few non-native hardy grasses on it is NOT fertile, useful soil. 4- Virtually no assurance that Minnesota's taxpayers be protected from clean up costs Granted that the SDEIS is not about cost benefit ratios, but the proposed plan contains almost no information about financial assurance. There is no assurance that PolyMet won't just declare bankruptcy, and once again, taxpayers will be stuck with billions in cleanup costs for untold decades. Damage deposits left by previous mines have been laughably inadequate to cover the actual clean up costs. Twenty years of (likely) way fewer local job opportunities than currently advertised, is in no way worth the loss of likely as many other jobs in the tourism and guiding industries forever. These jobs will not simply resume when the mine folds. How could they when the mine has left behind an ugly mess of polluted land and water with few of the most popular sport fishes, charismatic animals, or its iconic forests and wetlands. Respectfully, R. Yaeger 3750 Hill Ct NE Rochester, MN 55906

R.M.

57874

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project. This type of mining is not worth it, we need to protect our natural resources, especially water quality.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Rachael Sarto 3817 22nd ave s Minneapolis, MN 55407

DNR I urge you NOT to accept the SDEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model In conclusion it is my opinion that the few hundred jobs and monetary gain for a corporation is not worth the perpetual damage a

Rachel Butler 27517

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Lake Superior and the Boundary Waters are a national treasure and a refuge. I grew up on the shore of Lake Superior and return every year for its solitude and clean environment. With pollution and industry affecting so many of our natural places, our public lands need to stay public, and not be given away for the benefit of a few in industry. Please keep these lands protected for public enjoyment rather than private benefit and reject the open pit sulfide mine. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Rachel Butler 987 61st St Oakland, CA 94608-2307 (262) 565-8819

FYI

Rachel Eckert 57970

Save the beautiful boundary waters. They are one of the most beautiful places in Minnesota that more people deserve to enjoy. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Aletemative.

Rachel Garwin 41913

Dear Ms Fay, Please accept these comments on the PolyMet/NorthMet SDEIS. They represent my personal opinion and expertise as a conservation scientist (I hold an M.S. in Natural Resources from the University of Vermont) and an outdoor professional (I have worked for the Voyageur Outward Bound School as an instructor for 5 years). Cumulative Effects Insufficiently Examined CEQ defines cumulative effects as “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other action.” The SDEIS considers actions related to the taconite industry and public sector in this section. The SDEIS, however, fails to account for any additional copper-nickel sulfide mining activity related to the NorthMet project, and it is thus inadequate. I recognize that the NorthMet project’s location in the Lake Superior Basin will have little direct effect within the BWCAW watershed. I am concerned, however, that approving the NorthMet project will make it easier for other projects (such as the Twin Metals Minnesota, LLC, project along Spruce Road) in the BWCAW watershed to go forwaRd Twin Metals has already proposed using the LTVSMC processing plant, assuming that the NorthMet project goes forwaRd Since retrofitting an existing processing plant to process new materials would make it a hub for more proposed copper-nickel sulfide mines than just NorthMet, this action should be considered as connected to other foreseeable projects, including those in the BWCAW watershed. The co-lead agencies should properly study the cumulative impact of all related copper-nickel sulfide mining projects facilitated by the approval of the NorthMet project. SDEIS Inadequate as Model Process As the NorthMet project is the first copper-nickel sulfide mine to undergo environmental review in the State of Minnesota, this process will serve as a model for those that follow. I am deeply concerned about sulfide mining projects that will be proposed in the future, and I would like to have faith in the scientific rigor with which the NEPA process is undertaken. After a thorough reading the SDEIS, it is clear that it remains lacking in several respects. First, the degree of unknown associated with the NorthMet project is still too high. The SDEIS should include estimates for the length of time and amount of money necessary to treat the water in order to meet Clean Water Act standards. Instead of dodging the 200/500 years of pollution question, the SDEIS should have been designed to provide some guidance to the citizens of Minnesota as to how long environmental mitigation would have to laSt The lack of this crucial piece of information makes it impossible for the public to accurately weigh costs and benefits. Waiting until the permitting stage of the process is too late, as so much momentum will have built behind the NorthMet project that it will almost necessarily go forward at that point. The co-lead agencies should revisit this question and give the public a reasonable estimate of the estimated time and cost associated with treating the pollution associated with the NorthMet project. Second, the SDEIS uses a low-quality, unreliable study to support its socioeconomic impact analysis. The Bureau of Business and Economic Research (BBER) 2009 and 2012 studies are inadequate to the task of informing public policy, as they only consider assumed benefits of expanded mining activity in the region and do not assess costs. Buried in Appendix B, the authors admit, “Readers are encouraged to remember the BBER is providing an economic impact analysis. Policy recommendations should be based on the ‘big picture’ of total impact, and a cost-benefit analysis would be needed to assess the environmental, social, and governmental impacts of ferrous and non-ferrous mining in the State” (p. A-16).

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Rachel Johnson

41923

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Rachel Johnson Minneapolis, Minnesota

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, My hope is to bring my children to experience Lake Superior as I did growing up. We must make decisions that positively impact future generations, not pollute and irreparably destroy our world. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Rachel Katkar 773 Ohio St Saint Paul, MN 55107-3423

Rachel Kinnunen 42455

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Please, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. This gift of nature is too precious to jeopardize. For all these reasons, again I urge you to reject the PolyMet mine. Thanks for your concern. Sincerely, Ms Rachel Kinnunen 1415 8th St SE Minneapolis, MN 55414-1557

Rachel Lee 54544

I work on a lake right outside of the BWCA and I also spend time on Lake Superior. These places mean so much to me—more than could ever fit on this card. They help people grow and they help people learn about respect and wonder. We have to protect these places for us and for the future.

Rachel Rausch 39753

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The containment of mining wastes is a problem that cannot be solved definitively. The magnitude of waste created by sulfide mining would make it impossible to guarantee that pollution of the fragile ecosystem would not occur. Once mining wastes have been created, they continue to persist in the environment for decades to centuries and continue to pose a threat to the environment long after the mining operations have been abandoned. Once mining is done, will PolyMet be diligent enough to ensure that the waste from its operations have been taken care of. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Rachel Rausch 516 4th St SE Minneapolis, MN 55414-1718

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Rachel Rostad St Paul, Minnesota

You must be CRAZY if you think we TRUST INDUSTRY to self-regulate, take any responsibility for cleanup, or to do the right thing in ANY way. Look at what has happened in our nation due to LACK OF REGULATION, lack of oversight, under-funded OSHA and EPA, and continued coddling of big business in this nation: West, Texas - 15 DEAD Enid, Oklahoma - 2 DEAD Ghent, West Virginia - 4 DEAD Upper Big Branch Mine, West Virginia - 29 DEAD Bayer, Institute, West Virginia - 2 DEAD Deepwater Horizon - 11 DEAD West Virginia - poisoned water for 300,000 people, "Freedom" Industries declares bankruptcy, dodges hearings North Carolina "Patriot" Coal - toxic sludge in the water, but hey, it's all OK: the GOVERNOR OWNS STOCK in the energy company and has helped it to avoid ANY consequences for its actions The HALLIBURTON RULE that exempts fracking companies from any responsibility for cleanup. Those are just examples I can think of off the TOP OF MY HEAD. No research needed. Give me an hour and I'll find you a THOUSAND OTHERS. Trains derail because we don't spend money on infrastructure, too busy giving that money away hand over fist to the POLLUTERS. Pipelines rupture because the companies that build them do NOT CARE ABOUT THE ENVIRONMENT: they WORSHIP profits. NO. NO, I do NOT support you. NO, we do NOT want our beautiful state to turn into a waste dump so YOU can make MONEY. NO. NO. NO. NO.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, rafael johnson 322 lake st apt 307 excelsior, MN 55331

852 Brenner Ave Roseville MN 55113 MN DNR I have read most of the readily available SDEIS and other summary documentation, and wish to express some thoughts and concerns about the project analysis. Understandably it may not be possible for the agencies involved to provide detailed technical information, however the lack of specific information in the report also invites the concern that details are either not determined or they are being kept from view. The lack of knowledge about impacts of the mining project is suggested by Eric Carlson's statement that "details would be further worked out" on how one would manage the 3 main pollutants identified by the MPCA. I am concerned that the metals (some of which are highly toxic) are grouped into one category while mercury is a separate category. MPCA surely knows that several of the unnamed metals are far more toxic than is mercury, but seems to overlook this fact. With details to be worked out after a mining permit is granted suggests a lack of understanding about how things are likely to go after mining has begun. The land exchange program lacks an apparent realization that dollar equity exchange for land does not equate to environmental impact equity. The land exchange plan, like the pollution issue, is a plan "to be further developed". Only superficial mention is made of habitat fragmentation and how to compensate for its effects. The lack of a confident plan suggests that this assessment is premature. Personally I believe this is a high rick project for short term gains, and I do not currently support its implementation. Sincerely, Ralph Butkowski

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I must protest this mining proposal. A few hundred jobs are being offered in exchange for the loss of environment that is enjoyed by thousands in this state; these thousands support the tourism in this area. You will actually ****lose**** jobs, not gain them. In addition, we will have to monitor the waste for a period longer than our country has even been around. What are you thinking.. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I am writing to urge the MN DNR to not approve the PolyMet mine application. It is not credible that surface water treatment for hundreds of years will be paid for by a mining company that will have made its profits and departed the region within a few decades. The United States is littered with mining and other industrial polluters who make short term profits and then declare strategic bankruptcy. We are saddled with things like Superfund sites that spend public dollars, and even then, take decades or longer to remediate what damages businesses do in mere years. Our state can develop its natural resources in other ways, through tourism, through renewable energy production, and continued innovation in things like healthcare. We do not need the short term jobs and the long-term damage. Sincerely, Mr Ralph Wyman 400 Groveland Ave Apt 407 Minneapolis, MN 55403-3243 (612) 805-7314

Ramon Torres-Ortiz

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. And while we're discussing it, can you please try and shutdown the very same kind of mining that is going on in the Upper Peninsula of Michigan. It will only end with another Superfund cleanup situation. Why should the government keep having to use our tax dollars to cleanup corporate America's messes. Stop them in the first place and save us all huge financial and environmental burden. Sincerely, Randall Heldreth 367 E Hewitt Ave Marquette, MI 49855-3711

Randall Wright

DNR ..regarding this proposal, I looked at the risks/rewards of this project from a business and environmental impact, reviewed the overall pros and cons of this issue and find the risks out weight the rewards. Analyzing the investment and assuming my facts are correct, Polymet is a Canadian company based in Vancouver even though it seems they want you to believe they are based in St Paul. I also believe that a large portion of their financial investment is from a Swiss company that stock trades around a \$1- When I review the economy issues it's always a positive to have jobs created but when it's limited to just 20 years, that to me doesn't sound like a good investment when measured against the risks. What I would prefer as a solution for long term employment in the area is like the NWA/Delta reservation center in Chisholm that is green with no environmental risks and is not limited to just 20 years. I believe the state should seek out investments in these types of industries that don't have the environmental risks or potential negative impacts. Regarding the potential harm to the environment, if there are problems, there are no do over's and Minnesota's taxpayers could take a big hit. Damage to the environment, so close to one of our most precious resources, the BCWA might be forever. Is the state ready to take that risk. There are better, cleaner ways to increase long term employment and not just limited to 20 years the Polymet payback to the state is minimal at best and could do harm forever. You can never have enough financial guarantees when dealing with a precious resource like the environment certainly more than the minerals Polymet intends to extract. You cannot place a price tag on mother earth. The fact that they are proposing at least 200 years of water treatment should be the biggest red flag and for what, 20 years of operations. The state should be thinking about generational job growth, not just short term of 20 years. Also look what has happened in other issues around the country, what happens if they file for bankruptcy. All of the potential EPA fines, etc are worthless. Look at the water issues in the Appalachian states because of neglect in the coal industry and there are many other examples of similar scenario's around the country. With a proposal like this, the state has to look long term, fully weigh the potential negative impacts and protect one of Minnesota's most precious assets ..the environment. Randy Hauserman 72 Birnamwood Drive Burnsville MN 55337

Randy Holland

43243

Hello, The past two summers I've spent three months at a cabin in the Arrowhead region. After reading about this issue my concern is that sulfide mining permits for ALL mines (not just Polymet) is being rushed before the DNR can do more site-specific studies of underground aquifers. It's been pointed out that generic water flow assumptions are being used that may underestimate required site-specific treatment facilities. Furthermore, given that sulfide mining may require the longest water treatment plan in history, it's shocking that there is little scientific basis for the estimates of 500 years or more of treatment. Lastly, it is truly stunning to me that the mining job estimates don't factor in the risk to the much larger tourism industry. Collectively, these reasons beg that more time and science is allowed to ensure no environmental disasters occur, ultimately reducing taxpayer cleanup risks and possible harm to local wildlife, citizens, and Minnesota's future economy. I would also argue that any licensing revenue for the state goes into a trust fund that spreads out the revenues over the life of the water treatment. Otherwise this is simply pillaging Minnesota's resources for short-term gain that no one can deny puts future Minnesotans at risk (even if small) of paying for an epic cleanup. The reason is funds put aside may not be enough since corporations never remain static for centuries. Thus it's certain that Polymet and other mining companies won't exist in their present form centuries from now so restitution seems unlikely in case of disaster, leaving future generations to pay for the benefit of existing Minnesotans. If skeptical of this scenario, imagine Polymet being acquired or it's "risky" business segments being spun off and then later declaring bankruptcy. The legacy of Minnesota's current government is at stake to show that they have thought of all scenarios. Given the Arrowhead region's total mineral deposit potential, spending another 6-12 months to inject more science and facts into this discussion would show that short-sighted greed by both the state's budget and mining special interest won't trump the risk of polluting the Boundary Waters, Arrowhead region, and Great Lakes watersheds. If the science is reassuring, then few will protest if proper precautions are made. Rushing matters is a sign that the science and facts in favor of mining are weak. Please show Minnesota isn't afraid of science and continue studying whether this mineral opportunity is worth the risks. Thank you for reading my concerns about the Northmet SDEIS. Sincerely, Randy Holland 13225 Thomas Drive Little Falls, MN 56345 612-840-6914

Randy Lasky

38851

To: Lisa Fay, EIS Project Manager: From: Randy Lasky, Northspan Group, Inc. My name is Randy Lasky, President and CEO of the Northspan Group, Inc. Our address is 221 West First Street, Duluth Minnesota. Northspan is a private non-profit, 501(c) 4 business and community development corporation serving northeast Minnesota since 1985- On behalf of the Board, I am submitting comments on the proposed PolyMet project and Supplemental Draft Environmental Impact Statement (SDEIS). First and foremost, we support this project based on our analysis of the SDEIS documentation; we feel PolyMet is prepared to use modern mining technology to responsibly and economically mine the significant non-ferrous mineral deposit in our region in an environmentally safe and responsible manner. We have relied on the sound work done by our agency regulators and acknowledge your modeling and findings to be supportive of approving this document and authorizing the project to move to the permitting stage. In those areas of the SDEIS document where we have some expertise including understanding the modeling and findings shared about the potential local, regional, statewide and federal economic impacts of this project as well as current state law and the process to set financial assurances as part of the permitting process, we feel confident in sharing our perspective and support in these two areas. First, we feel the project has demonstrated via credible economic impact modeling, that it will deliver a significant economic impact over the 20 year planning period and beyond. This economic assessment modeling and significant returns must be recognized in its importance to the State as we also recognize the importance and value of meeting all of the regulatory standards, mitigation requirements and assurances that will eventually be imposed and monitored for years to come. Economic impacts such as an upfront investment of \$500 million in construction of the plant site as well as redeveloping a former iron mining area into a viable new non-ferrous mining operation improves the area, leverages the current physical assets, and improves the conditions of the mine site now and into the future as the area is reclaimed. It's about jobs and the environment and with the addition of 360 new, quality skilled mining jobs as well as over 600 indirect, valued-added, living wage jobs that can support families; this is significant in a region dependent on our natural resources for upwards of 50% of our regional Gross Domestic Product (GDP). If we look at direct financial impacts on the schools statewide and in the region, as well as tax revenues to local, state and federal government of approximately \$55 million annually, this is a win-win for us all. Second, in terms of financial assurances, we understand laws currently exist to provide permitting agencies the flexibility needed to make sure that the State and all of us are not forced to deal with a bankrupt situation and major environmental problems should something happen to PolyMet and this project. Those safeguards for non-ferrous mining can and will be imposed by Minnesota Department of Natural Resources (MDNR) during the permitting stage. In terms of flexibility to hold PolyMet accountable, appropriate assurances can be determined and implemented; under the law, MDNR could select from any number of financial assurance tools including trust funds or escrow accounts, surety bonds, letters of credit, certificates of deposit or insurance policies. Whatever instrument is selected, we agree it has to be bankruptcy proof, held in title by the State, continuously in place, annually updated and readily available to regulators to safeguard the State's interests. To further monitor and adjust assurance requirements for the long term, we understand the law provides MDNR the ability to conduct a detailed review of all of the costs of reclamation annually, and can adjust the financial requirements of the compa

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Randy Mahurin 1021 Greenturf Rd Spring Hill, FL 34608 US

Randy Wenthold

37877

My name is Randy Wenthold 38771 189th Ave Menahga MN 56464 612-817-4873 I must oppose the copper mine based upon what I am aware of in the taconite mining industry. I am a chemical engineer and represent a small company with chemistry technology to precipitate fine materials (flocclate) in water. I've worked with the US Steel facility and at the Minntac plant where nearly 45,000 gallons per minute of dirty water used to rinse the crushed ore is treated with a 1-4 million pounds per year of a chemical commonly called DADMAC (Diallyl dimethyl ammonium chloride) which is added to this dirty water to recover the solids that are suspended in the water being pumped to a settling pond 5 miles x 5 miles in size. I visited the Minntac facility and then obtained samples of this process water to show the company representatives what can be accomplished via the use of my companies chemistry. US Steel representatives provided us with samples of this water and samples of the Nalco company DADMAC chemical material currently in use. Note: Nalco is a large chemical company that provides this material to all the taconite facilities in MN and the paper mills as well. My company produced results that show our product would reduce the DADMAC consumption by 1/12 of present Nalco company product use and save US Steel an estimated \$200K per year in chemical expense plus shipping expense of 1/12th the present amount. US Steel representatives have decided not to move to my companies material. So the mining industry will continue to use 12X DADMAC material and discharge this chemistry into the environment vs. moving to a new DADMAC product chemistry that is readily available. It can be assumed the same situation/condition will be established at the copper mine (ie large chemical company establishing the use of their products which results in 12X the discharge of DADMAC chemical into the environment). The mining companies must use DADMAC and other polymer products to help recover the suspended solids as part of the mining and ore rinsing process. This cannot be avoided. What can be avoided is the use of massive amounts of the material vs. alternate suppliers.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ravi Katkar St Paul, Minnesota

I support the Polymet project: My concern is in the comment process, and the ability of the DNR to remove the political pressure based on the number of comments. Please, evaluate only on the technical validity of individual comments. I believe that you will be flooded with comments beyond out borders which could distort the project decisions and cause delays for another year of two. Ray Yuzna

15780

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands.

15781

Ray Yuzna 8016 32nd place Crystal, Mn 55427 I believe that the NorthMet SDEIS. and eventual operation of the reverse osmosis water purification will provide a research platform for future pollution control other than mining. Minnesota could become a leader in solving water pollution problems worldwide. Lets build this mine and see where it leads the world.

15782

Please consider, the Polymet process to control water pollution is a perfect platform for learning and moving Minnesota into the world stage of this type of pollution control. I believe that eventually it could be a new industry for Minnesota above and beyond mining world wide.

15783

I believe that the SDEIS is a complete document. My concern is the comment process, and the political weight DNR will place on the number of responses instead of the validity of content .

Ray Fenner 16726

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Ray Fenner 52962 Erickson Lane Sandstone, MN 55072

While I have significant concerns about the proposed mitigation involved in this mine and processing my comments are addressed to the issue of long time protection of the environment by guarantees. While it appears that some of the proposed assurances would be fleshed out in later documents, there is nothing that assures me that there is any legal framework or financial instrument capable of assuring its existence for the time periods involved. With the possible exception of the British East Indian Company formed in the days of the raj, there is no corporation or other legal framework that has existed for the time periods involved. What is to prevent a future court or legislature from excusing the commitments in the future, and even if they did not do so, the corporation or other institution could simply stop performing. Even with financial assurances they are no more valuable than the underlying institution issuing them, and unfortunately those do fail. I urge you to not approve these permits or allow this to continue until there is some assurance that the taxpayers are fully protected. Ray Schmitz 210 14th St NE Rochester, MN 55906 507 288 3948

I support Polymet for the following reasons: First, I have a personnel interest, I own stock. Second - I have invested in Minnesota, especially the Iron Range for the following reasons: *The project will bring in tax dollars and boost the economy in support of future development in the state. *A University research platform for future state wide environmental issues. Consider using the reverse osmosis processes designed in removing effects phosphate from farm lands which is now a much greater source of water pollution than Polymet. Also, the possibility of recovery of fertilizer, recycling it to provide cost reduction of the processing plants. *Polymet could provide a practical training aid in environmental engineering. *Controlling the existing pollution from the old LTV operation and refurbishing the plant and area. Last – Its good for the DFL party because: * The people living the area want the mine. The young people need a reason to stay in the area. Failure to pass the permits will give the GOP ammunition. Most of the environmental activists are not from Minnesota and do not contribute to the tax base. I hope you understand the great opportunity that Minnesota has to secure the future and protect the environment. Ray Yuzna

raybryan 14937

Do you really think that PolyMet will clean up the toxic waste generated by copper/nickel mining for the next 500 years. This is proposed for a very sensitive environment that if upset would destroy an entire _current_ industry for a half millennium - Tourism. Allowing the mining to proceed with such plans using current technology is short-sighted in the extreme and wasteful of valuable natural resources for the long-term future. Raymond C. Bryan

Rayma Cooley 52362

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Raymond Asomani-Boateng Urban And Regional Studies Ins Mankato, MN 56001 (150) 738-9503

Raymond Carlson 39770

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Raymond Carlson 337 W Sycamore St Sycamore, IL 60178-1412

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Raymond Nuesch 2000 16th Street NW Washington, DC 20009 US

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Protect us from the mine. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Rebecca Branham 2310 10th St S. Apt. 11 Moorhead, MN 56560

Lisa Fay, EIS Project Manager DNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
FR: Rebecca Carlson, 7445 110th St E, Northfield MN 55057 RE: PolyMet SDEIS Response To whomever it may concern: Our family owns property and resides seasonally near Ely, Minnesota. We believe the PolyMet SDEIS is inadequate and that this destructive project must not proceed as currently proposed because of the 1) widespread and severe environmental damage inherent in the PolyMet project and 2) the failure of the SDEIS to include a cost/benefit analysis and specific provisions regarding amounts and sources of financial assurance. We believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: 1) Economic Impacts -The SDEIS contains no cost/benefit analysis of the PolyMet mine. - The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. - The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. - What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. 2) Permanent Water Pollution -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. -The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. 3) Absence of Planning for Inevitable Accidents and Failures -The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate (see below), the SDEIS does not tell us how the costs of responding to such failures will be covered. -The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The Mine Plan Requires an Absurd and Unachievable Level of Monitoring and Maintenance for

Thank you for providing this space to comment. From the information I have read, mining for copper and nickel so close to the boundary waters and other watersheds is not advisable. The risk of contaminating vital waters needed for the present and future generations of people and animals outweighs any short-term gain of employment. Secondly, it would behoove our federal and state governments to support industries which safely "mine" for these precious metals in the discarded equipment that has already been manufactured. We need a comprehensive solution to the waste and current mismanagement of our industries that allows valuable components to be put into landfills instead of recycled for reuse. Minnesotans must take care of the natural resources that grace our state: first and foremost is the water and the biodiversity of our Northern tier. Jobs will be created in the realm of ecotourism and sustainable use of our forest resources. That is the trend we must believe in and plan for. Respectfully,
Rebecca Cramer 3148 29th Ave S. Minneapolis, MN 55406

Good afternoon, I am writing in support of the Polymet mining initiative. My belief is that the Polymet group has done extensive environmental research and has proven successfully that the techniques used and preventative measures they plan to use are going to help keep our waterways clean. The groups fighting Polymet are mostly people who do not have a vested interest in the success of this area. I personally want beautiful lakes and clean water, and as well, I know that mining keeps this area vital. Thank you, Rebecca Ekmark raekmark@gmail-com

rebecca jorgensen 34921

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest our great lakes are our greatest treasure. look around at the droughts, and the housing developments in the western states they want our water. do we want our lakes to end up looking like the river in west Virginia, or the lake and river in north/south Carolina. remember the tar sands spill in kalamazoo. well it is STILL polluting, and it needs to continue to be cleaned up. let's start protecting what is a great natural resource. Sincerely, rebecca jorgensen 6830 Apache Trl Westland, MI 48185-2802 (734) 748-3873

Rebecca Kemling 40189

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Rebecca Kemling PO Box 205 Ottertail, MN 56571-0205

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

R-E-B-E-C-C-A, L-Y-S-T-I-G. PolyMet's plan for an open-pit mine will directly destroy more than 900 acres of wetlands and threaten more than 10 square miles of additional wetlands with toxic contamination and drainage. No information is provided in the SDEIS about the amount and form of financial assurance damage deposit that PolyMet will be required to provide to cover cleanup costs extending over centuries. Abandoned mining sites across our nation are the single most costly environmental liabilities left to taxpayers. When funds are not available, waters, lands, wildlife and people in the area suffer toxic effects for generations. Instead of opening new mines which will cost taxpayers and the environment, we could greatly increase recycling of copper, nickel and other metals with less impact to the environment, reduced emissions of global-warming gases and provide greater potential for jobs. The US is presently recycling far less than half of the copper and nickel we discard every year.

---Original Message--- From: RMNHOME@aol-com [mailto:RMNHOME@aol-com] Sent: Tuesday, March 11, 2014 7:47 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Rebecca Nash 4632 Columbus Ave Minneapolis, MN 55407-3528

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Glencore should be a responsible party for financial assurance in PolyMet's mine plan To [Decision Maker], The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Rebecca Rom

18375

Hi. I'm Rebecca Rom. My last name is spelled R-O-M. I'm from Ely, Minnesota. I'm a third-generation Slovenian from Ely. My grandfather was an iron ore miner. I want to talk about how the project, the PolyMet-NorthMet project, as described in the supplemental EIS violates Minnesota law. The provisions that it violates relate to perpetual treatment. Minnesota rules 6132.3200 does not allow perpetual treatment. It reads, "To receive a permit to mine, the permittee must be able to close the mine in such a way that it is stable, free of hazards, minimizes hydrological impact and release of substances, and is maintenance free." The project features that require perpetual maintenance and monitoring are these: The hydrometallurgical tailings facility will contain highly reactive waste and must be isolated from the surrounding environment in perpetuity. The floatation tailings basin seek-and-to-capture system must operate at peak efficiency for at least 500 years. The category-one waste rock stockpile cap-and-see-to-capture system must operate at peak efficiency in perpetuity. The tailings basin and mine site reverse osmosis water treatment systems must operate for at least 500 years. The West Pit outlet structure must operate in perpetuity. Monitoring of water quality must occur at all receiving waters and groundwater points of compliance until the (inaudible) from mine areas meet water quality standards without treatment, which is over 200 years. The monitoring of the wetland vegetation must occur until the hydrology reaches a steady state, which is decades or more. And until (inaudible) from the project meets water quality standards without treatment, which is 500 years or more. The PolyMet SDEIS states that long-term treatment of wastewater is aided, which means the site will not be maintenance free at closure. This is over 500 years of treatment at the plant site and over 200 years of treatment at the mine site. (Inaudible) federal testimony before the US Senate committee on energy and national resources presented findings that the federal government spent at least \$2.6 billion to remediate hard rock mine sites from 1998 to 2007. In 2009 the US Environmental Protection Agency cost estimate for existing hard rock mine pollution cleanup was 20 to \$54 billion. In 2009 as part of the largest environmental bankruptcy case in history, the mining company was ordered to pay \$194 million in damages.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Rebecca A. Skouge Bloomington, MN Rebecca Skouge 8620 3rd Ave S. 8620 3rd Ave S. Bloomington, MN 55420

- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Rebecca A. Skouge Bloomington, MN Rebecca Skouge 8620 3rd Ave S. 8620 3rd Ave S. Bloomington, MN 55420

Rebecca Tollefson 43857

I am a 27 year old woman born and raised in Minnesota all of my life. Some of my earliest memories include camping. We used to go to the Untainted Beautiful Waters of the Boundary Waters and enjoy our summers. If I was ever thirsty I would stick my hand in the water and get a drink, just like the animals do. We did not purify our water in the 80's. My family always told me stories about how the animals live here naturally with no pollution and these are some of the cleanest fresh waters in the world. Time has passed and I have gotten older, but the Boundary Waters is as pristine as ever. There are times that I still drink the natural waters. After the mining starts would you drink the polluted water. Is filtering it going to be enough. How about the animals. Do they have the ability to filter their water before drinking. NO. I would challenge anyone after this starts to come and drink the water now. Its more common than not unfortunately that after mankind starts to mine, log and destruct the natural habitat that horrible catastrophic effects on Mother Nature and all of her inhabits. I would urge everyone to reconsider this proposal for all of the reasons. I hate having to just comment on one, I could comment on everyone. Save our forests and wetlands for generations to come. Rebecca Naomi Tollefson 3109 Utah Ave South StLouis Park, MN 55426 Sent from my iPad

Reed Heffelfinger 38840

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Reed Heffelfinger W 44th St Minneapolis, MN 55424-1025

Reginald Defoe 19511

Reginald Defoe R-E-G-I-N-A-L-D, D-E-F-O-E, 55 Morning Star Lane, Cloquet, Minnesota, 55720.Okay. I'm just -- how I'm kind of equating this is like to the Lower St. Louis Estuary and old Fond Du Lac, let's say, is where they used to have thousands of acres of wild rice stands and plants, and now you look at that area today, and it's just remnants of wild rice and a few plants here and there. And I remember when my folks used to tell me they used to harvest rice down there back in the '50s and '60s, and 1950s and 1960s, and now you go down there and look, and there's nothing there. So what happened is from industrialization and pollutions and over the years, and this is part of the watershed that extends up to the mining areas and PolyMet areas, and that's the headwaters up there, and everything down here degraded, and what we're going to do now is spend millions and millions of dollars to try to clean up that area in the Lower St. Louis River area. Lots of different agencies are in the process of cleaning up that area, get rid of all that pollution, all those contaminants that came down through that watershed. Now, what that makes me think is why would we further damage the area, the watershed, by opening up the sulfuric mining operations and to damage it any further when we're spending millions and millions of dollars on cleaning up an area that once used to be pristine with thousands and thousands of acres of wild rice. So to me, it doesn't make sense why you would further destruct a watershed and wildlife and that kind of stuff. And that's about it. Thank you.

Reid Carron 18316

My name is Reid Carron. I am from Ely, Minnesota. I'm married to a Slovenian. The SDEIS is wholly inadequate in a great number of ways to reflect the real environment and the economic cost of the proposed project. This comment is on focused on the inadequacy in the SDEIS with respect to certain socioeconomic considerations. The SDEIS does not attempt to correct the effects of the proposed exchange of Superior National Forest lands and of the destruction of wetlands with the protection provided to citizens by the Federal WEEKS Act, the National Environmental Policy Act, the Minnesota Environmental Rights Act, and the Minnesota Environmental Policy Act. (Inaudible) near the mine site project would destroy 913 acres of unique wetlands, plus many hundreds of acres of lands of high (inaudible), including (inaudible). These lands are currently owned by the US Forest Service in the Lake Superior Basin. Virtually all of the wetlands in mitigation in that site and basin are substantial distances from the habitat that would be fragmented and destroyed by the mine. The project indirectly affects thousands of acres of other wetlands in the Partridge and Embarrass River Watershed by pollution and changes in hydrology. The SDEIS fails to address any mitigation of a great majority of this wetlands exchange except to say that they have to be monitored after permitting and additional compensation may be required. The SDEIS admits that allowing private surface mining would be inconsistent with the US Forest Service legal mandate for acquiring and managing these lands. The SDEIS fails to address adequately the socioeconomic cost of the loss of intact contiguous existing habitat at the mine site or the relative value to non-contiguous lands to be acquired in exchange. The currently intact land exchange at the mine site has significant socioeconomic value for wildlife habitat, watershed protection. The SDEIS does not explain how the Forest Service could abandon its responsibilities to manage (inaudible) watershed protection. And there lies inflict harm upon the socioeconomic wellbeing of the citizens through the simple exchange that does not even pretend to provide replacement land in the Lake Superior Basin. Further, the SDEIS is inadequate because of its failure to acknowledge – the proposed project ignores basic rights to a clean environment guaranteed by Minnesota law. It acknowledges that the project will destroy or impair thousands of acres of land, pollute the water for at least hundreds of years. It will create other harmful environmental impacts such as pollution. The legislature declared in Section 116B4 of the Minnesota Environmental Rights Act that the state has a paramount concern for the protection of its air, water, land, and other natural resources from pollution, impairment, or destruction. The statute explicitly states economic considerations alone shall not constitute a defense to violations of the Environment Rights Act.

Reid Larimore 40345

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Reid Larimore 2915 Reed Ave Cheyenne, WY 82001 US

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Rene Gelecinskyj 2901 w 93rd st Bloomington, MN 55431

To Minnesota's Department of Natural Resources, I was born and raised in Virginia, MN and have always loved the Iron Range. I am in tears when I see our wonderful small towns withering away. I want jobs, just as most of us do. However, I want quality and honorable investors in our area, not those who abuse the system. In my research, which is just the tip of an iceberg, I found the following: GLENCORE XSTRATA "While only few were paying attention to the price of aluminum, some important industry players such as Goldman Sachs, JPMorgan Chase and Co and Glencore Xstrata, were allegedly inflating prices and disrupting supplies for the commodity. This is the central claim of HYPERLINK "<http://www.reuters-com/article/2013/08/07/lme-warehousing-idUSL6N0G82Q120130807>" a growing number of lawsuits, which state the named institutions conspired with the London Metal Exchange in hoarding aluminum and violating antitrust laws. The legal actions, brought by small aluminum manufacturers in the United States, include one filed Wednesday in Florida against Goldman, JP Morgan, the LME and Glencore Xstrata, as well as one against Goldman and the LME in Michigan." - etc, etc, (See article at: <http://www.mining-com/lawsuits-against-goldman-jpmorgan-glencore-xstrata-for-suspected-aluminum-price-manipulation-pile-up-57037/>) It is my understanding that Polymet has never operated a mine before so they have no track recoRd But Glencore's record is rather unsavory beginning with its association with MARC RICH "The Marc Rich Group History and company profile The Marc Rich Group is internationally active and engaged in the management of a diversified portfolio of financial market instruments and real estate projects. Its business includes direct investments in stocks, investment funds, currencies and the construction of residential, office and shop buildings. Recently, the Marc Rich Group is engaged and active in the international art market through MR Art Trading GmbH, Zug. In 1974, Marc Rich, together with his partners Pincus Green and Alec Hackel, founded the Marc Rich + Co AG (company limited by shares) in Zug, Switzerland, a commodity trading company which was renamed Marc Rich + Co Holding AG in 1987, while the commodity trading business continued to operate as Marc Rich + Co AG. In 1997, the Marc Rich + Co Holding AG was reorganised as a GmbH (limited partnership) which it remains to date. In 1993/94, Marc Rich sold his interest in the Marc Rich + Co AG to the company's senior traders. The company was renamed Glencore International after the sale. Glencore, the former Marc Rich + Co AG, also held a 53% interest in Südelektra Holding AG, which is today known as Xstrata. In 1996, Marc Rich returned to the commodity business arena by forming a smaller commodities trading group, which was sold to its management in 2003- Marc Rich, in close partnership with Denise Rich, Libby and Pincus Green and Val and Alec Hackel, founded The Rich Foundations. The Rich Foundations are made up of The Marc Rich Foundation for Education, Culture and Welfare, The Gabrielle Rich Leukemia Research Foundation and The Swiss Foundation for the Doron Prize. For over 20 years more than \$150'000'000 were allocated to approximately 4000 projects and individuals engaged in non-profit work in education, culture, social welfare and healthcare as well as in building up democracy and civil society." (See http://www.marcrich.ch/mrh_profile.html) "HYPERLINK "http://en.wikipedia-org/wiki/Marc_Rich" Marc Rich, a HYPERLINK "<http://en.wikipedia-org/wiki/Fugitive>" fugitive who had fled the US during his prosecution, was residing in Switzerland. Rich owed \$48 million in taxes and was charged with 51 counts of tax fraud, was pardoned of HYPERLINK "http://en.wikipedia-org/wiki/Tax_evasion" tax evasion. He was required to pay a \$100 million fine and waive any use of the pardon as a defense against any future civil charges that were filed against him in the same case. Critics complained that HYPERLI

To Whom it May Concern; I am writing in support of PolyMet Mining and their current Minnesota project under review. I am strongly in support of environmental issues and fully support PolyMet. I have been closely following published information and know several people involved with the project. They are committed to the highest standards and working diligently to support and provide Minnesota with a clean and environmentally sound mine. They will produce needed metals and create hundreds of jobs that can support families and sustain communities. PolyMet is committed to utilizing the best available emission control devices possible on all their mobile mining equipment. I back this project 100% and believe in PolyMet to fulfill their promises while proving needed metals and job opportunities. Please issue PolyMet the needed permits to proceed. Sincerely, Renee Manning Renee Manning, RN, BSN Nurse Clinician * United Heart and Vascular Clinic * United Hospital, part of Allina Health Phone: 651-241-2963 * Pager: 612-510-8333 * Fax: 651-241-2980 * renee.manning@allina-com Mail Route 65500 * 225 Smith Ave N, Suite 400 * St Paul, MN 55102 This message contains information that is confidential and may be privileged. Renee Reece-Murray

39981

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Renee Reece-Murray 20343 Nightingale St NW Cedar, MN 55011-9377

Renee Rumler

41992

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Renee Rumler Owatonna, Minnesota

Renee Valois

21574

Mar 5, 2014 Ms Lisa Fay MN Dear Ms Fay, Like all Minnesotans, I am concerned with protecting our clean water. PolyMet's plans to mine sulfide ore in northeastern Minnesota as described in the Supplemental Draft Environmental Impact Statement (SDEIS) are problematic. The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to make a smart decision. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest-the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. A paltry twenty years of profit for that company could create hundreds of years of toxic runoff and water pollution. If you do the math, that does NOT make sense. I care about this state which I live in-unlike the PolyMet people. Please do not let them sacrifice our quality of life for their short-term gain. Reject the PolyMet mining proposal. Sincerely, Ms Renee Valois 2014 Cleveland Ave N Roseville, MN 55113-5309 (651) 631-0499

Rep David Hill

18082

Thank you very much, Mark. Tonight, I am here representing the views and opinions of the Iron Range Delegation of Legislators. The Iron Range Delegation of Legislators encompass virtually 100 percent representation of all ferrous and non-ferrous metals in the State of Minnesota, and I'm here to tell you that Representative Didovich, Representative Anzalc, Representative Melin, Representative Metsa, Senator Saxhaug, Senator Tomassoni, and Senator Bakk, and I all have a position that we are here and it is our job to do the very best that we can for you folks and the taxpayers of this entire state to add value to the natural resources that we have, whether they be ferrous and non-ferrous, wood, tourism, the water, the use of the water. That is our principal job and that's what we strive for every single day and every single year. We are confident, all of us, that this process will move forward based on data-driven outcomes and that the emotions of the project will be set aside so that those outcomes can prevail and lead this project either to happen or not to happen. So in short and in closing, first I'd like to thank the former members of the legislature that are here tonight; Rukavinas, and Begich and Senator Dicklich. I know that they feel similar if not exactly the same. But we are here tonight as a group to tell you people that we unilaterally and unequivocally support the development of non-ferrous minerals in Minnesota until such time it is proven by the data-driven outcomes that it cannot be done, and then we are unilaterally against it until such time that we can prove that it is feasible, environmentally and financially. That is our position. We've held that position the entire time. This project has gone on for nine years, and I hope that people can understand that, embrace that, and that we can move forward with this project. Thank you, very much.

Rep. Barb Yarusso

42916

From: Rep. Barb Yarusso 201 Bridge St Shoreview, MN 55126 My comments are contained in the attached PDF file, but also printed below: Comments and Questions Regarding the NorthMet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement (SDEIS) From: Representative Barb Yarusso rep.barb.yarusso@house.mn 1- From the point of view of a chemical engineer, the SDEIS does not adequately account for all of the material outputs of the project. Amounts consumed by the process are listed for a variety of process chemicals, but there is no description of where they will end up. They can't just disappear. Will they degrade (into what.). End up in the tailings, concentrate, sludge disposed of offsite, discharged water. 2- The assessment of the probability of a spill of potassium amyl xanthate (PAX) during transportation to the site is judged to be "moderate". According to the modeling estimate, there is approximately a 1/60 chance of a spill due to a highway accident over the 20 year working period of the mine. The consequences of such a spill of course depend on location. However, they may be significant, since PAX is highly flammable and produces hydrogen sulfide on contact with water. Are local communities prepared to handle these specific hazards. 3- Will there be residual PAX on the copper concentrate which is to be shipped out by rail. Will this cause an odor issue as it degrades and gives off hydrogen sulfide. 4- The bedrock under the tailings basin is assumed to be a "no flow boundary". What effect will the possible lowering of the pH in the basin over time due to the addition of acid-producing tailings be on this. Will it have any effect on whether small fissures grow, or on the integrity of the boundary between the bedrock and the bentonite barrier at the walls. 5- Is there any historical data or anecdotal information to indicate that well water quality in the area changed after the start of previous mining operations at the site. 6- Descriptions of the use of reverse osmosis to treat water for discharge focus on sulfate concentrations. Will the process also remove copper, nickel, and other heavy metals. 7- What is the potential environmental impact of concentrate spilled along the railway when it is shipped out for processing. The area between the plant and Lake Superior has several trout streams How close are the tracks to these or other streams or rivers, do tracks cross any of them, what would the cumulative impact of spills be on aquatic life. 8- Is there ever going to be a time when the potential of environmental harm from the tailings and other materials left behind will cease. The modeling did not address this question, but Minnesota law doesn't allow for perpetual harm. There should be modeling of the long term time evolution of the concentrations of components of interest 9- There is the hope (but not a guarantee) of development of a passive, biological system – is this to address sulfate issues. I can't see how it could help with heavy metals, because you can't make them go away. 10- Would it make more economic (and environmental) sense to use a system that increases rather than minimizes oxygen contact with the tailings in order to exhaust the potential for sulfate formation, while treating the water, to eliminate the indefinite treatment of polluted water at the site. 11- Is there any point along the Embarrass, Partridge, or St Louis Rivers where heavy metals would tend to precipitate (due to local chemistry) and accumulate. 12- What is the oldest facility that has a liner of the type to be used for the hydrometallurgic residue facility. What does the manufacturer say about the expected lifetime.

I am writing in response to the request for public comments. 1) Not enough science and successful modeling has been presented to give confidence to the public on the scientific basis on which to assure sufficient protection of the waters of northern Minnesota. The limited availability of proven models supports a more cautious approach that requires demonstration sites and laboratory demonstrated sustainability. Why have small demonstration sites and implementation models of the proposed processes not been required as part of the establishment of a scientific analysis of the validity of the proposed protections. 2) There is insufficient sensitivity analysis of the groundwater modeling. Why weren't more sophisticated approaches used and required. 3) It is noted that exceedences on lead levels can be expected during times when there is a lot of natural runoff in addition to that created on site. Lead is one of the best documented pollutants and can result in lasting impacts in lowering human intelligence and having major other impacts on human and animal health. Why should exceedences on this known dangerous pollutant be in any way acceptable and why were these not flagged as unacceptable and in need of lasting prevention and mitigation. 4) The recent studies of wild rice impacts of the expected pollutants threatens a historic and cultural resource to the Native Americans and all residents of our state and a valueable source of food and habitat for key Minnesota species. Insufficient assessment of alternatives that would preserve, not mitigate this unique historic, cultural, diet, and habitat resource are noted and deserve specificity and the honoring of Treaty rights. Why has this area not been more sufficiently analyzed. 5) There is no demonstrated capacity for the state to develop and implement models of financial assurance that will adequately enable continuous monitoring and environmental response for many centuries. That greatly exceeds the time period that our country and its rules of laws have existed. No economic models that are accepted broadly within that field of science can establish confidence in predicting future costs and revenues over that period of time. Therefore acceptable risk levels cannot be determined and financial advance funding cannot be adequately planned for. What economists and economic research can support the assumptions for financial assurance. What legal structures for enforcement are needed at the federal, state, and international levels to enforce accountability over the next five centuries. Given that the company proposing the mine has international ownership, is US and MN law sufficient to enforce actions against that entity and or its successors. Should the "no action" alternative be adopted until such time as there is established scientific confidence that risks can be managed and funded within a time period of less than 75 years. 6) The Minnesota Constitution clearly limits the purposes and processes for long term obligations of the state. Can the need to maintain, monitor, and fund risk related activities for periods measured in centuries be defined as an ongoing financial obligation of the state. If so, under what authority other than specific, direct legislative act can authorize such longterm obligations and is that able to be delegated. How is that supported by recent Supreme Court rulings. 7) Minnesota has a long history of "pollutor pays" even for clean up of environmental risks that were not known or identified at the time of the polluting event or processes. How can that be enforced against pollution risks not identified or anticipated at this time. How will that added potential risk and obligation be accomodated in financial assurance. 8) What testing evidence is available that the proposed liners, membranes, and other containment and protection materials are sufficient to last through 500 or more centuries without deterioration, cracks,

NO POLYMET. TOO DANGEROUS LONG TERM [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Rev. Charles Flynn 57341

My name is Father Charlie Flynn. I am the priest in Gilbert and Eveleth. And I suppose one thing that I would like to do in a gathering like this is to get a big collection, but I'm not going to do that. In the last year I have presided over 55 funerals and seven baptisms. The range is dying. The people are dying. Its population has been like that. And I would like to have something like PolyMet come in that could possibly reverse that and resuscitate our communities that are dying. So, hopefully, I am fully in support of PolyMet and providing jobs to our dying communities. I looked up the environmental review statement. It seems to be very much in accord with preserving God's creation and making sure that nothing bad happens to it. There seems like there are more rules out there than our church has rules and they have more power out there than the Inquisition ever had, so basically, the whole thing seems like it is going to preserve our clean water, preserve our environment and keep everything the way it should be. So, again, I have no fears that that will happen because the long arm of the law is out there. And I am fully in support of clean water, as well as PolyMet. So, I believe that's going to happen. Good luck with PolyMet. I hope it happens. Okay? Thank you.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dec 22, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The public may be easily misled into welcoming sulfide mining into the state, since we have a long history with iron ore mining and taconite. However, sulfide ore mining will change the face of northern Minnesota forever. Our watersheds are huge porous underground resources that sustain a world-celebrated wilderness. 100% of sulfide mines leak toxic carcinogens and sulfuric acid. The ancient Greek and Roman mines around the Mediterranean are still leaking today. We can count on the death of aquatic life and the terrestrial life - including human beings - dependent on it, if sulfide mining is allowed in Minnesota. Some think that sulfide mining would bring jobs to MN. On the contrary, it would bring a few hundred part time and full time jobs, that would be intermittent, given world ore prices. The mining would last 20 years. Minnesota would lose a slowly, but steadily growing recreation economy - and wilderness that is a world treasure for the world. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Rev. Wendy Jerome 37 Upton Ave S Minneapolis, MN 55405-1943

Dear Ms Fay, Dear Ms Fay and Mr Bruner, You know all the good scientific and health reasons for rejecting the PolyMet Mining project. They're all listed below. I just have one question: Do you want a 500 yr legacy of sulfide pollution of northeastern Minnesota and Lake Superior TO BE YOUR LEGACY. Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessmen

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Rhonwen Tas 4896 kent drive shoreview, MN 55126

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Ri Zoldak 3339 Emerson Ave S Minneapolis, MN 55408-3528

Rich

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Rich Femling 1946 Tatum St Saint Paul, MN 55113-5442 (651) 647-1860

I would like to submit the attached study of using FLY ASH from coal fired power plants in closing mines with acid mine run off as part of the Polymet mine EIS review. The study analyses the effectiveness of using coal fired power plant fly ash in preventing acid mine run off. Minnesota Power land fills 100% of its millions of tons of fly ash in their ash ponds. THE EIS FAILS TO CONSIDER THE USE OF FLY ASH AS A SOLUTION TO POTENTIAL ACID MINE DRAINAGE AND USE AS A MINE CAP CLOSURE ALTERNATIVE AND US AS A NEUTRALIZING AGENT IN THE MINE PIT. Richard Libbey—18603 Hale Lake Drive—Grand Rapids MN. 55744

I am commenting as an individual saying the only option is zero treatment after closure. If this is not possible then no mine should be permitted. Rather than refilling the pit with sulfate laden crushed waste rock like mixing a martini in a glass with class 2-4 ore piles high is sulfur to instead completely enclose the stock pile with a bottom liner and impervious overlay of geomembrane and concrete plus soil overlay --. The EIS needs to consider the use of fly ash from Minnesota Power's electric power plants which is high in PH and now put in tailings basins to be mixed with the concrete mixture. If we can keep the sulfides from air and water it might work. The runoff during stockpiling before mine closure would have to be treated. --- If the Polymet mine can't develop a plan with zero discharge after closure then leave the ore body in the ground for future generations. ---I question the ground water migration figures and suggest test wells be drilled and pumping from the fracture zones to measure the ground water movements and fracture zones. This will give a more accurate basis to determine ground water migration. -- What is the predicted out flow of the mine pit after closure and the water quality with and without refilling it with waste rock. --I worked for Minnesota Power for 25 years and was a control room operator at Cohasset's Boswell Coal Fired plant . We are the second largest power company in the state behind Excel. We recently installed a reverse osmosis system to treat well water similar to what Polymet plans to use for water treatment for as long as necessary. It is a high maintenance system computer controlled with pumps constantly running and filters to be changed once a week. The Polymet water treatment plant would have to be manned 24 hours a day with at least 4 full time employees if one person is on per shift plus fill in for the weekend coverage plus vacation coverage plus needed maintenance personnel. One of the most common alarms I got in the control room was the 'Reverse Osmosis System Trouble alarm'. A plant employee would be dispatched to attempt to correct the reverse osmosis problem. I'm not sure how long these can run before they wear out and become obsolete and require complete replacement. Also a back up power supply is necessary and the electric grid may have to remain intact for 200 plus years. The contaminates that are removed from the water have to be disposed of somewhere. How is Polymet going to handle the dirty contaminates that are removed from the water. Also I would suggest at least 500 million guaranteed up front bond tied to the consumer price index. The labor expense alone needs to be calculated. I would estimate at least \$250,000 per year in operator wages. --**DEMONSTRATION MINE TO PROVE SAFE MINING AND SUCCESSFUL CLOSURE—NO MORE MINES SHALL BE PERMITTED UNTIL ONE MINE CAN OPERATE AND PROVE NO DISCHARGE OF POLLUTANTS AFTER CLOSURE**—If the EIS predicts mining can be done with no negative environmental affects only one mine be permitted until successful closure can be demonstrated for a demonstration mine. Prove it can be done before the floodgates open. - Also under environmental law related actions and cumulative affects are to be considered. The draft EIS does not consider the total impacts of possible future mines in the Duluth complex that is a certainty if Polymet is approved. - I would also suggest that we pass a law similar to Wisconsin's that requires citing a similar mine that has operated at least 10 years and has showed successful closure for ten years any where in the world before applying for a permit to mine. No applicants have been able to demonstrate this to date in Wisconsin. Respectfully submitted-Richard Libbey-18603 Hale Lake Drive-Grand Rapids MN 55744

Information on using waste fly ash [CCP'S] in mine closures. This should be considered in the Polymet EIS. The EIS is incomplete without considering all alternatives. Extensive research conducted by the Surface Mining Control and Reclamation Act (SMCRA) indicate that the placement of coal combustion by-products (CCP'S) on the mine site usually result in a beneficial impact to human health and the environment when used to mitigate other potential mining hazards. This activity can also improve the economics of mining when used as a non-toxic fill within the spoil area prior to grading and final reclamation. Current beneficial mining related CCP applications are as follows: An alkaline seal or fill material to contain acid forming materials and prevent the formation of acid mine drainage. An agricultural supplement to create artificial soil on abandoned mine lands where native soils are not available. A flowable fill that seals and stabilizes abandoned underground mines to prevent subsidence and the production of acid mine drainage. A construction material for dams where such materials are needed to create a compact and durable base. A non-toxic fill material for final pits within the spoil area to reduce reclamation cost

I Feel the SDEIS is inadequate because it does not analyze a ZERO discharge upon closure option. The current option of indefinite treatment by Reverse Osmosis is totally unacceptable. The only way this mine can be permitted responsibly is a NO ACTIVE TREATMENT OPTION. I propose placing the waste rock in class 2-4 be placed on an impervious bottom liner with a collection system in case of failure. Plus totally encapsulating the top of the waste pile with another impervious layer rather than back filling it in the East pit. The composition of the protective cover should consider the use of Minnesota Power's FLY ASH that has a high PH and when combined with Calcium Carbonate or Portland cement forms an impervious solid barrier. The EIS should also consider using Minnesota Powers fly ash as a neutralizing agent either on the waste rock pile or adding it to the mine pit water. It has a PH of 10-12 but contains trace amounts of heavy metals. Fly ash has been used to successfully close coal mines and has been shown to neutralize the acid mine runoff. The fly ash is currently placed in an ash pond . To prevent acid mine drainage the pile has to avoid exposure to oxygen and water in combination. THE SDEIS SHOULD ANALYZE THE FEASIBILITY OF TOTALLY ISOLATING THE SULFATE BEARING WASTE FROM AIR AND WATER. IT DOES NOT DO THIS AND IS THEREFOR INADEQUATE. A concrete and fly ash mixture could be used in conjunction with a geomembrane and a top cover of native soils with vegetation. The EIS should consider a concrete-fly ash cover of sufficient thickness to prevent water in filtration. If the Russians can entomb the highly radioactive Chernobyl site we should be able to encase a pile of waste rock. The soil layer would have to be of sufficient depth to prevent the penetration by mature tree roots. The cost of such a system would be high up front but when compared to long term maintenance as proposed for water treatment and vegetative removal could be feasible a long term solution. This should be analyzed as an alternative in the final EIS. The proposed action of filling the East pit with the sulfate bearing waste rock is a recipe for disaster. It is like putting crushed ice in a martini glass. The surface area of the rock mixed with oxygen rich water will produce acid and sulfate runoff. THE FINAL EIS NEEDS TO PREDICT THE WATER QUALITY OF THE EAST PIT WHEN FILLED WITH WASTE ROCK AND WHAT IT WOULD BE WITHOUT THE WASTE ROCK BACK FILLED INTO IT. THE FINAL EIS NEEDS TO DETERMINE IF THE PIT WILL OVERFLOW IN PERPETUITY AS THE CANISTEO IRON MINE ON THE NORTH SIDE OF BOVEY IS DOING AND COSTING TAX PAYERS MILLIONS OF DOLLARS TO CONTROL EVEN THOUGH THE WATER IS SOME OF THE HIGHEST QUALITY IN THE STATE. IF THE POLYMET MINE OVERFLOWS WITH TOXIC RUNOFF THE PROBLEM WILL BE UNMANAGEABLE. Thank You for this opportunity to comment-First the environment-Second jobs and business profits. A life long Ranger. Richard Libbey - 18603 Hale Lake Drive - Grand Rapids, Minnesota 55744

Five years ago I visited the former LTV site and toured the mine area to learn more about Polymet,s plans. I was impressed with their presentation and felt the local people involved were sincere in their belief that no environmental damage would occur because of the operation. Upon returning home I purchased 100 shares of Polymet stock. I acquired the stock for two reasons. First, I feel strongly that if we, as Americans, are going to continue to demand gold, copper, platinum, paladium, etc we need to be responsible for mining those minerals here and be willing to take ownership of the problems associated with that mining. It seemed unethical to throw our demand on other counties, many of which do not have adequate environmental or labor laws to protect either their land or their people. Secondly, since I felt I a personal responsibility I wanted to make sure if my opinion changed I would be able to have a say, even though it would be a limited one, in how the company was run and have an avenue for expression. After reviewing the SDEIS I am becoming increasingly concerned about the mines effect on wild rice. The latest report shows the 10 parts per million limit as probably a sensible amount of sulfite in the water. I am seriously concerned that their will be an aggressive action by certain parties to increase that greatly (in some reported cases to as much as thousands of parts). This is a vary troubling development. Wild rice is a sacred grain to the Ojibway people of this area and is protected by treaty. If the permit is granted I would strongly feel very strong ongoing monitoring be required. Wild rice is a valuable resource in itself and should not be sacrificed in order to extract other resources such as copper. Lastly, though this is not so much an environmental concern, I am deeply troubled by what I am currently hearing regarding the fact that nearly all the copper is scheduled for transport to China. I supported the mine originally because I believed we would be using these minerals primarily for domestic use.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Minnesota is too fragile yet important a natural resource to threaten with this. Sincerely, Richard and Justine Kingham 4821 Dexter St NW Washington, DC 20007-1018

Mar 10, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Richard Adams 2257 Gibbs Rd Traverse City, MI 49696-8056 (231) 421-8275

Richard Amey 39989

Richard and Katherine Collman 636

Dear Lisa Fay, In a Dec. 5 letter, opinions are sought, so here is mine. What price wilderness. What price our nation's great parks. What price pollution in our lovely northern waters. What price put on the short term vision for copper and nickel for world computers only to ruin some waters and woods in the next 100-500 years. We can put a price on short terms needs and suffer in the generations to come. What will the fourth generation from us think of our decision now. Will they bless us or curse us. Will we sell our souls for short term profit. It was done with the buffalo. It was done with the white pine. I cannot believe it will again be done with minerals under the earth in spite of promises of mining companies to clean up their acts against the environment. Fracking be damned if that is even possible.. To quote Mark Twain (.) "A mine is just a hole in the ground with a liar standing next to it." When will we wake up. Thank you, someone, for listening. I have never yet heard back from DNR on any issue I have written them about, but I did want to register my opinion. I grew up just west of Duluth. Rev. Richard F. Collman 15 Fareway Drive Northfield, MN 55057 507-645-1357

richard anderson 41170

Please do not permit PolyMet to proceed with the proposed project of sulfide mining. I strongly believe that preserving our natural resources, including uncontaminated water, is more important than temporary financial gain. Respectfully submitted, Richard A. Anderson 6880 East Highway 61 PO Box 215 Grand Portage, MN 55605

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Richard Bergman 317 Valley Rd Two Harbors, MN 55616

While I understand the passion of those that are focused on environmental issues, I have a difficult time accepting this narrow perspective. I would really like to put a box in front of the hearing sites suggesting that those who are absolutely opposed to the project deposit their computers, cellphones, car keys, medical devices, etc into the box. Anyone that would do that may not have my agreement, but they would have my respect. For those that don't use the box, you have to assume that mining for materials for these products is ok as long as it is done in some other country. Is it fair though to the folks in these other countries if there is really no safe way to do this mining. I don't see how you can have it both ways. We need what Polymet will mine and this mining can not be done more safely in any other part of the world. I believe that the review process is as complete as it can possibly be. Let's get the project moving. Richard Bradford, 315 Dorchester Drive, Hoyt Lakes, MN 55750

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Richard Carlson 12521 74th Ave N Maple Grove, MN 55369-5282

Feb 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

My name is Richard Flesvig, F-L-E-S-V-I-G. I'm a resident of Eagle's Nest Township near Ely. I'm here to express my strong opposition to the acceptance of the SDEIS. I'm here because the law requires me to speak out. According to section 116B.01 of the Minnesota Environmental Rights Act, the legislature finds and declares that each person is entitled by right to the protection, preservation, and enhancement of air, water, land, and other natural resources located within the state; and that each person has the responsibility to contribute to the protection, preservation, and enhancement thereof. The proposed SDEIS must be rejected because it is significantly flawed in many sections. I will briefly speak to a few of these flaws. By express admission in the SDEIS significant water pollution will last for 200, 500 or longer in terms of years; and will require perpetual water treatment. Not all of the polluted water will be treated. Respective to perpetual environmental contamination. The 90 percent capture rate of polluted water bears no scientific proof or substantiation. So the SDEIS must be rejected. Again, according to section 116D.04, subsection 6 of the Minnesota Environmental Policy Act states, "No state action significantly affecting the quality of the environment should be allowed nor shall any permit for natural resource management and development be granted where such action or permit has caused or is likely to cause pollution, impairment or destruction of the air, water, land, or other natural resources located within the state so long as there is a feasible and prudent alternative consistent with the reasonable requirements of the public, health, safety, and welfare. And the state's paramount concern for the protection of it's air, water, land, and other natural resources from pollution, impairment, or destruction. Economic considerations alone shall not justify such conduct." No such conduct is provided – no such alternative is provided in the SDEIS. The SDEIS indicates that the details of the financial assurances required to sustain a 200- or 500-year period will not be disclosed until the permitting process commences. This is unfortunate as I seriously question how anyone can properly calculate the staggering dollar amount let alone provide a financial assurance for this long term of a period. Based on these flaws on the SDEIS must be rejected. Thank you.

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining must be banned in Minnesota until it can be proven safe. And it has not been. This type of mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Richard Frase 2831 James Ave S Minneapolis, MN 55408-2158 (612) 872-8559

Richard Fryberger

57257

I have to ask myself what do I value the most – and our fresh water resources are at best endangered. Iron mining ok – sulfide copper extraction no – please don't allow this to happen here. Thank you. Richard Fryberger 3399 Riley Road Duluth, MN 55803

Dear Ms Fay, Dear Lisa Fay and others interested in the PolyMet SDEIS The PolyMet SDEIS is inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Richard Fuller 1081 Laurel Ave St Paul, MN 55104

15272

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are threatened, endangered or of significance to tribes. •The SDEIS fails to study cumulative adverse impacts on moose of the PolyMet project and other activities that destroy habitat and increase global climate change. •The SDEIS fails to provide a cumulative analysis of impacts to clean water, plants and mammals that are significant to tribes and protected under treaties, throughout the tribal Ceded Territories in the Lake Superior Basin. In summary, please reject the PolyMet SDEIS as inadequate and reject the proposed PolyMet sulfide mine and Land Exchange as destructive to the public interest and harmful to tribal rights, clean water, vital habitats and the health of future generations. Sincerely Richard Fuller 1081 Laurel Ave St Paul, MN 55104

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Richard Gravrok 2925 Monterey Ave Apt. 102 St Louis Park, MN 55416 952-926-6655

I am writing today in support of the Polymet Mining proposal for Northeast Minnesota. There is no question that this area is in need of the jobs this mine will create and support in the surrounding communities. It appears the company has addressed the environmental concerns with this recent Environmental Impact Statement and has reasonable plans in place to address these concerns. Having visited a number of copper mining areas around the world both during mining and smelting periods and after, I am convinced that the industry has come a long way in addressing environmental damage it caused and now is better prepared to minimize such damage from newer operations such as Polymet is proposing. I grew up in Virginia, MN and still enjoy visiting the North Shore of Lake Superior and the boundary waters lakes every year. I certainly do not want the quality of my visits affected and I do not think they will be by this project. This review process has gone on long enough. It is time to move ahead and provide this needed economic boost to Minnesota. Dick Henke 1077 Sibley Memorial Hwy #607 Lilydale, MN 55118

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

---Original Message--- From: mudman0007@gmail-com [mailto:mudman0007@gmail-com] Sent: Monday, March 10, 2014 8:05 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Richard Mammel 1209 Birch Hill Dr Albert Lea, MN 56007-1802

Lisa Fay EIS Project Manager MNDR Division of Ecological and Water Resources Environmental Review Unit I am writing to request an extension for further review of the Polymet Plan for sulfide mining adjacent to the Boundary Waters area of Minnesota. I am concerned because of a decades-long personal association with the BWCA of Minnesota and also because of my concern about the long-term potential public financial obligation for remediation of damage to the BWCA. I am urging an extension of the time for public review of the Polymet sulfide mining plan for the following reasons: 1) Allow time to review and correct the misleading statements about drainage from the 100 mile swamp. It is clear from expert geological review that the swamp drains in part via Langley Creek into the BWCA. This is a fact which Polymet has omitted from its plan. Mining wastes, which will certainly flow into the 100 Mile Swamp will therefore ultimately flow at least in part, into the BWCA. 2) Provide time to plan and execute, before operations begin, water flowage tests within and out of the 100 Mile swamp. These would presumably include both water volume flow rates at appropriate times and also potential contaminant migration rates. 3) Provide for a secure funding source in the event that remediation is found to be necessary at some future time. I do not have financial expertise, but it seems that this should be in the form of bonding rather than dependence on a corporate balance sheet subject to the vagaries of a bankruptcy court. This remediation, if ever needed, should not become a public expense. Sincerely, Richard D. Morrison N7120, County Rd F Menomonie, WI 54751

To whom it may concern, I am vehemently opposed to the Polymet mine project. I fear that my beloved BWCAW will be forever spoiled for short term profits. I moved to Minnesota in 1974, immediately after college. My primary reason for selecting the local job over a job in a different area was Northern Minnesota. I currently have a cabin in the Ely area on Burntside Lake. Not enough emphasis has been given to the fact that this mine is not only putting the jobs of the tourism area at risk, but many, many people like me would not relocate here if the environment is spoiled. I enjoy a BWCAW trip every year and if that is taken away because of pollution I will relocate to an area that values pristine wilderness more than the State of Minnesota. I know the lure of jobs and economic prosperity is great. If you decide to proceed with this mine, my advice is this. Have Polymet run their mine for 1 year and then monitor the effects on the environment for 5 or 10 years. Let's face it, those precious metals are not going anywhere and they also become more valuable the longer they stay put. This will test out the theory that Polymet can mine the sulfide laden rock without polluting the valuable waters of Minnesota. Trust, but verify. Please, please do not trust the mining industry. Many broken promises have been made. Are you prepared for the brain drain that would occur if the environment is polluted. Thanks. Rich Morse 1405 29th Ave NW New Brighton, MN 55112

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Richard Olson 45 University Ave SE Unit 610 Minneapolis, MN 55414 612 331-9798

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Richard Olson 45 University Ave SE Unit 610 Minneapolis, MN 55414-1196 (612) 331-9798

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. With the midwest poisoning their water supplies with herbicides, pesticides and other chemicals. Other states having water supplies contaminated from fracking or having water supplies rationed due to drought and climate change disrupting weather patterns throughout the world, plus human population of earth near 8 billion, it is no longer prudent to endanger our GREAT LAKES with further pollution. I will remember your decisions and party affiliation in future elections. Sincerely, Richard Pierce

Is it worth it?? Would it be economically more feasible to subsidize mine workers (unemployed) than to pay for environmental cleanup for 100 years? With residual damage really beyond restoration. Richard R. Lund 8104 Highwood Dr, G121 Bloomington, MN 55438

Richard Spyhalski

41787

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Richard Staffon

18347

My name is Rich Staffon. I am a resident of Cloquet, Minnesota. I lived in -- it is Rich, R-I-C-H, Staffon, S-T-A-F-F-O-N. I have lived here in northeastern Minnesota most of my life. I grew up hunting, fishing, camping and canoeing in the beautiful forest here in our northeastern part of our state. These comments reflect my personal view and I think it is important that the people of Minnesota have the opportunity to comment on the PolyMet sulfide ore mine project because the land on which this mine will be built is our land, the mine's wealth and the earth beneath is our mineral wealth, and the forest, fish and wildlife and waters of this land are owned by us, the people of Minnesota. We have the right to expect the federal and state natural resources agencies that we fund that they will, with our sacred trust, preserve, protect and wisely use these resources. This mining proposal I believe does not live up to this sacred trust. It will destroy at least three square miles of high-quality sufficient wildlife habitat, including forests, wetlands and streams. This habitat would cost several million dollars if you went out and tried to buy it in the open market today. And the project may impact a much larger area of land. This project will increase mercury and water pollution in the St. Louis River Watershed, which is already impaired by these pollutants. This has serious implications for human health, especially fetal development (phonetic) in northeastern Minnesota, for people who eat fish, and it will also impact wild rice. And finally, it will leave a legacy of polluting the soil and water in the St. Louis River Watershed that will need to be treated at great costs for possibly hundreds of years. Millions of dollars have been spent to clean up the legacy of industrial pollution that was left right here in the lower St. Louis River several years ago. Much progress has been made, but yet much work is left to be done to clean up this mess. Have we learned so little, that now we are willing to create the same problem in the upper regions of this watershed? I am not opposed to mining, but I am opposed to an irresponsible mining project that destroys too much land, leaves us with a long-term legacy of pollution and increases the enforcement nightmare for our public agencies. These agencies are unlikely to have the ability to monitor and to require the mining companies to actually do what they promised. Let's leave these minerals in the ground for now. They are like money in the bank and they will only grow in value over time. We need to learn how to mine them responsibly. Thank you.

richard taylor

39145

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr richard taylor 1619 E 6th St Duluth, MN 55812-1210 (218) 428-8233

Richard W. Swanson

I stand with the Minnesota Center for Environmental Advocacy and the Mining Truth folks in opposition to allowing the permitting process to go forward, for all of the reasons stated by those entities. We simply cannot afford to risk our environment for "progress and jobs." Those two elements cannot be allowed to drive everything and outweigh serious concerns about environmental and health dangers. If there is any doubt, the doubts must be resolved in favor of the environment and health. There certainly have been doubts raised in the EIS and subsequent comments. Please do not sweep those doubts aside in favor of economic gain or the technical "needs" of our modern lifestyle. Demand more. Thank you for listening. Richard W. Swanson PO Box 508 Grand Marais, MN 55604-0508 h(218) 387-1862 w(218) 387 2902 cell(218) 370-1119 _____ Information from ESET NOD32 Antivirus, version of virus signature database 9533 (20140312) _____ The message was checked by ESET NOD32 Antivirus. <http://www.eset-com>

Dec 20, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. There could not be a worse time in our countries history to even contemplate putting sulfide ore mining in the Arrowhead Region of Minnesota. We are just beginning to understand how badly we have fragmented the forest here, how impaired our waters are already, and how even iron mining has degraded the health of citizens in this region. Our efforts should be put to cleaning up what we have already mucked up and not trying to determine just how much more pollution we can tolerate. This is the worst type of mining at the worst possible time in our history. The myth of "strong regulations" in Minnesota must be scientifically evaluated, mining company variances denied, and corporate polluters held totally accountable before we embark on further pollution of this region. I strongly suggest we need to hold off on sulfide ore mining in this region until we have a much better plan in place than offered by Polymet. Let's begin to create a living zone in N.E. Minnesota rather than another dead zone. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Richard Watson 114 E Boundary St Ely, MN 55731-1331 (218) 365-5511

44623

<http://beforeitsnews-com/environment/2014/03/polymet-environmental-impact-statement-has-incorrect-maps-2495246-html> A website that provides more detailed information about the mapping issue at [HYPERLINK "http://beforeitsnews-com/r2/.url=http://www.bwcasulfideminig-org/"](http://beforeitsnews-com/r2/.url=http://www.bwcasulfideminig-org/) www.bwcasulfideminig-org is receiving increasingly serious attention. The website documents that the first incorrect map in the SDEIS appears as Figure 4-2-3-1 on page 472 and that a comparative government map of the swamp area is available at [HYPERLINK "http://beforeitsnews-com/r2/.url=http://www.nationalatlas-gov/streamer"](http://beforeitsnews-com/r2/.url=http://www.nationalatlas-gov/streamer) www.nationalatlas-gov/streamer. The downstream flow mapping feature of the [HYPERLINK "http://beforeitsnews-com/r2/.url=http://www.nationalatlas-gov/streamer"](http://beforeitsnews-com/r2/.url=http://www.nationalatlas-gov/streamer) www.nationalatlas-gov/streamer map was used to show that the eastern portion of the One Hundred Mile Swamp drains via Langley Creek and the Dunka River to the BWCA, and that the drainage will also affect the Quetico Provincial Park along the US – Canada border. Real life understanding of the effect of the proposed mine on the BWCA requires determining the split of waste drainage in the swamp that goes to the St Louis River and BWCA watersheds by hydraulic conductivity testing which has not been done. Ongoing protection of the BWCA requires periodic water testing for mine waste at Langley Creek and the Dunka River which is not provided for in the uncorrected SDEIS. I've commented before on other issues but have discovered other issues with the SDEIS that should be brought to your attention. The Polymet SDEIS should not be approved and will require significant clarification, changes, and research in an attempt to rectify, if that is even possible. The Beneficiation Process requires Ore Crushing and Ore Grinding both of which are not designed specifically for low grade sulfide ore. The SDEIS claims: Ore Crushing "The existing coarse- and fine-crushing building emission control systems would be replaced with components that meet or exceed the particulate emission standard required of new sources at taconite plants." Ore Grinding "The existing ore-grinding emission control systems would be replaced with components that meet or exceeded the particulate emission standard required of new sources at taconite plants." Those comments in the SDEIS relating to the emission control systems for the ore crushing and grinding operations of low grade sulfide bearing ores shows a basic lack of concern or knowledge of the basic differences between iron mining and low grade sulfide ore mining and processing. It should not have to be stated the two are significantly different. The chemical and physical characteristics of the low grade ore crushing and grinding will, of course, have a different chemical composition and will also have a different particle size profile with the possibility of much greater quantities of dust and fine particles, possibly even Ultra Fine Particles that should be handled in a different manner than at a taconite plant. At the very least, the physical and chemical differences should be tested and defined for appropriate and specific design of the emission control system for the low grade sulfide ore crushing and grinding operations and not rely on taconite plant designs. Additionally, I could find no mention of Ultra Fine Particles in the SDEIS. The science is well understood. Ultra Fine Particles are toxic due to their size and not necessarily their chemical makeup. Nano Particles or Ultra Fine Particles which may be present in crushing and grinding operations are definitely produced when high explosives are used to blast rock and are present in diesel exhaust. Testing for UFP's at all physical handling stages, blasting, crushing, grinding, and transport should be standard. And, elimination or control of UFPs, a known health hazard, must be accomplished. Could UFP's be partially responsible for the higher than average incidents of certain cancers in the mining areas of Minnesota. Current research shows that with nanoparticles comes nanotoxicity. These UFPs may be as hazardous or more hazardous than amphibole asbestos. Any EIS must include a consideration of all sources of UFP's, quantities of UFP's generated by each source, and a method for controlling such particles to eliminate human exposure to UFPs. In studying the Beneficiation Process, we discover that there is a list of chemicals that are listed as "Consumed." This list amounts to a total of 29,738-5 tpy (tons per year) of additional chemicals, of varying degrees of toxicity, that will be added to the tailings basin according to a reply I received from the DNR. The destination of these process chemicals are not listed in the SDEIS. These chemicals are not innocuous as their MSDSs show. This is problematic in itself, a large quantity of varying degrees of chemical toxicity that have essentially been unaccounted for and is not included in modeling and could have a significant impact on chemical interaction in the tailings basins. The modeling of what happens in the tailings basin is therefore incomplete and misleading. The complexity of the total chemical and biological (microbial) makeup of the tailings basin is far from realistic or representational. The current SDEIS is flawed, incomplete, and not acceptable for the protection of workers, the watersheds of Minn

Rick 39533

Hello, I would like to address the issue of backfilling the East Pit after year 11- Section 5-2-2-3-1 of the EIS. Common sense tells you that the aquifer in the area and in the pit will be affected by such an operation. There is no way the current compaction levels can be redone to seal off any contaminants from entering the aquifer. The plan calls for pumping water back in it including "treated water" from the WWTF. The word limit is in the EIS. Limit to me means not quite as much. There should be no oxidation of the sulfide minerals. To allow this type of operation to proceed would lead to a direct injection of sulfides and heavy metals into the aquifer. Minnesota has worked hard to clean up and update old septic systems and municipal waste water treatment system that can contaminate the aquifer. Now is not the time to start another contaminator of the aquifer that will have to be addressed and paid for by future generations. 500 years plus is a long time with prohibitive costs that will be a burdon on future taxpayers. Thank you, Rick Fry 9322 West Branch Road Duluth, MN 55803

Rick Brandenburg 54658

Rick Cannata 18203

I'm Dennis Loosbruck. I'm a member of the Local 49 Operating Engineers, and I'd like to turn my time over to Rick Cannata, a fellow union member. I do support the mining industry. Thank you, Dennis. My name is Rick Cannata. I've been a member of Minnesota-North Dakota's Laborer's Union for 35 years, and I'm actually wearing a dual hat. I'm the mayor of Hibbing, Minnesota, too. I was born and raised on the Iron Range. I've been in construction, in the laborer's union, like I said, for 35 years. My grandfather was a miner, an underground miner. My father-in-law owns a cattle farm that's a quarter mile from Hibbing Tap, when mines are built without the studies and all the precautions there is. I support PolyMet Mining. I support and believe in the agencies from the State to Federal that did the studies. And I can -- one thing I want to make clear. Someone was up here that said, "I wonder if PolyMet is going to use union workers." Well, they are going to use union workers. They've talked to us about a project labor agreement, so that's a myth right there alone. Another thing is, I've been hunting and fishing since I could walk up in Northern Minnesota. I enjoy the outdoors, and I live up there, my family lives up there. If I didn't believe in this project, I would be against it, but they've done the studies, and it's a proven fact. They spent many years right now, a lot of money to get this project going. We need the jobs in Northern Minnesota, not just the construction jobs and the mining jobs, but it's all here, the manufacturing, all the spinoff jobs, because like the mayor of Hoyt Lakes said, we have thought outside the box. We're a way bigger town than Hoyt Lakes. We have economic developers. We've tried everything up there. The IRRRB helps us out. Mining is what Northern Minnesota is. And for all you people that are against this project and all mining, like Tom Rukavina said, you might as well throw your phones on the ground right now and stomp them because this is what the future is, and if you want to make the Iron Range profitable and see this country grow, you've got to let this project go ahead and quit fighting about it and let them build it and show what the future holds. So thank you very much. That's all I have to say. Thank you.

Rick Dahn 15962

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Rick Dahn 50 Hays Cir Silver Bay, MN 55614-1242

Rick Holcomb 48165

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Rick Holcomb 1701 Madison St NE #403 Minneapolis, MN 55413

Rick Liljegren 37521

I believe the review process has been thorough, and that regulators will ensure Polymet's planning, design, and controls will address environmental impacts. Our regulators have shown they have a clear understanding of mining issues, have done an excellent job to date ensuring existing mining controls protect our environment, and have no doubt they can continue to do the same at the Polymet site. This project is good for Northern Minnesota, Minnesota as a whole, and the country, and should move forward. Rick Liljegren 130 Ropponen Road Esko, Minnesota 55733

Rick Mayerich 22275

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I would also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Richard Mayerich 11739 Townline Road Hibbing MN 55746 Rick Mayerich CWI Industrial Systems Technology Department Head Program Instructor Hibbing Community College 1515 E. 25th Street Hibbing, MN 55746 218-262-7358 Email: rickmayerich@hibbing-edu

Rick Olson 44693

The risk to water quality, wild rice, fish, birds, other wildlife, and other segments of the environment are too high to permit sulfite mining in northern Minnesota. I am convinced PolyMet can't conduct mining operations and at the same time not damage the environment. How is the DNR assured PolyMet will be able to pay for environmental cleanup years after the jobs are gone and the environment is severely damaged. What is the economic impact on the region. Are the top jobs for Canadian's. Jobs would be created by mining; however the potential to lose jobs in the area is a factor. The net gain of jobs is not known. Tourism and recreation jobs may be lost and property values may decline or increase in some areas. Potential benefits of sulfide mining is not worth the potential to severely damage a watershed that connects to the largest fresh water lake in North America. Richard E. Olson

Rick Putnam

39076

DNR I urge you not to accept the SEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model In conclusion it is my opinion that the few hundred jobs and monetary gain for a corporation is not worth the perpetual damage and pollution non

Rick Schroeder

21201

I am adamantly opposed to the Polymet mine and others like it currently being considered in Northeastern Minnesota. Pollution is caused by either bad laws allowing people or companies to pollute legally or people or companies breaking the law by making poor decisions, be it through ignorance or greed or both. I am under the impression the mining of these minerals has never successfully been completed without significant pollution. Evidence of this is the outlawing of this type of mining in other states. I hope through your due diligence you have an opportunity to discuss the concerns of law makers and residents of these other states to understand the experience they gained and what they would do differently. The BWCAWA was an unbelievable achievement, creates lifetime memories and, can provide extraordinary opportunities for centuries to come if, and only if, you make the right decision. Let's hope you do and we are not (especially those who are making the decision) made a fool of. My name is Rick Skoog, S-K-O-O-G. I guess my main point is I really find it hard to believe that a for-profit company, who is a foreign corporation, is going to put up the money, and they fully admit that it is probably going to be for 200 years' worth of water treatment. I really find it hard to believe that a for-profit corporation is going to put up that amount of money and guaranty that amount of money. And I find it hard to believe that that amount of money can be put in a safe place, without some politician stealing from this, "We have got a big fund here and it is just sitting here and it is not doing anything, so we better borrow from that fund." I really find that hard to believe. Plus, during that time, all of that waste rock isn't going anywhere. It is just staying right there. They are only treating the water problem. They are not treating nothing. They are not treating the problem. They are just treating the runoff from the water. I just find it completely hard to believe that a for-profit company is going to put up the money and the financial assurance to make this happen, because they are a for-profit company and they are in it for the money. And, plus, it is a foreign corporation. And the second that anything goes bad, they can go back to Chile, they can go back to Switzerland, and they totally leave the state taxpayer or the federal taxpayer for the cleanup. And I just don't see any reason that -- no compelling reason to have 20 years' worth of mining that is going to end up producing 200 years' of pollution.

Ricki Disdier 16569

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Listen, we need nature. We need it. Let's not destroy it for yet more profit. Please reject SDEIS. Sincerely yours, Ricki Disdier 1149 14th Ave SE Minneapolis, MN 55414

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Rita Ann Youngs

9591

Hi. NO. I am totally AGAINST this project. There is nothing more important than our most precious resource, clean water. We cannot leave future generations of Minnesotans strapped with polluted water. Industries are dumping some very hazardous chemicals into the ground around the USA when fracking. It will come back to bite this country in future years. Then where will communities turn for fresh drinking water. Minnesota and the Great Lakes. We need to do more recycling and reusing materials versus digging into this precious land. I do want the people of Ely and surrounding areas to have jobs and commerce. There has to be some other "clean" industries that can help the area with creating jobs. Please put my "NO" vote into the recoRd I am TOTALLY against this project. Rita Ann Youngs 11247 Cedar Pointe Dr S. Minnetonka, MN 55305 P.S. Please confirm receipt of this e-mail.

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. We need to seriously consider the impact on wildlife and the environment as well as humans. I do not feel this is too much to ask. It is the minimum . Sincerely, Rita Bauer 4119 Excelsior Blvd St Louis Park, MN 55416-4726

Rita Jarrard

20706

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: The proposal by Polymet to trade acreage in the Superior National Forest for other land in northeastern MN sounds unlawful and dangerous. 1- These other lands include those "protected" by treaties with Ojibwe Indians. How many more times will people of power vote to disrespect our early Americans. 2- Pollution from such mines would destroy the land for hunting, fishing and growing of crops by the Ojibwe, and create untold health hazards for ALL future generations of Americans. 3- Meanwhile, big oil companies get richer and more careless . HELP. Do not approve this proposal. Sincerely Rita Jarrard 976 Cortland Dr S Apple Valley, MN 55124 952-236-8996

Rita Kovtun

43220

To whom it may concern, I would like to add my comments on the PolyMet Mining Inc Project: For the safety of Minnesotans and Americans for generations to come, I do not believe that this project should be continued. Sulfide mining releases toxic metals and can create Acid Mine Drainage (AMD), polluting our rivers and groundwater for hundreds of years - long after the profits are spent and the products buried in landfills. PolyMet's own study says that the water from the mine site would need at least 500 years of treatment. When weighing the pros and cons of the project, it seems logical to discontinue the project as the number of years of profit are only a fraction of the number of years of treatment and rehabilitation of water and land. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Please try to weigh the project in terms of the effect on your own future daughters, sons, grandchildren, and all those that come after them. Thank you for taking the time to consider my comments. March 13, 2014 RE: NorthMet Mining Project and Land Exchange: Supplemental Draft Environmental Impact Statement (SDEIS), November 2013 I am Rita O'Connell, D.Env. (Doctor of Environmental Science and Engineering from UCLA), a biology and environmental science instructor at Lake Superior College, Duluth, Minnesota. I also worked for many years at the Minnesota Pollution Control Agency, specializing in water quality protection, both surface and ground water. I am also a native and long-time resident of northeastern Minnesota. I have no objection to harvesting the resources of this beautiful region by mining, logging, etc, but am also very concerned that we protect our environment, for human enjoyment AND the continued health of our ecosystems, as well as the important ecological services they provide. I commented on the previous EIS for this mining project, and found reading this new SEIS an even more formidable task than reading the EIS. I have a number of concerns, but have limited my comments to a few, all related to water quality issues. COMMENT 1 – WATER QUALITY TREATMENT TIMELINE: Providing water quality treatment for 200 to 500 years (or more) is incomprehensible to me. Questions it raises include: Do you really think the company will be around or responsible for that long. Will the state of Minnesota be around in 500 years. Look back at what was happening 200 years ago (1814) or 500 years ago (1514), and could people in those times accurately predict what would happen today. No, and no more can we predict our distant future. So can we really, in good conscience, even consider permitting a mining action whose wastewater discharges do not meet water quality standards without mechanical treatment at the time of or shortly after closure. Is it legal to permit a facility with such a long-term timeline. If the company is still in existence in 200-500 years, its own estimate of postclosure costs is \$3-5-6 million per year (Table 3-2-15), which multiplied by 200 years is \$700 million to \$1-2 billion. Will the company's profits from 20 years of mining be sufficient to pay for that. It seems to me that this is an indication that they don't expect to need to pay these costs. Or will they prepay those entire cost in an upfront manner ("Financial Assurance Instruments described in 3-2-2-4-2) – \$3 billion for 500 years. Will this instead become like Minnesota's Closed Landfill Program (authorized by the Landfill Cleanup Act of 1994, which resulted in the state taking over the responsibility (and costs) for proper closure and postclosure care at many landfills around the state. As in that case, the state's citizens will again foot the bill. Will this mine do any better job treating their wastes than any in the past. For examples, how about the 5,000 years of acidity and toxic dissolved metals in the Rio Tinto district in Spain where the river pH reaches as low as 2-2-5 or the 2-37-2-57 pH and toxic dissolved metals in the abandoned open-pit copper mine called the Berkeley Pit in Butte, Montana. I think we should adopt Wisconsin's position – a "ban" on future sulfide rock mines until they're PROVEN safe. No mine has yet done so. COMMENT 2 – WATER QUALITY TREATMENT METHODOLGY: I have several concerns on this issue: REVERSE OSMOSIS (RO) – I was surprised when I heard, via our local Duluth news sources, that Polymet had chosen RO as the water treatment process to be used after closure (page 3-52). This is a very expensive process. It also produces a concentrated waste product that must be removed to "appropriate off-site facilities" (page 3-72). There is likely to be a very large volume of those wastes, and they are easily water soluble, since they were dissolved in the water that was processed in the RO facility in the first place

Dear Commissioner Landwehr and DNR Staff, I am writing to request that at the next two Public Meetings for PolyMet's North Met mine plan in Aurora and in St Paul that the your agency enforce your guideline that no signage will be allowed in the public meeting rooms. It was most disconcerting to have pro mining people in the large hall at the Duluth meeting displaying their signs toward the back of the hall. Following repeated direction by the police in attendance to remove their signs, these people did so for a short period of time and then displayed them as soon as the police moved to a different area. Signage was only to be displayed outside of the entrance to the DECC in my understanding. This could have been easily controlled by a simple announcement in the large hall that anyone displaying a sign will be escorted out of the hall. Rules are only good if they are enforced. The media made sure to have images of these signs in the various papers following the event. This sends a message that it is OK to have a sign and the next Public Comment Period in Aurora could possibly be a sea of pro mining signs. Everything else about the event last Thursday evening was well organized, informative, and beneficial. Please let me know if this issue will be resolved for the next two meetings. Thank you. Jane Koschak PO Box 397 Ely, MN 55731 218-365-6625

RE: Public Comment Submittal: Supplemental Draft Environmental Impact Statement, PolyMet Mining, Inc. – NorthMet Mining Project and Land Exchange Email directed to: [HYPERLINK "mailto:NorthMetSDIES.drn@state.mn.us"](mailto:NorthMetSDIES.drn@state.mn.us)NorthMetSDIES.drn@state.mn.us [HYPERLINK "mailto:Westlake.Kenneth@epa.gov"](mailto:Westlake.Kenneth@epa.gov)Westlake.Kenneth@epa.gov [HYPERLINK "mailto:Douglas.W.Bruner@usace.army.mil"](mailto:Douglas.W.Bruner@usace.army.mil)Douglas.W.Bruner@usace.army.mil [HYPERLINK "mailto:MJimenez@fs.fed.us"](mailto:MJimenez@fs.fed.us)MJimenez@fs.fed.us From Jane and Steve Koschak PO Box 397 Ely, Minnesota 55731 Dear Ms Fay, Mr Westlake, Mr Bruner, and Mr Jimenez, Please find attached a crucial and timely letter from Carla Arneson published today in the Duluth Reader and also the Twin Cities Daily Planet in Minnesota. Here is the link from the Twin Cities Daily Planet. <http://www.tcdailyplanet-net/news/2014/03/12/community-voices-it-s-whopper-polymet-s-myth-9938-tailings-seepage-collection> PolyMet's SDEIS has a flawed water flow model. And, now with this latest research of the SDEIS coordinated by Paula Maccabee, WaterLegacy attorney, it is apparent that the SDEIS also has another flaw – water seepage. “The projected seepage from PolyMet’s tailings basin and the Mine Site Category 1 waste rock stockpile has been grossly underestimated. “PolyMet does not propose to line the Tailings Basin, nor is the existing LTVSMC Tailings Basin Lines.” (SDEIS, p.5-161) A proposed tailings basin of some 2,900 acres will sit, unlined, on top of an existing, leaking and unstable, tailings basin. Foolhardy. Ridiculous comes to mind. As WaterLegacy’s attorney Paula Maccabee summed it up, “The SDEIS assumption of nearly perfect seepage collection is the critical foundation upon which all claims that PolyMet might comply with water quality standards downstream of the tailings piles rely. This assumption is unreasonable, unfounded, inconsistent with site conditions and inconsistent with the Modeling Work Plan methodology adopted by PolyMet.” The SDEIS claims that 99-38% of the total seepage from the tailings piles will be collected and treated is reflected in “Table 5-2-2-36 NorthMet Project Proposed Action Tailings Basin Seepage (gpm) During Operations” on page 5-159 of the DEIS. As they have done before, tribal staff questioned whether the claims for capture and treatment of groundwater were realistic in the summer of 2013 when the preliminary SDEIS was issued. Co-lead agencies responded that the same plan of using groundwater containment with slurry walls and permeable trenches had been routinely used for 50 years at various mine and industrial sites. Hundreds of operating systems in place, they indicated, and that “it is typical to achieve greater than 90 percent groundwater capture.” (SDEIS) However, no examples of those “hundreds of currently operating systems” are listed in the SDEIS. As Ms Arneson states in this attached letter: “ it was discovered that the only example the lead agencies had (of field experience with tailing seepage pump-back) was a study to estimate possible seepage collection at the Minntac tailings basin. And records obtained from the US Army Corp of Engineers through a Freedom of Information Act Request indicate that the seepage collection system at Minntac had an approximate return rate of only 50 percent.” 50 percent is sure a lot less than the 99-38 per cent claimed in PolyMet’s SDEIS. Inaccurate, flawed information. And, from those hundreds of operating systems lauded by the SDEIS, only one could be found. Amazing. PolyMet’s Website has a “Water Quality Fact Sheet”. It states the following: “Water control and treatment methods have been used successfully in mining and many other industrial and municipal applications for decades. They will be used at the PolyMet site to meet all applicable water quality requirements.” Deceitful. Lies of omissions. The Public is being sold a “bill of goods”. If this is the best this SD

March 13, 2014 From: Jane and Steve Koschak Po Box 397 Ely, MN 55731 Dear Ms Fay, Mr Westlake, Mr Burner, Mr Jimenez, The Maps used in the SDEIS are flawed. We live at the confluence of Birch Lake and the South Kawishiwi River, and have lived here and operated our two tourism recreational businesses for 38 years. We lie directly adjacent to the Boundary Waters Canoe Area Wilderness (BWCAW). We have been most concerned about incorrect maps being used in this SDEIS for some time. "Maps in the SDEIS released on December 6, 2013 make it appear that sulfuric acid and heavy metal containing mine runoff will drain only into the already impaired Saint Louis River watershed when in fact drainage can go to two watersheds, one of which includes the unspoiled Boundary Waters Canoe Area wilderness. The SDEIS maps draw a much smaller swamp downhill from the mine compared to existing government maps. According to US Government maps, the One Hundred Mile Swamp downhill from the mine is 10-4 miles long and drains to both the Saint Louis and Rainy Lake (BWCA) watersheds but SDEIS maps show a shorter 5-5 mile long swamp that is missing the portion of the swamp that drains to the BWCA. Omitting the portion of the swamp that drains to the BWCA supports PolyMet's conclusion that seepage of mine waste water to the BWCA watershed will not occur. Dashed, teal colored outlines of the One Hundred Mile Swamp on green satellite image maps are difficult to see and it might have been expected that the mapping discrepancy would go undetected in the 90 day public review period. Marking of important map features in such an obscure way may be seen as evidence of intent to avoid connecting an environmentally risky mine with the fragile and iconic BWCA wilderness. A website that provides more detailed information about the mapping issue at www.bwcasulfideminig-org is receiving increasingly serious attention. The website documents that the first incorrect map in the SDEIS appears as Figure 4-2-3-1 on page 472 and that a comparative government map of the swamp area is available at [HYPERLINK "http://www.nationalatlas-gov/streamer"](http://www.nationalatlas-gov/streamer) www.nationalatlas-gov/streamer. The downstream flow mapping feature of the www.nationalatlas-gov/streamer map was used to show that the eastern portion of the One Hundred Mile Swamp drains via Langley Creek and the Dunka River to the BWCA, and that the drainage will also affect the Quetico Provincial Park along the US – Canada border. Real life understanding of the effect of the proposed mine on the BWCA requires determining the split of waste drainage in the swamp that goes to the St Louis River and BWCA watersheds by hydraulic conductivity testing which has not been done. Ongoing protection of the BWCA requires periodic water testing for mine waste at Langley Creek and the Dunka River which is not provided for in the uncorrected SDEIS." (Before It's News) The Boundary Waters is a designated wilderness area of National Significance. It is the most widely visited park in all the US with some 250,000 annual visitors. Untrustworthy conclusions about sulfide mining pollution from PolyMet's proposed mine can't go unresolved. The incorrect mapping in the SDEIS is a huge issue. This DEIS is flawed and must be rejected. Public Sources: PolyMet Environmental Impact Statement Has Incorrect Maps. Before It's News, St Paul, Minnesota. March 11, 2014- <http://beforeitsnews-com/environment/2014/03/polymet-environmental-impact-statement-has-incorrect-maps-2495246-html> PolyMet SDEIS: Public Comment Jane and Steve Koschak, 3-13-14

RJoa 3951

I have two main concerns about the proposed mine in Northern Minnesota; quality wetlands and truSt First, I don't believe wetlands are replaceable. The wetlands in the proposed mine area are imperative for wildlife of all kinds as well as migrating fowl. It is my understanding that there is proportionally only a small quantity of wetlands in the watershed of the area. Replacing this biologically priceless land with a larger chunk of essentially man-made wetland that has already been robbed of its wealth in another part of the state could never be a "fair" trade. Sub-par is the nicest way to describe this practice. Second, there are stories all over the country of mining companies not doing what they've agreed to do as far as pollution mitigation. They go for years without supervision or inspections from federal or state authorities. When they are finally held accountable they simply say it is too expensive to correct and will cut into profits for shareholders or company owners. They pay a small fine and continue business as usual. Profits are considered a good reason to destroy the health of local people and lands. Thank you, Roseanne Joa 2320 130th Ave NW Coon Rapids, MN 55448

I live north of the stock pile ponds in Waassa Township, which has the Embarrass river and the Trimble creek waterways running through them. Living close to both of these water tributaries has me worried to what will happen to the area if this mining project goes through. I will be long gone before any effects from this project, whether negative or positive occur. I am looking more to the future than the present. From reading and researching all the different scenarios that could happen, more negative than positive attributes occur. First off the Polymet Corporation says that they will not pollute the area[,which flows North of their mining operations, which includes the Trimble Creek and the Embarrass River area. This area flows into the Saint Louis River Basin, plus the Partridge River waterway, which flows south, and eventually ends up into Lake Superior.] For a process that can only be (not proved) shown on paper Everything that Polymet assumes is just a projection, and the DNR and the MPCA has to take these projections, and make a decision if it benefits the area for future expansion. Let's look at what Polymet says they will do to our economy\; 200 permanent jobs Just a number. I worked for a iron mining company for 31 years and realize that the 200 job number is probably high and it is probably in the 150 employment range. Remember profit is the goal for any company in order to stay in business. The spin off number of jobs for this project is also a prediction. These are my thoughts. {Aurora, Hoyt Lakes, Babbitt, Biwabik},went through these times before Polymet says they will employee 200 employees for 20 years for the lifetime of the plant which equates to 10 employee per year for the 20 year life of the plant: To the residents of these communities: When you look at the added number of permanent jobs, Which Polymet forecasts, that they will employee [10 employees fore 20 Years A 20 year To the residents of Aurora And Hoyt Lakes. You need to look into the future.Polymet is not the answer Polymet says they will employee 200 permanent employees for 20 years. This equates to 10 employees per year This is a pretty poor number for employment when you look at the number of negative ads/products Sent from Windows Mail

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public intereSt The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. Please reject the PolyMet SDEIS as inadequate and reject the proposed PolyMet sulfide mine and Land Exchange as destructive to the public interest and harmful to tribal rights, clean water, vital habitats and the health of future generations. Sincerely Rob Adams 2011 E. 2nd St Duluth, MN 55812 541-683-0851

48086

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National ForeSt PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. It is our job to protect irreplaceable wetlands and fresh water resources in the Lake Superior Basin for generations to come. Pease turn down the PolyMet project. Very truly yours, Rob Adams 2011 E. 2nd St Duluth, MN 55812

Rob Davis

18136

This is by far the biggest thing I've ever done. So I won the public speaking lottery tonight. And I was not expecting that. Hi. Good evening. I'm Rob Davis. I might have the easiest name to spell. R-O-B, D-A-V-I-S. There's probably a few other Rob Davises in the crowd. It's good to see you all. I am a business person and an eagle scout and also a Minnesotan. And so I'm speaking from those three perspectives tonight. As a business person, I absolutely appreciate jobs and economic growth. I'm a marketer. I help people tell their stories. And I love the diversities of businesses that we have in Minnesota. And we need to keep Minnesota's economy absolutely strong and growing. I'm also an eagle scout. And as an eagle scout, I learned the value of wilderness and water and air. And I learned the value of quiet places. And if you haven't been to one, absolutely go. It is completely, completely transformative. And also as a Minnesotan I'm proud, I'm really, really proud that we have a crowd like this frankly on a night like tonight. I'm really proud of this state for having such a diversity of growth and ways to build its own economy. And I'm proud of how critical we are about the way that we want to grow. On PolyMet, as a Minnesotan it's a near certainty -- we all have to embrace the facts. And it's a near certainty that there will be millions of dollars of cleanup. That's just a trade off. We're thinking about jobs and we're thinking about how much it's going to cost. Minnesotans, I would challenge us -- I would challenge Minnesotans to say, "There is a different way we can spend that money." There is a different way that we can spend that money. Broadband is coming to Ely next summer. That's what they tell me. And not only that, if you're going to invest millions of dollars in cleaning up over the next 500 years, let's invest millions of dollars creating clean, renewable jobs. Jobs that last 500 years in the state of Minnesota. PolyMet is not a Minnesota company. I get it. That's great that other companies want to invest in Minnesota. But you have to do business the way Minnesotans do business. And we do it the smart way. We don't want something that is going to be here today and gone tomorrow. We want things that last. The Minnesota State Fair is a fantastic tradition that has been around for more than 100 years. There is so many great things that have been around for a long time. PolyMet is not a Minnesota company. It's just not a good deal for Minnesota.

March 13, 2014 Dear staff at the Department of Natural Resources: This is my second e-mail with comments on the PolyMet NorthMet supplemental draft environmental impact statement. My earlier comments were submitted on January 15, 2014, and are included at the bottom as reference. The EIS should specify what would happen during a large flood. The EIS should specify in detail the impact of a large flood or other extreme weather event on PolyMet's proposed water filtration process. Over a 500 year period there is high risk that an extreme weather event would happen in the proposed mine area, especially with the prospects for increased weather volatility in the context of climate change. As recently as June 2012, 10 inches of rain fell in Duluth during a short time causing a great deal of damage. The staff I talked with at the January 28 public hearing in St Paul noted that a flood of that size would likely overwhelm PolyMet's proposed water filtration system. This would result in toxins spilling over into several water sources. The number of jobs created by PolyMet's mine should not be considered a tradeoff for a clean environment. Minnesota can wait as long as it takes until mining and containment technologies are proven to be effective. Mining jobs are time limited. Whether the proposed mine is started today or in 10 or 20 years from now, Minnesotans will have the same amount of jobs and those jobs will last the length of the life of the mine. In 10, 20 or even more years from now a generation of Minnesotans will be ready to work the good paying mining jobs at this site. The state can and should wait until the sulfide mine water filtration technology has been tested and used in a multi-year project with absolute perfection in another location before trying it in Minnesota. We need time to reduce risks that ultimately the taxpayers of Minnesota would have to pay if PolyMet's proposed environmental clean-up plans fail. Granted as mining technology improves, the number of jobs could be smaller in the future, but in that case the jobs will likely be even higher paying and safer. The EIS should assess the risk and implications for the environment if PolyMet is sold or goes into bankruptcy. Mining companies like PolyMet that get projects off the ground can be bought out by larger multi-national corporations that have less investment in the local community. There is risk that if PolyMet is purchased by a large mining firm that the new owner will not show as much good faith in adhering to promises to safeguard water sources from contamination. The EIS should consider potential mining firms that could someday purchase PolyMet and how environmental clean-up responsibilities would be transferred to these companies. There is also risk that PolyMet could enter into bankruptcy, go out of business and no longer have financial resources to keep the area's water clean. The EIS should spell out contingencies should these economic events happen. A buyout or a bankruptcy has environmental implications due to the 500 years or longer of time required to maintain clean water at the mine site and surrounding area. Thank you for your thoughtful consideration of these issues. Rob Grunewald 2561 Burnham Road Minneapolis, MN 55416 --- Message sent on Jan. 15, 2014 Dear staff at the Department of Natural Resources: I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. As an economist, I find the PolyMet mine proposal does not meet the cost-benefit test. The costs to Minnesota in the long run are much larger than the proposed benefits of adding jobs to this region in the short run. Furthermore, a deterioration in the water quality and environment generally puts future generations at risk and also other sustainable economic purposes for the area. PolyMet Mining Company's proposed NorthMet sulfide mine does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least

Rob Kutsi

My name is Robert Kutsi and I have reviewed all of the information. Currently I am serving on the Gilbert City Council and am a father of four. I support the Polymet project. Being a father of four I am very concerned about our land, upon review I feel very safe with the future of Polymet and securing jobs for our future. Thank you. Robert Kutsi Gilbert City Council

Rob Ramer

57283

Please accept these comments on the Poly Met Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose, exchange of federal land within the Superior National Forest, and cumulative impacts from mining. The proposed mine poses unacceptable risks to our waters and communities, and I support the No Action Alternative.

Rob Simonich

38377

Hi my name is Rob Simonich, I've lived in Babbitt, Mn. my entire life. I went school there, I worked a Reserve Mining while in high school. I belonged to the union, and now I'm in my 25th. year as a teacher at Ely. I've always used the outdoors, and have a cabin in the area. I do not have a problem with Poly Met developing a mine in the area. Based on the impact statement, I have total confidence in Poly Met and our DNR to do the right thing. No one wants to destroy what we hAve That's why we live here. Please let Poly Met continue to do the good work they do to develop a mine here. It would would mean very much to let our schools grow, along with our communities. Please issue the permits, in a timely manner. Thank You Rob simonich, 52 Astor Road, Babbitt Mn. 55706

Robbin Zimmerman

15937

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: We currently live in one of the higher taxed states. Why are we not utilizing public funding to preserve our state for future generations. We don't need businesses coming here and ruining our water and natural habitats. If Minnesota needs more money I would bet a paycheck that there are cleaner, healthier businesses to deal with. We need not be tramps and/or enviromental whores with our decision making - not when it stands to effect future generations so substaintially. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Robbin Zimmerman 8716 Midway St NE Blaine, MN 55449

Robby Bragg

40586

Hello, I am writing as a Minnesota citizen speaking out against the Polymet mine. The affects of this mine will be detrimental to not only the environment but will not help the economy or jobs in the long run either. Since the mine is a temporary endeavor so would be the workers' contracts. Unless you are planning on the environmental destruction that would be caused by this mine and the jobs that would come of that. If so, I think that is a pretty hypocritical precedent to set for our children. This mine will not stand, Your Minnesota Citizen

ROBERT A BRODIE 14782

I would just like to submit a comment regarding the possible mining operation in Northern Minnesota. I am a member of several environmental groups, and have read with some dismay about the likelihood of the mining operations disrupting the water tables and creating havoc to populations of people and wildlife in the future. It is difficult for me to understand the shortsightedness of these operations. I have read of many mining companies going bankrupt and leaving the states to clean up massive spills, after the companies have made their profits. Our water is a precious unrennewable commodity and the few FULL time jobs that will result in this endeavor will not be worth the likely leakage of heavy metals into the water. It is in the foreseeable future that water shortages will become an economic reality, with talk of getting water supplied to other states from Lake Superior. Really. We should be aware that our clean water is an important source of life, not only for Minnesota's people and environment, but also as a viable economic tool for the future. Our children deserve a healthy life with clean air and water. Thank you for your time. Sincerely, Debra Gerads-Brodie, 365 Oak Hill Drive, Red Wing, MN 55066

Robert Ambler 42089

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Robert Ambler Minneapolis, Minnesota

Robert and Kathryn Stodala 57209

Regarding the SDEIS, specifically the Partridge River baseline base flow and the XP-SWMM model predictions, we feel that base flow has been underestimated in the Partridge River by 3 to 4 times. This would mean transport of greater quantities of pollutants. Current base flow projections are outdated and do not align with the rating curve from the new MDNR winter monitoring data or data from the Dunka Rd gauge. Robert A. & Kathryn Z. Stodola 131 N. Hawthorne Rd Duluth, MN 55812

Robert Bartholomew

18213

Hi. My name is Robert Bartholomew, B-A-R-T-H-O-L-O-M-E-W. I'm from Hoyt Lakes, Minnesota, and I just feel as heartfelt as she does about this mine. So let me tell you what I am. I'm president of the Hoyt Lakes Chamber of Commerce. I'm also a retired steel worker. Thirty-five years I worked in the steel mines up there. I'm also a proud union member for the last 50 years, and I wouldn't trade it for anything. When they started the tac mines in Hoyt Lakes, it was a polluter. Iron mining was not the most kindest to this environment, but through the years and through our union and through people that cared that actually worked at this plant, it got changed. Pollution went down tremendously. I feel we can do the same thing at this new mine. This is up to the people that work there. Do you actually think that people that work there are going to let this mine destroy our area, our environment? No, they're not. You're wrong. I know you have feelings, but that's not the way it's going to be. For the last eight years, I've been wondering what's going on, what's happening. I get three minutes up here. It's taken nine years of my life to decide on if this mine is safe or not. So far it's pointing to yes, it can be safe, and there's policies in place to make sure it is safe. I don't think these three entities that work for us, us, the people of Minnesota, the DNR, the Corps of Engineers, I don't think they have any vested interest in this other than ours, and if we don't have faith in them, what do we have faith in. I can't believe that we can't trust outfits that are designed to protect us; let them go ahead and protect us. Okay. Well, I, for one don't have all the answers about this, and we won't have until we see the operation of this mine in full swing. Too late, maybe? I don't think so. And that can only happen if we believe in our system. And we do. And I do. I believe in this system. They've done their job. Now let's hope we can do ours and put this plant in operation for some honest, good, hard-working people. Thank you.

Robert Baxton

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Robert Baxton 721 East 9th Street Duluth, MN 55805

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, The opportunity for PolyMet Mining Corp. to make some money in the NorthMet mining project is attractive, naturally. Everyone is in favor of more jobs and economic activity. However, it is a forgone conclusion that the project will end up polluting the waters of the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness, since Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Reassurances that this will not happen mean nothing once the damage has been done. This ends up being a tradeoff between water quality which serves everyone forever if we protect it, and short term economic gain for a small number. Therefore, I conclude that the Federal land exchange of protected Superior National Forest land to facilitate PolyMet's open pit sulfide mine is not in the public interest Sincerely, Robert Bruner 1102 N Pleasant St Royal Oak, MI 48067-4332

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Robert Bullis 19088 Dodge St NW 19088 Dodge St NW Elk River, MN 55330 763 441 0565

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Robert Bullis 19088 Dodge St NW 19088 Dodge St NW Elk River, MN 55330

Robert C. Jackson

47356

DNR, I grew up in Minnesota and return every year to enjoy the beauty of northern Minnesota's lake country. This proposal for a first Minnesota open-pit, copper-nickel mine is a big undertaking, and I appreciate the diligence you are using to assess the proposal. That said, the proposal is still a huge gamble. In an operation this complex and long-running, the risks to the immediate and downstream environment, as well as to the people working the mine and processing plant and to the people who live, work, and recreate nearby, stare us all in the face. Complex risk assessments in any human endeavor are rarely one hundred per cent accurate. We here in Washington are spending generations and seemingly endless amounts of money to clean up places like Puget Sound and the Hanford Nuclear Reservation from those complex human endeavors that turned out to have significant adverse consequences. If we must err, let's err on the side of safety and high quality of life. Specifically, in response to the SDEIS, I ask that you please do the following:

- 1) Let the MN Department of Health do a health impact assessment of the proposal. Northern Minnesota babies are already born too often with hazardous levels of mercury in the blood, probably from mothers consuming mercury-contaminated fish. The operation will release mercury into air and water. No containment system can guarantee capturing all of it. Also the risks of lung problems from amphibole mineral fibers released during rock-crushing operations seem unknown.
- 2) Rethink the proposed land swap and mitigation plan. If I understand your video correctly, Polymet's plan is to draw down the groundwater level under 913 acres of coniferous peat bogs and mitigate their activity by restoring wetlands elsewhere; then to trade another pool of lands for ownership of the land on which they own the mineral rights for the proposed mining. Peat bogs are ancient with unique plant communities which cannot be replaced, at least not for thousands of years. Restoring wetlands elsewhere is not a good bargain.
- 3) Add weighted valuation to your overall damage risk strategy of avoidance, minimization, and compensation. In my value system avoidance has a much higher weighted value than minimization. Compensation, no matter what the dollar amount, is a last resort with almost no value compared to the loss or degradation of habitat for threatened animals, numerous plant species including wild rice, human health via air and water quality, and the land itself.
- 4) Make a serious study of tunnel mining as an alternative.
- 5) Don't be committed to saying yes to Polymet's plan. If the cost's are too high, deny the permits. Thank you for considering my concerns, Robert C. Jackson 717-33rd St Everett, WA 98201-

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

---Original Message--- From: bobcraft01@msn-com [mailto:bobcraft01@msn-com] Sent: Monday, March 10, 2014 7:09 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Robert Craft 100 King Street West Saint Paul, MN 55107-3656

Robert Cramer

42484

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Robert Cramer 29865 cty 25 Peterson, MN 55962 (507) 875-2313

Robert Davis

40004

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Robert Davis 4127 Colorado Ave S Saint Louis Park, MN 55416-3135

As a resident of MN for all but 3 of my 46 years (born and raised here) I expect more of Minnesota State government than the usual DNR 'rubber stamp' of yet another proposal to destroy the wilderness. The DNR should have learned a lesson from the White Bear lake aquifer depletion debacle. They 'rubber-stamped' every request to pump water from that aquifer and the citizens suffered while the wealthy few benefited. Now your commissioner is being sued by the White Bear lake association. This PolyMet proposal will be similarly 'rubber-stamped' by your leadership and no doubt all the public comments will be dutifully ignored as you serve your corporate masters. This will become another Love Canal or Armley Asbestos disaster where the executives walk away with millions leaving someone else to suffer the environmental damage, birth defects and cleanup costs. Please acknowledge receipt of my comment so this can be used as evidence in the coming (hopefully) criminal trial of your negligence. Gratefully submitted December 29th, 2013- Bob Devine Web/Application Developer

Dear Mr. Dabney,I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement.In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental and economic impacts.I have been a frequent visitor to the area of the proposed mine for many years, enjoying the natural beauty, pristine conditions, and quiet of the area. My children have attended wilderness camp in the area, I have traveled many times to the Boundary Waters, and I continue to visit the area to enjoy its scenic and natural beauty.Over the course of the last twenty years, I would estimate that my own personal contribution to the local economy through spending on these various recreational activities has been approximately \$100,000. Through that spending, I have supported the local economy and local jobs.The SDEIS fails to adequately and accurately account for the impact that the thousands of people like me have on the local economy, and the harm to the economy if the mine is built under the currently proposed conditions and restrictions. The current SDEIS fails to appropriately quantify the decrease in recreational economic activity that WILL occur if the mine is built. If the waters or air of the BWCAW and the surrounding area are damaged by this mine or its aftermath, fewer visitors (including myself) will come to the area. This would have a significant negative impact on the economy of the area that will outlast the productive life of the mine by decades or centuries. The SDEIS needs to account for this negative impact in a meaningful way.Furthermore, PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to.The proposed mine plan does not keep Minnesota's water safe and clean:The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated.In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site, undermining confidence that it can accurately predict future water conditions. There is evidence that the current surface and groundwater flows in the Partridge River basin that were used in the SDEIS were flawed. Correction of those errors may significantly impact the conclusions of the SDEIS.The proposed mine plan does not put safeguards in place for when things go wrongThere are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6.2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment? The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. History tells us that such system failures DO occur, with regularity.

Robert Flynn 33919

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have POLLUTED WATERS IN ALL OTHER PLACES WHERE SULFIDE ORE MINING HAS OCCURRED. NO technology exists to prevent that here in Minnesota. It threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is based on inaccurate data, manipulated by the "researchers." PolyMet mine is NOT in the public interest. That conclusion is quite obvious to all who are not motivated by money and influence. Sincerely, Robert Flynn 3604 14th Ave S Minneapolis, MN 55407-2712 (612) 827-5061

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

My name is Robert Fors. I live at 16445 Gerdine Path, Lakeville, MN 55068- I am in favor of the mining projects in northern Minnesota. I believe this project will create much needed jobs in the region, provide tax revenues for the state, bring investment dollars into the state, and it will provide opportunities for educated young people to find employment in MN. Sincerely, Robert Fors

Robert Frame

46787

The costs of trying to keep this copper mine (and its openly anticipated expansion) from being hugely damaging to water quality and from causing other environmental degradation is unknown, and unknowable. Therefore, the most stringent review as well as limitations/requirements on the company need to be the guiding principle for the DNR and the whole state. You must absolutely not be cowed into approving the project against realistic evidence and projections, and must be willing if necessary to flatly deny permission. Frankly, it does not help that the industry has been unreliable, even duplicitous, in the paSt (I make no claims about PolyMet's managing company, as I did not research them. But they cannot simply reject the reality of false claims and deliberate environmental damage of others in their industry as not reflecting on them and creating the context for Minnesota's review and decisions.) Robert Frame 2530 Blaisdell Ave, Minneapolis, MN 55404

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Robert Haarman 2503 Brighton Ave NE Minneapolis, MN 55418-3924

To Mr Dabney, Mr Bruner, and Ms Fay: I would like you to reject the PolyMet Northmet sulfide mine project based on the extensive risk to water resources and human health in the Lake Superior Basin. PolyMet's SDEIS does not provide a comprehensive enough analysis of the long-standing impacts to clean water, ecological integrity, and human health. In addition, I do not believe that enough consideration has been given to the long-standing economic impacts to Northeast Minnesota, and the state taxpayers at large. While the PolyMet project may increase economic activity in the region, those economic benefits would be very temporary and largely go outside of the state. Meanwhile, the economic risks due to environmental clean-up would be virtually permanent and ultimately rest on the shoulders of Minnesota's taxpayers. Thank you for your consideration of these concerns. Robert Herling 1226 E 2nd St Apt. F Duluth, MN 55805

Robert Hershovitz

18286

My name is Bob Herskovitz, Robert Herskovitz. I am a citizen of St. Paul. I work in historic preservation and I am concerned about irrevocable damage to cultural resources as a result of this project. Some of the cultural resources are very fragile and the damage cannot be undone. For example, if there is a faint historic trail that gets disturbed or destroyed, you can't restore it. It is gone. Like an archeological resource, once it is disturbed, its value in terms of providing data, its value is diminished, if not lost. So, from a professional standpoint, I am concerned that there isn't adequate protection. I'm not sure that it is possible to have adequate protection for some of those lost resources. My other comment is not professional, it is just a personal opinion. It is that this is not really tried and true technology. As a museum conservator, we work on artifacts that are important for us as cultural resources. And what we do as conservators, we try and do so that our actions are reversible. That's the goal. It is an ideal. It is not always possible. That's what I'm concerned about here. It is that these things are even more fragile than an artifact or an object, which can be at least partially restored. I am concerned that the corporation that causes, for example, environmental damage really in the long run is not responsible for that damage and it can declare bankruptcy and walk away, and the citizens of the state are left holding the bag to pay for the cleanup for however many years. If the potential costs of cleanup could be calculated and the company would be willing to put up a surety bond for even 200 or 250 years, 500 years ideally, then the citizens would have some assurance that we will not have to pay for the damage caused in the obtaining of corporate profits; the water quality, the cultural resources, the destruction of land. And those are my concerns.

Robert Hoekstra

34903

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, PolyMet's destructive and polluting open pit sulfide mining cannot be allowed to negatively impact the region's natural resources and public health of the Superior National Forest Sulfide mining in Minnesota threatens wetlands, rivers, lakes and streams. The Arrowhead Region of Minnesota including Lake Superior and the Boundary Waters Canoe Area Wilderness will be adversely effected. The risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations will be significant. Acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred, and it is not in the better interests of anybody or anything living in that area of Minnesota to have sulfide mining devastating the region too. Sincerely, Robert Hoekstra 965 Vassar Ave Holland, MI 49423-5304 (616) 394-0684

Robert Johnson

19510

My name is Robert A. Johnson, J-O-H-N-S-O-N. And my address, I live at 120 North 42nd Avenue East, Duluth, Minnesota 55804. First of all, when we first heard when Cravaack won over Oberstar, the first thing we heard about was that this proposal of mining up north, we were going to weaken all the environmental standards, and there was a really big push for that, and that worried me right from the start. And then I heard from the Sierra Club that one of the things about sulfide mining is that it will cause problems in breathing for a large part of our area and that more and more people will need inhalers, including our kids. And I use an inhaler right now. Okay. Then from there, as this thing is going on, I'm really worried about our kids' future. The Boundary Waters is just a pristine area, and we know with global warming that 30 years from now, fresh water is going to be a high commodity, and this area, if it was left pristine, could make more money than could ever be done with this mining by keeping the area pristine and keeping it open for people and keeping it as a clean area for our kids growing up. Instead, we're sacrificing our children's future, we're sacrificing the land itself, and we're sacrificing all the wildlife in it. Sulfide mining is a very dirty process, and it should not be done in Northern Minnesota. It shouldn't be done at all. You know, we should save these pristine areas when the climate really gets bad. We don't know what the future holds. There could be a depression in the future. One of the things I heard about this PolyMet thing lately is that they expect the people of Minnesota to pay for the cleanup. Now, how is it that a foreign corporation can come into Minnesota, make profits off our land, leave, and leave us with the cost of cleaning it up? That just doesn't seem right at all. The problem we have is I don't think we have a democracy anymore. We really don't. I don't believe that our representatives actually represent us; I think they represent the corporations. The rich are never going to represent the poor at all, and I think something like this that's going to affect us, the wildlife and our children's future should be voted upon by the whole state. We should take a vote from every person in the state, and we should vote whether we should let PolyMet destroy our environment. I don't think it's right to let a few representatives who can be bought decide our future. I think it's really wrong, and I think it should be stopped, and I can't believe that they're allowing this to happen. It's just ridiculous. That's all, I guess, I wanted to say. But I do believe Minnesota should vote on this and not just a couple representatives who supposedly represent us. Thank you.

Robert Jones

I am writing to you my concerns about the proposed Mining Project. What continues to confuse me is the fact that water is the most precious resource we Minnesotans need to cherish and protect, and yet this mining proposal is for an area surrounded by our lakes, rivers, streams, and marshes - the very resource that defines our state more than anything else. How can the MN DNR and the US Forest Service even consider the possibility that such a dangerous proposition for our state would be worth the jobs it could produce. Where is the leadership at the state level that makes it clear that we Minnesotans cannot sacrifice our most valuable commodity at any price whatsoever. We must be constantly reminded of all the water pollution questions that this project proposes, not how much money can be made from mining minerals. And we only need to look to the ongoing drought in the west, and the continued chemical leakage problem in the state of Virginia as sober reminders of how valuable water is to us human beings, and how blessed we are in this state to have such an abundance of clean water. Our water must be forever protected. This mining project will endanger our most valuable resource. Thank you for this opportunity to comment. Sincerely, Robert Kaiser 1064 Pleasant Avenue St Paul, MN 55102

---Original Message--- From: meanderlodge@comcaStnet [mailto:meanderlodge@comcaStnet] Sent: Tuesday, March 11, 2014 9:47 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Robert Kaiser 1064 Pleasant Ave Saint Paul, MN 55102-3311

Please reenergize the ground water pollution problems of coal mining operations in KY, WV, PA, VA, NC that shut down because cleanup was ineffective, thus causing uninhabitable lands for humans and species of plant and life matter this is very problematic, has it been corrected by the past profits of coal mining corporations? Will Twin Metals, PolyMet provide continuous insurance, bonds and monies for the future problems and effects the ore processing causes that are unknown? Clean water for delusion is not the solution for controlling pollution.Robert Lawrence Dryke4827 Howard Green RdDuluth, MN 55803

Robert Lohman, Motley, Minnesota. Over the years there have been a lot of really bad plans presented in Minnesota by corporations, by government agencies, sometimes by individuals. 30 some years ago, 33 years ago now, I was working with a lot of other people in stopping nuclear waste from being buried in old granite quarries. A lot of people came out, and it took a long time, but that plan was never implemented. Then maybe six or seven years later, the State of Minnesota came up with the idea of setting up a hazardous waste site somewhere. And at that time 11 counties, they wanted to be that particular location. And again, a lot of people came out, spoke out time and time again, and finally after about three, three and a half years, that program was dead. Now, there have been a lot of other potentially disastrous plans presented. But I think the PolyMet mining proposal ranks right up there with having a hazardous waste site and it is pretty close to having a nuclear waste site in Minnesota. I can't understand how anybody is willing to put Lake Superior, the Boundary Waters wilderness, various wetlands, plants and animals at risk. For what? 350 jobs, 500 jobs for 20 years? Another thing I can't understand is why would we even be talking to PolyMet, who has never operated a plant? To me, that's like if you need an operation and you are talking to your doctor and he says, "Well, actually, I've never done an operation like that before." And you say to him, "Hey, that's no problem. Give it a shot. Let's see what happens." That's what we are doing with PolyMet. I was also thinking about Glencore (phonetic). Apparently, Glencore is the corporation that has the money. They also have Tony Hayward as their Chief Executive Officer. You probably remember Tony, he was CEO of British Petroleum during the great oil spill of the Gulf of Mexico. And he famously said at one point, "You know, I'm really tired of this oil spill thing. I want to get my life back. I've got a lot of other things to do." So, we're inviting corporations like this into Minnesota and we are going to take their word for the fact that they have state-of-the-art technology and nothing is going to happen? However, with bisulfide mines all over the world, bad things have happened. The environment has been wrecked all over the place. So my hope is, I don't think these hearings will do anything. There is so much money involved, I think -- I think this project will be approved, and once it is, there is probably six or seven other projects in the wings that will come forward. And once you approve one, it will be a lot easier to approve the other half a dozen. My only hope is that a lot of people come to northern Minnesota and they come to PolyMet's corporate office in the Twin Cities and they just keep coming until the thing is stopped. Stop the mine from hell. Hallelujah.

Robert Mahutga

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Robert Mahutga 379174 County 1 Eagle Bend, MN 56466

Robert McCaa

58019

No copper mining near Minnesota Lakes. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Robert McPherson PO Box 2212 Tofte, MN 55615-2212

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

I am writing in support of the PolyMet project in northern Minnesota. I know, personally, many of the principal people involved with the development of the project and believe that they would not be involved with a project that would jeopardize the very environment in which they live – and more importantly, where I live; a stone’s throw from the St Louis River, upon whose headwaters the project will be located. I am writing in support of the environmental review process in place that is evaluating the project, ensuring that the project will comply with existing regulations. Minnesota, for many years, has been a leader in protecting its environment. I have found the SDEIS process, although lengthy, to be a sound and detailed process, based upon scientific principles and not prone to political maneuvering. I think the people of Minnesota should rest assured that their environment will be protected. Many opponents of the project have used the transgressions of previous mining ventures in other locations to impugn the reputation of both PolyMet and the regulating agencies. I am confident that the agencies will evaluate this project on its merits alone, and not engage in “punishing the son for the sins of the father” or finding it guilty by association to secondary parties. We, as a society, have learned from past mistakes, and are technically more sophisticated than 50 or 100 years ago. The technologies proposed in the project will allow us, as a society, to have the minerals we need, and protect our environment. I wanted to comment a bit on the economics of PolyMet to the region. I realize that this is not pertinent to the SDEIS or the work of the agencies. However, given what I have seen in the public hearings regarding this project, it is evident that the topic is important to others who may have some sway going forward. Much has been made of the boom and bust cycle of mining, and it has been put forth as a reason not to do more of it in northern Minnesota. I think it’s important to remember that all industries experience this issue. We have seen it in housing just recently. We have seen it in autos and steel and other manufacturing over the past 30 years. The Twin Cities area was, at one time, a hub of milling, railroads and farm implement manufacturing. Industries that faced decline and replaced with high-tech and medical. Yet, I would venture to guess if someone like John Deere wanted to place a facility there and employ 400 people the people of the Twin Cities wouldn’t tell them, “No thanks, we’ve experienced this boom and bust before – not interested”. The Iron Range is first, and foremost, a mining district. Its location and small population does not support a vibrant service economy or service industries, which can be done anywhere and tend to gravitate to large population centers with amenities. Tourism has been put forth as a way to diversify the economy, but wages and benefits in this industry pale in comparison to the compensation in the mining sector. A person with a mining career will easily make above \$50,000/year with full benefits. I seriously doubt that most people in tourism are making this. No resort owner can afford to pay someone that kind of money to bring out breakfast or change the bed sheets. I was an employee at LTV when it closed in 2001- I was fortunate to land in a comparable career. Most of my co-workers were not so lucky. And I can tell you they were not excited about their financial future as they investigated employment in the area outside of mining. Diversification is an admirable goal, but not at the exclusion of present economic realities. PolyMet is presenting the area with the opportunity for 350 living wage jobs. The very sort of jobs the country has been talking about and looking for. I realize this is an environmental issue at this point. But it should not be forgotten that there are people in this and people matter.

Robert Nobrega

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Robert Nobrega 441 Montana Ave Davenport, FL 33897-5627 (401) 521-7171

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Robert Puls 133 3rd Ave SW Apt 616 Hutchinson, MN 55350-2471 (320) 587-8055

Robert Risch

44099

One of the biggest concerns that I personally have with the PolyMet proposal relates to sulfide mining's real potential to create long term pollution as waste materials are exposed to water over the years. This will happen both from rain water and from the mine being located in an extremely high, water-rich environment. Financial assurances, to deal with this long term reality, would have to extend beyond the lifetime of anyone alive today. To my knowledge, no financial assurance, of this open ended duration, by a corporation, has ever been enacted and/or is still successfully being carried out. To believe that Glencore / PolyMet would be the first corporation to stand behind their financial commitment, beyond their abandonment of their active mining, is but wishful thinking. Thank you for the opportunity to comment. Robert Risch 2870 Hwy 61 Two Harbors, Minnesota 55616 218-348-6284

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Robert Rodenz 150 5th Ave SE, Apt 4 Spring Grove, MN 55974

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Robert Sothern 1903 Selby Ave Saint Paul, MN 55104-5945 (651) 644-5438

Robert Taylor 41945

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Robert Taylor Saint Paul, Minnesota

Robert Thomas 3452

I encourage you to prevent the Poly Met mining operation. Damage to the water and the soil and the atmosphere would result from this type of mining. Its impact on the environment would be catastrophic and the cost of the damage would be extremely high. Theodor Thomas 20 Exchange St E, Apt A1107 St Paul MN 55101-5228

Robert Tipping 43010

Comments on the Northmet SDEIS are in the attached document and copied in this email. Sincerely, Bob Robert G. Tipping 1837 Berkeley Ave Saint Paul, MN 55105 With regard to saline groundwater, the SDEIS states "The concern for the NorthMet Project Proposed Action is whether excavation of the East Pit and West Pit could penetrate zones of saline or briny groundwater or otherwise draw these waters to the surface, thereby increasing the salinity of the West Pit water, which is proposed for treatment at the WWTF" (SDEIS 5-113). While the impact of saline water on the chemistry of the mine pit is a concern, the presence of saline water has broader implications regarding the modeling characterization of the Duluth Complex in the SDEIS as a homogeneous low-permeability hydrogeologic unit. Saline water often is encountered at depths greater than the proposed mine pit depth throughout the Canadian Shield. It is also known to occur near the land surface in areas where structural and hydraulic conditions allow for it. In Minnesota, this occurs in places along the North Shore, but also has been found within the Arrowhead interior along contacts between intrusive (dikes) and host rocks, and in or near contacts between rock units. Measured chloride concentration in water samples is a good tool for identifying saline waters; near-surface waters have concentrations typically less than 10 mg/L. Concentrations above this level, even as low as 50 mg/L can indicate some admixture of saline water. Comparing the ratio of chloride to bromide in water can help distinguish between higher chloride concentrations due to some contribution from a saline source, and chloride from anthropogenic sources. The conceptual hydrogeologic model presented in the SDEIS of the mine, plant and tailings basin site, particularly with regard to solute transport, would be improved with an inventory of chloride to bromide ratios for surface water and groundwater. This inventory should include sampling from discrete intervals in long open holes. Elevated chloride concentrations have been encountered in both groundwater and surface water at and near the site (SDEIS 5-113; Barr, 1976). The presence of some admixture of these waters in the near surface (less than 500 feet) indicates there may be hydraulically active fractures in the bedrock.

Robert Tomassoni

18259

I am Robert Tomassoni from Virginia, Minnesota. I'm formerly from Eveleth and a lifelong Iron Ranger. I worked for United States Steel for over 35 years and have seen unbelievable changes in those years. I am proud of my mining past and understand and know the history of the Iron Range and mining. I know what we can do and what we can't do. I consider myself an environmentalist. I believe in protecting and safeguarding our environment. I have read the Environmental Impact Study and truly believe in my mind, heart and soul that we can mine these precious minerals in a safe and environmentally sound manner. The other part of my comment is to tell you about the men and women that work for PolyMet. I have worked with a majority of them. Joe Scipioni, Jim Tieberg, Paul Brunfelt, Dave Draves, Latisha Gitzen and the DeVaneys. They are all professional, dedicated, hard-working individuals that I have known and trust. They are second, third and fourth generation Iron Ranger and miners. They are honest people with high integrity that I fully trust and respect. These same people are the leaders and pillars in our communities that live on the Iron Range. They are raising their children and grandchildren on the Iron Range. They love northern Minnesota. I know they would never do anything to endanger our environment and the wonderful way of life in northeastern Minnesota. The PolyMet plan is built on the latest science, mechanics and world-class engineering. We can build a world-class mining facility in northern Minnesota. We can mine copper, nickel, gold, and other precious metals better than anyone else in the world and we can do it safely and in an environmentally friendly manner. Help Minnesota grow. Help the Iron Range grow good paying jobs for future generations of miners. Help make PolyMet a reality. Go PolyMet. Thank you.

58158

I worked for US Steel for over 35 years! I know mining as a wage employee and as a manager. I've seen unbelievable changes in those years. All for the better for workers and the environment. I've read the EIS and believe with our caveat knowledge which includes Engineering in all degrees of Engineering! I consider myself an environmentalist. I believe in protecting and safe guarding our environment. We have the knowledge and know how. The experts have reviewed this permit and we can do this properly. Enough is enough. Let's move forward to protect our country, to create good paying jobs while mining these minerals in a safe and environmentally safe mine. We can do this right. We are a world class mining operation at Polymet.

Robert Topliff

9497

Dear Lisa Fay: As someone who has always appreciated the environment that we are blessed with here in Northern Minnesota, I am most concerned about losing that, should things go wrong with the Polymet and other possible projects. We share the Great Lakes with all of our neighbors, and do not have the right to contaminate any of them, nor the surrounding waterways. Without usable water for human consumption, we are nothing, and the economy is worthless. Unfortunately, history does NOT show these types of projects in a good, non damaging light. This is why we look with a critical eye, and are not so easily buying their promises, which in the past have been broken, and the areas left to try and clean up the damage. Lake Superior is sacred, and we cannot take the risk of contamination again. Thank you for your consideration. I hope and trust that the DNR will consider these points. Sincerely, Faye A. Topliff

9504

Dear Lisa Fay, As a native of Minnesota (over 70 Years), and having traveled extensively, I have grown to appreciate what we have in Minnesota, a better environment than a lot of other places. I have worked with others to correct the Silver Bay Taconite tailings in the lake issue and other regrettable environmental fiascoes in other parts of our country and World Wide. I would ask you and the rest of the DNR personnel who are working on this issue to consider the following. "What if we are WRONG on this issue." "What if any damage is catastrophic and CANNOT be corrected or reversed." What ever is done here affects everything downstream. Consider the Mississippi rivers change from the Headwaters down. Final comment, we need clean water and clean air to survive. Sincerely, Robert D. Topliff

54149

I do NOT! [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Although I am personally environmentally oriented, I am not opposed to the PolyMet mining plans, so long as there is continuous oversight by State of Minnesota employees during construction of any retention/holding water bodies, as well as continued inspection/oversight on a weekly basis so long as the mine operates. Due diligence on the state's part should allow the northeast region of the state to recover somewhat economically. Thank you. Robert W. Trevis Eagan, MN

Robert Walker

18218

My name is Robert Walker, and I live in Oakdale and I've been a resident of Minnesota for the past 40 years, and one of the resources we have in this state is very valuable and is becoming more valuable through the world is relatively clean water. Lake Superior is the largest body of fresh water in the world, and we need to protect that water, and the way we can do that is to make sure that we develop our economy in ways that will not pollute that water, and there hasn't been a sulfide mine anywhere that hasn't had the problems that so many others have spoken about here, tonight, and I think it really -- the SDEIS addresses some things and points out things that are an issue, but it doesn't give solutions in there. Treating the water for 500 years? That's not a realistic possibility, and we need to be assured ahead of time that anything of this nature will not pollute that lake and the other waters in that area because water is something we cannot live without. That's all I have. Thank you.

Robert Walsh

16177

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, More industrial pollution of our environment is not the answer. Clean water is not a negotiable commodity. Just look at the disaster in West Virginia. People may want the "benefits" they believe that come from certain industries but the damage can be very long term and costly in terms of clean up, if at all possible. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Sincerely, Mr Robert Watson 3501 Marwick Dr Plano, TX 75075-6224

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, roberta cassidy 3405 west 49th street minneapolis, MN 55410

49955

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. Though a few jobs will be gained in the short term, the long term consequences for water quality and wildlife are far more critical issues. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Roberta E. Newman

40408

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Roberta E. Newman 300 Monte Vista Ave Mill Valley, CA 94941 USA

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Roberta Ryan 44692

Hello. I've been exploring the mining proposal as a project for one of my college classes. After reviewing much of the available information, I'm vehemently opposed to the project. While economics are important, this endeavor simply isn't worth the possible risks. No matter how tight regulations are or how careful everyone is, it's impossible to control everything all of the time. I'm not willing to gamble Minnesota's wildlands for profit and prosperity. I hope the state isn't, either. A heartfelt thank you to those taking the time to review these comments. You are very much appreciated. Roberta Ryan 310 139th Ave NW Andover, MN 55304

After attending open houses in Duluth and Aurora, I support this project, as well as the process that got us to this point. The information tables really helped put the process into layman terms I was impressed by the depth of research. This project should move forward Those who feel more time is needed to understand project, should have taken the time to go, listen, read and be truly informed. We can, and will do this right. Scott M. Bunney 2445 Echo Trail Ely, MN 55731 218-410-2219

Robin Grinnell 40164

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Robin Grinnell 211 Woodhaven Ln Mankato, MN 56001-5786 (507) 934-0916

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. The Cooperating agencies have been correct, as one co-lead agency MDRN now recognizes, in their objection to relying on the deficient and misleading reliance on XP-SWMM model used to extrapolate flow data. This model is flawed, as direct observation shows. The SDEIS must be reworked and revised concerning this aspect. Sincerely yours, Robin Raplinger 916 17th St N Virginia, MN, MN 55792

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. I am not against mining. I am not against construction jobs. I am against tax payers funding cleanup costs of corporations. The proposed PolyMet project's Supplemental Draft Environmental Impact Statement (SDEIS) tells that mechanical water treatment is part of the modeled project and that it is to last 200 years for the for the mine site and 500 years for the plant site. They are uncertain how long this water treatment would actually be needed, but it is stated that "PolyMet would be held accountable to maintenance and monitoring required under the permit and would not be released until all conditions have been met." SDEIS 3-2-2-3-12 or p.3-124 (SDEIS pdf p. 285) In a following section 3-2-2-4 Financial Assurance, it is explained that "financial assurance instruments covering the estimated cost of reclamation" is required. An estimation of 120-170 million dollars at closure and 3-5-6 million dollars per year after closure. All of the hundreds of millions of dollars of financial assurance are to be fully valid, binding, and enforceable under state and federal law and not be dischargeable through bankruptcy. How could such an estimate of costs ever be accurate and guaranteed for 200-500 years or more. We have no idea what changes in law and the economy could take place in 200-500 years. PolyMet does not have the resources to guarantee those immense liabilities and could be described as a "shell corporation" when the major investors, including Glencore, enjoy that protection. What this proposal asks you to accept is 20 yrs of 200-300 jobs and promise that PolyMet will fund everything for 200-500 yrs. Could anybody believe PolyMet or their "financial assurance" will be around hundreds of years after the mine operation, and its value, is gone. This externality, the cost of reclamation as well as health and environmental degradation, will likely be borne by future generations and their grandchildren, great grandchildren and so on for many generations if proper steps are not taken now. Please require Glencore is liable through written documentation to the same degree , reference in the above paragraphs, as Polymet. . Sincerely, Mr Robin Raplinger 916 17th St N Virginia, MN 55792-2137

I attended the first of three hearings that are set up to address the EIS for the Polymet Project. I stand behind and trust the state and federal agencies that are involved in preparing this document. We all know how strict the state of MN is. I am concerned about our environment, who isn't. I, however, do know a few of the people who are instrumental in this project, and they themselves have families to be concerned about. I believe and trust that they themselves would not support this project if they felt their future families would be hurt. We need the jobs, the economic growth, and spin offs from this project. I say let's go forward and permit this project. - Robin Stark, Realtor, Licensed in Minnesota Village Realty Inc. 4325 E 9th Ave Hibbing, MN 55746 218-263-8877 HYPERLINK "<http://www.villagerealty.us>"www.villagerealty.us Robin's cell 218-969-4048

Thank you for the opportunity to comment on the draft Environmental Impact Statement (EIS) for the PolyMet NorthMet Mining Project and the associated Land Exchange. I own properties outside Aurora and Ely, Minnesota that will be directly or indirectly impacted by the proposal. No mitigation or pollution control measures are perfect. My property on the St Louis River may be directly impacted by any water pollution. First of all, I don't believe the short-term economic benefits, including possibly increased valuation of my property near Aurora, justify the potential long-term adverse impacts to the environment. I am not convinced that over time water quality will be protected. Increased aluminum, lead, mercury, copper, cobalt, nickel and sulfate concentrations in wetlands, including lakes, rivers and groundwater are unacceptable. Besides damage to water quality, the project would result in: net loss of forest, natural wetlands, and wildlife habitat; direct harm to rare plants and their habitats; loss of areas of high biodiversity significance, reduced carbon sequestration and increased carbon emissions; and air pollution. The EIS does not address mitigation of reduction of lands available to tribal members to hunt, fish and gather, or how adverse environmental effects may be exacerbated by potential climate change. It is unlikely that proposed mitigation measures will be 100% effective. The long-term public benefit of these lands would be reduced significantly by this project. The amounts of insurance and the reclamation bond are inadequate. The mining company must have sufficient insurance and a large enough bond to cover all potential accidents, repairs, insufficient mitigations measures, and site restoration when mining is completed. The EIS has an inadequate range of alternatives. There must be other practical alternatives that reduce impacts on wetlands, forests, and wildlife habitats. The proposed land exchange with the Superior National Forest is not fair to the taxpayer or the resource. Besides contributing to the environmental problems I list above, a near 1:1 land exchange is not justified. Lands used for mining are worth far more in dollars than forest lands. Government policies require land exchanges be of lands of equal value, not equal area. The EIS needs to include a real and comprehensive economic analysis of land values. The Superior National Forest should gain many more acres from the land exchange than proposed or the mining project should be reduced significantly in size if transferring only 6,722 acres from private to public ownership. For example, I recall a land exchange in the 1990s in which LTV Mining provided the US Forest Service with about 5,000 acres in exchange for 40 acres within the LTV mine. The proposed PolyMet land exchange does not serve the public interest. I urge the federal and state authorities to reject the EIS and the project. If an unfortunate decision is made to go ahead with the project, it must include a comprehensive monitoring and evaluation plan that focuses on the environmental concerns I listed and has trigger points to halt or shut down the project when environmental consequences become unacceptable by exceeding prescribed thresholds. Thank you for your time and consideration. Sincerely, Robin Vora 1679 NE Daphne Dr Bend, OR 97701

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Robyn Dochterman 16277 Quality Trl N Scandia, MN 55073-9723

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I have lived in the Duluth area all of my life, 73 years. As I travel around the country and see all of the economic expansion, new businesses, new buildings, new housing, new schools and new roads being built. I wonder why is it that in all my years living in Minnesota, I have never seen that kind of prosperity and economic progress. I am in favor of the Poly Met Mining project becoming a reality. What an opportunity for the State of Minnesota to show us Minnesotans and the rest of the country that we are indeed interested in bring good pay jobs to our State. If the Poly Met Mining project it is rejected, I will most definitely have the answer to my question. Rodney Monson 4313 Lavaque Road Hermantown, MN 55811

Rodney Olsen 57281

Please accept these comments on the Poly Met Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose, exchange of federal land within the Superior National Forest, and cumulative impacts from mining. The proposed mine poses unacceptable risks to our waters and communities, and I support the No Action Alternative.

Roger A Morrison 52295

Roger Morrison 2900 14th Street SE Austin, Minnesota 55912 March 12, 2014 To: NorthMetSDEIS.dnr (HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us) As a lover of the Boundary Waters Canoe Area (BWCA), I have made many trips to the BWCA to canoe, fish and be in the most beautiful natural environment that I have encountered. I think what impressive me the most is the lack of motorized transport in this area, it makes it pristine like no other place I have been. Know this is a fragile ecosystem I am worried about the possible impact on the BWCA posed by mine drainage at the PolyMet's NorthMet project. The data I have reviewed from PolyMet's shows that water that will be discharged from the project site would not enter the BWCA lakes or streams In my review of the government maps of this area it shows a need to determine the actual effect of mine drainage into the waterways on the edge of the Boundary Waters. The proposed mine site is uphill from the One Hundred Mile Swamp, which drains into the BWCA watershed. There is a lack of testing and research to on the part of PolyMet to show that water entering One Hundred Mile Swamp will not then flow into Rainy Lake and the BWCA watershed. This is evident by the authors of the Supplemental Draft Environmental Impact Statement (SDEIS) using incorrect maps which contradict the government maps along with omitting sections of the One Hundred Mile Swamp. I also have concerns that there is little or no assurance that PolyMet LLC has the financial resources to ensure that any damage done to the environment will be adequately and properly cleaned up. For these reasons I think that PolyMet needs to complete a new SDEIS using the correct maps and the project should not be allowed to progress until the new information can be reviewed. Additionally PolyMet must ensure they are completely vested in all cleanup related cost if there were to be some accident or issue. Very Respectfully, Roger Morrison LTC Roger A. The contamination will last forever (if the past tells us anything). Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Roger Dahlin 47181

Mar 12, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. As a harvester of wild rice for more than thirty years, I have personally observed the sensitivity of that species to changes in water conditions. Research has demonstrated that wild rice is negatively affected by even mildly elevated levels of sulfide in the waters in which it grows. The region surrounding the proposed PolyMet mine has many lakes and streams in which wild rice forms the basis for rich aquatic ecosystems and provides an important food source for many waterfowl, including swans, geese, and several species of ducks. Significant damage to stands of wild rice in this area would profoundly impoverish habitat for many other species, constituting a tragic diminution of biological diversity. Aside from the environmental damage which would occur as a result of harm to wild rice, there is a notable cultural consideration to be made. Native Americans living in areas where wild rice grows have for many centuries harvested and eaten it. After being parched and hulled, the grain keeps for long periods of time, which makes it an important food for surviving long northern winters. The harvesting and processing of wild rice has long been integral to the hunting/gathering culture of northern woodlands tribes. Many continue to practice it, as do other Minnesota residents. The potential for damage to this natural crop represents a threat to both native cultures and natural harvest traditions of many others. I am not satisfied by assertions that water polluted by the proposed mining will be treated to meet strict quality standards. Such assurances mean nothing when something goes wrong and contamination spreads. Such things do happen. I'm not willing, without much more convincing evidence that any such accident will be immediately contained and its effects negated, to tolerate the risks to our environment and heritage that an open pit sulfide mine would bring to northern Minnesota. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Roger Dahlin 1533 Gilmore Valley Rd Winona, MN 55987-7610

Mar 5, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Not only does the proposed PolyMet mining project present serious environmental risks to the ground water and overall ecosystems of the northeast part of Minnesota, this project will increase the amount of pollution that is added to our atmosphere through coal generated electric consumption. In addition to securities and protections for Minnesota's ground water and ecosystems that are in jeopardy as a result of this project, PolyMet should be required to present a means for offsetting all of the additional coal generated electricity that they will consume. This means could be through contribution to the Conservation Improvement Program (CIP) fund, or through direct deployment of renewable energy generation such as solar or wind power. We must insure that this project is in the best interest for all of Minnesota before it is allowed to move forward Letting a small few compromise the natural beauty and ecosystems of our state for their personal profits and leaving the tax payers holding the bill for the cleanup efforts is not an option. Please consider all aspects of this project and how it will impact Minnesota in the coming centuries. Sincerely, Mr Roger Garton 33650 190th St Akeley, MN 56433-8448

Roger Heegaard

Dear DNR, As a citizen of Minnesota who uses the BWCA annually, I am opposed to mining in the area. We need to keep what little is left of the natural world pristine and available for wilderness experience. We cannot put our water resources at risk, as this mining operation would surely do. Thank You, Roger Klisch 1180 Norell Ave Stillwater, MN 55082

Roger Meyer

47301

Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The environmental impact of the mine and the long term economic impact of such an operation require that the PolyMet mine not be allowed. The current and future citizens of Minnesota have the right to clean water and a sustainable economy. The extraction of resources will cause environmental damage during extraction and leave the citizens of Minnesota monitoring and/or cleaning up the site for centuries after operations cease. This has not been proven to be possible for the duration required by this mining operation. The short-term economic gain from this project does not come close to off-setting the short-term environmental impact and the long-term risk. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Roger Meyer 1692 Dayton Ave Saint Paul, MN 55104-6104

Roger Skraba 18311

Roger Skraba, S-K-R-A-B-A, Slovenian, from Ely, Minnesota. I rise in support of this SDEIS. And I do that as a wilderness guide that makes my living in the wilderness. I need that in order to survive in Minnesota because there's so many jobs here. Not. What I want to speak to about the tourism, because we've always gotten along and we always will get along, we just have to tolerate each other. And as mayor of Ely I used to have to listen to both sides and come to a decision. And if I pick one side and say, "The anti-mining people are absolutely correct and the mining people are wrong," I'm wrong. You have to look at it from both sides. There is a solution. And one of the solutions is -- and I think all of us here -- and I appreciate what this document is, is a science document. I don't have the knowledge to make these decisions that regulatory agencies do. I'm trusting them. If they come out and say "It can't be done. The numbers can't prove it." Then it can't be done. And we'll wait for another day when people are smarter and there's another process. As of right now the process that they applied for and are being scrutinized on, if it happens, it happens. It's not something that our passions can make it happen either way. The science is going to solve this problem and we have to trust that science. And I trust the process. Whether it supports my beliefs or not, that's here nor there. But as a wilderness fishing guide, I am not concerned. I trust that the mining, when it happens, is going to be done properly. And if it's not, then I'm out of a job. So I rise in support. One issue -- the other thing I wanted to discuss a little bit was the mercury content. The number is 1.3 nanograms. And one of the concerns I have about that is -- again former mayor -- we have a wastewater treatment plant and we have to be concerned about our mercury that we put into the water. And I'm always kind of wondering about the stuff in the air. How do we measure that it comes from foreign countries or from ourselves? And how does that go into this EIS? And I didn't catch it all. I don't know how that is measured. But I think we need to all look at that. And if guys already did the math on it and did the science, I appreciate that. It's something that I'm concerned about. That maybe the standards that we set for ourselves are so high that it's not attainable. And I'm not saying that we should allow mercury. I'm saying we need to look at where is the point source. If it is coming from the air, then we have to take that into account and not just the point source. I truly believe that the process that we're going through right now is something that I can support. And I hope we all can get together and find a common thread for all of us. Thank you.

Roger Strand 7352

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade. Not surprisingly for this type of mine, the PolyMet SDEIS is still inadequate. Just for openers, it fails to adequately address dangers to workers' health and to the citizens of the affected area who look to our State Agency leaders to protect the source of their drinking water. I'm a retired physician. I was born, raised, and spent nearly all of my working life in Minnesota. It is my chosen water-filled habitat. I just read a news article about a serious local drinking water problem in West Virginia. It is apparently just one of a long list of health problems in that state which can easily be traced to a long-standing culture of lax pollution control of industry and mining operations. Well, this is not West Virginia. I like to believe that we, our children and our grandchildren can expect better treatment from our elected and appointed leaders in Minnesota. Please reject the PolyMet SDEIS and deny the permits that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely, Roger W. Strand, M.D. Roger Strand 20901 Hwy 71 NE New London, MN 56273

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I am a resident of Ohio and I am concerned about the possibility of increased open pit mining in the Minnesota area, specifically the plans for the PolyMet project. I have worked in the environmental field for over 30 years as a fisheries biologist for the Ohio Environmental Protection Agency (OEPA) in the capacity of Environmental Scientist. Most of my work for OEPA focused on environmental quality in Lake Erie where I studied the Lake's fish communities and the impacts of pollutants on their structure, physical health, and tissue contamination. I have since retired. In Ohio we endeavored to reduce the levels of contaminants in our fishes for many years, requiring dischargers of mercury to reduce and eliminate any mercury in their effluents and air releases. We have a long way yet to go. Currently all fish species in all waters of the State are listed for consumption restrictions due to the pervasive nature of mercury pollution in our area. This pervasive condition is the result of air deposition derived from air discharges in states west of Ohio, such as Minnesota. It will not be possible for Ohio to meet the requirements of the USEPA as long as air born mercury is transported to our state. As long as such conditions continue Ohio will be in Non Compliance for all of its waters. This is, as you know, a violation of law. It is my understanding from a review of available information that the state of Minnesota has not yet established compliance with its mercury discharge regulations and that many of its mining operations are exceeding their permit limits for mercury. For Ohio this is an unacceptable proposition. Minnesota is contributing to the damage of Ohio's environment and disenfranchisement of its people to clean waters and edible fish as required by the Clean Water Act and its legal permutations. As part of my duties at OEPA I participated in the International Joint Commission's (IJC) Lake Erie LaMP process as a member of the Ecosystems Objectives subcommittee. Our subcommittee clearly indicated that tissue contamination in Lake Erie's fish community has to be eliminated and that a zero discharge of toxic chemicals and tissue contaminating materials be achieved. The activities of Minnesota, by failing to enforce its own laws, is a clear violation of the objectives put forth by the IJC. Minnesota is a member of the IJC and has agreed to cooperate with the other members in achieving their goals. For these reasons I am requesting the state of Minnesota place a moratorium on all future permits requested in your state until full compliance with mercury discharge regulations is achieved. I specifically request the permit for the PolyMet open pit mine not be approved. Sincerely yours, Roger Thoma 3015 Creekside Dr Westlake, OH 44145

Rolf Carlsen 45432

Hello. Please add me to the long list of those who think this mining proposal is not in the long term interests of any MN resident. It is a short-sighted proposal with huge long-term problems for the residents of this state. Thanks for listening - I hope you make the right decision and stop this proposal in its tracks. Rolf Carlsen

Roma Leuty 7207

Dear Ms Fay, Dear Federal and State Agency Leaders: The PolyMet sulfide mine plan would end up like the Reserve Mining debacle that we had to deal with. It took years to stop the dumping of tailings in Lake Superior. This mine has the potential to be much serious. STOP the rape of our environment. Roma Leuty 161 Ave NW Andover, MN 55304 763 434 3295

Rome Hutchings 10918

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not ever be built. Sincerely, Mr Rome Hutchings 13633 Ferman Ave NW Clearwater, MN 55320-6125 (763) 878-1694

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Rome Hutchings 13633 Ferman Avenue NW Clearwater, MN 55320

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Romola Newport 5 Cardwell Street Greymouth, NZ 7802

I believe the environmental review process has been sound and thorough. State and federal regulations will ensure the measures and controls will protect the environment. Time and money is wasted with this long delay in allowing permits. The only winners are the lawyers and mining competition from other areas. Polymet is a win win for MN and the Nation. Delaying only wastes our money an resources. The biggest complainers are also some of the largest polluters.

Ron Brodigan 39798

March 10, 2014 Ms Lisa Fay; Our response to the PolyMet Draft Environmental Impact Statement is attached to this email. Respectfully, Ron and Judy Brodigan

Ron Deike 12056

Extraction industries routinely use bankruptcy to avoid obligations to fund environmental clean up. The example of Freedom Industries (supporting coal mining) in West Virginia is pertinent. Immediately after their chemical spill which fouled drinking water for hundreds of thousands, Freedom Industries declared bankruptcy and skipped out on Congressional hearings - completely irresponsible and completely predictable behavior. This is exactly the behavior we can expect from a copper miner in Minnesota. This project should not go forward because the state and the taxpayers will be stuck with the clean-up bills. Assurances from extraction industry companies are worthless as has been demonstrated time and time again. Ron Deike 792 26th ST NE Rochester MN 55906

Ron Dicklich 18156

My name is Jesse Johnson. J-E-S-S-E, J-O-H-N-S-O-N. Ironworkers Local 512. I cede my time to Ron Dicklich. RON DICKLICH: My name is Ron Dicklich, D as in "Don," I-C-K-L-I-C-H. I am executive director of Range Association Municipalities of the Schools. That's 25 cities, 15 school districts, and 10 townships in the taconite (inaudible). Right in the heart of where all the mining is taking place, which has taken place for 125 years. And we've already been mining in the Superior National Forest for 125 years. My organization represents that area. And we've been on record in support of this project in 2007 by saying that we were for a safe, scientific process that will create a project that meets the standards that are set in Minnesota statute. PolyMet Mining has never once come to try to change anything. And although it has taken a long time, and what has impressed me in all my years in public office is they have never come and tried to have anything changed. They may not be happy, but they just go and keep doing more. And actually the process has been good. This will be a very clean project because of the long process it's taken. We've always supported that. I've been a county commissioner. I've been a state senator. I've been the mayor. I've been a school board director. Always working with the companies to make sure the process worked. I went to the Minnesota Senate in 1981. Every taconite plant in Minnesota was built without an EIS. And we said that can't be right. As political leaders on the Iron Range, we worked together with our agencies, the agencies like the PCA and the DNR, which we totally trust with this process, to make mining and other industrial development safe. The environmentalists worked with us. I had 100 percent rating with the Sierra Club. Now they call me a polluter because I'm for a company that can meet the standards that we set. And as it turns out, they said that they were for clean development. That wasn't true. They're for no development. And they proved it by coming in on this project when it's very certain that this company can meet all those standards. And so I want to thank our agencies for working as hard as they did and for making the process as long as they can and covering, uncovering every aspect of this project. And just one last thing. When I talked to the environmentalists about the things that we would be mining for making our cell phones and everything else, I said, "So tell me, you would rather have these mined in countries that have no environmental protection?" And they go, "As long as it's not in my backyard." Shame on you.

Ron Holch 39851

Comments For The Draft Environmental Impact Statement (SDEIS) for the State and federal environmental review of the proposed PolyMet Mining Inc. project Dear Board Members, In my opinion, threatening permanent and pervasive damage to the Boundary Waters is tantamount to threatening the heart and soul of Minnesota. This is unconscionable but not the worst outcome this plan could cause. If you wanted to pollute the North American Continent, there is no better place to start than despoiling the area that is in question. That is because this proposed mining area sits at the beginning of three major continental watersheds: Mississippi drainage to the Gulf St Lawrence drainage to the Atlantic Hudson Bay drainage to the Arctic Ocean. Sulfides that leave here can pollute the lion's share of our nation and Canada with acid waters and leaching heavy metals for 500 years. Our oceans are already becoming more acidic every year. Is this a prudent way to provide 300 jobs for 20 years. Ron Holch <http://conscienceandcommons.blogspot.com/> _____ HYPERLINK "<http://www.avast-com/>" This email is free from viruses and malware because HYPERLINK "<http://www.avast-com/>"avast. Ron Lawrenz 18224

My name is Connie Grundhofer, G-R-U-N-D-H-O-F-E-R, and I'm giving my time to Ron Lawrenz. Good evening. My name is Ron Lawrenz, R-O-N, L-A-W-R-E-N-Z. I believe it was Yogi Berra who said, "It's like dij`vu all over again." We visited this and spent a great deal of money evaluating the potential to do copper-nickel mining as part of the environmental quality board's regional copper-nickel study back in the 1970s. I was a researcher for the DNR and hired to analyze plants and animal tissues as part of that larger study. Some of the issues are different, such as the impacts of smelting. And after all that time, we just witnessed the smelter-devastated landscape at a (inaudible) in Ontario. On the other hand, some of the concerns remain unchanged like the impact of sulfides mixed with water, what happens to the ecosystems in those conditions. I know technologies have changed, but I hope that someone has blown some dust off that old study and gone back to look at what we did back then, because we didn't mine copper-nickel after that study was done. I know part of that study (inaudible.) In the same context, my first job with the DNR has led to a 13-years career with the Fish and Wildlife Division. A good part of that was spent in the environment as environmental use specialist, DNR research coordinator and (inaudible.) I am trained and degreed in special biology and luminology and aquatic biology and a specialty in paleolimnology, which is using lake waters to look at the histories of lakes, so I've done a little historical work on lakes. I'm reminded of another favorite quote by Huxley, and it says, "Our only gauge for the future is studying the past." That reflection is of little comfort to the context of our current discussions, and I'm unaware, as many have pointed out, there's been a sulfide mining effort anywhere else that has not polluted the environment. That's my gauge for the future. Many of those issues linger today. I've seen mines on the Row River, gold mine, sulfide mines and they're still leaking today after 100 years. Thankfully, they're smaller than the mines proposed here. This debate has a very strong emotional component, and I understand the fight for jobs. I would argue that we need to focus on tangible issues; selling, trading land for fragments of lands in 900 places, trading wetlands, rather than unique ecosystems. Not understanding the hydrology. I did the hydrology on a lake up there, Thrush Lake, and let me tell you it was very difficult, if not impossible to understand the fragmented nature of the bedrock up there. I'm opposed to this project based on potential impacts, and I suggest that we not approve this EIS. Thank you.

42953

Dear Ms Fay, I have attached my comments concerning the NorthMet SDEIS. I would like to have them included as part of the comment record for this project. Thank you, Ronald William Lawrenz 5717 22nd Avenue South Minneapolis, MN 55417 Phone: (651) 399-4385 E-mail HYPERLINK "<mailto:lawrenz@q-com>"lawrenz@q-com

Ron McGriff 13950

I have grave concerns about the proposed copper-nickel mining operation in NE Minnesota. All mining activity of whatever kind has some impact on the environment, human and animal species. I can not see any amount of "protective" or "repair" dollars that will be truly effective for an operation whose processes and waste have the potential to impact nature for 200 to 300 years. This proposal should be rejected for the health of our area and the planet. A relatively small number of long-term jobs can not justify it. Ron McGriff 3102 413th Ave NW Braham, MN 55006

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: This open-pit sulfide mining proposal needs swift and categorical rejection because of its scientific short-sightedness and negative fundamental energy direction. It exists in conspicuous, diametric opposition to the expressed wishes of most Minnesotans and Americans, except for those profiteering industry corporados without environmental ethics and vision. Apparent local support is typically-, pneumatically-based on, and artificially-amplified by, the full pockets of deceptive speculation and empty promises of quick-boon, short-lived jobs - the stuff of politics, but not science.. Denying this proposal deserves bold Executive leadership in PUBLIC and environmental interests, leadership with the courage to avert projecting current ecocidal directions into our, and our progeny's, already-fragile future, Current public interest leaders' legacy for quality of life is defined by this decision. To not reverse known attendant directional consequences, including those further threatening global water inequities and accelerating climate degradation, in denial of facts totally underscored by ALL science beyond short-term economics, as well as by common observation, would be a dereliction of leadership and oversight of irreversible planetary consequences. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand

Dear Ms Fay, Mr Bruner and Mr Dabney: This open-pit sulfide mining proposal needs swift and categorical rejection because of its scientific short-sightedness and negative fundamental energy direction. It exists in conspicuous, diametric opposition to the expressed wishes of most Minnesotans and Americans, except for those profiteering industry corporados without environmental ethics and vision. Apparent local support is typically-, pneumatically-based on, and artificially-amplified by, the full pockets of deceptive speculation and empty promises of quick-boon, short-lived jobs - the stuff of politics, but not science.. Denying this proposal deserves bold Executive leadership in PUBLIC and environmental interests, leadership with the courage to avert projecting current ecocidal directions into our, and our progeny's, already-fragile future, Current public interest leaders' legacy for quality of life is defined by this decision. To not reverse known attendant directional consequences, including those further threatening global water inequities and accelerating climate degradation, in denial of facts totally underscored by ALL science beyond short-term economics, as well as by common observation, would be a dereliction of leadership and oversight of irreversible planetary consequences. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. “The emperor has no clothes.” The fact that no leaders, especially the DNR Leaders, Governor Dayton and our Congressmen and Senators, are not speaking out boldly against such an incredibly bad idea for the state of Minnesota and all it's citizens fits that description perfectly. Based on the facts this plan will: #1 Destroy thousands of acres of beautiful, sustainable forest – forever. #2 Create a relative few, hundreds, of direct jobs for Minnesotans which mostly will be the lower end of the pay spectrum for only a few decades. The highest end jobs come from outside the state and country. #3 Trade the value of Minnesotans or in other words OUR LAND, and mineral wealth of precious metals for a few decades of jobs while exporting the profits to foreign companies. #4 Billions of dollars, not to be under estimated, and State Expense of time for: A. Hearings and reviews B. Legal Work C. Monitoring, testing and Policing of the sites D. Cleanup and treatment of downstream and underground water from pollution and the cost of damage to fisheries E. State invested cost for road upgrades and maintenance F. Inevitable Litigation G. Loss of recreational attraction and jobs for the tourist industry H. The future loss of jobs and recreation of a local recession when production ends I. The greatest “ The theft of what we could have left for our grandchildren to enjoy and for their quality of life” For this we get a few hundred jobs over a short few decades - and endless damage. The American Indians were cheated and abused but they negotiated a better bargain than this. It's time for our leaders who work for all the citizens of the state not just a few, to realize the damage this will do and that they are without any clothes. Let them know, please. My name is Ron Scherle. You want my statement. I am for PolyMet Mining to come here and stay here and to proceed forward. Yes, that's it. That's basically all. I think a person has to show when they come to these meetings how many people are for it and how many against it. And you will see the people for it far outnumber the people against.

Ron Shoden 42853

Dear Lisa: I am writing to you in regards to PolyMet Mining, Inc., NorthMet Project. Although I have not read the entire EIS, I have been following closely along with this project since the beginning. If the federal & state agencies are satisfied that PolyMet has complied or have exceeded with state & federal regulations pertaining to the EIS, and give their blessing, there is no reason why the Polymet Project should not proceed and begin the permitting process. I have attended most of the public comment period meetings and have also kept in close contact with PolyMet officials throughout these several years. PolyMet has worked very hard on the second EIS draft and I believe the draft is totally compliant. PolyMet employees and their investors have shown great patience over these many years and should be commended. Obviously, the economic impact PolyMet will have on local, state and even national levels will be tremendous and much needed as we continue to climb out of this recession. Finally, I know and trust Polymet officials; if they believed the project would have a negative impact on the environment, they would not proceed. Several officials have lived in the area their entire lives and raised their families. It is time to put our trust in the state and federal agencies who have worked extremely hard on this document. It's time to move forward and get the PolyMet Project producing!! Very Truly Yours, Ron Shoden General Manager Viking Explosives LLC 218-263-88456 x 303

Ron Sternal 18222

My name is Ron Sternal. I'm a third-generation Minnesotan, and a retired Wall Street executive. Sternal is spelled S-T-E-R-N-A-L. You've all heard that the -- Northern Minnesota's home to one of the largest copper deposits in the world. It's not. It doesn't even come close. At peak production, this mine will produce 72 million pounds per year. The largest copper mine in the United States, which doesn't even make the list of the top 10 mines in the world, is the Morenci Mine in Arizona and that produces 1 billion pounds a year or 13.8 times more than the mine -- proposed mine in Minnesota will. If the price of copper stays high, and currently it's dropping, the price is down 10 percent for the year and many analysts say the super cycle for copper is over and prices will be going lower, but if the price is right, the major benefit to be derived from the PolyMet project, besides the hoped-for financial return to its owners, are the hoped-for jobs it will produce. The public discussions over the last few weeks have established if the mine is built, there will be 360 jobs for 20 years, plus an uncertain, but large amount of land, air and water pollution that the SDEIS is supposed to quantify. The SDEIS addresses environmental risk. An equally great risk is organizational risk. Can we trust PolyMet. But it was not PolyMet we need to trust. It is Glencore Xstrata. Glencore Xstrata is the primary owner of PolyMet and as the research firm, Stifel Nicolaus states, Glencore Xstrata will buy the rest of PolyMet when all the permits are in place. So who is Glencore Xstrata and can they be trusted. Glencore Xstrata is a Swiss-based firm known for its ruthlessness. This is the fourth largest mining company in the world. It controls 50 percent of the world's copper through its ownership of 100 mines around the world and its commodities trading operations. Glencore Xstrata's CEO is Ivan Glasenberg, who prides himself on extracting maximum profits from its overseas holdings. Under his leadership, Glencore Xstrata has run a long list of labor and environmental abuses, including 58 mining fatalities between 2008 and 2010, over twice the number reported by any other mining company over that period. Just in 2012, the environmental and labor record includes dumping raw acid into waterways in the Congo; Failure to provide a vapor barrier to prevent acid mist from descending on 3,000 people in Zambia; Utilizing child labor as young as 10 years old at mines in the Congo; and causing environmental damage at the McArthur River Mine in Australia. Then (inaudible) talked with the local unions to address the issues. There are number of -- can we trust these people to do it right in an area of (inaudible) in Northern Minnesota? I think not. But wait. Maybe we'll get lucky and they'll sell the mine to the Chinese as they are selling the mine in Chile. Thank you.

Ron Ulseth

18341

Good evening. My name is Ron Ulseth, Grand Rapids. That is U-L-S-E-T-H. It is on the screen (indicating). I am an engineering educator and have been educating the youth of northeastern Minnesota for more than 20 years. In fact, I have many of my graduates in this room tonight, and hundreds of them are working in this region right now, as stewards of our northeastern Minnesota region. Every day as I'm teaching the future engineers, we look to have them consider three things. And one is to develop a robust scientific knowledge and understanding of engineering principles. And the second is to become critical consumers of information. To try and sift through the emotions that are heavy on any issue, like the one we have here (indicating), and also try and sift through statements that perhaps are misleading. The third thing is we ask them to develop what we call an engineering intuition. It is based on those first two. It is to take the sound principles of science and engineering and your critical ability to think, to then be able to develop a way to make good decisions that have been put in front of you. 40 years ago, when I was growing up in rural Blackberry, Minnesota, on the wall we had a rotary dial phone and we had a party line. Now, here we are, 40 years later, and look what the technology has done. I can be flying in an airplane across the world and talk to my grandchildren back here in Minnesota. The technology growth has been incredible. Speaking of those grandchildren back here in Minnesota, tonight I had to take a night off from helping my son build his house where my grandchildren will grow up and live in this region. So, it is with this emotion of knowing that my grandchildren are going to have to live here and with this engineering intuition that I have developed over 25 years of practice and in teaching others to practice, that I used my intuition to look at the science. And my intuition tells me that I believe, as I have read the EIS, and it tells me to believe what I have seen. It is not based on any other emotion than my intuition in looking at the scientific principles and any information put before me. And as has been stated before, I have my intuition that tells me to give great trust to the Army Corps of Engineers and the Department of Natural Resources and others who will issue the permits and who will be the regulatory agencies. Thank you.

Ron Wetzell

18261

My name is Ron Wetzell. Someone pretty smart once said, "Underneath complexity lies simplicity." But it is also the case that simplicity can precede complexity, as in Occam's razor, O-C-C-A-M, apostrophe S, R-A-Z-O-R, as in the principal of parsimony, as in, "Keep it simple, stupid." With respect to the proposed PolyMet Mining Project, the obvious and simple answer can be found both before and after complexity. The answer is that it is immoral and unethical of us to encroach upon, to mortgage, to pilfer our children's rightful heritage to a clean and healthy environment for our benefit of a few hundred jobs for 20 some years. It is flat out wrong. History is replete with example after example of our making deals of short-term gain for a distant cost. The "Buy now, pay later." Isn't that pretty much how we have financed our last two wars? "Let the kids pay for it." How is that deficit looking for us these days? Oh, never mind, the kids will take care of that. Throughout history we have asked what can we take and what can we use from our environment? Even after our grudging acknowledgment that global warming does exist, are we not yet able to ask what does our environment need from us? We all bemoan the failure of persons and organizations from taking responsibility for problems they create. Aren't we called to stand up here and to witness to our deepest values? I retired from county government coming up to four years now, after a 30-year career. I once had a button that I never had the courage to wear in public. It read, "Trust me, I work for the government." That is even funnier today than it was several years back. To that I would ask, do any of us have greater reason to have faith in a business or company than we do our own government? Help me remember how well the state bailout of Northwest Airlines went, some number of years back, in which they promised to build and use maintenance facilities in Duluth. As I am able to remember, oh, not so well. It would be one thing if that experience were the exception. But we all know so well that is a rule. Seriously, what entity do we know that we can trust for 200 years? For 500 years? The answer regarding this project is not complex. It is pretty simple. The pinch is that it calls us to have courage to walk the talk of our deepest failures. We have here the opportunity to be who we say we want to be. We need to say no to this project.

Someone pretty smart once said, “underneath complexity lies simplicity.” But it is also the case that simplicity can precede complexity as in Occam’s Razor, as in the Principle of Parsimony, as in Keep It Simple Stupid. With respect to the proposed Poly Met Mining Project, the obvious and simple answer can be found both before complexity and after complexity. That answer is that it is immoral and unethical of us to encroach upon, to mortgage, to pilfer, our children’s rightful heritage to a clean and healthy environment for our benefit of a few hundred jobs for 20 some years. It is flat out wrong. History is replete with example after example of our making deals of short term gain for a distant cost: buy now, pay later. Isn’t that pretty much how we have financed our last two wars? Let the kids play for it. How’s that deficit looking for us these days? Oh, never mind, the kids will take care of that. Throughout history, we have asked, “What can we take and what can we use from our environment?” Even after our grudging acknowledgement that global warming does exist, are we not yet able to ask, “What does our environment need from us?” We all bemoan the failure of persons and organizations from taking responsibility for problems they create. Aren’t we called to stand up here and to witness to our deepest values? I retired from county government coming up to 4 years now after a 30 year career. I once had a button that I never had the courage to wear in public. It read, “Trust me. I work for the government.” That is even more funny today than it was some years back. To that I would ask, do any of us have greater reason to have faith in a business or company than we do our own government? Help me remember how well the State bailout of Northwest Airlines went some number of years back in which they promised to build and use maintenance facilities in Duluth. As I’m able to remember – ah, not so well. It would be one thing that experience were the exception, but we all know so well that is the rule. Seriously, what entity do we know that we can trust for 200 years, for 500 years? The answer regarding this project is not complex. It is pretty simple. The pinch is that it calls us to have courage to walk the walk of our deepest values. We have here the opportunity to be who we say we want to be. We need to say no to this project

Ronald Bendis 33421

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Sulfide mining threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Sincerely, Ronald Bendis 433 Pleasant St Woodstock, IL 60098-3238

Ronald Harris 35110

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Ronald Harris 2802 50th St S Wisconsin Rapids, WI 54494-7171 (715) 421-4113

Ronald Iannelli 38486

My name is Ron Iannelli. I live at 307 SW 10th Ave Grand Rapids, MN 55744- We moved to Grand Rapids from the Twin Cities in 2003- I feel the MPCA, DNR and the State have enough safeguards in place to allow this project to go forward Thank You Ron

March 4, 2014 Ms. Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St. Paul, MN 55116
Mr. Douglas W. Bruner Regulatory Branch, St. Paul District U.S. Army Corps of Engineers 180 Fifth Street East, Suite 700 St. Paul, MN 55101-1638
Mr. Tim Dabney Deputy Forest Supervisor U.S. Forest Service Superior National Forest 890 I Grand Ave Place Duluth, MN 55808
Subject: Comments re PolyMet Open-Pit Sulfide Mine & Mine Wastes Plan SDEIS
Dear Sirs and Madam, I have worked as an environmental health professional for 30 years. I have a Master of Science degree from the University of Minnesota in Environmental Health with an emphasis in environmental toxicology. I am also a Certified Industrial Hygienist. I have grave concerns regarding the likely emissions of mercury from mining operations. The US EPA's review of the draft EIS raised many objections to insufficient characterization of uncertainty and risks from mercury. In my review of the Supplemental Draft EIS, I do not believe these have been adequately addressed. Specifically:
• Section 5.2.2.3.4 states "Mercury was not included in the GoldSim model, as insufficient data and a general/lack of definitive understanding of mercury dynamics prevented modeling mercury like the other solutes." This is unacceptable.
• A footnote to Table 5.2.2-50 states "Volatilization rate is estimated based on the low end of the range of values discussed in Section 6. 6.2. 3. 7 of Poly Met 2013 i." Why is this allowed?
• The SDEIS states "There are several factors that appear to influence mercury methylation, including total available mercury, organic carbon, temperature, micronutrients required by sulfate-reducing bacteria, sulfate loadings (over the range for which sulfate may be a limiting factor for sulfate-reducing bacteria), and certain hydrologic conditions. The NorthMet Project Proposed Action is expected to have little or no effect on most of these things, but the effect on two of these, sulfate concentrations and hydrologic conditions, warrants further discussion. These two potential effects are discussed below." How can a claim like "... is expected to have little or no effect on most of these things ..." be allowed to stand without detailed substantiation of each? Why has the Minnesota Department of Health not been involved in a quantitative health risk assessment? I believe this is a critical step to ensure an objective evaluation of public health risk. From a practical standpoint, I believe the 'alternatives analysis' provided by Polymet is grossly insufficient. I've worked with numerous metals recycling facilities on environmental issues in my professional career, and it is incomprehensible to me that this type of mining continues, when there is more than enough of the metals that Polymet seeks to mine available through recycling. The EIS must provide a thorough analysis of alternatives to this mine. Lastly, I would like to state the obvious, even ludicrous assumption- that we can have any degree of certainty about what is going to happen 200 years from now. The only thing we know for sure is that the BWCA will still be here in 200 years. Polymet and its successor companies (or their 'financial assurance') - not too likely. Please reject the Polymet SDEIS. Sincerely, Ronald L. Pearson, M.S., CIH 1903 Pinehurst Avenue St. Paul MN 55116
CC: The Honorable Mark Dayton, Governor of the State of Minnesota

57277

Dear Federal and State Agency Leaders: In 2010, the U.S. Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory. The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever.

Ronald W. Stromsness

45036

Dear dear Minnesota Department of Natural Resources; I am 66 years young and been around the barn a few times. I find it whelming the number of people that are sticking there heads in the sand and are in favor of this ill-advised fiasco. To agree that PolyMet can be believed in any way shape or form on whatever proposal they come up with and then astoundingly agreed to by any department is a crapshoot at beSt Well before the attempt is made to extract any materials from the land in Northern Minnesota, I suggest we wait until they have a few more notches in their stick, proving this can be done with minimal harm not only to the environment but to human safety as well. Lets not forget who we are dealing with here. One percenters and politicians. And lets face it, greed is high on the liSt I say this because I believe the minerals they recover will be sent overseas for processing where decent wages and environmental laws are non-existent. When and if we ever do this mineral extraction lets do so when we, the good old US of A can process the materials with good wages, strong environmental and human safety laws to protect not only us but our world. We already have problems with mercury and acid precipitation here in Northern Minnesota. Lets not exacerbate to those problems we currently seem to want to do nothing about. Thank you for the opportunity to voice my opinion. Cordially, Ronald W. Stromsness

Ronna Hanson

41934

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Ronna Hanson 65 W Chisholm St Duluth, MN 55803-1505 (218) 724-7139

Ronnie Puckett

54110

I do not believe the PolyMet mine is a good idea until it has been proven safe and clean and Minnesota should not be the testing grounds for this. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Rory Cardinal 5660 156th Ln NW Ramsey, MN 55303-6101 (651) 795-1204

10861

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1) Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2) Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3) Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Rory Cardinal 5660 156th Ln NW Ramsey, MN 55303-6101 (651) 795-1204

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Rory Cardinal 5660 156th Ln NW Ramsey, MN 55303-6101 (651) 795-1204

Please protect Minnesota lakes. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Rory Scoles

18114

My name is Rory Scoles. I am from Finland, Minnesota. I own and operate a downhill cross-country ski and snowboard shop. I want to talk about trusting our officials in these processes. That we are all kind of putting our eggs in that basket as far as our government entities keeping an eye on our environmental quality. I watched the openly allow corporations to violate their water permit down the river for 10 years. Yeah, the review looks great. I want to trust the DNR, the agencies to do their job. I personally watched in my area them not do their jobs. We're all human and make mistake. Our job is to hold people accountable when (inaudible) flood. I do not see those types of events included in these environmental processes. That's one of the biggest oversights. All this will be in the ground for 100 years. Our kids and grand kids are going to be here and deal with this planet we live on. (Inaudible) dealing with extremes. If you can't wake up to that fact and look at what is happening on the planet, seeing the records broken on a monthly, daily basis, your priorities mixed up. I have two sons and lot of talk about progress and how wonderful progress is. On one hand it is a double-edged sword. We need copper for devices. I have a smartphone. I don't have electricity in my house. And how many of you people have kids or grandchildren that spend time in front of these screens. That's what this copper is going to China to make the devices to be sold back. (Inaudible) spend less and less time with us. I'm not going to allow that to happen. Thank you.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Rosa Arsiaga 2217 S 7th St Abilene, TX 79605 US

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, rosae brown 170 good counsel drive mankato, MN 56001

Dear Public Representatives: I write to you today concerning PolyMet Mining Inc.'s proposed NorthMet project to be located in northeastern Minnesota, near Hoyt Lakes and Babbitt, as well as mining proposed by Twin Metals. My ancestors on both my mother's and father's sides came to Minnesota in the 1850's and generations of our family have enjoyed Minnesota's high quality of life ever since. This is our home. Seven generations of our family have been born and buried on this land. The Anishinaabe have been here eons longer and remain to this day as well, no thanks to many US government policies. My husband and I summer on the shores of Farm Lake in Ely, Minnesota where we are privileged to occupy a lot with a simple log cabin. We are grateful every day (even in the prolonged sub-zeros of this winter) for the beauty and spirit of this land where we were born and raised. We look forward to growing old together as our children and grandchildren flourish here as well. We have been closely following the proposed mining projects of Polymet and Twin Metals with open minds. After careful reading and thoughtful discernment on the various sides to this issue, we must now step forward to declare our opposition to the sulfide mining proposed. Our opposition to this type of mining is for the following reasons: Northeastern Minnesota is a jewel, not only for the state of Minnesota, but for the entire nation. We have carefully protected our natural resources in the past and must continue to do so for future generations. Minnesota is known for its water - its 10,000 (12,000) lakes - and must continue to protect its water for all times, especially as lack of clean water is becoming an increasing concern for all living things in our world. The land of Superior National Forest has been purposefully set aside in public trust and should remain so. The acid mine drainage from sulfide mining kills fish, wildlife and plants and irreparably damages the wild rice harvest and way of life. A mere 20 years of copper mining will require centuries of water treatment and entails much greater environmental risks than the taconite mining of the past. A look at mining history, shows that mines in Colorado, Montana and South Dakota have gone bankrupt and left tax payers to clean up the terrible environmental messes they left behind. They will never be the same. Computerized projections do not trump real mining history, which shows that sulfide mines produce polluted drainage. period. The US Environmental Protection Agency presented mining as one of two top dioxin producing industries in the nation (The Washington Post, 1/5/12). In 2010 metal mining was responsible for 41% of all toxins released into the environment. Mining by-products such as arsenic, manganese, thallium and mercury increase risks of cancer and other illnesses, developmental and neurological damage in human persons. Our neighbors in Wisconsin have put a moratorium on new sulfide mines in their state until the mining industry can demonstrate that a mine has operated for 10 years and closed for 10 years with no acid mine drainage. We need to follow that wise path. It is time to just say "no" to corporate interests which bring excessive income to a few at the expense of quality of life for many and the future of life on our planet. Sincerely, Rosanne E. Fischer 10540 Raven Loop NE Foley, MN 56329

Rosario Greenwood

18239

My name is Rosario, R-O-S-A-R-I-O, Greenwood, G-R-E-E-N-W-O-O-D. I come here to tell a story that I would like -- that sets a precedent what makes me talk here so those things will not be repeated here. In my country of origin, Peru, South America, there is an old mine called Yanacocha, Y-A-N-A-C-O-C-H-A, Yanacocha. The company that owns that mine, basically, is Newmont, Newmont Mining Corporation from Colorado. To today, exportation earns them maybe \$7 billion -- until now, they earn maybe \$7 billion. Unfortunately, the idea was that they bribe the people, and they got the concession to develop there, to exploit the mines. It is the second largest in the world and maybe the first one in whole Latin America, the biggest. They're supposed to -- originally they say that it was going to be environmentally friendly, that they were going to help the people create jobs, lift up the city. They promised everything good for the people over there. Unfortunately, it's been totally the opposite. The lake that they use for developing in the process of the gold, the lake has been evaporated. People don't have water. There is contamination all over. Beautiful pristine areas, vegetations totally contaminated, toxic pollutants. The kids have wounds, lacerations all over their bodies. And of course, the Newmont Corporation which is based in Colorado, here, easily they get their money, and they didn't even care. Thousands of people have been demonstrating there, and of course, they took reprisals against those leaders and one of them was killed, one or two people, I think. The reason why I'm talking is because I don't want those things to be happening over here in such a beautiful area in the Boundary Waters and I don't know, there are more things that I should talk about but I don't know what else to say. Thanks you. Not only is the Newmont Mining Corporation from Colorado, but also is the World Bank International Finance Corporation that wants to benefit from that, and one Bentura, owners from Peru, B-E-N-T-U-R-A family. It's important that my comments are heard because that mine is where the treasure -- the Inca treasures were hidden in Peru and at that area, and of course if the people over there were respected but not killed because now the people are fighting for whether they have water or gold. What is more important? The people are trying to survive now. They want water, not gold. Now, they want to open another mine that is called Conga, C-O-N-G-A, Conga, and the people are fighting, but you know bribes, corruption, maybe they want to go ahead, want it or not, and people are afraid that the same thing is going to happen and the destruction of the lovely area, not only in vegetation, farm, fauna, flora, you know, the whole ecological disaster. They promise that they are going to be environmentally friendly, but totally the opposite has happened, and the people live in misery, not even in human but substandard means of life. Who cares? Nobody cares. Contamination with mercury and other many horrible chemicals, you know.

Rose Carlsen

45334

I live in Minneapolis and visit the north shore of Lake Superior as often as possible to enjoy the beauty, the hiking and ski trails, the boundary waters wilderness as well as local restaurants and art venues. I think the Polymet mine proposal is a bad idea for the state of Minnesota and that region in particular. The short term long range impact on the environment including the moose population, water quality for wild rice, and the surrounding boundary waters wilderness area to name just a few would be dire. Any project that requires a 100 year or more clean up plan is ridiculous to even consider. In order to move forward at all a rigorous and thorough study of environmental impact needs to be completed. If mining must occur the idea of an underground mine with the tailings being reburied in the mine should be considered. Thank you. Rose McManus Carlsen

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Rose Doran 635 foote ave Duryea, PA 18642 US

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

20077

Feb 27, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Rose Knopff 2523 Brenner St Saint Paul, MN 55113-1002

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Rose Knopff 2523 Brenner St Roseville, MN 55113-1002

40279

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Rose Knopff 2523 Brenner St W Roseville, MN 55113 US

Dear Ms. Fay, I am a student of Humboldt High School in Saint Paul. I would like to inform about the problem with the polymet mine doing. Why would you let the company to mine in an area that would impact our whole environment? The company is not trustable. This project can generate a pollution for centuries and will poison our pure boundary water to a sulfuric acid. As a student of an environmental school, I am concerned about the safety of our environment. Because the map on the polymet is wrong and this is giving the company taking advantage on mining a huge area. This needed to fix and giving people the right map. I hope you will make the right decision and I appreciate your help. Sincerely, Rose Line 461 Maryland Ave W 101 Saint Paul, MN 55117

Rose Lo

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Rose Lo 5308 Highland Rd Minnetonka, MN 55345-5629

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Please don't allow this. Lake Superior is a glacial lake, its waters are too cold for the wildlife to recover quickly. Also it would break my heart to lose this iconic place to pollution. My family served at KI Sawyer and Lake Superior is one of my first childhood memories. I know the economy is poor, but allowing this would only make the areas around the lake poorer. Once a land is tainted it takes decades for it to recover. There are better ways and you have the power to insist on better. Sincerely, Rose Olszewski 1514 Yorkshire Dr Apt 3 Howell, MI 48843-1051

Rosemary Johnson

I have not heard any discussion of requiring polymet to dispose of tailings other than storing them on the surface. Why not deposit them in some of our abandoned open pit iron mines or underground mines. The tailings could no longer create surface water problems and storage problems would be solved. I know that this sounds simplistic but some variation of this idea might be feasible. As it stands I definitely oppose the mining. We could very well be left with a badly damaged environment and huge storage costs when the mining company pulls out or becomes insolvent. Teddy Roosevelt had the foresight way back then to protect land from ever increasing development. Certainly we could do likewise today when there is so little undeveloped land left. Sincerely, Darrel A. Johnson Eveleth, Minnesota

46496

Lisa Fey, EIS Project Manager, I understand that PolyMet's chief investor plans to sell copper concentrate to China. That means that we here in Minnesota will be putting our water quality etc at risk to benefit one of our most challenging and dangerous rivals. I'm all for more jobs and opportunity for young people in our area. I am against a project that has the potential to spoil the very things that many of them want to stay here for. In the end the MDNR will be blamed for anything that goes wrong with this project ["the DNR approved it"]. They all have an out but you do not. Sincerely, Darrel A Johnson 405 N Van Buren Ave Eveleth MN 55734

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. I insist that this I'll thought out SDEIS be rejected for all the reasons stated above. Sincerely yours, Rosita Aranita 1440 Randolph Ave #305 St Paul, MN 55105

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. We are the government ultimately and we the citizens will be the ones to suffer the dire consequences of a rushed assessment and implementation. I support all the reasons and recommendations previously laid out. Sincerely yours, Rosita Aranita

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams, and public health across the Arrowhead Region. In my job as I dentist, we have to deal with mercury issues. Some science tells us that mercury exposure from fillings is ok because it is such a low dose exposure of elemental mercury. However, mercury is a known neurotoxin and highly regulated pollutant. We use amalgam separators to remove as much mercury as we can from our waste water, and then have the contaminant disposed of properly. Dentists continue to use less and less mercury containing fillings because we know mercury is a known toxin. Adding mercury and arsenic to our waters through a large mine is irresponsible. The notion that the contamination from something as large as a sulfide mine can be treated and contained is asinine. I use science to my advantage all of the time with materials I use. However, we do find that our predictions about materials can be wrong no matter how good the scientific method was. Using Minnesota and its citizens as another mining experiment is not appropriate. I don't feel the science or technology is advanced enough to successfully complete this mine without adversely affecting public health and the environment. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Ross Anderson 4550 London Rd Duluth, MN 55804-2340

I'm sure Polymet (a Canadian company) wants us to get in line so they can exploit our minerals. Just like another Canadian company wants to exploit their nasty oil and build a pipeline across America. They should ruin Canada before coming down here. Then maybe the environmental message will sink in with them. What's the rush. Those minerals have been in the ground for billions of years and they only get more valuable. Add the unnecessary risk to the environment - I don't think this needs to happen any time soon. There's plenty of Canada for them to ruin while they wait. Thanks, F. Rowland Gosling White Bear Lake, MN

It is important to me personally and I believe to all the people that live in northern Minnesota to help develop industries. People and the environment can co-exist together with industry as a means to support communities and families. I have seen industries develop new ways of controlling their impact on the environment, while supporting the communities they share space with. As an example of change, I can say with great surety that communities, people and industry have taken responsibility for their impacts on the environment in a responsible way, when that impact has become known. I have lived to see this personally and bring your attention to the St Louis river as an example of positive change. During the years previous to the 1970's the strategy for dealing with waste materials was to dump them directly into the St Louis river. Everybody did so. The general public, the city of Cloquet, all industries located along the St Louis river systems did so and at the time was considered a valid way to manage waste materials of every kind. There was at one time, township place's to dump residential garbage, this was done in an uncontrolled environment and just about any dip in the land scape would do. I believe that was a common practice just about anywhere in the United States. Here we are today, awareness and knowledge have increased substantially across the states; industries and municipalities, the general public, all of us have taken responsibly for what we do regarding our impacts to the environment. We also have a successful history of environmental stewardship and industrial development right here in the wood city of the north Cloquet, Minnesota. I bring Potlatch Corporation, now Sappi into the lime light as an example. While permitting the new expansion of the paper mill, Potlatch re-wrote the standards for that industry based on the available technology at the time back in 1990- The paper industry has gone through extensive change over the last 20 years and continues to do so. The point I am making is that this industry was successful in achieving environmental stewardship, while supporting the community it does business in. People have the right to exist, to seek the American dream of home and family, self-sufficiency. I believe industry has stepped up to the plate and done what was required based on the knowledge and awareness at the time, has taken responsibility, by taking the appropriate actions for positive environmental stewardship. I very much support PolyMet's development of mining operations. Roy Maki Jr Cloquet, MN

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please protect the beautiful wilderness areas we are privileged to have in Wisconsin and the Great Lakes region. Say "no" to the Federal land exchange of protected Superior National Forest land would open the way for the PolyMet Mining Corporation's NorthMet mining project. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. This project's potential impacts on our region's natural resources and public health are too serious to risk for the temporary profit-making it could produce. Those risks include degradation of water quality, dangers to human and animal health, and loss of life sustaining wetlands. Please protect our land and our waters from poisonous pollution. Sincerely, Rozanne Screven 3357 N Humboldt Blvd Milwaukee, WI 53212-1737

Rudy Perpich

Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. We shouldn't even consider a project with a 500 hundred year pollution monitoring requirement. It is ludicrous. If the mining companies work with the U of M and other universities to develop ways to safely contain the pollution, then the permits can be issued. Otherwise, with current technology, acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Rudy Perpich 12000 Marion Ln W Apt 1322 Minnetonka, MN 55305-1305 (952) 593-0680

Dear Ms Fay, Poly Dear Federal and State Agency Leaders: We are seeing the effects of Frac sand mining in WI and MN. The industry showed up without warning. The effects have impacted the locals and the larger public without any oversight via the government local or state. It would be fair to say they were blindsided by the mining concerns. Truly the mining company's don't care how it effects the locals or the environment. It would be fair to say the same is true of the mining companies that want to get at the ore in northern MN. There should be a moratorium on the permits until the government dedicates real money towards establishing strict studies and develops MN mining rules that guarantee a zero tolerance for pollution issues. They mining company should be required to restore the land and water quality back to original. Profits should be Escrowed until the mine has closed. Guarantees must be made to the public that continual environmental monitoring be done. That monitoring shall only be done by a citizen approved impartial company with their own financial records monitored by a state auditor to assure the public there is no manipulation of the data. The costs to the state for the continuous monitoring and oversight and auditing shall be borne by the mining company. There should be consequences and fine schedules established prior to any permitting. Make it clear to any mining concerns that MN means business - that the MN laws have teeth. The state should act to protect and defend the environmental concerns of the citizens of the state. It should not be easy for the mining company to extract the ores from MN land. It would be better that the state take the stand that makes it clear to any mining concerns that there will be costs and to doing mining in MN. It should make it clear that the corporate officials will be held personally responsible in any legal negotiation with MN. Make it so any mining company that wants to do business in MN will think twice before signing any agreement with MN In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Russ Erickson 3915 Grand Ave South Minneapolis, MN 55409 612 823-1228

20038

PolyMet Mining Comment Thursday Feb 27th 2014 1) Regulation – It should be made a requirement that only non-partial government regulated third party firms will be allowed to do the monitoring of the environment testing. 2) The enforcement and fine structure should be in place and have real consequences for all of the corporate executives involved in the mine. That includes PolyMet , Glencore Xstrata and any future owners or corporate concerns. 3) The definition of what constitutes a failure of the environmental issues should be laid out and made clear for both the mining companies and the citizens of the state. Thanks - Russ Erickson 3915 Grand Ave South Minneapolis MN 55409 612-823-1229 HYPERLINK "mailto:russee4@msn-com"russee4@msn-com

20039

PolyMet Mining Comment Thursday Feb 27th 2014 1) Will you require the corporate partners of PolyMet in the mining company (Glencore Xstrata) be required to sign the permit and share in the mines potential future liabilities. 2) Will any liabilities be attached to future purchasers of those companies. The issue here is that at no point should the state and the taxpayers be left holding the bag for environmental cleanup. 3) The permit should only be let out to a company that can prove through past mine site demonstration that they can mine without damaging the environment. Thanks - Russ Erickson 3915 Grand Ave South Minneapolis MN 55409 612-823-1229 HYPERLINK "mailto:russee4@msn-com"russee4@msn-com

Russ Erickson 20040

PolyMet Mining Comment Thursday Feb 27th 2014 1) List and detail the forecast costs of all the environmental clean-up issues 500 years into the future. 2) List the enforcement methods - fines – fees – legal expenses - executive jail terms for failure and list the moneys escrowed by the mining company to be set aside to meet these expenses. I work for an environmental services firm. If we were to be found at cause for a pollution event there are specified fines and jail terms in place. No less should be required as a compulsory prerequisite to doing business in Minnesota. Thanks - Russ Erickson 3915 Grand Ave South Minneapolis MN 55409 612-823-1229 HYPERLINK "mailto:russee4@msn-com"russee4@msn-com

20041

PolyMet Mining Comment Thursday Feb 27th 2014 1) Will the wetlands be replaced. 2) Will the moose and other wild life endangered by the loss of their habitat be relocated. 3) Will the quality of the land swap be of equal value. 4) Will the peat lands be moved and reestablished as it takes thousands of years to develop them. 5) Will the mine pits be filled in after completion of the mining to restore the landscape. 6) Have the lands involved in the land swap been established and judged to be of comparable quality. 7) Will they add to the area adjacent to the superior National ForeSt Thanks - Russ Erickson 3915 Grand Ave South Minneapolis MN 55409 612-823-1229 HYPERLINK "mailto:russee4@msn-com"russee4@msn-com

20042

PolyMet Mining Comment Thursday Feb 27th 2014 1) Will the bedrock underneath the tailings locations be studied for cracks and fissures. Will the cracks and fissures be grouted. 2) Will all the acidic waters coming off the tailings piles be captured and run through the RO process for the full 500 year projection of pollution contamination (not just 200 years). Will the mine be required to fund this operations cost of the ground water cleanup and pumping of 10's of millions of gallons a year through Reverse Osmosis filtration for 500 years in advance of the permit being issued. 3) Will the mine be responsible for 100 year overtopping rain events. 4) Will the state code that requires the mine to be left maintenance free at mine closure be upheld. This is a potentially negative economic issue that in the long run will outweigh any short near term jobs and economic issues. Thanks - Russ Erickson 3915 Grand Ave South Minneapolis MN 55409 612-823-1229 HYPERLINK "mailto:russee4@msn-com"russee4@msn-com

2151 Folwell Avenue Saint Paul, MN 55108 January 28, 2014 Tim Dabney US Forest Service, Superior National Forest 8901 Grand Ave. Place Duluth, MN 55808
Dear Mr. Dabney: We are writing to express our concern about the possibility of sulfide mining in northern Minnesota and particularly the draft environmental impact statement that is now open for comment. We have been going to the BWCA since 1961—first by ourselves, then with our children, and now our children are taking our grandchildren. Our love for the BWCA has led to our purchasing a cabin on Burntside Lake. We feel we have made and are continuing to make significant contributions to the economy of the Arrowhead. Here are four of our concerns: 1. We Minnesotans are not used to hard rock mining, and many of us do not appreciate how harmful the sulfuric acid from the tailings will be. We need to recognize the fact that grinding the rock into small particles increases the surface area exposed to water. For example, rock 100 meters on a side, when ground to the size of baby powder (10 micrometers) will have increased its surface area by a factor of 10 million. We have already seen this in "mine slime," in our taconite mines, but it does not leach acid. Slime from the proposed mine would leach sulfuric acid. The acid will be spread to places where it will do damage by the water that is already flowing through the existing tailings basin. 2. The number of new jobs that is projected is actually small compared to the number of existing mine jobs in the Arrowhead. 3. The short term effects will include excessive noise from drilling and blasting. 4. The profits will go to people outside Minnesota, and probably in other countries. The profits from tourism remain in the community. We hope you will take these facts into account as you evaluate the EIS. Sincerely, Cynthia A. Hobbie Russell K. Hobbie

Russell Knuti Jr. 9534

Please accept my letter of approval of the draft EIS for the Polymet project. Thank you for your time. Rusty Knuti.

Russell Martinez 54228

It has come to my attention that the SDEIS made are wrong. PolyMet re-drew the maps. They have left out half of the one hundred mile swamp. That leaves the BWCA completely unprotected from the acid mine drainage. Governor Dayton needs to address the MN DNR to do their job and tell PolyMet to provide a correct environmental impact statement that has financial information, has the correct geography in maps, has correct hydrology studies. I would like the maps in the SDEIS (Supplemental Draft Environment Impact Statement) to be corrected. Measure the percolation rate through the swamp. Sincerely, Russell Martinez 286 Winifred St. Paul, MN 55107

Russell Palma 58134

As a scientist I am both appalled and incredulous that this project is even being considered. The potential impact on future generations is incalculable. It is ludicrous to think that any company can plan for hundreds of years of remediation, or that they have the financial wherewithal to cover all contingencies. Polymet is most likely to follow a well-worn path of extraction and abandonment as evidenced by Superfund sites all across the western US. I sympathize with the need for jobs in northern MN, but there must be some line in the sand where the cost to the earth and future generations is simply too great to justify the risk. The state could better allocate its resources by using the money it would spend to protect ground water for hundreds of years by using it to retrain miners and other Minnesotans for jobs of the future, rather than the extractive past.

Ruth B Agar 57926

Do NOT do any copper mining near MN lakes. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Ruth Bartling 4300 W River Parkway #341 Minneapolis, MN 55406

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Ruth Gedge 40312

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Ruth Gedge Bretton Peterborough, ot PE3 GB

In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

The quality and short term gain of jobs does not balance the long term destruction of water, land, habitat and quality of life. Many of Polymet's statistics & data are questionable as to accuracy. Please do not allow this! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

I fully support the PolyMet project. The extensive regulations and controls they must go through provide a reasonable assurance that environmental impacts will be kept to a minimum. I plan to be at the public meeting in St Paul on January 28 in support of the project. _____ Ryan Birkenholz, P.E. | Sr. Project Engineer | Golder Associates Inc. 1751 West County Road B, Suite 105, Roseville, Minnesota, USA 55113 T: +1 (651) 697-9737 | IP Phone Ext. 69501 | D: (651) 697-9737 | F: +1 (651) 697-9735 | C: +1 | E: [HYPERLINK "mailto:Ryan_Birkenholz@golder-com"](mailto:Ryan_Birkenholz@golder-com) | [HYPERLINK "mailto:rbirkenholz@golder-com"](mailto:rbirkenholz@golder-com) | [HYPERLINK "http://www.golder-com/"](http://www.golder-com/) www.golder-com This email transmission is confidential and may contain proprietary information for the exclusive use of the intended recipient. Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Ryan Bradley 13 Laurel Hill Rd Unit B Greenbelt, MD 20770 US

Dear, Lisa Fay, EID project Manager and staff For the last four summers I had the privilege to work as a canoe guide and outfitter in the Boundary Waters. The outfitter and resort where I worked was located on Birch Lake outside of Ely. Birch Lake and the surrounding area is currently being explored for future development of non ferrous mineral resources by Twin Metals. River Point Resort and Outfitting where i worked in located only a few minkes from both the Spruce Road deposit and the Birch Lake deposit, given this proximity hive experienced first had the effects of exploratory drilling let alone an actual mine are already having on the surrounding environment and the federally protected wilderness. One of the most nocitable side affects of the drilling is the excessive noise pollution. Particularly in the winter when sound travels much further. One of the issues with the current NorthMet SDEIS that i've recognized is the inaccuracy of the projected levels of noise pollution and the GIS models used to estimate them. I have a bachelors degree in geography and several years of experience using GIS systems and while examining the SDEIS i noticed the metopes used were not adequate and didn't factor in the changes in winter. I would also recomend using more accurate data on the actual nose levels themselves as the ones used are simply not realistic in my experience with Twin Metals. The amount of noise generated and how it affects wildlife should also be looked at closer. One of the other weakness in this document is the protection against catastrophic environmental events. As the climate changed the frequency of the 100 year and 500 year storm events will increase resulting in much for intense precipitation events in the area. The SDEIS does not adequately project the possible damage and risk of a spill, leak, or overflow from containment ponds. The mine must be designed to withstand at least a 1,000 year rain event without risking pollution. The DEIS does not adequately factor in the long term affects of climate change. Sincerely, Ryan Alger 2805 Thomas Ave APT F. Eau Claire, WI, 54703

Primary Messages •I support PolyMet Mining and believe they will build and operate a mine that complies with all regulations and protects the environment. •I trust the multiple State and Federal Agencies involved in preparing the document. •This SDEIS demonstrates that PolyMet can develop this resource in a sustainable manner and there are logical, engineered solutions proposed for potential impacts. Economic Impact and Jobs •PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our mining economy. •PolyMet will contribute to the local and state economy at a time when we really need the jobs and economic benefit. •PolyMet can produce these metals in an environmentally sound manner and create hundreds of jobs that can support families and sustain communities. •Enough is enough; let's get on with permitting this mine. We want jobs. •PolyMet will provide millions of dollars in local and state taxes to support our communities and educational system. Ryan Gaffke 124 Amund Dr Proctor, Minnesota 55810 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

Ryan Heule

To whom it concerns, With the Duluth Complex formation being this large, it will be mined sooner or later and the area could use the economic impact. My questions/comments are mainly to do with reclamation and waist water since I live down stream in the watershed. After this project does go end of life who will be responsible to post shutdown monitoring of the tailings basin and pit water in the event Northmet is no longer around. Does the financial assurance take into account inflation in the event this mine operates beyond its 20 year life. I just want to make sure there is enough funding to do the reclamation of the site and enough funding in the event of an unexpected major environmental disaster to do the environmental clean up. From what I have read and the presentations that I have seen put on by SME I feel this project will be positive addition to Northeast Minnesota. Ryan

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Ryan Hunter 27 Mill Ave Whitefish, MT 59937

Ryan L. Burke 43968

Dear Lisa Fay, I am writing you today to ask that this proposal be rejected on the grounds that it puts all Minnesotans at risk. We have never had mining like this in our state and there is an exceptional amount of evidence that it will cause irreversible environmental degradation. The people of Minnesota need sustainable investments that will bring us ahead, and not destroy our water systems and the Northern economy. These companies do not have the state's best interest, nor do they plan on making long-term investments in our people. Please reject this mine and the many other proposals that will come. Minnesotans deserve better. cheers, Ryan Burke 2329 Pillsbury Street, Saint Paul, MN 55104 University of St Thomas, MN Class of 2016 605-929-4438 Students for Justice and Peace Leadership Board Green Team E-Board Student Assistant OSF Library Peace - Pax - Paz - Lapè - ?????? - ????? - Paix - ??;?? - Vrede - ????? - Pace

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I would like to comment on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I do not believe that the possible contamination of Lake Superior, and hence the entire Great Lakes waterway, and the Boundary Waters Canoe Area Wilderness is worth the minerals gained via mining in these areas. I am greatly concerned about this project's potential impact on this region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Ryan Mc Bride 62405 County Road 7 Elkhart, IN 46517-8950 (574) 862-1389

Ryan Patron 41994

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ryan Patron Baxter, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Ryan Sbol 2009 E 86th st Bloomington, MN 55425

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

To whom it may concern, There are many aspects of this proposed mine project I find of concern. But there is one that is overwhelming importance and that is the discrepancy in the mapping supplied by Polymet. The map the Polymet mine people have offered in their paperwork doesn't encompass the entirety of the 100 Mile Swamp as is indicated on government maps. I believe this is an intentional misrepresentation by Polymet of the SCALE and NATURE of the 100 Mile Swamp which encompasses wetlands and ephemeral wetlands. This mapping discrepancy should have been one of the first things on which the Minnesota Department of Natural Resources demanded clarification from the Polymet organization in the early years of development of the EIS. To add to this issue of what surface waters are contested as being potentially subject to pollution, the hydrology of the area is not well understood other than in the vaguest practicable terms. There is also no sign Polymet intends to add hydrology protections to its management of the site by drilling test wells to test for seepage at set distances from the site. Once pollutants like sulphuric acid begin to slowly seep into the 100 Mile Swamp, the ecological security of the nearby Great Lakes is no longer. At that point, we can only recognize that they should be renamed the Great Leaks. The nature of the Great Lakes fishery will change for aeons and the use of the Great Lakes as a source of fresh, potable water will be compromised for two countries if the impossible nature of the reality of a 500-year remediation plan is ignored. There are several unique environmental threats posed by this copper/ nickel mine that do not seem to be addressed in the EIS. The mine itself is a threat not only to Minnesota bodies of water but potentially to international waters, ie, the Great Lakes. Despite all their planning and promises of extreme measures, contaminated wastewater treatment lagoons may overflow or may crack over time as has happened w/countless cement lagoons of similar design. Many CAFOs have experienced leaching of animal waste into aquifers once there is deterioration of their manure lagoons. Chemical contamination lagoons in such an ecologically sensitive area w/such a high water table would be subject to extreme of temperatures from the freezing and thawing and I cannot imagine these lagoons would hold up over a 500-year remediation period. There is no reality in this EIS to the suggestion this company is intent on allocating financial resources for the expected 500-year remediation period, never mind if they've made any effort to scale up their remediation efforts if there is any leakage over time that begins to infiltrate the Boundary Waters Canoe Area Wilderness. There are significant advance steps which should be taken prior to permitting going forward. Taking into account the discrepancies between what I consider to be the legitimate mapping of the 100 Mile Swamp and the maps redrawn by Polymet, I believe we must conduct baseline hydrology mapping of the 100 Mile Swamp, the Dunka River and other flowage in the Rainy Lake watershed so we have a clear understanding of subterranean water flow and just how quickly we are risking pollution seeping into the Great Lakes. If the hydrology studies show that Polymet is unwilling to TRULY PROTECT the Rainy Lake watershed and the Great Lakes by drilling test wells for pollution tracking and is otherwise unprepared to handle subterranean pollution, then the permitting process should be reconsidered. There has never been a company whose environmental responsibilities have outlasted the company for the length of time required by the remediation of the amount of tailings produced by this mine. Considering this mine site will be an environmental threat that has to be overseen for a 500-year remediation period, we have not considered what that means legally in terms of entailing this company and any other company that subsequently purchases the Polymet compa

Dear State Representatives, Committee Members, and Civil Servants— Thank you, for your considered thinking regarding Minnesota's resources and the sustained well being of Minnesota's children and grandchildren. I find the balanced, reasoned, respectful document below, truly expresses my thinking. I appreciate the time you give to reading my thoughts. Duluth-Superior Friends Minute on Copper-Nickel Mining in Northern Minnesota As Quakers, we are called to live simply, to care for the creation, and to husband resources. In light of that calling, we have been concerned to understand the implications of copper-nickel mining proposed for northern Minnesota by PolyMet, Twin Metals, and other corporations. Our research leaves us deeply troubled. Traditional mining in this state has been very different from the copper-nickel mining now proposed. Iron ore deposits in northern Minnesota were so rich that originally iron was, essentially, just scooped out of the ground; the copper-nickel deposit, by comparison, is exceptionally poor. About 99% of the rock from which the metals must be extracted would be waste, and much of it would have to be ground to the consistency of powder. This waste rock bears sulfide. Sulfide-bearing rock exposed to air and water yields sulfuric acid, producing forms of pollution (including mercury, arsenic, lead, and other toxins) that, according to PolyMet's own documents, will last at least 500 years. Proponents of copper-nickel mining argue that our current way of life demands these metals, that opening these mines will provide high-paying jobs, and that new tech-nology will prevent pollution. All of these claims weaken drastically when scrutinized. Yes, our current way of life requires copper; however, since copper scrap already provides half of US annual demand for that metal and the US provides 23% of the world supply of recovered copper, recycling holds tremendous potential for fulfilling most of this nation's needs. Given the devastation that copper-nickel mining commonly leaves in its wake, we are also led to question the wisdom of our current way of life. The argument that copper-nickel mining will boost the regional economy seems a half-truth at beSt Typically, mining companies import their expertise from elsewhere; only half the jobs promised by the mining companies are apt to go to local residents; the highest-paid positions will be taken by outsiders, who will leave the area once the mine has been exploited. Mines are also subject to shutdowns when market prices drop. The metals extracted from these mines will likely be exported; the profits will go to share-holders around the world rather than the residents of northern Minnesota. History predicts that once these mines are exhausted, their owners will declare bankruptcy and absolve themselves of responsibility for damage left behind. The argument that new technology will prevent pollution is little more than wishful thinking. Sooner or later, copper-nickel waste rock creates acid mine drainage, which often eats its way to ground water. New technology remains experimental, untested on an industrial scale, while exploratory drill sites in northern Minnesota are already leaking acid. Even if technology can be developed to treat copper-nickel pollution effectively, who will pay for, operate, and maintain this technology twenty-four hours a day, day after day for 500 years or more. Corporations come and go; so do governments. We understand the hunger for jobs in northern Minnesota, though people have lived here for thousands of years without depending on paychecks from multinational corporations. Over the past two decades, while the mining workforce shrank, the economy diversified and grew less vulnerable to the boom-and-bust cycle of the mining industry. We support continued diversification. We support selective, sustainable-yield logging and the development of value-added forest products. We s

Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Sally Fineday 28890 Connection Drive SE Pennington, MN 56663

18513

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. PolyMet is aware of local environmental concerns, and is taking state of the art precautions to assure that these concerns are satisfied. The contribution to state and local economies will be substantial. Sincerely, David D. Furness

Sally Munger

18132

Good evening. I'm not standing here to speak as a technical expert on the SDEIS. There are many people who have spoken on that tonight, but I'm speaking as a person who is very concerned about what we have when the copper-nickel mining comes to Northeastern Minnesota. I'm the proud daughter-in-law of Willard Munger, the long-time chair of the House Natural Resources and Environment Committee who is largely responsible for the strong environmental regulations we have in place in Minnesota today. I wish Willard were here tonight to lend his voice in opposition to this proposal. Why do I say that? Willard knew that clean water is the key to life and fought his whole legislative career to keep our waters safe and clean. More and more, we are seeing how precious a resource clean water is as areas of our country and around the world experience water shortages. Why would we want to take a chance on this process when we are in a water-rich area and the report itself says that remediation will be needed or could be needed for 500 years. That alone makes no sense. Add to that that copper-nickel mining has never been done anywhere without significant environmental damage. Let me say that again. Copper-nickel mining has never been done anywhere without significant environmental damage. The immediate response to that has always been, "That was using old technology. We have something new." Now, that new thing is reverse osmosis. Before we take one step to do this, I ask that it be proven that this process will work on the scale that will be needed. In other words, prove it first. I understand that jobs are needed on the Iron Range. Are the jobs that will be created livable-wage jobs, and how long will they really last? Is this really the answer? I've heard it said that the NIMBY principle, not in my backyard, is coming into play here. I am glad people are saying not in my backyard. This is everyone's backyard, and we are right to want to keep it safe and pristine. In my family of origin, we had a saying. If you have to ask the question, you already know the answer. The answer in this case -- is that Northeastern Minnesota is not the place to do this type of mining.

To: Lisa Fay, EIS Project Manager, MDNR Division of Ecological and Water Resources I am against copper sulfide mining in northern Minnesota and believe your SDEIS does not sufficiently deal with extremely concerning issues to me and many other concerned organizations. I am a Duluth and Ely resident. My family has lived in both places for generations. I have also recently experienced 3-5 years of unemployment by my husband, so know well the difficulty in living in a region that provides little economic opportunity. However, despite my desire for well-paying jobs here, I am smarter than to be seduced into the clutches of this slick Polymet project public relations campaign and resulting incomplete SDEIS for the greedy gain of a few dozen unsustainable jobs. The SDEIS provides no detailed definition of what financial assurance funds will be placed in trust to ensure that water flowing from the waste piles and tailings ponds will be treated and maintained for the required hundreds of years, and that contamination episodes can be cleaned up in the highly predictable event that the company goes out of business soon after closure. The hydrologic model for the water moving through the mining and processing site dramatically underestimates the volume of water passing through, and the rate it moves across and under the waste containment sites. Thus, this crucial predictive tool greatly understates the risk of significant acid rock drainage impacts to surrounding wetlands, groundwater, the Partridge and St Louis Rivers, and ultimately Lake Superior. Please don't leave these serious report deficiencies to be resolved "later." Don't make residents, taxpayers and other agencies responsible for dealing with negative water impacts down the road from this project. This revised version of the project has not been improved enough to assure that the mine's waste and the laws and variables of nature can now be managed so as to avoid major pollution for the indefinite future, beyond a time when our present regulatory systems may even be functioning. All the states which have already suffered acid mine drainage from sulfide mines have underestimated the pollution that would be generated and have grossly inadequate funds escrowed for this task. Polymet has not convincingly demonstrated their ability to operate and close this mine without saddling Minnesota taxpayers with extraordinary cleanup costs and northeastern Minnesota citizens with harm to our water resources and risk of negative impacts on our health. Unlike ferrous mining, Polymet's open pit sulfide mine operation has significantly greater potential to pose human health risks through contamination of drinking water and fish, seriously degrade the St Louis River, destroy wild rice and irreplaceable wetland habitat, and harm the lake that holds the world's fresh water. The fact that our Minnesota DNR is even considering putting at risk our 10% of the world's fresh water for short-term economic gain is sad and shameful. If this project is approved and built, I will seriously consider leaving Minnesota - that's how betrayed I will feel living in my beautiful state and northwoods home for allowing such a devastating event to happen here. Sincerely, Sally Rauschenfels 1026 S. Lake Ave Duluth MN 55802

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404 " Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation " wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect " wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

To Whom it May Concern I am writing to express my concerns over the proposed Northmet mining project for Northern Minnesota. I disagree with how the current (Supplemental) Draft EIS disregards the concerns of the Fond du Lac and Grand Portage Tribal Governments, the 1854 Treaty Authority, and the Great Lakes Indian Fish and Wildlife Commission. I also believe the some of the maps in the draft are incorrect. Specifically, the map of the One Hundred Mile Swamp. I do believe that runoff from the project will enter the BWCAW and impact our waterways and wilderness areas in Minnesota. The maps are not correct and therefore the environmental impact statement is inadequate until the maps are corrected to show the real details of the area. Please consider the facts and inconsistencies of the proposed project and deny permits. Protect our land, waterways, wildlife and recreational opportunities .and importantly, our need for clean drinking water. Respectfully, Sam DiVita 2063 Ames Ave Saint Paul, MN 55119

From: samjodi@runestone-net [samjodi@runestone-net] Sent: Monday, March 10, 2014 5:43 PM To: Fay, Lisa (DNR)
Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Sam Ilstrup 12352 175th St Barrett, MN 56311-1167

To whom it is of concern: I wish to register my opposition to the copper-nickel mining as proposed. Since this involves sulfide rich ore and the best of projections indicate that this type of mining cannot be done without long-term risk to groundwater contamination, I believe the plan to do such mining at key headwater sources is impractical and ill-conceived. I have seen the effects of other types of mining in the mountains of Colorado where discharge from the mines runs a poisonous orange and in Kentucky where coal mining has poisoned water. Since this state so heavily relies upon water and is a source of the Mississippi, I urge the rejection of plans for this mining. Sam F. Johnson 1504 Parmeadow Drive Northfield, MN 55057

To whom it may concern: After attempting to read the PolyMet EIS and faltering after only a few pages, I realized that I didn't need to continue for one simple reason. If 2200 pages are required to explain exactly how this project can be safely implemented, then there must be tremendous potential for negative outcomes. The simple solution is to prevent any of those outcomes by stopping the project before it starts. Let me pose a hypothetical: If you purchased a toy for your children and it came with a 2200 page manual describing exactly how your children should use it to prevent injury, would that be encouraging. Probably not. You'd probably assume, as I have done with the PolyMet mining project, that the only reason such assurances are needed is that the product is inherently dangerous. Assuming that my hypothetical isn't convincing, look west to Holden Village to see the legacy a copper mine can leave. That mine has left a scar on the face of one of the most pristine and beautiful wilderness areas in the world. Let's not allow PolyMet to do the same thing to our wilderness areas. Thank you for your time. Sam Steinberg Prior Lake High School Science Teacher

Dear Ms Fay, Dear Ms Fay and Mr Bruner, I am writing to you as a future landowner in an area that is likely to be negatively altered by the proposed PolyMet sulfide mining site. My family owns a summer camp for children with special needs, and it is located on land between Ely and Isabella, MN. Someday, I will be co-owner of this land, and I look forward to being able to continue the tradition of helping children to understand and appreciate the Great North Woods. I am deeply concerned that PolyMet, a company that has never before operated a mine, will not be able to follow through on their claims to not pollute, and that it will be my generation that has to pay the price – in superfund taxes, and by losing priceless wilderness. I know that jobs have to be created, but I would prefer to see efforts channeled towards lasting jobs, not positions that will be cut as soon as the mine is either shut down or done providing copper. This copper, incidentally, will be sold to China instead of used in the United States, which I also object to. PolyMet's Supplemental Draft Environmental Impact Statement talks about using 'reverse osmosis' on the water to keep pollutants from leaching into the aquifer and the Lake Superior Basin, but the science isn't sound. Even if reverse osmosis did work, 99% of what the mine is going to produce will be waste products. Is that 1% of copper-nickel needed so badly that we can afford to overlook the potential damage that could be done to more than 8,260 acres of St Louis River watershed. Open-pit mining like this has been done in more arid climates, and pollutants have still found their way into water. That threat will only be more potent in our water-rich environment. As a future landowner, I have been following this issue with interest, and have been wading through PolyMet's smokescreens of misinformation to get to the scientific facts at the heart of this proposal. I would like to request that action be taken against the PolyMet plan, in the form of postponement until a better plan can be developed that captures and controls runoff pollution from the mine. I would also like the plan to address the care of workers, as PolyMet's financial backers have a history of human rights violations. Sincerely, Samantha C. Bauer Samantha Bauer 6406 Bear Lane Duluth, MN 55803

Dear Ms. Lisa Fay, EIS Project Manager I think that this mining project is a good idea. There are many reasons why I support this project. First of all, I think that we all use products everyday that we wouldn't have if these metals weren't made available. I think that the project proposer is going to be responsible and minimize the effects of water pollution and air pollution. For example, PolyMet has come up with air filters that can help filter during rock crushing and processing. They are also going to use energy efficient equipment and processes. To minimize water pollution they propose to have liner systems to prevent chemical from seeping into the ground. They will have groundwater containment systems to help control the wastewater. The project proposer will also minimize the effect on the animals too. PolyMet will use old mining sites to plant new vegetation on. They will keep the invasive species under control in these areas. They will also put back some nutrients in the soil that are needed for the land to have growth again. Polymet will have to remove some wetlands, but they will be replacing them elsewhere. They will try to work around them the best that they can. To conclude, I hope that you will take some of these reasons into account. I think that that plan is good and I think that we could really benefit from this. From, Samantha Henderson, 8th grade student at Southwest Junior High

Samantha Henningson

47706

Hello, I am getting this in under the wire, and for that I apologize. This mining proposal should not go forward I understand there are jobs at stake, and that the minerals being mined are in demand. But these are short term considerations. The landscape and waters of Minnesota are forever, and I do not believe for one minute that PolyMet will pay to remedy problems that this is created - in either the short, or more importantly, long term. Thank you for your consideration. Samantha Henningson 1235 Lafond Avenue St Paul MN 55104

Samantha Urbanski

41842

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Samantha Urbanski Wheaton, Minnesota

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Sami Dix Savage, Minnesota

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I know all my spiritual friends keep talking that we are due to enter a golden age, but all I can think is it must be something that is going to happen after a mass extinction, and the planet is terraformed. Fracking around the new madrid fault, coal waste, and now this. The Koch brothers already have a coal waste mountain right over us south of Chicago. You guys have all the power, and your main focus is how to keep the corporate money flowing in. I sign a gazillion petitions, and it seems everyday your trying to do something else awful. I pray to God that he must know what is happening here, and all I can do is keep pleading/yelling at you guys to stop them from destroying the planet. I remember in the Bush admin. they were saying Jesus was coming back soon, so it didn't matter what they did, because God was going to wave a magic wand and make everything better. Of course there is the concept of tribulation, but they think they're going to be pulled up into heaven, and escape from all this hell they are creating on earth. To the rational mind this is insanity, and I find it hard to disagree. Doesn't God want us to try and keep from destroying the earth. Are you going to bet the future our children and grandchildren will have to deal with, on what many would consider infantile obsessions with power and money. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Samuel Crook 930 Erie Ave Logansport, IN 46947-3514

Samuel Welle 38792

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Samuel Welle 5325 13th Ave S Minneapolis, MN 55417-1842

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, The very thought that we would take a "chance" on polluting our presteen northland for jobs that will last less twenty years over pollution that could last over five hundred years totally baffles me. What is more important to all living beings than our water supply. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Sandra Carr 4207 236th St SW E302 Mountlake Terrace, WA 98043 US

Dear Federal and State Agency Leaders: In 2010, the U.S. Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory. The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Sandra Lien 629 5th Ave S Hopkins, MN 55343-7711

Reading the facts on the Copper/Nickel Mining seem to me to leave little room for debate. A. No example of a Copper/Nickle mine that has not contaminated water. B. Sulfuric acid produced with negative effects on soil and plants. C. Never before tried in MN. D. Mine Co. leaves the mess to the local community. Reading on I note this Co. has never operated a mine before; it is not an American Co. and the parent Co. has a record of tax evasion and numerous fatalities. It is ridiculous to mine in the Superior National Forest a location set aside for wildlife, and for generations to come as a area of beauty and nature for all to enjoy. There is not one positive reason to want this mine in MN. How is it possible to contaminate water, air, land and negatively impact wildlife areas in return for 350 jobs and 20 yrs of production. This then requiring a 200 to 500 year clean up, if cleanup is even possible. Water, Land, Nature are the three most important qualities that any state has, to ruin them would leave the next generations a state with problems much more serious than jobs. Without clean water and food tradition is negated. Please consider Common Sense ahead of Greed and keep Minnesota a state where future generations can live in peace with nature. Sandra Reuther, past president, LWV Brainerd Lakes Area 29790 Lake shore Dr Breezy Point, MN 56472

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Ms Fay, As a science teacher I am contacting you to plead that you stand up for our fresh water, forests, and American Indians of Minnesota. There is so much to lose with this project.. Why would we risk having anything happen to our Superior Nat'l forest and fresh water supply. We have a national treasure ~~ are we willing to gamble with it.. What if we lose and there is an accident. There are several reasons to say no to this proposed land swap. Why would we want to swap out high quality land for lower quality lands scattered around. What is the benefit for Minnesota. There is NONE. Why would we allow ANY corporation with a notorious environmental record anywhere near Minnesota water. Again . What is the benefit for Minnesota. There is NONE. Will you be able to sleep at night when an accident happens. Do the right thing Stand up for Minnesota and say NO to Polymet. The short term jobs aren't worth it. Don't sell out the state for the rest of us. Do what's right for Minnesota. Sandy Loney Science Teacher Brainerd Minnesota

Why would we risk having anything happen to our Superior Nat'l forest and fresh water supply. We have a national treasure ~ are we willing to gamble with it.. What if we lose and there is an accident. There are several reasons to say no to this proposed land swap. Why would we want to swap out high quality land for lower quality lands scattered around. What is the benefit for Minnesota. There is NONE. Why would we allow ANY corporation with a notorious environmental record anywhere near our Minnesota forests and water. Again . What is the benefit for Minnesota. There is NONE. Will you be able to sleep at night when an accident happens. Do the right thing Stand up for Minnesota and say NO to Polymet. The short term jobs aren't worth it. Don't sell out the state for the rest of us. Do what's right for Minnesota. Sandy Loney Science Teacher Brainerd Minnesota

51072

Dear Mr Dabney, Mr Bruner and Ms Fay: As a science teacher I am writing to ask that you reject the PolyMet sulfide mine project. I am asking that you reject the land exchange. No way should mining waste be happening near our national treasure ~ clean fresh water. That would be very short sighted thinking on everybody's part. PolyMet's main investor is known around the world for being a major polluter. Why would we risk doing business with this company. Are you really willing to risk our water. Will you be able to sleep at night if/when an accident occurs. Please say no to this ludicrous idea. Thank you in advance. Sandy Loney Science Teacher Sincerely
Sandy Loney 5730 Birchdale Road Brainerd, MN 56401 2184546678

Sandy Lucas 40987

Mar 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Sandy Lucas 1315 Bayard Ave Saint Paul, MN 55116-1641 (651) 895-4502

Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuri

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The matter isn't "if" the water will be polluted, but "when" it will be polluted. With moose deriving not just water but also food from the waterways around the NorthMet project, moose will be negatively affected by this mine. To date, there hasn't been one sulfide mine or open-pit mine that hasn't polluted the waterways. Such as the Dober mine that has killed off all aquatic life in a 7 mile stretch of the Iron River and the 10 mile stretch of the Brule River. A study done on open-pit mining practices, while all projects reviewed stated that it wouldn't pollute, over 76% of the time it did. Along with that, 89% of these mines polluted when it was stated that it was "completely safe". This has caused entire ecosystem to be destroyed in the states of Montana, New Mexico, and Nevada due to the sulfide mining contamination of thousands of waterways. Also, when these mines contaminate, it is up to the taxpayers to fend for the tens-of-millions-of-dollars bill because some of the mining companies filed for bankruptcy. This mining practice is too dangerous for Minnesota and definitely too dangerous for northeastern Minnesota. Tourists bring \$1-6 billion in revenue per year in the arrowhead region. They travel from around the world to fish and camp in the pristine waters of the Boundary Waters Canoe Area Wilderness. What's going to happen to that revenue when the fish are killed off and the waterways are too toxic to swim or even camp nearby. That \$1-6 billion is going to go to a place where the state proves that it cares about the environment. Sincerely, Ms Sandy Stoffel 7655 Saint Croix Trl S Hastings, MN 55033-9494

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Sanford Taly 5645 Star Cir Excelsior, MN 55331-8403

To Whom It May Concern, I respectfully submit the following comments on the PolyMet mining proposal in northeastern Minnesota: I question the accuracy of the modeling used to predict the impact of the project on both ground and surface water quality and quantity due to data limitations. More data is needed to make an accurate assessment of potential impacts in these areas. I strongly question the conclusion of the SDEIS on potential sulfate and mercury pollution impacts to water resources within and near the project area. Interactions among these water quality constituents are complex and many questions remain about the necessary rules and enforcement required to adequately ensure protection and nondegradation. Finally, on a broader, more holistic level, I believe we must take a precautionary stance on a project of this nature and magnitude. If a true Cost Benefit Analysis was conducted, would 20 years of extraction and a few hundred short term jobs outweigh the cost of (at least) 500 years of pollution clean up and health impacts of which we can not know. Thank you for the opportunity to comment, Laurie Sovell 240 W George St Saint Paul, MN 55107

Sara Anderson 57254

Like in the past, mines similar to the proposed Polymet, have contaminated the earth, environment, water and presumably people and creatures [ILLEGIBLE] near the mines and along waterways connected or within proximity. What effects does this have on human and animal life, since NO testing has been conducted on cancers, illnesses, water pollution linked to human/animal life indirect correlation to the proposed mine? Sara Anderson 1801 Superior St Duluth, MN 55812

Sara Bible 41967

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Sara Bible 3014 Brunswick Ave S Saint Louis Park, MN 55416-2046

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, sara bocklund marine, Minnesota

Sara Brice 44540

The resources aren't going away, they are safely stockpiled for the future when their worth will be exponential. Leave it there. Sara Brice 702 Aldrich Dr Northfield MN 55057

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Years ago, I went on an extended canoe trip in the Boundary Waters Canoe Area Wilderness. It was a wonderful experience, and I had never before seen such a pristine, beautiful wilderness environment. Sulfide mining, and any other kind of mining, simply should not be allowed in or near this beautiful area, or anywhere near Lake Superior and its headwaters. The risks to the environment, wildlife, and public health are too great to allow any kind of mining. Thank you for your attention to and serious consideration of my concerns regarding this critically important matter. Sincerely, Sara Darby 100 Park Ln Apt 212 Contoocook, NH 03229-3139 (603) 746-1217

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Sara Haase 2264 320th St E. Northfield, MN 55057

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I am gravely concerned about the long-term impact of Sulfide mining outside of the BWCA. I would like to know exactly how you plan to hold PolyMet accountable financially for a 500 year window of time, for any adverse environmental impacts from sulfide ore mining in the proposed area. There is no record of any company staying intact for that kind of time horizon. What evidence do you have that they have the commitment or the financial reserves to back-up their promises for this extended period of time. This in my mind is a delusional premise to believe they can actually deliver on this kind of time horizon, or even that they have any genuine intention to do so. So how do you 'trust, but verify' on this kind of proposal. As well, what level of pollution are you going to deem 'acceptable,' in terms of runoff into adjacent rivers and lakes. What impact will that run-off have on fish, birds, wild rice, and wildlife in the region. How large of an area will the mining impact. What protections will be put in place to ensure that heavy metal contamination does not occur in the watershed surrounding the mining site. What level of ongoing monitoring will the DNR and EPA have. What regulatory teeth will you have to hold PolyMet accountable. Unfortunately, the national and state trends have been to 'relax' environmental regulations, in favor of promoting a business- friendly environment. So, tell me, who will make sure we do not end-up with a 500 year window of unregulated pollution from this proposed mine. I would like to know who will sign their name to that pledge and back it up with the best environmental monitoring available now and in the future. Please do not sell out this region to the highest bidder with the best sales pitch. Thank you, Sara Harrison I The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Sara Harrison 4536 Aldrich Ave S Minneapolis, MN 55419-4840 (612) 827-8018

57993

We cannot afford to accept monitoring & clean-up of 500 years of water quality, protection, post-PolyMet mining! Water is life period! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Sara Hill

39474

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As you revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Proper site management should be part of the cost of business, not a cost to taxpayers in Minnesota. Jobs are not a profit to Minnesota if Minnesota needs to pay any site maintenance or clean up. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Sara Hill 1198 James Ave Saint Paul, MN 55105-2919

Sara Mairs

43851

Hi, My name is Sara Mairs and I have lived in Minnesota most of my life. I spent my formative years paddling the pristine waters of the BWCAW with YMCA Camp Widjiwagan. I continue to travel every year to Ely with my family to paddle those same waters, and watch the same wonder and magic in my own children as I experienced myself. There are so few pristine wilderness areas left in our country and in the world. Doing anything for short term gain that would put this resource at risk is beyond my comprehension. I STRONGLY oppose copper sulfide mining in northern Minnesota. Beyond the potential contamination of the water of this amazing wilderness area, there is a long history of negligence on the part of mining companies, and I do not trust the integrity of any mining company to follow through on efforts to prevent known and unknown problems from occurring. The only way to ASSURE the health and safety of both the ecosystems and the residents of this area is to NOT mine in the first place. Thank you for listening. Sara Mairs 1407 Arona Street St Paul, MN. 55108

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I made my first canoe trip in the BWCA in 1966 and have made lots of others since then. I am 70 years old and will be returning to canoe and camp in this beautiful wilderness this AutguSt This is a precious area that must be protected for all time so that my grandchildren and others' grandchildren can know wilderness and wild things. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Sara Roberts 5490 Caddis Bnd Apt 204 Fitchburg, WI 53711-7163 (608) 273-1114

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely Sara Roberts 5490 Caddis Bend Apt 204 Fitchburg, WY 53711 608-273-1114

I'm opposed to this mining project. The long-term loss, damage and sacrifice outweighs the short-term benefits. I grew up in Northeastern Minnesota and treasure it. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dmiinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Sara Wright

41984

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Sara Wright Roseville, Minnesota

To whom it may concern, I would like to submit comments proposed PolyMet mining proposal for northern Minnesota. Here are a few of my concerns regarding the proposed mining project and the impacts that it would have on the native environment of Minnesota: 1) There does not seem to be enough information and consensus on the likely impacts of sulfide mining on the environment. In a similar case in Wisconsin, the state decided that they would wait for another mining project to be initiated with no environmental impacts before agreeing to start one. This would be the first sulfide mining project in Minnesota, however other similar projects have all had issues with water contamination. To date, I do not believe there are any cases of sulfide mines that have operated without significant environmental impacts. 2) PolyMet does not seem to have a very clear proposal for dealing with containing waste created as part of the mining process. Sulfide mining leads to lots of waste, such as tailings and run-off. Piling the tailings does not seem to be a practical or aesthetically sound solution. Run-off is going to be incredibly hard to contain, because it can easily seep into the groundwater and then lead to contamination of surrounding ground and surface waters. Thousands of acres of the Boundary Waters watershed would be affected, influencing many people's enjoyment of these native areas, and destroying them for generations to come. 3) PolyMet has promised to be responsible for all clean up necessary due to this mining proposal. However, the lifespan of the project is 20 years, and wastewater and other treatments could take over 500 years. There is no way that PolyMet can agree to and promise to be responsible for that length of time, as it is well over a human lifespan. This would then fall to the state, and future generations would have to pay for clean-up for years. These are only some of the considerations that must be taken into account when reviewing the DEIS. Thank you for your work on this issue, and I hope that we can protect Minnesota's native environment for years to come. Sarah Alexander 681 Birch Lane South Shoreview, MN 55126

Hello, I would like to register a comment about the proposed Polymet Mine in northern Minnesota. I grew up in Minnesota and plan to return in a few years; my roots and family are on the Iron Range and North Shore. I urge you to reject the proposed mine. There is a place, in our government, for encouraging resource extraction and job building - but there is also a place for allowing such opportunities to pass when they would do more damage than good. Some resources are not possible to extract without risking significant, expensive, and long-lasting damage to local economies; as a culture, we do not have a strong record of resisting temptation, and the consequences when we fail are frequently borne by the very people that we imagined would profit. Please consider that when chemical contamination and spills affect water resources in this less-than-wealthy area, and when ecotourism is reduced because of the water contamination and spoiled vistas, and when the mine closes and jobs disappear again, the residents in this region will be worse off than they are now. The mining-town story is common enough to be a cliché: people scrape by on low-paying, dangerous jobs, enduring inevitable chemical spills and pollution, watching the wealth generated by the mine get funneled off to company executives. When the mine is worked out, the jobs disappear and leave these communities worse than before the mine arrived. Regulation, job safety improvements, and promises by Polymet may soothe some worries, but I don't believe we have the rules or the enforcement capacity to solve most of these problems Northern Minnesota needs jobs, but it doesn't need these jobs: please don't make them go through this again. The behavior of other mining companies causes me to doubt that Polymet will really take care of these people and clean up their mess. Please don't trust them to do the right thing - as our state government, it is your job to distrust those that might take advantage of us and our resources. It is rare that a government acts that way, but I believe Minnesota has the potential to break the pattern. Thank you, Sarah Betzler

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Sarah Blum Sarah Blum 4017 14th Avenue S. #10E Minneapolis, MN 55407

Dear MN Department of Natural Resources, I've spent the last several months reading through the Northmet environmental impact statement (EIS) and relevant literature and thinking as critically as I can about whether the project is a good idea for Minnesota. While I understand the arguments on both sides, I've finally come to a conclusion that I stand behind 100%: Moving forward with the PolyMet project (and copper mining in Minnesota in general), would be a terribly misguided and devastating mistake, both environmentally and economically. There are many weaknesses in the scientific and economic analyses for the PolyMet EIS (including inadequate statistical and spatial analyses, failure to address model limitations, poor literature review and vague economic projections). While I did not have the time to write up a thorough assessment of the deficiencies, I introduce a few of them below. I grew up on the Iron Range, about 30 miles away from the proposed PolyMet site. Taconite mining is a core part of my identity. My father and grandfather both spent decades of their lives working for Minntac and Reserve Mining Co., respectively. I completely support safe and manageable modes of mining. Taconite mining put food on the table every day of my childhood and a summer job at Minntac helped me pay for college. I'm very grateful for the opportunities that mining made possible for me, and I want similar opportunities to be available to my niece and nephew and future generations. But sulfide mining, in my estimation, is drastically different from and much more dangerous than taconite mining. I think a 2008 US Fish and Wildlife-commissioned study of mining operations with acid-forming minerals best sums up why moving forward with the PolyMet project would be a foolish and short-sighted decision.

http://www.pebblescience-org/pdfs/Final_Lit_Review_AMD.pdf They studied the environmental impact statements and outcomes of hundreds of sulfide mining operations and found the following: "Based on review of the acid mine drainage literature it is clear that severe world-wide ecological consequences, especially for aquatic resources, have resulted from mining ore deposits with acid-forming minerals. Accurate prediction of the onset and aggressiveness of low-quality acidic water discharge is perilously difficult using the best available science. [Emphasis mine] Multiple complex geochemical, biological and hydrologic factors create a daunting task for mining engineers to profitably recover mineral resources while preventing discharges of metals and acidity to surface and ground water." I know there are many economic challenges in northern Minnesota and I don't have the perfect answer but I think there are other options that can bring numerous, skilled jobs to the Iron Range for the long term and won't threaten to turn the state's freshwater ecosystems into Superfund sites. Instead of mining, one possibility is mineral reuse and recycling. The current percentage of copper supplied by recycled materials is approximately 30%. That percentage is expected to double in the next several decades. In other words, most of the world's copper supply will soon be derived from copper recycling. Why not be forward-thinking and build copper (and other precious metal) recycling facilities in northern Minnesota. These could supply quality jobs for an indefinite amount of time with a drastically reduced level of environmental risk. I implore you to reject the PolyMet EIS. PolyMet has simply failed to establish that its project can adequately mitigate the extensive and well-known risks associated with the mining of ore deposits with acid-forming minerals. Please do not risk adding northern Minnesota to the long list of acid mine drainage disasters. Kind regards, Sarah Reed, Phd University of California – Berkeley Environmental Scientist with specialties in soil science and spatial analysis

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Sarah Hayes 1055 Agate Street St Paul, MN 55117

Reluctantly, I say no to the nickel copper mine. It threatens the wild rice, the water supply for 60,000 people. The jobs today are not worth the risk tomorrow. Residents, taxpayers, and our beautiful environment will suffer if there is contamination. As we saw in the aftermath of the recent spill in Virginia, the company can quickly declare bankruptcy and the cost of cleanup - if cleanup is even possible - will be left to taxpayers. It is not worth the risk. Vote no, please. Sarah Heggestuen

Dear Lisa Fay, I am strongly opposed to the copper, nickel, paladium, and gold mines propped by Twin Metals and Polymet that would be located south and west of Ely, Minnesota. The Boundary Waters Canoe Area Wilderness is America's most visited wilderness area and one of the oldest designated wilderness areas in the nation. Despite what proponents of the copper-nickel mines say, creating new mines within 50 miles of Ely would be extremely detrimental to our local economy. The mines will not only be an eyesore, they will also increase rail and truck traffic, which would negatively affect tourism in the area. The noise from drilling and moving material destroys the wilderness experience on the southern end of the Wilderness area near Spruce Road and Birch Lake. Most importantly, there is no evidence that our most precious resource, the interconnected system of pristine waterways, will adequately be protected. Acid mine drainage in our waters is unacceptable. Sulfide-bearing rock brought to the surface will turn into sulfuric acid and leach into our waterways, resulting in irreparable damage to our biotic community. **DO NOT ALLOW ANY HARD ROCK MINING WITHIN 50 MILES OF ELY MINNESOTA.** Thank you, Sarah Malick 56 W. Shagawa Road Ely, Minnesota 715-410-2941 <http://graphics.hotmail-com/greypixel.gif> "Seek first to understand, and then to be understood" -Steven Covey

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Sarah Musgrave

44687

The wetlands that will be removed are not replaced in the same watershed and the whole issue is not addressed and seem of little concern to everyone. The wetlands serve as a way of cleaning the water directly flowing into Lake Superior. Removing the wetlands will cause increased pollution into another great natural resource. Also the vast amount of water needed to mine will cause damage to the ecosystem. Because of climate change it is creating draught or flooding conditions. The chance of pollution flowing to the surrounding area because of extreme weather is likely to occur. At other times it could cause water shortages. Sarah Musgrave 7717 Chicago Ave #108 Richfield, MN 55423 612-327-2842

Dear DNR, I'm writing to express how truly worried I am about the proposed PolyMet mine. I sincerely hope that you will reject this project outright. Minnesota is a beautiful place. And our abundant fresh water is a big part of what makes this place special. Not everyone is so lucky. But we shouldn't let our abundance make us stupid. We must take good care of our resources - and this mine project looks just disastrous for our fresh water. 500 years or more of pollutants leaching into the ground water and our waterways. This is a no-brainer. Reject PolyMet's permit application. Minnesota doesn't want their business. Perhaps we need to invest some resources into retraining underemployed residents of northern Minnesota. That would be far more cost effective than selling off our beautiful northland resources to a corporation that might not even exist in 20 years. Please, please say no to this mine. Sincerely, Sarah Nelson Roseville, MN

Dear Ms Fay, I respectfully ask that you deny Polymet/NorthMet a permit to mine in the state of Minnesota. I also ask that you deny the Section 404 permit allowing for destruction of wetlands. This activity would (if allowed) destroy the vital and vibrant tourism economy in northern Minnesota. It would jeopardize the Boundary Waters Canoe Area Wilderness - not only environmentally, but it would impact every activity tourists partake in; from sightseeing and wildlife viewing to hunting, trapping and fishing. Part of the plan is to "monitor and treat polluted water for 500 years" . This is simply not feasible. A project that openly plans to pollute fresh water for that long should never be allowed. Fresh water is the necessary for life as we know it and is becoming more and more scarce. We must protect our resources for future generations, not sell them to the company who spends the most. I am a resident of the town of Bayfield on the Bayfield Peninsula in northern Wisconsin. I look out my window as I type and there is Lake Superior, all frozen. There is the ice road out to Madeline Island, and The Apostle Islands National Lakeshore, all around me. This proposed project would affect all of the Lake Superior Basin, sulfuric acid in the lake will not stay in one place as you certainly know. In Wisconsin we know firsthand the destruction sulfide mining causes. We share Lake Superior, not only with each other, but with all future generations as well. I want my grandchildren to be able to swim at the beaches of this beautiful National Lakeshore. I want the tourists to be able to come and visit the ice caves and the sea caves. And I want to be able to travel to the BWCA, as I will be doing this summer to spend 10 days canoeing and portaging through the most beautiful wilderness I have ever experienced. Please keep our economies and our environment healthy. Please deny PolyMet/NorthMet a permit to mine in the state of Minnesota, reject the exchange of Superior National Forest land that would allow the project to move forward, and deny the Section 404 permit. Respectfully, Sarah Nevins 231 North 1st Street Bayfield Wisconsin 54814

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Sarah Nurnberger 5516 Lyndale Ave S Minneapolis, MN 55419-1720

Sarah Oppelt

36615

Sarah Oppelt 14760 Easter Avenue Apple Valley, MN 55124 I do not support the approval of the PolyMet mine in Northern Minnesota because of concerns over the environmental impacts over the short and long term. The mine will provide relatively few jobs for a relatively short amount of time with very likely significant environmental impacts. If the mine is approved, please do ensure that there are significant financial assurances in the permitting process. It is important to me as a Minnesotan that there is enough money to deal with contamination problems when they do arise to minimize the impacts on our precious waterways and land. Thank you, Sarah Oppelt - "Be tough, yet gentle. Humble, yet bold. Swayed always by beauty and truth." -Bob Pieh

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Let's learn from the mistakes of the past, not repeat them. My family has been in Minnesota for generations, and I feel so lucky to be connected to a place of such beauty, with great societal values that include caring for both the environment and for people. Please reject the PolyMet NorthMet SDEIS as inadequate. Please reject the PolyMet open-pit sulfide mine and wastes proposal because it poses unacceptable risks to human health. If you are not ready to reject the PolyMet project at this time, at least require a re-do of the SDEIS to address major gaps and flaws in the analysis of impacts on human health: How much mercury would be released directly or indirectly into surface waters from all PolyMet sources. Please re-do the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. Please re-do the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. Please re-do the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury in fish. 5-Assessment of cumulative cancer and non-cancer risks from existing and additional sources of toxic chemicals, such as manganese, arsenic, lead and nickel, applying the most protective health risk analysis. 6-Assessment of all risks using a 70-year "lifetime" for exposures. 7-Assessment of cumulative risks of multiple chemicals and exposure routes (drinking water, fish, wild rice) on infants, children and the elderly. 8-Assessment of cumulative risk of toxic chemicals (mercury, arsenic) in fish, game, and wild rice on persons who rely on fishing, hunting and gathering for subsistence. 9-Assessment of cumulative risk of methylmercury contamination of fish in the St Louis River and estuary for Lake Superior. •Complete the mercury TMDL study of the St Louis River before finalizing the PolyMet SDEIS or issuing any permits for the PolyMet sulfide mine project. The PolyMet SDEIS is an inadequate assessment of human health impacts and the PolyMet sulfide mine and mine wastes proposal poses an unacceptable risk to the health of fetuses, infants, children and adults in Minnesota. Please reject both the PolyMet SDEIS and the PolyMet mine. Very truly yours, Sarah Pradt Sarah Pradt 1282 Stanford Ave Saint Paul, MN 55105

Sarah Schaefer

Polymet's proposal will leave cleanup for 500 years at its lowest proposed timeframe. This is likely a bill that will be paid by Minnesotan tax-payers. Despite claims that this project will create jobs and revenue, only 100 jobs in 20 years of its existence will be for in-state workers and only approximately 1% of revenue will stay in-state. Say NO to the Polymet proposal to mine NE Minnesota.

Sarah Sederstrom

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Sarah Sederstrom 8700 Jeffrey Ave N Stillwater, MN 55082-9251 (651) 407-6220

Sarah Shankle

There's .5 ounce of copper in your cell phone - if every time we bought a cell phone we included 5 pennies for the manufacturer in our payment - that would cover it. A computer, perhaps 30 pennies, A tablet, maybe 20- Batteries, I'm not sure. So, how about we eliminate the penny as currency and collect the pre 1983 all-copper pennies for manufacturers needing copper. Too simple. Not really. Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely sarah wilson 3442 10th avenue south Minneapolis, MN 55407 6128252160

Sarah Wolbert 42491

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Sarah Wolbert 3237 Chicago Ave Minneapolis, MN 55407-2104

sbarkema 7201

We are sending this email to inform you of our strong opposition to the Polymet project being allowed to proceed. To even think about letting this project continue is hard for us to understand. The people behind this6 push have only one thing on their mind. \$\$\$\$\$\$ They will do anything and promise anything to get this started. The damage it WILL cause and the pollution it will create now and for hundreds of years are what we and our next generations will have to live with long after the \$\$\$\$ has disappeared. The HUGE potential for additional damage and problems that can happen once this project gets the go ahead is in no way feasible for the few temporary jobs they SAY will be made. Minnesota should NOT be made a testing ground for this form of mining when they have such a BAD track record and our environment laws are not being enforced. This is just setting us up for a MAJOR MISTAKE We could go on listing many other objections but the bottom line is if we had to vote on this, they would NOT get the go ahead. They cannot be trusted to do what they promise and people with vision and common sense will not allow this to continue. We need leaders to vote for what is the right decision for Minnesotans and protect us and our country from plunder NOW. After our environment is trashed, it will be too late to do the right thing. This is just the tip of the iceberg that will come if we don't stop it. Byron and Sherry Barkema 2742 Hwy 3 Two Harbors, MN 55616

Schmidt Michael 17371

Hello, The more I read about the proposed copper sulfate mine in NE MN the more I am against this. This time of mining appears to be a boom-bust proposition with so much potential for immediate and ongoing pollution and industrial damage to the environment of this beautiful natural and tourist area. Even with a very large bond posting by the company or industry I do think support this type of a destructive industry in Minnesota. Sincerely, Michael Schmidt 428 Bruns Court St Paul, MN 55127

Please don't allow the Polymet mine upon in northern MN. I've tried to get as I can on this topic and nothing adds up. There is no track record of a pollution free solution for the type of mine and it is right next door to the BWCA. I don't believe one but that anyone is going to sign up to clean water for 200 to 500 years. Especially when they pull up stakes after 20-40 years. Polymet wants all the reward, but who do you think is taking on all the risk? Scot Dauner 10000 Nord Rd Bloomington, MN 55437

scott anderson

9473

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I do not understand why 300 jobs for 20 years is more important than clean water. This mine will play out in 30 years. while the water has another 480 years before it might be non-toxic. this 480 years who will pay for the containment of the toxic water. Tax payers. The containment plan of this toxic water, does it take into account large rains, like in june of 2013, the 100 year rain. What if polymet goes bankrupt to get out of their commitments. then the tax payers will be held accountable. Remember the United States is only 238 years old. 500 years is along time to contain toxic water. This is the largest fresh water basin in the world. Water flows north, and south. How much of a tourist area is Butte Montana. Waste Land, with way less water to be messed up. how is their containment doing, how much is that costing. Have you ever read the LORAX. I think you should. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, scott anderson 125 4th ave two harbors, MN 55616

Scott Bennett 2065 Oak Glen Trail Stillwater, MN 55082 March 13, 2014 TO: HYPERLINK
"mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us .

As an avid outdoorsman and a financial contributor to the Minnesota DNR and who spends a lot of time fishing, hunting and camping along the north shore region of Lake Superior I am very concerned about the possible impact on the BWCA posed by acid mine drainage from PolyMet's NorthMet project.

PolyMet's web site claims that water that will be discharged from its project site would never enter the Boundary Water Canoe Area Wilderness lakes or stream. In reality, however, hydraulic conductivity testing is needed to determine the actual effect of acid mine drainage into the waterways on the edge of the Boundary Waters. The proposed PolyMet mine site borders and is uphill from One Hundred Mile Swamp, which drains (in part to Langley Creek, which is a tributary to Rainy Lake in the BWCA watershed. Without hydraulic conductivity testing and measurements, PolyMet has no way to show that water entering One Hundred Mile Swamp will not then flow into Rainy Lake in the BWCA watershed.

It is also a concern that the authors of the SDEIS have used incorrect maps which contradict the US National Atlas watershed map, with the goal of suggesting that mine waste water will not seep into the BWCA watershed. Significantly, the SDEIS claims that there is no delineated boundary for One Hundred Mile Swamp—while in reality, the boundaries of One Hundred Mile Swamp have been delineated, and are accessible at HYPERLINK "<http://www.nationalatlas.gov/streamer>"www.nationalatlas.gov/streamer. Having first misrepresented the mere existence of One Hundred Mile Swamp's boundaries, the SDEIS maps then omit the section of One Hundred Mile Swamp that drains into the BWCA watershed: whereas the National Atlas shows a 10-mile-long wetland that drains to both the St Louis River and BWCA watersheds, the most recent SDEIS maps depict the One Hundred Mile Swamp as only six miles long, and as existing only on the St Louis River side of the divide. PolyMet's re-drawn and inaccurate maps would mislead a reader to believe that its proposed project would have no impact on the Boundary Waters.

Finally, there has been no baseline water testing in the Dunka River, Langley Creek, or anywhere else in the Rainy Lake watershed. Without such testing in the Rainy Lake watershed, there is no way to gauge the possible harm to the BWCA and Quetico from PolyMet mine drainage.

For all these reasons, PolyMet must be required to correct its SDEIS to include accurate watershed mapping, with hydraulic conductivity testing in One Hundred Mile Swamp, with water quality testing for the BWCA watershed, and with a data-based statement of the impact of the proposed mine on BWCA water quality.

I know that the Boundary Waters are a unique and fragile ecosystem which needs our protection. It should concern everyone who is responsible for protecting our resources—which PolyMet has affirmatively misrepresented and omitted crucial facts in relation to its project proposal. I urge you to view the SDEIS critically, and to require PolyMet to provide correct and appropriate data so that the impacts of its proposed project can be accurately assessed.

Sincerely,

Scott Bennett-Minnesotan

Scott Bol

18134

So I'm Scott's Bol, and I guess I want to wish peace on earth, good will to all here. I was going to bring that as one of my signs but I forgot it so I guess I'll just pass it on verbally. I want to speak today about concern about jobs and environment. I very much realize that a lot of folks are desperate for work. I'm very disappointed that we didn't create jobs when our market fell back in 2007/2008. And so many people are hurting for jobs. I know I volunteer as a citizen patroller and I'm very concerned and in our neighborhoods that people are desperate. They're going to be doing desperate things if we don't have jobs, and I think the risks, now, for this sulfide mining is just too great; that -- that the tremendous storms that we have these days, with what happened in the Philippines with world-record typhoons, and the tremendous flooding that we've had in Duluth, it's actually true that with global warming we're having tremendous weather changes and the storms are coming. So we have 500-year storms, we have 100-year storms every few years. So when we have seepage from the holding pits, they could flood and that could be a tremendous problem. Now, I think about the economic concerns in West Virginia and what happened in West Virginia that Freedom Industries went bankrupt. They found that these unanticipated costs of all that spillage was tremendous. That would be unfortunate. I would want us to make sure we have all of our stockholders and all of our investors in PolyMet to make sure that they are going to be accountable and not for five years, but for decades, and we start looking at a tremendous amount of years. So it's a huge insurance cost. We know tragedies happen. They happened at Chernobyl in the Soviet union, they happened at Fukushima in Japan. So tragedies happen, you know. We -- people came here saying they trust the agencies. Things go wrong. They trusted the agencies in West Virginia, and the Freedom Industries found the freedom to declare bankruptcy. So let's be careful here. We value our environment. I value jobs. I want us to stand together, strong. I had a union brother come up and thank me just recently for joining him in standing up at Black Friday. We were giving out pizzas in Duluth to the Walmart workers. So, I'm very concerned about labor. I want jobs. We need to stand together for jobs, but not this one.

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Scott Coryell 3168 SW Rockbridge Dr Lees Summit, MO 64081-3868

10799

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Scott Coryell 3168 SW Rockbridge Dr Lees Summit, MO 64081-3868

11427

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Scott Coryell 3168 SW Rockbridge Dr Lees Summit, MO 64081-3868

Scott Cramer

19869

Scott Cramer 3148 29th Avenus South MPLS, MN 55406 I have listened to the voices of my fellow Minnesotans about copper mining, and am struck by what I have heard. Everyone says they are concerned about preserving our beautiful land, our precious water and our children's future. And yet, a troubling fact remains. Mining is a highly disruptive activity that will cause hundreds of years of monitoring and clean up after all the ore is gone. Otherwise, we face wide scale water pollution. This time frame should give us pause. When we think of our ancestors, we rarely remember little beyond our own grandparents. From their time to now, human population on the planet has more than doubled. We utilize every conceivable material, and manipulate every possible resource into what we want. And whether we most value our cell phones, I pads, wind turbines and solar panels or our snowmobiles, aluminum boats, pickup trucks and rifles, what we have in common is our need for more metal. But if we are true stewards of the earth, we should be most concerned about our legacy. What will we leave for the future generations. Will America fall apart if we leave this copper in the ground. Might it be possible that 100 years from now a safer, cleaner, cost efficient method of mineral extraction will have been found. Don't we believe that leaving waste dumps and mine pits leaking toxic chemicals is no gift but rather a poison pen letter to our future offspring. The irony that our success as a species may contain the very seeds of our own destruction is not lost on me. If we truly love our children, our land and our planet, we must find a better way to care for them, and we must start now. We are the caregivers and caretakers for what will come after us. Lets start acting like it, and not permit this mining. .

Scott Daby

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. The potential long-term negative environmental impacts far outweigh the potential short-term economic gains. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Scott Daby 3509 Roosevelt St NE St Anthony, MN 55418-1556

4175

Dec 22, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Five hundred years is the amount of time Polymet corp. says will be needed to treat the groundwater pollution at the metallurgical site. Think about that number for a moment. 471 years ago, Copernicus published his heliocentric theory of the solar system which proposed that the sun is the actual center of the universe. 496 Years ago, Leonardo da vinci had just completed what would prove to be one of the most famous pieces of artwork in history; The Mona Lisa. 511 years ago, Christopher Columbus had just finished the last of his exploratory voyages to the Americas. 500 years ago, the United states would not exist for another 263 years. The DNR/EPA is asking the public to read, digest, and comment on a 2300 page Environmental Impact Statement in 90 days. What is the rush. Give the public the time it needs to fully look over the report. This is a decision that will not only affect us, it will affect future generations for hundreds of years to come. I urge you to extend the comment period. Sincerely, Scott Duffy The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Scott Duffy 2336 Golfview Dr White Bear Lake, MN 55110-5505

To whom it may concern, I have done my best in the time allotted to read over the EIS report for the northmet project, and I have some serious concerns regarding the proposal. I have highlighted a few of the glaring issues below: -On page ES-53 the EIS states: " Air quality of the BWCA will not be adversely affected". The EIS makes no mention of the air quality of the immediate area surrounding the project site. How will this project affect the air quality of the surrounding area. -The Moose, was recently added to the states "species of special concern" list, and if population trends continue, will be placed on the state's endangered list in the near future. The EIS makes no mention of the effects on Moose and moose habitat that this project will have. How much moose habitat will be destroyed with this project. What is the Moose population in the area. -In 2002, Duluth Minnesota, a mere 100 miles from the proposed mine site, had a "500 year" flood which devastated the surrounding landscape. The Babbit area also received over 10 inches of rain during this same storm. The EIS makes no mention of what contingencies are in place to protect the mine site if this type of event should happen. How can you even begin to make these types of calculations with any level of confidence. -What happens in the event of a "worst case scenario". The EIS paints a very sanitized vision for the mining process. In reality, there will be pollution. How much pollution is the question. What happens if it is discovered that the mine site is leeching sulphur and other pollutants into the groundwater. Who is going to pay for the cleanup costs. What will happen to the surrounding wildlife. What will happen to the largest (and cleanest) freshwater lake in the world. What happens if these events occur after the mine is closed. How can a company possibly give financial assurances for 200-500+ years in the future. Do we really want a superfund in this state. What will happen to the DNR's reputation with the public if this project is allowed to move forward and then there is some type ecological disaster. How could the public ever trust the DNR again. We are at an important crossroad. This is probably the most important issue that the DNR has faced in many decades, if not ever. Whatever decisions are made with this project will set a precedent for years to come. The floodgates will be opened for all of the other mining projects who are sitting on the sidelines waiting to see how the Polymet proposal plays out. There will be no turning back. Sincerely, Scott Duffy 961 County Road D Vadnais Heights, MN 55109

Dec 22, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Five hundred years is the amount of time Polymet corp. says will be needed to treat the groundwater pollution at the metallurgical site. Think about that number for a moment. 471 years ago, Copernicus published his heliocentric theory of the solar system which proposed that the sun is the actual center of the universe. 496 Years ago, Leonardo da vinci had just completed what would prove to be one of the most famous pieces of artwork in history; The Mona Lisa. 511 years ago, Christopher Columbus had just finished the last of his exploratory voyages to the Americas. 500 years ago, the United states would not exist for another 263 years. The DNR/EPA is asking the public to read, digest, and comment on a 2300 page Environmental Impact Statement in 90 days. What is the rush. Give the public the time it needs to fully look over the report. This is a decision that will not only affect us, it will affect future generations for hundreds of years to come. I urge you to extend the comment period. Sincerely, Scott Duffy The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Scott Duffy 2336 Golfview Dr White Bear Lake, MN 55110-5505

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Scott Dulas 5311 Greenwood Rd Duluth, MN 55804

As a young person living in the state of Minnesota it is obvious that job creation should be forefront on our minds. The PolyMet Copper Nickel mine, is not the way to create these jobs and boost our economy. The amount of short term benefits are vastly outweighed by the massive implications that the mine could have in the future. The clean up of the mine is in the neighborhood of 500 years. That is completely unacceptable. Even though the PolyMet corporation claims responsibility for the clean up, how can we as minnesotans make sure that a brand new mining corporation will last 500 years into the future to continue the clean up process. The mine also is poised too close to the spectacularly preserved boundary waters area. Ruining that area through exploitation of the natural resources shows a lack of forethought and planning for the future. As the future of the state of minnesota, I do not want the burden of cleaning up the mistakes of the paSt Sincerely, Carter Francis Senior at Prior Lake High School

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Glencore should be a responsible party for financial assurance in PolyMet's mine plan To [Decision Maker], The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. My name is Scott Helgeson, H-E-L-G-E-S-O-N, from Bloomington, Minnesota. I have an MBA and I've worked for a number of companies, including some large industrial companies. I understand what "present value" is. I understand what "future value" is. I understand financial modeling. I understand that what we have here is a 500-year commitment, which is absolutely insane. I just came back from Salt Lake City. You cannot breath the air there. The air is so polluted in Salt Lake City that I want to tell you, you can't walk around outside and jog or do anything. And people are concerned about their health. Now that's air quality. Just up the road in Salt Lake City is a big mine, copper mine. The people who live next to that copper mine are relying on reverse osmosis for their town water. They cannot drink it. The EPA says it's just fine. I am damn glad I don't live in West Virginia. What is going to prevent this company from going belly up in 30 years from now, declaring bankruptcy, and saying, "Gee we can't pay the bills anymore." What is going to prevent that? What assurances are we going to have that this is going to be a long-term financial commitment to take care of our water and our natural resources for 500 years. Are we insane? I mean what investment does anybody do for 500 years these days? Nobody does. And yet we're being sold this bill of goods that somehow for 500 years they're going to watch over this polluted water and make sure it doesn't seep into our natural environment up there and pollute what we have, which a lot of people their job depends on it. I own some land and a cabin up by Lutsen on the North Shore. I have three daughters. And I'm concerned about this narrow, short-term view of ours that can possibly rationalize this insanity. Thank you very much.

Hello, I have been reading about the proposed copper sulfide mining project up by the Boundary Waters, a beautiful natural resource so unique to my beloved Minnesota. I have been on many transformative experiences on my journeys in the BWCA. It truly rivals my trips to Machu Picchu in Peru, the Taj Mahal in India and Cappadocia in Turkey. I hate to think that something could even remotely threaten the natural beauty we possess locally. This mining operation has serious environmental consequences. And in my opinion, not enough jobs created to validate the destruction of the land, water, and habitat. PolyMet itself has said it could take up to 500 years to clean up the toxic mess this kind of mining creates. I am absolutely sick of the environment losing out to big corporations. I am doubly concerned that this issue hits so close to home. Please protect the Boundary Waters. Scott Hochhalter Minneapolis, MN - "The world needs more people who specialize in the impossible." -Theodore Roethke

Dear Ms Fay, To Whom It May Concern, Who do we look to to keep our air and water clean. Is anyone looking out for the human species or any other species on planet Earth. How can the DNR possibly think the PolyMet project is a good deal. Corporations have long ago figured out how to influence every government official/representative/agency with copious amounts of money and this influence leads to made up "facts" about whatever "project" they're working on. The PolyMet project is no different. There has never been a mine that hasn't polluted the Earth. Science cannot clean up the mess once it is made - and it certainly will be a gigantic mess. As a life-long Duluthian I am already loaded up with heavy metals according to results from my blood work. How will PolyMet make the Duluth area any better. I don't care about a few jobs and a majority of money that will head to other countries thanks to a few minerals extracted from this area. It is time for the government to begin looking out for the people and all life on the planet. A great first step would be to reject the Polymet land exchange. Respectfully, Scott Kylander-Johnson Scott Kylander-Johnson 4110 99th Ave West Duluth, MN 55810

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Why should any sane person think that NorthMet can be any different. What bond and in what reasonable amount can be required to compensate this and future generations of Citizens for the problems that NorthMet is likely to create for our planet. What justifies this project anywhere on the planet. What say will Citizens be given, one-man-one-vote basis, so that the decision is not left to potentially money-corrupted politicians and the corporations that corrupt them and our governance. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Scott Lombardo 4022 N Hamlin Ave Chicago, IL 60618-2106 (773) 908-0251

We had a cabin mid Gunflint Trail until last summer and we have visited this area and gone canoeing and camping in the BWCA for many years. We are very concerned about this Polymet Project and the danger it poses to the environment because of its proximity to this pristine wild area. We understand that this would bring many jobs to northern MN to people who really do need those jobs but we feel it cannot be at the expense of possibly long term harm to the waters of the BWCA and its environment plus to nearby areas as well as pollution travelling the rivers to other areas. Polymet really does not have a track record we can look at to see how well they do on environmental protection and a major investor is a European company with a less than stellar record for environmental protection among other things. We are not convinced they can be trusted to know what they are doing and do as they promise. The time needed for Polymet to treat this water is just too long to really count on anything. We just cannot believe with enough certainty that Polymet will not find a way out of this expense as soon as it is done mining the area. It is a business and the bottom line and keeping investors happy is the most important thing to them. Also who knows what the world will be like in 500 years or what other unforeseen factors will enter the picture in hundreds of years. It seems that testing and long term projections concerning the toxic byproducts of this mining are not adequate and do not take into consideration every possible reach and scope of this pollution. From what we have read, it seems the studies may be unrealistically optimistic. In addition to or as a result of the ground and water pollution, the mine would destroy many acres of ecosystems for many wildlife species that are very special to Minnesota as well as destruction of wetlands and important vegetation. These are the things we and the many tourists who come here come to see. We love this area and do not want to see anything implemented that could pollute the clean water that is so special to the area or make it harder for our special animals like the Lynx, Moose and Wolves to survive. We also do not want to see the Superior National Forest cut up by a mine. Getting isolated pieces of land in exchange is nearly worthless to the experience of the visitor who goes to the Superior National Forest to camp and hike and fish and see wildlife and just experience peace and quiet. If these things that are so appealing to so many are impacted negatively the gain in employment from mining may be offset by the decline of tourism to the area and all of the money and jobs that brings. Another point is, if Polymet ceases to exist or just gets out of cleanup once it is done mining, then it is up to the state and the taxpayers of the state to continue with the cleanup and that would have a negative impact on all of us who live in Minnesota. We urge you to reject Polymet's current plan for mining in Minnesota. Thank you, Scott and Sue Long 1240 79 ½ Street Victoria, MN 55386 [HYPERLINK "mailto:suelong@entplace-com"suelong@entplace-com](mailto:suelong@entplace-com)

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Rd St. Paul, MN 55155 Douglas Bruner Regulatory Branch, St. Paul District U.S. Army Corps of Engineers 180 Fifth St. E., Suite 700 St. Paul, MN 55101 Tim Dabney, Deputy Forest Supervisor Superior National Forest 8901 Grand Ave. Place Duluth, MN 55808 Susan Hedman, Regional Administrator EPA Region 5 Ralph Metcalfe Federal Building 77 W. Jackson Blvd. Chicago IL 60604-3590 March 10, 2014 Re: PolyMet Mining Project and Land Exchange SDEIS I have concerns with the PolyMet Supplemental Draft Environmental Impact Statement. 1.) I am concerned that we, in the US, are bending over backwards to accommodate a foreign mining company that has a very good chance of polluting NE MN for many centuries. 2.) The amount of water used/consumed was grossly under stated in the SDEIS. The actual water used will change the figures used for water treatment. Even using Poly Met's figures, the water used will deplete some aquifers and there is a threat of contamination in other aquifers. 3.) The MN DNR is aware that the modeling used regarding water quality was flawed. 4.) The reverse osmosis is not a proven process and has only been "tested". 5.) PolyMet isn't even sure how to handle the residue. 6.) The dams, dikes, pumps, and pipes will last 500 years? Of course not. A no to each item. Long term maintenance wasn't address or was inadequately addressed. 7.) Wetlands that will be destroyed are very unique and cannot be replaced or renewed. How can you replace a peat bog that is tens of thousands of years old? 8.) If this project will create a few jobs, why are other established industries/business going to be negatively affected? Logging. Recreation. Tourism. Local business. Local residents. We are putting our environment in jeopardy. Water is our most valuable resource. Not copper. Not nickel. No mineral is more valuable. And we are willing to sacrifice that for profits that won't even stay in our country. Please take a good hard look at what will be an unfortunate sequence of events. Thank you for the opportunity express my position. Scott Mead 9130 W. Branch Rd. "Duluth MN 55803 (218) 848-2051

I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. 1 The proposed mine plan will not keep Minnesota's water safe and clean because: PolyMet would need to actively treat polluted water for at least 500 years; Each year, 11 million gallons of untreated polluted seepage from the tailings basin will enter groundwater; and Each year, over 5 million gallons of untreated polluted seepage from the mine site will enter groundwater. 2 The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. When accidents occur, will we be left to hope for the best. 3 The proposed mine plan would not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. After closure, the following will be left: 526 acres and over 167 million tons of reactive waste rock on the surface; a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer; A synthetic and soil cover over the waste rock pile requiring annual maintenance, erosion repair, and removal of plants that might perforate the synthetic material; A pit "lake" whose water level must be maintained through pumping to prevent contaminated overflows into the nearby Partridge River; A tailings basin pond whose water levels must be maintained through pumping to prevent contaminated water from over-topping dams and entering the nearby Embarrass River; and A lengthy network of pipelines conveying polluted and treated water must be monitored and maintained for at least hundreds of years. 4 The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance the company will provide are not outlined in the revised mine plan. The public does not know the cost of 500 years of water treatment, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability. Given the need to monitor the consequences of the mine for hundreds of years, why is the mine being given serious consideration. A commitment for hundreds of years is simply not meaningful. And, if polluted seepage ruins fragile and pristine wilderness, how will money solve the problem. If the mine is approved, it will be just one more example of privatizing profits and socializing risk. SCOTT MOEN 491 MONTROSE LN SAINT PAUL MN 55116-1134 (651) 428-1547 HYPERLINK "mailto:smoen@ecobizlaw-com"smoen@ecobizlaw-com P Please consider the environment before printing.

Scott Polyner 10711

My name is Scott Polyner I Live At 2435 Grant McMahan Blvd. in Ely MN and I am in favor of the Polymet project going forwaRd I have worked at Minorca mine in Virginia MN since 2007 so I am familiar with the regulations mining operations must follow to maintain required permits. I have been assigned dozens of projects to install new emission monitors, improve access to existing dust collection systems, and controlling process water for conservation reasons. Some of these improvements were made due to technology changes from 1976 to current day, and some were made because monitoring was not required before but all were made to comply with an evolving regulation process that strives for a clean as possible process for all mining operations. Having read the SDEIS, I am confident that the involved agencies will hold this project to those same standards that allow us to have the largest taconite mines in the USA and still have the cleanest water in Minnesota. I understand that there are differences between the copper process and the iron process, but I believe the MPCA, the DNR, and the Army Core of Engineers will adapt and over come any issues that arise. I am a fifth generation Elyite, I live 20 minutes away from this proposed mine and if I thought there was any danger to the water in my well, or the outdoors I hunt and fish in, I would not support this project as strongly as I do. In conclusion, I see no reason for any of the involved agencies to deny Polymet the permits they need to start this mine 10 plus years in the making. Thank you for your time Scott Polyner

Forgot to include: Scott Robertson 5125 Bryant Ave S Minneapolis, MN 55419 On Wed, Jan 22, 2014 at 7:07 PM, Scott Robertson <[HYPERLINK "mailto:scotterob@gmail-com"scotterob@gmail-com](mailto:scotterob@gmail-com)> wrote: I do not support the proposal for NorthMet Project mining, nor for the land exchange proposed with the Superior National ForeSt The detailed descriptions of wastewater control design in the SDEIS are encouraging, but that report's conclusions about mercury concentrations in the St Louis River watershed assume 100% performance of the WWTP, bentonite clay containment barriers, etc Based on experience with industrial water protection systems, I would ask the authors what level of wastewater containment failure they would find acceptable. Were various levels of failure modeled for the EIS. I find no evidence that they were, which does not seem reality-based. Systems do fail, and it's rational to predict a realistic rate of failure. I grew up along the St Louis River in the 1970s, and it was a very impaired waterway. I'm proud of the steps Minnesota has taken to address water quality within the St Louis River watershed, and the steps that various federal, state and interstate agencies have taken to address threats to Lake Superior. They are healthier than they were. I do not believe the rosy description that NorthMet WWTP discharge will actually help clean up the St Louis River. I think it's great that was taken as a design goal, but I do not believe it will happen. As far as what rate of failure EIS authors might find acceptable: my answer is none, because I do not believe this mine is "what's next" for the Iron Range. I do not oppose mining per se; however I do oppose any expansion of mining in Northern Minnesota, incl taconite mining. I simply believe that this part of our land has done it's share. Aerial photos show that much of the Range is wasteland. I was last there 3 weeks ago and was reminded of how many smokestacks, how much scarred earth, and how depressed the towns are. It's time for the citizens of the Range to find other things to do than cut trees and pull rocks from the ground. And it's time for them to stop shipping wealth away to faraway owners, and to keep it for themselves.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Scott Slocum 3639

12/20/2013 To: Minnesota Department of Natural Resources From: Scott Slocum, 1416 Birchcrest Drive, White Bear Lake, MN 55110- Re: Insufficient PolyMet sulfide-ore treatment SDEIS. I have read about the dangers of sulfide-ore mining in Minnesota, and about the plans proposed by PolyMet Mining, Inc. to avoid those dangers. It is clear to me that the Supplemental Draft Environment Impact Statement (SDEIS) prepared by PolyMet Mining, Inc. is not sufficient to avoid the dangers of sulfide-ore mining in Minnesota. Therefore, I recommend that the proposed PolyMet mining project (and any project without sufficient safeguards) should not be allowed to proceed. -Scott Slocum

Scott Smith 38757

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Scott Smith 10421 Shelter Grv Eden Prairie, MN 55347-4858

Scott Watkins 42050

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Scott Watkins Willmar, Minnesota

Scott Wolff 46992

I doubt anything I say will make a difference, but here are my two cents: I remain inherently distrustful of a large corporation that floods the media with their message (eg their sponsorship of the Mn HS hockey championship) and brings busloads of workers wearing hardhats to public hearings. They have strong commercial interest, while the rest of us have nothing to gain, just a lot to lose. Can Polymet show us a similar project that has gone well without environmental damage. I don't think so. I would like to know who is responsible if something goes poorly. Specifically I would feel much better if individuals at the upper level of the Polymet hierarchy have something personally at risk, "skin in the game" if you will. If there is a massive environmental problem, I would like to see their personal assets at stake-they can still get a nice salary, but the 2nd and 3rd homes get liquidated to pay for it. They can be very friendly and polite, but who really pays. since corporations now have the rights of individuals, who goes to jail for a jail-able offense. You have heard all the other objections so I won't trouble you with redundancy. Sincerely, Scott Wolff 4136 Minnesota Ave Duluth, MN 55802

Sean Heckman 6717

My name is Sean E. Heckman, 33375 Ski Hill rd Bayfield, WI. 54814- Email slheckman99@yahoo-com. Phone 715-209-2557- First I would like to state that I am a investor in PloyMet. I also believe that PloyMet has invested heavily in the control of pollutants. I am a layman and would never claim to fully understand the full process of the water treatment. I believe they will be a leader in the forefront of responsible mining. Just a little back ground of myself. I live in a very healthy town of Bayfield, WI. and have lived here for 35 years. I am the Chief Engineer for the Madeline Island Ferry line so I am very dependent on the tourist industry on lake Superior. That being said when we first moved here when I was in the Coast Guard in 1979- At that time there was a thriving fishing industry, logging industry and a manufacturing plant in town although small. Local families could survive and make a descent living and the children of these families could stay in the area. When my children went to school they would walk with about 15-20 other children from the city of Bayfield. Now Bayfield has become a second home community or homes of wealthy retirement people. Now there may be 4 children from the city going to the school. The bulk of the student population is from Red Cliff which is a town just north of Bayfield and a Indian reservation. No new families can afford to move into Bayfield because of reality prices and no jobs of a high enough pay to live here. Depending on tourism does not work. Only the Bed and Breakfast and restaurant owners make money. The jobs that are here are low paying, seasonal and without any kind of benefits. There are a few like myself that have year round jobs and were lucking enough to have bought land before the reality prices went through the roof. They only other main employer is the government Fed,State and local. My children who are all educated, one is a RN, one a musician and the other is a lieutenant in the US Air Forcse will never be able to return to this area because of lack of good high paying jobs. We are a material society and until we start to reduce the population the demand for raw materials will be present, why not take the forefront to responsible mining, help bring good year round high paying jobs to northern Minnesota and get them off unemployment. It seems that all the environmentalist are on their computers, their cell phones and their cars protesting this and forgetting that all of the above has copper, or iron or other metals in them. There's a saying around here. You want your cars, your cell phones, your computers but you want to (poop) in the neighbors yard and not in your own. Why not do it cleanly and controlled in your own. Thank You for your time.

Sen. John Marty 42961

Hello, Here are Senator John Marty's Comments on the Supplemental Draft EIS. Thank you, Emmy Waldhart Intern, Office of Senator John Marty

Sen. Bev Scalze 9508

I haven't sent any comments yet. Connected by DROID on Verizon Wireless --Original message-- From: "*NorthMetSDEIS (DNR)" To: "Sen. Bev Scalze" Sent: Wed, Jan 29, 2014 20:19:04 GMT+00:00 Subject: RE: PolyMet Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. We will review the comments you have provided. Responses to all substantive comments will be included in the official record. If you have provided your address, you will be included in mailings or electronic distribution of the record.

9578

Tony, Thanks for sending your comments. I agree with them. I attended the hearing at the River Center last night and joined the groups of people with "clean water" stickers on their clothes. You are right that the underground water movement has not been addressed, nor has its affect on the streams and rivers flowing into the BWCA. This was brought up at the hearing last night. You should send your comments to the DNR at [HYPERLINK "mailto:NorthMetDEIS.dnr@state.mn.us"](mailto:NorthMetDEIS.dnr@state.mn.us) NorthMetDEIS.dnr@state.mn.us before March 13, 2014- Also, you could mail the comments to Lisa Fay, EIS Project Manager, MDNR Division of Ecological and Water Resources, Environmental Review unit, 500 Lafayette Road, Box 25, St Pul, MN 55155-4025- It is very important that they hear from you. Thanks again for sending the e-mail message. >>> Tony Jordan 1/28/2014 1:06 PM >>> My Name is Tony Jordan, and I live at 3754 Rustic Place, Shoreview, MN 55126- Although it has been 8 years since I've been to the BWCA, I know it to be a true "water world". The flow of the visible water through passages connecting lakes for 100 miles or more is a sensitive provider of all forms of life in the area. The flow of the water that we can't see underground is even more intricate and sensitive. The minerals are not going anywhere and their value will only increase. We should wait for technology to be developed to offer the possibility of mining them without the accompanying destruction that future generations will pay for. I am against the mining proposal because of the irreversible damage that will be done to the area. I am in favor of an additional user fee for the BWCA that would be shared with the residents of the area to compensate for their not getting the 300 some jobs that come with the destruction of the area. Thank you, Tony Jordan (651) 482-9608

Senator Al Franken 47597

---Original Message--- From: october@usfamily-net [mailto:october@usfamily-net] Sent: Tuesday, March 11, 2014 4:56 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, September Steinolfson 6711 Canterbury Ln Eden Prairie, MN 55346-2844

Serina Gebrehiwet

54181

I am against the mine. The water is going to become polluted. The boundary waters are important to the area that you are going to destroy. It is very popular in Minnesota so it should be kept with us. You can mine somewhere else less important. This mine has been done in other lakes and rivers and the negative affects they have on the environment. It hurts the ecosystem. The acid will throw off the PH balance and kill life in the water. The affects are too negative and copper and nickel can be found elsewhere.

To whom it may concern:It has come to my attention and many others that the SDEIS map have mislead the public. The map of the swamp has cut off half of the one hundred swamp diverting everyone from the fact that the BWCA will be completely unprotected from the acidic drainage of the mine. The public is not aware of this, they are not aware of something that will affect the rest of their lives and their children's lives. They are not aware of what may endanger them because they have only been told of the benefits. It will provide jobs; an economic boost but how many people know that less than 2% of the water on earth is pure water? Before we know it, there will not be any pure water left! Are they willing to take this risk knowingly? This needs to be fixed because they are misleading the public.Sincerely,Shandra ThaoProud Student of Humboldt High School1238 Jessie StreetSaint Paul, MN 55130

Shane Johnson

3/13/14 I have reviewed the SDEIS for the Polymet Project, and fully approve of the proposed processes and mitigation systems as well as the science used in designing them, and ultimately constructing them. I also believe from an economic standpoint, that expediting the current processes so Polymet could begin construction immediately would bring a desperately needed, immediate economic boost to the Iron Range, not to mention the added benefit of more public lands, through the land exchange. I fully support the SDEIS in its entirety. Shane Johnson 7955 Waris Road Embarrass, Minnesota 55732

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Shannon Darsow 13376 Carrach Way Rosemount, MN 55068-4807

Shannon Martin

18277

My name is Shannon Martin. I would like to publicly oppose the PolyMet mine. I think 500 years of water pumping and treatment is not a good trade-off for 20 years of jobs. I think one of our top priorities in the state should be the state protecting our natural resources in the long run. That's it. Thank you very much.

Shannon Palma

21586

Mar 5, 2014 Ms Lisa Fay MN Dear Ms Fay, To Whom It May Concern: Please put our wildlife first. Irreversibly hurting our habitat would be a sad legacy. I want my little boy to have the same relationship with the outdoors that I had. Please don't do something you can't take back. West Virginia should stand as an example of what happens when we let business come before people and animals. Please protect our water. Sincerely, Mrs Shannon Palma 382 Haskell St E West St Paul, MN 55118-1646 (320) 491-2792

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, sharjeel khan Saint Paul, Minnesota

To Whom It May Concern: I, as a citizen of Minnesota and resident of the Iron Range for 58 years, have total confidence that Polymet has done everything possible to make their operation safe for our environment now and for my grandchildren. I can not believe that with all the time and studies that have been made and proven, that there should be any question of this. Polymet will be an extremely great benefit to our area, and to the state as well. Sincerely, Sharlyn Dahl 5490 Carnation Ave Virginia, MN 55792 218-741-7882

57503

To Whom It May Concern: With all of the time and money that has been and is being spent on environmental issues, I have full confidence that all it will be an environmentally acceptable mining operation. The permitting process takes a ridiculously long time. Hopefully, from here to start up, will go much faster. Sincerely, Chuck Dahl 5490 Carnation Ave Virginia, MN 55792 218-741-7882

From: sharon angell magliulo [mailto:smagliulo55731@yahoo-com] Sent: Monday, February 24, 2014 12:17 PM To: Fay, Lisa (DNR) Subject: Official Comments for PolyMet's Supplemental Environmental Impact Statement (SDEIS) COMMENTS FOR NORTHMET MINING PROJECT AND LAND EXCHANGE Lisa Fay or to whom it may concern: We are asking for the "No Action Alternative" because the following are inadequate, flawed, or missing from PolyMet's Supplemental Draft Environmental Impact Statement (SDEIS):

- Inadequate cumulative impacts and effects. "Past, present, and reasonably future actions" are not included. Public needs to be informed that this is the beginning of a sulfide-mining district in the lake country of the Arrowhead. The NorthMet Mine and other proposed sulfide mining projects would be in the Duluth Complex, not on the IronRange; this is not being addressed.
- There is no cost benefit analysis.
- The LTV tailings basin is unstable and leaking. The SDEIS underestimates the amount of leakage. There are faults and streams running under the basin that the SDEIS does not address.
- The hydrology is flawed. Poor comparison to the Canisteo Pit. Not the same geological formation; not the same depth; inadequate test borings.
- National Forest Land must not be exchanged. The Weeks Act protects the land. Also, the exchange does not adequately compensate the American Public for loss of this land. The exchange will have a significant effect on wildlife habit and corridors, loss of wetlands and wetland functions (inadequately addressed), as well as overall ecological quality.
- There is no "500 year event" at the core of the SDEIS. An SDEIS based on a hundred year event is insufficient.
- The SDEIS is flawed in the areas of water exceedances and rates of water flow. Conclusions are incorrect. One year of documentation is insufficient for water flow.
- The SDEIS is flawed in its determination of faults and fractures.
- The SDEIS is flawed in its determination of the amount of seepage collected and treated, as well as its levels of toxicity. It is seriously flawed in its assessment of seepage that escapes untreated.
- The impacts from the tremendous amount of coal-fired electricity used to operate a sulfide-mining district (or one sulfide mine on top of taconite mining releases) are not adequately addressed.
- Climate change is not addressed. Carbon based energy used to do this type of mining is irresponsible. PolyMet alone would emit 707,342 metric tons of carbon dioxide each year.
- Sulfates: the effects on wild rice, on newborns in the Lake Superior basin due to mercury levels in fish, and other related ecological impacts need to be better understood and addressed before any sulfide mine is permitted.
- Ecological affects of extensive limestone treatment on an entire ecosystem need to be addressed.
- Chlorides are insufficiently addressed, essentially ignored.
- The reverse osmosis plan is insufficient and unproven on the scale involved. Sulfate removal is overestimated. None of Minnesota's taconite mines have found reverse osmosis to be feasible. The Eagle Mine in Michigan is already having problems
- There are no elucidated plans for unforeseen events; repeatedly saying that the company and agencies will deal with incidents as they arise is not only unacceptable, it is negligent. Not having back-up plans spelled out and included as part of the SDEIS makes this document incomplete.
- The Regional Copper Nickel Study is forty years old. Still valid. However, additional studies need to be done in this decade before any sulfide mine permit is issued.
- Perpetual treatment or any long-term treatment after closure is unacceptable; a mine is to be maintenance free under Minnesota Rules.
- In the best interest of the people of Minnesota financial assurance needs to be part of the public comment period, with transparent and complete information provided.
- This type of mining has never been done successfully in this type of water environment.
- Water must b

I am a mother of a 3 year old boy and I want to protect Minnesota's waters and wildlife for the next generation. I support the No Action Alternative. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Sharon DeCelle

March 12, 2014 Lisa Fay, Environmental Impact Study (EIS) Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Lisa Fay, We should not be copper-nickel mining in Minnesota, not here, at the headwaters of the mighty Mississippi. Northern Minnesota is the site of 3 major watersheds. We and many states downstream from us need fresh, clean water. I am concerned about the pollution that is left behind for hundreds of years after mining ceases, especially water pollution. The PolyMet project, which is reportedly the tip of the iceberg in companies who are exploring options in Minnesota, proposes 20 years of mining near Hoyt Lakes (20 miles south of the Boundary Waters Canoe Area Wilderness). Per Renee Richardson of the Brainerd Dispatch (January 30th, 2014), "once mining operations are done, mechanical water treatment at the site is proposed for 200 years at the mine site and 500 years at the plant site. The state reported it's unknown how long water treatment would be required other than to say long term." Northern Minnesota should not extend mining rights to an outside corporation that cannot realistically provide stewardship for our water nor our environment. Kathryn Hoffman, staff attorney with the Minnesota Center for Environmental Advocacy, said "the process to treat the water is complex, requiring multiple systems to work successfully and a mine in Michigan using a state-of-the-art reverse osmosis plant to do just that has already had more than 40 permit violations for not meeting water quality standards." While jobs are important, we may be talking about as few as local 90 jobs in the balance compared to 500 years of ongoing water treatment. I support jobs in northern Minnesota that are sustainable to all life in the area, and I encourage the Minnesota Department of Natural Resources to take a leadership role in promoting sustainable industry. However, Hoffman estimated that while "PolyMet project is expected to create 360 jobs after experts in the mining field are imported the site will create about 90 local hires." In summary, the Minnesota Department of Natural Resources should block copper-nickel mining in northern Minnesota. Thank you for taking comments under consideration. Sincerely, Sharon Lane-Getaz. PhD 32293 Alta Avenue Northfield, MN 55057 Sharon J. Lane-Getaz, Phd ----- AsSt Professor Statistics and Education St Olaf College 507-786-3411 URL: <http://sharonlanegetaz.efoliomn-com/Home>

To Whom it may Concern: I have been trying to learn as much as I can about the proposed Polymet copper mine in northern Minnesota. Based on what I have figured out, the potential negative impacts far outweigh the positives. The environment that this type of mining is being proposed in makes no sense given the impact it will have on water. However, I do understand that the DNR is in the position of making that determination according to information in hand. What I have not been able to figure out, is how will a mining company be able to control the sulfides reacting to air and water as they are exposed, as they are uncovered in the pits. I realize that the waste will be encapsulated in the waste piles, but what happens before the waste is transferred to that site. Obviously, exposing acres and acres of rock which contain these sulfides, will impact air and water quality. There will be dust and there will be seepage not all of the water can possibly be captured and the air will travel with dust in it. Additionally, I understand that there should be some financial assurance from the company to avoid taxpayers having to fund clean-up efforts in the future. I am concerned as to how anyone can come up with the amount necessary. How can we know. And, what discount rates will be used. We are unsure of how many years we are even trying to project the needs for these funds to become available. How can we possibly know what costs will be at some unknown date. In my mind, it has to come down to cash in the bank right now that will compound at some future rate to allow enough money to deal with issues. Finance is my occupation. I understand how much discount factors impact results. And, I also understand that we are dealing with a huge company (Glencore) that will be sure factors are used to their advantage. I don't think they have the reputation of caring about environmental impacts and will work to make as much profit as possible. Therefore, they will persuade us that what is being put up as funds will be sufficient, but it will not be. If the State of Minnesota was dealing with a known commodity, a company (Polymet) that actually had experience in this type of operation and that was not being funded by a company (Glencore) that clearly has a bad reputation, there could be hope that past practice would indicate a positive future outcome. In this case, neither applies. Thank you for giving us the opportunity to comment. The future of the state is in your hands. Please take care of us. Sharon Legg 10110 Olive St NW Coon Rapids, MN 55433 [HYPERLINK "tel:763-755-6567"763-755-6567](tel:763-755-6567)

Sharon Lindberg

The mining process & its clean-up has never successfully prevented environmental problems before. Contaminated water still must be dealt with!! Unless PolyMet is willing to put one billion dollars up front for the eventual clean up, this copper mineral mine should not be dug. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Sharon Marquis 25 Ridgewood Rd Willington, CT 06279 US

Sharon Meister

45787

I would like you to consider not approving this project. I think the real resource that we need to covet is clean fresh water. In the future, it will truly be the most valuable and, unfortunately scarce resource. I don't see how anyone can assure us that the water used in the processing of this mine will not leach into the surrounding surface or ground water. Thank you. Jeff Meister 8540 Cain road Corcoran, MN 55340

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Sharon Root 504 Fairgrounds Rd Marshall, MS 56258

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Sharon Root 504 Fairgrounds Rd Marshall, MS 56258

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

March 7, 2014 Greetings United State Forest Service, This letter is asking you to reject the proposed PolyMet Land Exchange. PolyMet is proposing that the Superior National Forest swap 6,650 acres of high quality land in the Partridge River headwaters for lower quality land scattered throughout NE MN. The deal may be good for PolyMet but breaking up large pieces of acreage into scattered pieces does not serve the ecosystem well. This also violates the 1854 Treaty with the Ojibwe tribes. Have we not violated too many treaties already for far too long? Thank you, Shary Zoff 1651 Two Harbors Road Two Harbors, MN 55616

Shawn Beattie 6604

Dear Sir or Madam, I'm writing to comment on the proposed NorthMet mine. I live in the metro Twin Cities area, but like to vacation up north and recreate/hunt in the area as well. As citizens of this state we are extremely fortunate to have such a beautiful, natural landscape to call our own. Having lived about half my life out on the East Coast of the US I can appreciate this luxury even more because we lacked large, public natural areas that hadn't already been tainted. I realize from an economic standpoint there would be new jobs created if the mine was approved, and that would obviously be a boon to the local people in the area. But I cannot support the mine based on the risks and long-term possible complications it may cause to such a pristine area. Once it's gone or ruined, it's so difficult to get back, if at all. The company has stated they will be good stewards, but unfortunately history is not on their side. And accidents happen; just look at the rail car explosions that have happened recently, or the water poisoning in West Virginia last week. Please do not allow this mine to be approved. Thank you, Shawn T. Beattie 4742 102nd Trail North Brooklyn Park, MN 55443

Shawn Bryant 15439

Hello, I want to express my strong opposition to approval of the proposed Polymet copper-nickel mine. The potential damage to the environment would be impossible to overstate. More to the point, name a company that has been in business for 500 years. This is the proposed time period for which environmental mitigation would be required if the project is approved. Most insightful was the action of the West Virginia company who declared bankruptcy within days of spilling chemicals into the water supply for the city of Charleston. Similarly, the Wyoming pit mines which have recently been abandoned by the mining companies leaving open mines and environmental waste behind. The local benefit of a few hundred jobs lasting 20 years (at most half of the working lifetime of an American worker) does not come close to mitigating the environmental degradation and danger which would come with the proposed mine. Sincerely, Dr Michael Grouws, MD 2311 Willow Lane S. St Louis Park, MN 55416

Numerous reasons have been registered regarding the SDEIS being inadequate and I concur with those conclusions, feeling no need to restate them once again here. I am opposed to the PolyMet project moving forward as it is shocking that the state would consider permitting a project with detrimental environmental impacts that will require mitigation longer than the probable lifespan of the corporation pursuing the permit. It is beyond ironic that the same agency that would fine a taxpaying, license-buying Minnesota citizen for a minor fish or game infraction would actively encourage a foreign corporation to do permanent damage to our forests and waters to plunder Minnesota's ores simply so the agency can appease a vocal anti-environment contingent who repeatedly overstate the positives and understate the considerable negatives of this mining proposal. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Shawn Resch Woodbury, Minnesota

Shawn Roed

3565

The environmental sensitivity and public value of areas within and surrounding the proposed mining sites, as well as the disturbing environmental record of copper-nickel mining, leave no room for error in the regulatory process. A report released by Conservation Minnesota, Friends of the Boundary Waters Wilderness and the Minnesota Center for Environmental Advocacy highlights sulfide ore mining occurring in other states and countries. In many cases, despite guarantees that water quality standards would be met and efforts from mining companies to do so, unacceptable contamination of water supplies and soil resources happens over 75% of the time in and around mining sites. When contamination occurs it can be difficult to cover the costs for cleanup and remediation. Mining companies go bankrupt or fail to set aside enough financial assurances ahead of time, and taxpayers can end up holding the bill to cleanup their own community. These concerns should be taken seriously given the proximity of these mining proposals to the BWCAW, and their location within the Superior National Forest and Lake Superior watershed. This is not something that we should risk based on uncertain potential results - we have to be caretakers of our lands for future generations. DO NOT MOVE AHEAD WITH THIS PLAN. Shawn Roed 4855 Idlewild Street Duluth MN 55804

I believe that PolyMet's Supplemental Draft Environmental Impact Statement (SDEIS) is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. Wild Rice needs exceptionally clean water, and as such, is threatened by the certain water pollution that will result from the sulfide mining process. Additionally, this mine poses a threat to wildlife, including the federally listed Endangered Canada Lynx. By fragmenting its habitat, the mining is certain to negatively impact Lynx. The mining would also affect the long-eared bat, a species proposed to be listed as endangered. Eleven state-listed endangered, threatened, or special concern plant species and six state-listed animals are known to occur in the proposed PolyMet mining area. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest-the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream long after the mining operation is done. However, the assessment does not look at the extent of the affects to these many species of plants and wildlife. This is simply unacceptable. Concerning human health, the World Health Organization lists 10 chemicals of major public health concern. Of those, sulfide mining involves five of them: mercury, arsenic, lead, asbestos, and air pollution, which (again) the SDEIS does not sufficiently address the extent and impact of these chemicals. Additionally, the SDEIS does not look at the possible health impact of dust containing asbestos-like amphibole fibers because such dust is not regulated. This is clearly a health concern, as we learned in the 1970's when a north shore iron ore pit was court-ordered to stop dumping its waste containing similar fibers into Lake Superior for fear of the hazards to human health that the fibers pose. Perhaps one of the most prevalent arguments for PolyMet is the number of jobs it will create. However, these jobs are attached to severe toxic pollution, health concerns, destruction of habitat, and threats to wildlife. Instead, we should be bringing clean jobs to the Northland. The Green industry is growing tremendously and has a sustainable future (sustainable in terms of job security as well as environmental sustainability). For current and future generations of Minnesotans, all of this is unjustifiable. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Shawna MullenEardley B.A. Biology Duluth resident

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Sheila Dillon 1701 5th St SW Willmar, MN 56201-4179

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Sheila Mandell 401 E. Las Olas Blvd Fort Lauderdale, FL 33301 US

I am strongly opposed to the proposed mining operation. I grew up on the Iron Range south of Biwabik near five lakes Wynne, Merritt, Esquagama (these are a chain of lakes flowing toward Lake Superior) and near the smaller Silver and Bass Lakes. The St Louis River also winds through this area on its way into the St Louis Bay and Lake Superior. The Iron Range is a valuable water resource and sulfide mining jeopardizes the safety of water, wildlife, and people. I have also used Crane Lake, Lake Vermilion, and other smaller waterways for recreation. The state of Minnesota has long touted its "Land of 10,000 Lakes." I can't imagine the horror of sulfide mining within this kind of watershed. In this time of increasing need for water resources across the country, it is foolhardy to ruin the ample fresh water supplies here. Economic development concerns need to be secondary to the health and welfare of the landscape. PolyMet has presented information suggesting that they could contain the effluence. They are not able to predict extreme weather events, human error, and failures of technology-all of which are likely to occur. They always occur. Corporate interests must be set aside and not drive government policy in the interest of health and safety. Thank you for your vigilance in protecting the quality of life in Minnesota. Sheila Packa 2 Chester Parkway Duluth, MN 55805 HYPERLINK "<http://www.sheilapacka-com>"www.sheilapacka-com 218-393-4218

Sheila Sullivan

10237

I would like to have my voice heard: I DO NOT support mining of copper and other metals in and around Superior National Forest. I understand that jobs are important but we need to consider long term economies not a 20 year stint that may damage other business in the end. After the news of water contamination in West Virginia I am hoping more people see our wealth in terms of vital natural resources such as the water we drink and the air we breathe. These can be replenished and are seen as renewable. The amount of water we have on our Earth is finite and by poisoning it we are limiting our quality of existence. I realize Polymet has a plan to treat the water - for hundreds of years. Why would Polymet commit to such a long term agreement. And how long is long. Please explain who will continue to treat the water when Polymet is not longer in existence. Has any company lasted over 200 years. If we could replace the ecosystem and guarantee no water contamination then I would be happy to add jobs to the economy. There has been no evidence of mining where the land returns to its natural state. It is too invasive to our Earth. Please provide jobs that search for improved technologies for mining and perhaps focus on recycling and reusing of old metals. Many up and coming companies are looking for money making opportunities that also consider our Earth's resources as finite. Thank you for giving me the opportunity to express my views. Sheila Sullivan

To Whom it May Concern: I am writing to list the concerns I have about Polymet's proposed mining project. I am a public school music teacher with 25 years of teaching at Virginia High School in Virginia, MN. I have a master's degree in instrumental music education and have made the Iron Range my home since 1988- I also serve on the board of directors of two 501(c)(3) non-profit organizations in the region-The Mesabi Symphony Orchestra and the Minnesota State Old Time Fiddle Championships. I am married to a native of the Iron Range, and together we are raising two school-aged boys. The boys love their communities, their schools and their environment. Our hope is that when they return to the Iron Range after their schooling that we have preserved the legacy of clean air, clean water and clean land for them and their families to enjoy forever. I am not in support of the Polymet mining project for the reasons below. 1- First and foremost is my concern about pollution of our environment. We love the Boundary Waters Canoe Area Wilderness and we recently purchased land on Elbow Lake and built a log cabin. We value being able to hunt and fish on the lakes around our region. We have taught our boys to only eat the small fish or the plant eating fish like sunfish due to the high levels of mercury already in the larger fish. Since there has never been a sulfide mine able to pull metal out of the ground without leeching toxins into the ground water and surface water, I am convinced that no matter what Polymet says they will not be able to mine in our region safely. 2- I am concerned about current mining operations that are not meeting minimum wastewater discharge standards. What kinds of variances will be allowed for Polymet. If we can't or won't police the taconite industry, how much more difficult will it be to police Polymet. 3- I am concerned about the costly effects of cleaning up the poisoned water and soil when Polymet either goes bankrupt or gets sold to some other company. In the past, the state (that means me, the hard working tax-payer) gets stuck with the bill for the cleanup. That is not fair to burden our children with these cleanup costs. 4- I am concerned about the astronomical cost of health care for all the individuals who will develop illnesses decades later due to unsafe exposure to manganese, arsenic and mercury brought about by pollution from Polymet. This could be a huge health care crisis that, again, the tax-payers will foot the bill for. We need a company who is committed to the health of the community. I do not believe that Polymet is that company. 5- I am concerned that in exchange for polluting 6,000-8,000 acres of pristine water rich land, we are returning much less important and quite scattered lands to wetland. In my mind that is not exchanging an apple for an apple. 6- Finally, I am concerned about the Polymet's lack of support for the community in the form of giving to non-profits, especially the arts. The non-profit arts organizations that I am affiliated with have repeatedly asked for funding from Polymet for projects that bring quality live music to the underserved audiences of the Iron Range. We have repeatedly been denied this funding. The iron mining companies of the past invested in the communities, schools, libraries, etc in the cities in which the mines operated. That is why the aging Iron Range schools all have beautiful auditoriums rivaling Carnegie Hall, and why the schools have one or even two swimming pools. We don't need companies whose large corporate headquarters are states and even countries away. We need a company willing to invest in its community. I do not believe Polymet is that company. I am overall very much opposed to the Polymet mining project for all the reasons listed above. Thank you for allowing me to comment on the SDEIS. Feel free to contact me by letter, phone or email if you need any further information.

Feb 19, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Even if PolyMet offers to mitigate wetland loss by constructing wetlands or purchasing and conserving other acreage, such measures are inadequate. Newly constructed wetlands would not contain the biodiversity or carbon-storage capacity provided by intact bogs - the science and practice of wetland restoration is simply not advanced enough. Purchase and conservation of wetlands outside the 100 Mile Swamp watershed won't mitigate the impacts to ground- and surface-water flow that will occur if the wetland destruction proposed by PolyMet is permitted. Further, the drawdown and drying of peatlands that will occur if the plans proceed as proposed, will result in rapid decomposition of existing peat and a substantial release of CO₂- Lastly, the SDEIS needs to take into account not just the anticipated impacts under the current climate, but the likely impacts in future under probable future-climate scenarios. The expected changes in precipitation and temperature will impact bog hydrologic regimes (and therefore plant and animal assemblages and water chemistry. Even peatlands not directly destroyed by the proposed activities will be less resilient to climate-change impacts because of the disturbances caused by mining. Permitting the proposed PolyMet activities would be short-sighted and cause much more environmental harm than economic benefit. Sincerely, Shelby Flint 1145 Raymond Ave Apt 2 Saint Paul, MN 55108-1937 (603) 988-6237

Shelley Colvin

38762

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Shelley Colvin 2267 Walnut Ct S New Brighton, MN 55112-5014

From: Shelley Hines [mailto:pshines@msn-com] Sent: Sunday, February 09, 2014 8:37 PM To: Fay, Lisa (DNR) Subject: Please ensure Polymet's SDEIS addresses details of financial assurances I'm being told that the financial assurance section of the Polymet SDEIS does not reflect details about how much money would be required to pay for cleanup and in what form it would be held. As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for the conceivable potential period of water treatment 3) Identify other responsible parties (eg major investors) and how they will be held responsible for long-term cleanup should PolyMet be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation of what would constitute adequate treatment Thanks for your attention to these issues. As a taxpayer, an accountant, and a father, it is important to me that the people of Minnesota be protected from the risks of this mining process if it becomes a reality. Too often, corporate America is not held responsible for the long term risks of their pursuit of short term profits. I do not want to prohibit mining activity if it is determined to be a reasonable risk, but I do want to make sure that the companies profiting from it are required to assume the cost of the risks, not the taxpayers. It is the responsibility of agencies such as yours to ensure that the long-term view is taken in addressing issues such as this. Thank you for protecting current taxpayers and our children and their descendants. Shelley Hines 5540 Candy Cove Trl SE Prior Lake, MN 55372 Ph. 952-447-7298

19474

Lisa Fay, EIS Project Manager MDNR Div. of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney, US Forest Service Ms Fay, Mr Bruner, Mr Dabney: Please increase the length of the comment period from 90 days to 180 days for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS). Please also reschedule the proposed January public meetings so that they happen later in the comment period. If you can't do that, please add another public meeting toward the end of the extended comment period, such as in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Sorry, but we in the public just can't possibly read everything and be ready to speak up about the project after just a few weeks which include the winter holidays. I don't think this is fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is REALLY long, like 2,169 pages long. This is like four or five Harry Potter books, and not nearly as easy to read or understand. * My understanding is that the SDEIS is not written so that members of the public can readily understand it. It's going to take a lot of work just to make sense of what it is saying. * I'm being told the SDEIS doesn't explain some of the most important issues, and that the SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. I'm hearing that no data is provided to support the level of financial assurance proposed, and as an accountant I'm big on data. * I'm hearing the SDEIS seems to be one-sided, so plenty of time is needed for both sides to address the contents * For the public to be able to tell if the conclusions in the SDEIS make sense, the list of references will need to also be made available to the public, and time will be needed to review the source information. The PolyMet NorthMet sulfide mine proposal is very controversial, so it is critical to give adequate time for all parties to review, understand, and comment. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens will matter when the government makes its decisions. Sincerely yours, Shelley Hines 5540 Candy Cove Trl SE Prior Lake, MN 55372 Shelley Hines 5540 Candy Cove Trl SE Prior Lake, MN 55372 952-447-7298

Why do we have to keep learning the same lesson over and over again? We're promised "Pie in the sky" benefits when what it really means is a few people benefit and the rest of us pay. 500 years to clean up the results of a few years of "productive" mining? It only makes sense to those who will ultimately profit—and those who pay will suffer the consequences for generations.

I believe that the PolyMet project should receive their necessary permits to continue their goal to mine non-ferrous metals up on the iron range. I have lived here for 30 years and believe that today's processes for such a project can be done in a most protective way to not harm the water, air or land. I believe that PolyMet has meet all the necessary steps to ensure that the process is sound. I have property (a cabin) very close to the area that is intended to be mined and feel that my way of life and use of my property would not be adversely damaged. Please allow the permitting process to continue for PolyMet. Thank you. Shelley Rask | Administrative Assistant TOWN AND COUNTRY ELECTRIC (218) 741-4618 Phone (218) 741-5802 Fax

Shelley Robshaw 20120

PolyMet Mining's proposed copper nickel mine near the boundary waters is dangerous to a precious natural resource. Wild rice has already been hurt by the sulfide released into the water from previous mining. Waste water and contamination holding tanks have been proven to be unreliable. We cannot risk destroying the environment for this short term gain. The negative impacts will live on for generations. PolyMet cannot guarantee the safe performance of its process, nor can it provide the financial resources to handle cleanup activities long into the future. As supporters of the Superior Hiking Trail and the boundary waters, we ask that you do not approve this venture. Shelley and Michael Robshaw 1410 Lafond Ave St Paul, MN 55104

Shelley Strohmaier 15430

My name is Shelley Strohmaier. My address is 3800 Upton Ave S./Minneapolis/MN/55410- My husband and I also have a home in northern Minnesota, about 7 miles south of Biwabik. This issue is of great concern to us. By way of background, my father was an engineer with US Steel and played an integral role in designing and operating the Minntac mine in Mountain Iron. I share that personal information to provide context that I do not come from a general position of opposing mining. However, my reading and researching on copper sulfide mining has convinced me that the polymet mine poses an unacceptably high level of risk to our pristine northern Minnesota waters. It seems absurd and short sighted in the extreme that the state would allow a mine project to go forward that will produce only a few hundred jobs for just 20 years. In return for those relatively small and short lived gains for the Northern Minnesota economy, we risk hundreds and hundreds of years of spoiled waters. Time and again throughout the world (including sites in Colorado, West Virginia, and Montana), sulfide mining companies have destroyed the environment and failed to provide the funding required to prevent or repair the environmental damage they have caused. Please do not let this project move forward, for the sake of those of us who value protecting the environment for us and for countless future generations.

I'm writing to submit a comment on the Supplemental Draft Environmental Impact Statement (SDEIS) for PolyMet Mining's proposed NorthMet project. First, I want to express my confidence in your agency to thoroughly evaluate the project and its ability to mitigate potential environmental impacts. I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. Additionally, I'd like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out – all the more reason to support it. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country. Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. We cannot afford to miss this job opportunity. This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Based on my review and the level of detail included in the draft EIS it appears that a thorough evaluation of the project and potential impacts has been completed. Thank you Sheri Plesha Gilbert, MN 55741

Dear Reader: 1- The public deserves more time to educate themselves and weigh the costs and benefits. Please extend the public comment period. 2- Polymet's proposal to implement water osmosis treatment has been unproven on such a large scale. 3- Polymet's proposal to contain contaminated waters erroneously pro-ports that the geological underground is not fractured and therefore, a "holding" tank of some type is to contain contaminants. The geology of northern Minnesota is widely known to be fractured. 4- Sulfide mining has never been done in such a lush waterway. The mining industry has no proven track record for keeping waterways clean. 5- Polymet's promise of more jobs brought to northern Minnesota does not take into consideration the jobs lost due to lack of tourism with polluted waters. 6- Please require a health cost impact. I understand children born in northern MN already have higher levels of mercury which may have resulted because of taconite mining. 7- The proposed site is in a verdant marsh area. This land is not replaceable by a equal land exchange. 8- There is no "damage deposit" required of Polymet should contamination occur. (I do not believe that sulfuric acid can even be removed from water.) Please insist on a damage deposit. 9- By Polymet's own projections, copper contamination to fish, at its best, will be 100 X's greater than DNR's safety levels of contamination. 10- I have already chosen to go camping away from lands where preliminary drilling is said to be going on. I understand the sound of drills can be heard throughout the night. Let us preserve our jewel of northern Minnesota. It is not worth the risk of a short sighted economic boon. Thank you for reading this. I am, Sherie Bosak, St Paul, MN

Sherita Townsend

I don't think it's a good idea to mine on the boundary waters. People go there to relax and enjoy the wilderness. These waters are very important to Minnesota. Mining on the boundary waters could cause pollution. It would never be the same. Our boundary waters is more important than mining copper and nickel.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Sherrie Christian Prior Lake, Minnesota

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I am sending this email to notify you that I am not in favor of the proposed mining operation. Sheryl Huffman

Sheryl Wilson 45942

I am unable to attend a local meeting since I live in out state Minnesota, but I need to express my very negative reaction to this proposal. The environmental damage caused by this enterprise will be significantly greater than any positives this mine will bring to the area or Minnesota. 300 jobs is really just a drop in the bucket. I am so tired of rhetoric that encourages people in depressed economic areas to poison their surroundings in order to make a living. Think about what has happened in the poor coal mining areas of Kentucky and West Virginia. This is just big business preying on the economically disadvantaged for the sake of huge profits. In addition, this type of mining is environmentally unsound and has proven to be very likely to cause damage in the future. Let's not be so short sighted. We have a beautiful state here and the Boundary Waters are a national treasure. Please don't put all of that in jeopardy for only a few hundred jobs. Sheryl Wilson Sent from my iPad

Shira Brech 57184

Don't mine near the boundary waters – work towards job creation through renewable energy – we need to be moving forwards – the boundary waters is beautiful and preserves humanity and hope – protect the people, workers, and planet. Thank you. Shira Brech 3825 Aldrich Ave So Minneapolis, MN 55409

Shirley Ann Steinhagen 57180

Minnesota, the "Land of Sky Blue Water." In my opinion, we should respect and this "Land of Sky Blue Water." Contaminated streams, rivers and lakes are at serious risk to the health of all animals and our forests. Let's not forget the people who consume contaminated wild life from creatures in the water and on land. It is necessary to have a decent population of people living and raising families and having jobs to earn a living and enjoy our state. Where does this lead us if the ground and air so contaminated? It puts a risk of our resources a life for everyone well into the future. Let us not forget Lake Superior and the dangers of contamination. There needs to be a more safe way and not to rip the ground asunder. Shirley Ann Steinhagen 8738 Vinland St Duluth, MN 55810

I feel strongly we must protect our Arrowhead Region from such toxic mining. At this time I see no guarantee of safety to our water, air or wildlife. The risk is much too great. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Shonie Buenvenida 56461 180th Ave West Concord, MN 55985

Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Shonie Buenvenida 56461 180th Ave West Concord, MN 55985

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Shonie Buenvenida 56461 180th Ave West Concord, MN 55985

Dec 24, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have witnessed sulfide mining firsthand in South America. The waste-water from sulfide mining damages the ecosystem around the mine, as well as everything downstream from the runoff. Studies show there is not a possibility long term pollution, but a certainty. It doesn't belong in Minnesota. The companies that own the mines will reap the profits and then leave, forcing the citizens of Minnesota to deal with the damage to the health of humans as well as wildlife. There is no guarantee that any company will be around long enough to sufficiently correct all of the damage done, no matter what these companies promise in the beginning. However, there is a guarantee that damage will be done to the natural environment, especially the irreplaceable Boundary Waters Canoe Area Wilderness. Destroying the beauty and health of the state of Minnesota is not worth creating a few hundred temporary jobs. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Benjamin Cook 6805 Athena Way Inver Grove Heights, MN 55077-2413 (651) 492-1640

Dec 23, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The known - and unknown - hazards of sulfide mining demand that any permit granted for mining in Minnesota be conditioned on a posted bond sufficient to cover the costs of mitigating any and all of those hazards. Beyond that, the state must first be assured by all competent authorities that this project will not damage Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations. The state must recognize that the mining of precious metals beneath our surface may first require the development of new mining technologies. In this regard, would-be miners should be encouraged to contribute funding for research by the University of Minnesota and work with the University to develop those safe mining practices. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Dear Mr Bruner, Having read the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement, I have great concern about the proposed PolyMet Sulfide Mine. I do not think this project should be allowed to go ahead because of it's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. PolyMet spokes people talk of job creation, but as a resident of North East Minnesota who lives only a little above the poverty level, I feel strongly that a few dozen or even several hundred jobs are not worth long term damage to our environment. Though the economic benefits of this project are questionable, I don't think any economic benefit is worth this potential threat to our environment. Also, it's worth noting the economic benefits of metal mining tend to be very volatile leading to long term downturns and the decline of local communities. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. An additional fear is that if this project is given the go ahead, it will open the door to even bigger sulfide mining projects by Twin Metals and others. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. As far as I can tell there has not been a sulfide mining site that had not resulted in significant long term pollution. Given that runoff water from the site will need treatment for some 500 years, the chance of significant pollution at some point seems highly likely. Thank you for considering my comments. Simon Gretton 1300 E Hwy 169, Apt. 137 Grand Rapids, MN 55744 (218) 491-3713 [HYPERLINK "mailto:simongretton@gmail-com"](mailto:simongretton@gmail-com)simongretton@gmail-com

Dear Ms Fay, Since I contacted you several days ago it has come to my attention that internal DNR documents show groundwater base flow is 200-300% higher than the rate used in PolyMet's analysis. It seems that neither the SDEIS nor the sulfide mine project are based on good science. Given the extensive history of sulfide mining pollution and the potential long term threat to receiving waters, this confirms my opinion that this project should be rejected. Sincerely, Simon Gretton 1300 E Hwy 169 Apt. 137 Grand Rapids, MN 55744 [\(218\) 491-3713](tel:%28218%29%20491-3713) On Mon, Mar 10, 2014 at 3:46 PM, Simon Gretton <[HYPERLINK "mailto:simongretton@gmail-com"simongretton@gmail-com](mailto:simongretton@gmail-com)> wrote: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Dear Ms Fay, Haing read the PolyMet Mining Corp. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Simona F Minneapolis, Minnesota

Please re-write the EIS until there is more information or more examples of successful mining without long term pollution. I am thankful that there is going to be an EIS on the effects of the Polymet Mine...I only ask that the EIS take several things into mind. Think about the after effects of mining. One, the tailings and impact on the land of the unused material from this mining. Think about the total picture of the future—the sulfuric iron will seriously affect the land and water of the area, and the ecological changes that cannot be undone. In addition to the ecological changes, past mining experience, have seriously shown that the long term safety or isolation of the waste cannot be guaranteed. To preserve the waste from running into the land should be important. Put the responsibility clearly on Polymet, and think about how it is impossible to ensure 500 years of securing the waste. 10 years of mining for 500 years of after effects or possible pollution if it fails.

Skip Fay 57975

We shouldn't mine in the current proposed area. Even if you can "mitigate" risk, the current natural state is too valuable, and our water is at risk without a mine. How precious is that water? Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Feb 15, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. The SDEIS acknowledges that amphibole fibers are present in the rock to be mined, that crushing the rock for processing releases these fibers, and that these fibers are suspected of causing mesothelioma in workers. The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the PolyMet mine and plant site. A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process. Specifically, the DNR should: 1) Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length 2) Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure 3) Revise the SDEIS to eliminate inaccurate characterizations of the University of Minnesota mesothelioma study. Specifically, eliminate statements that imply that commercial asbestos is the primary risk factor for mesothelioma risk Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms solfrid ladstein 1892 Wellesley Ave Saint Paul, MN 55105-1615

41899

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms solfrid ladstein 1892 Wellesley Ave Saint Paul, MN 55105-1615

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans and other Americans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Sonia Schmerl 539 S 1st St Ann Arbor, MI 48103-4947 (734) 668-1402

Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources, which is in direct violation of the Clean Water Act. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights:

- Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines.
- Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value.
- Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes.
- Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish.
- Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected:

- The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands.
- The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense.
- The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx,

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Sonja Johnson 3000 W. River Pkwy. #112 Minneapolis, MN 55406

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. Under federal and state environmental laws and Clean Water Act Section 404, please: • Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance. • Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS. • Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions. • Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses. • Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin. • Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands. Please reject PolyMet's SDEIS as inadequate and reject PolyMet sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceable wetlands and fresh water resources in the Lake Superior Basin for generations to come. Very truly yours, Sonja Johnson 3000 W. River Pkwy. #112 Minneapolis, MN 55406

Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. The Boundary Waters are a sacred place for many Minnesotans and Americans-I urge you to ensure the protection of these lands. We have a duty to future generations and the Earth to make educated decisions regarding proper environmental treatment of our lands. People often find solance in these waters, we must protect our connection to these lands. Please STOP the Ploymet.. Sincerely, Ms Sonja Meintsma 14541 Wellington Rd Wayzata, MN 55391-2414

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: As a resident of northern Minnesota, I value the clean water and unsullied natural areas. The proposed PolyMet mine would destroy what I love most about this area. It is not a sustainable source of jobs, and it would greatly deteriorate the quality of life for human residents and wildlife, not to mention decimating the local tourism industry. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. Mar 6, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. Minnesota has already implemented the Legacy Amendment, which allocates a significant amount of its' revenues towards the Clean Water Fund. The pollution from the PolyMet proposal that would leak into ground water, and which would affect surface water will just add to the list of Minnesota's impaired waters. Additionally, the proposal includes the destruction of vital peat bog habitat, and carbon-sequestering forest. The projected 20-year use of the PolyMet mine seems cursory; considering the 100's of years that the waste water treatment facilities will operate after the mine closes, along with the time and money that will have to be spent on the restoration of the surrounding areas. In Minnesota we proudly pay extra taxes in order to protect our beautiful and bountiful ecosystems - please respect this fact and do not support the PolyMet mine, which would undermine the progress of Minnesotan's hard-earned tax dollars towards cleaner waters and lands. Sincerely, Ms Sophie Justinak 3967 114th Ln NE Blaine, MN 55449-7031 (763) 232-6128

Soua Xiong

54236

Dear Ms. Fay, My name is Soua Xiong and I am writing to you from Humboldt High School. I have heard that there is going to be a mining in the Bounding Water Canning Area (BWCA). I have not been to the BWCA, but my family is making plan to have a camping trip there in the summer. From what I have seen in the website of the BCWA, it is naturally beautiful place. I want that place to stay like that for the next hundreds generations and even mine generation to explore in the wild. Please keep it safe from pollutions and mining, even anything from destroying it. About the mining that is going to take place around that area, please I want it to be change. Even though the SDEIS drew a map that the mining won't affect the BWCA, from what I have seen, that map is wrong. The SDEIS have a wrong calculation of the map. They left out the half of the one hundreds mile swamp. That means it also leaves the BCWA completely unprotected from the acid mine. There are lacks of evidence that the mining won't goes to BCWA, but the mining will only affect Lake Superior. But the map is wrong because Langley Creeks goes to BCWA not Lake Superior. There are many possible solutions to protect the BCWA: 1. Correct the SDEIS maps and measure in the right calculation of the mining 2. Testing the water of the Langley Creek into the BCWA 3. More evidence that the mining won't affect the BCWA Please consider these possible solutions to keep BCWA protected for many years ahead of us. Sincerely, Soua Xiong

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Spencer Ludtke 1451 Juliet Ave Saint Paul, MN 55105

Clean water means more than profits Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dmiinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Stacey Bishofsky

42065

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Stacey Bishofsky Elgin, Minnesota

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Stacey Larsen

I support PolyMet and the work they are doing in the State of Minnesota. The fact the we have a local deposit of copper, nickel and PGMs of this magnitude speaks for itself. Why would we not mine these metals domestically. Since it can be done soundly and produce local jobs and revitalize a struggling economy in northern Minnesota, I do not know of any reason why our state would not want to mine these metals. As someone who works in a career in the environmental field, I have every faith that they will not harm our environment. I believe the laws in place in our state and country ensure that. As someone who's job is connected to the mining industry, mining plays a key role in keeping me, as well as hundreds of other Minnesotans, employed. Please keep the process moving forward and lets get this mine permitted. Stacey Larsen 240 Spring Street Unit 221 Saint Paul, MN 55102

The environmental impact statement which is supposed to protect the environment has a big problem. PolyMet did some revisionist geography to imply that acid drainage from waste rock piles can't flow to the BWCA because the site is on the south side of the Laurentian Divide. In fact, the mine is uphill from a wetland that exists as a divot in the divide and drains down both sides. A pretty big divot, it even has a name – The One Hundred Mile Swamp (it's actually a little over 10 miles long). This concerns me. I would like PolyMet to do more testing on the flow through the swamp to ensure BWCA is safe. Thank you. Staci Revers

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Stacie Groll 200 W Sterne Pkwy Apt 109 Littleton, CO 80120-3852 (720) 583-6330

Stacie Whaley

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, stacy chladek-doyle 18n 2nd st pleasantville, NJ 08232 US

Again, my name is Stan Paczynski. I'm a business representative for the Brick Layers and Allied Craft Workers. I represent about 2,800 people, working people. I'm here in support of the PolyMet project. For one, I trust in the numerous agencies and facilities that have done their homework and their due diligence. And I have my full trust in what they do. Not only in the jobs and economic stability to the area I think we need to rely on our people doing their job, again, with the agencies and the government entities that are doing the permitting processing and have faith. I look forward to the process going forward as a safe process. It's a construction project if the work goes through and to bring some growth and economic stability to our Northeastern Minnesota.

My name is Stephanie Digby. I live in St. Paul. This is just a very brief comment. I will be writing further. I have discovered that in the reclaimed water and in the whole reclamation process microorganisms have not been considered. I have a doctorate in botany. I have studied algae and microfungi that inhabit only the water. They are environmental indicators and they are also necessary for the health of the water and the water system. They are the start of the food chain. I have been told this has not been considered. I will be writing to you with suggestions about how to do an evaluation. Thank you.

Stephanie kRawn

5984

Dear Sir: This morning I listened to the Public Radio program about the mining project you are proposing near Aurora, Minnesota. It appears that people who are concerned about the project oppose it because of water issues. Wouldn't it be prudent to try to resolve those issues by researching ways to not contaminate the water system. To me it comes down to big business vs the average Joe. At what point does big business take over the course of our lives and what can we do about it. I would prefer not to have this battle. Please find a way to help the water system in Northern Minnesota remain pure for those who use it AND be able to extract the various minerals you need. I apologize for the money you have already sunk into this project, but the well-being of Minnesota residents should also be considered. Thanks, Mrs Stevie Rawn St Paul, MN

Stephanie L Carlson

57148

The PolyMet's mine proposal would not be in the best interests of the people or land of Minnesota or the greater region, were it to go through. We cannot afford the environmental degradation and water pollution that would ensure. Our precious resources of water, particularly, along with forest and wildlife, are irreplaceable and are worth far more than any short-term profits to be gained by sulfide mining. The trade-off is not worth it, and the damage inflicted could, I believe, not be undone, resulting in great loss for all of us, for generations to come. Stephanie L. Carlson 4414 Robinson St Duluth, MN 55804

Stephanie Onorat

18250

Stephanie S-T-E-P-H-A-N-I-E, Onorat, O-N-O-R-A-T. I moved to Minnesota in 1998, with all its pristine beauty and the fact that the residents appreciate and enjoy. In regards to the focus of the evening, the PolyMet proposed sulfide mine, I will preface my remarks with a quote from the union of concerned scientists because it is so apt. "Politicians and lobbyists have exaggerated scientific uncertainty to delay actions that would protect the public from tobacco, pesticides, the ozone hole and acid rain. When people believe the science is not settled, they are less likely to take or demand action. Who benefits from the uncertainty? Big business." In this case, big business is PolyMet. PolyMet's initial environmental impact statement was so vague that they were requested to provide another one, which is somewhat more substantive. Nonetheless, the risk of benefit analysis is essential here and the scarcity of facts at Minnesota's disposal, as well as the ones we do have, dictate the rejection of the proposed mine. Under the risk-benefit analysis, the risks, fact one would be sulfide mining is toxic. It will result in environmental destruction, loss of wildlife, habitat, economic loss, and water contamination for possibly 500 years. The flip side of the risk-benefit analysis, the benefit, as we know at this point, can only with certainty be said that PolyMet stands to benefit from this transaction. They will make their fortune and move on, leaving us with currently unquantifiable damage because the flaws in their environmental impact statement have not yet been alleviated. I would note that PolyMet has not committed to establishing a trust fund with millions of dollars in it so Minnesota can monitor its water for the next 200 to 500 years, which appears to be a certainty. And finally, there's simply a lot of lobbying going on here. Let me end with a quote from the union of concerned scientists in that regard. "A UCS-commissioned study by The Center for Responsive Politics found that prescription drug, biotechnology and medical device companies spent more \$700 million lobbying Congress and the White House between 2009 and 2011. In 2012, Congress gave these industries more say in how prescription drugs and medical devices are approved." Don't allow PolyMet's aggressive attempts to influence, override Minnesotan's common sense.

Stephanie Onorato

9627

I attended last evening's Public Comment Hearing at the St Paul River Centre and was disappointed that I was not chosen to speak (although I did put some remarks on the record with a stenographer). I'm sure it was a misperception on my part, but it did seem as if 2 out of every 3 speakers chosen by the lottery system represented some business enterprise that stood to gain from approval of the PolyMet sulfide mine. At any rate, I have some additional comments post-Hearing. The first is actually a question: What does the government stand to gain from this transaction. Is PolyMet going to pay us for this opportunity, if granted. Or do we simply give them carte blanche to come, destroy the environment and then leave us with a gaping hole in the ground and rampant toxicity, not to mention other deleterious environmental effects. Have they agreed to put millions into a trust fund for Minnesota's use so we can monitor and possibly clean-up pollution for hundreds of years after they are long gone. If that premise is correct, is the justification the few hundred jobs PolyMet will create for a finite period before the copper and nickel supplies are exhausted. Some speakers were proponents of job creation in the Iron Range / diversification but this proposal does not address the issue. The Iron Range economy was based on mining and this is a continuation of the same. If the government is serious about diversification / job creation there, monies need to be invested in technology and training for those jobs, because they have a future. Finally, there was discussion about the "land-swap" that PolyMet has so generously proposed. I believe the terms involve the government relinquishing control of prime land situated in National Forest (or close to it) for land somewhere - no mention of where. Is it in a swamp. Is the value even remotely comparable to what is being given up. What will be the effect of a full-on mining operation in the middle of pristine forest. At the very least, destruction of habitat, interruption of the life-cycle and feeding/migration habits of wildlife, pollution and NOISE from constant drilling and trucking in the midst of our quiet space. This proposal is a travesty. Only PolyMet stands to gain long-term and the self-serving businesses linked to PolyMet's fortunes. There is no track record for PolyMet - only talk; apparently, their second EIS is also flawed. Let PolyMet experiment elsewhere before destroying what is Minnesota is known for.

38882

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Stephanie Onorato 31520 White Rock Trail Welch, NJ 08033

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. . Sincerely, stephanie sharp 2763 128th Ave NW Coon Rapids, MN 55448-1162 (763) 757-4951

Stephanie Summers

40119

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. Any plans that rely on keeping systems to protect the environment in place for hundreds of years seems unrealistic if not practically delusional. The mining companies almost never keep their promises and cut corners at the first opportunity. What happens when the company goes out of business or is bought. I sympathize with the need to improve the area's economic picture but this plan seems inherently flawed. This kind of natural environment is fragile and must be preserved for the enjoyment and use of all humans and for the welfare of our brother and sister beings now and in the future. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Stephanie Summers 743 Parkview Ave Saint Paul, MN 55117-4045 (651) 488-8528

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I AM GIVEN TO UNDERSTAND THAT CORPORATIONS ARE LEGALLY PEOPLE- THAT BEING THE CASE, THIS CORPORATION/PERSON IS, BY ITS TOXIC ACTIONS, CARRYING OUT A SLOW FORM OF SUICIDE-BY-POISONING-ITS-HOME.. SICK, SICK, SICK.. AND PROFOUNDLY, HEINOUSLY SICK IN THAT HE/SHE/IT IS NOT ONLY KILLING ITSELF SLOWLY, IT IS ALSO, IN THE PROCESS, KILLING ALL WITHIN RANGE OF ITS WEAPON OF CHOICE. STOP THE POISONING OF OUR HOME IT IS PATHOLOGICAL, SICK, TRULY INSANE. ALL OF OUR CHILDREN WILL BE SUBJECTED TO THIS POISON, SICKENED AS WELL, AND THEIR CHILDREN, AND THEIR CHILDREN, FOR GENERATIONS. STOP THIS MADNESS. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Stephen Bailey 4778 Edward Dr Deming, WA 98244-9415

Feb 17, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). It is lacking vital information about long-term water treatment and how it will be paid for. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest, which we own and should not surrender. More than 900 acres of wetlands will be directly destroyed by the mine. The SDEIS proposes no mitigation for the indirect wetland impacts. Additional toxic metals such as mercury, copper, and nickel that are not captured for treatment will damage aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Mr Stephen Dahl 36 Diane Dr Kingston, RI 02881-1213

Stephen Greenfield

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I realize that metals have to be mined somewhere, but sulfide mining inevitably leads to heavy metal contamination, and should never be done in a place like the boundary waters that is so connected to multiple major watersheds. The revenues look tempting, but the amount of time that we will have to manage the pollution and its costs clearly dwarf any benefits. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Stephen Greenfield 3429 Girard Ave S Minneapolis, MN 55408-3818 (612) 825-6202

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Stephen Hamre 22090 Ethan Ave Forest Lake, MN 55025

Dear Ms. Lisa Fay, EIS Project Manager, I believe that the Polymet Mining Inc.'s plan to extract copper, nickel and platinum group elements will greatly affect Minnesota, both positively and negatively. The economy of Minnesota, I think, will benefit from the surge of job opportunities and the addition of a new mining branch. The disadvantages, however, seem to outweigh the advantages. First, six endangered or threatened species will be affected by the mining operations. Some species, such as the Canada lynx, will be directly affected by noise and possible habitat destruction. Others will be indirectly affected. Eleven plant species will be affected by the mining operations. If these species aren't protected then they will possibly go extinct. Secondly, air and water quality will be reduced. During mining sulfur dioxide and other gases will be released. The gases will be released throughout the entire processing of the material. Dust will reduce visibility, taking away natural beauty from the surrounding area. Mercury could also be found in small amounts in the tailings pit. If this were to contaminate the water, then there would be a significant loss of plant and wildlife. Copper, cobalt, and nickel could also be released, all of which could affect the water-based organisms, if they were allowed to enter the water. Thirdly, a great number of cultural resources will be affected. Although the Sugarbush camp area will not be affected, other nearby resources will be. Parts of the Laurentian Divide will suffer damage. The Divide has been sacred to the Ojibwe people for centuries. The Erie Mining Company Concentrator Building will be affected due its proposed refurbishment and use. The mining will also happen on land that was ceded to the United States by the Bands under the 1854 treaty. This reserved the right for people to hunt, fish, and gather on these lands. With mining operations affecting wildlife, the damage is unknown. Finally, reclamation of the lands may leave them permanently damaged. Deconstruction of buildings will be time consuming and cost lots of money. Hazardous materials will need to be correctly taken care of otherwise the surrounding area will greatly suffer. Storms have the potential of washing pollution off site. These are just some of the many disadvantages that may come as a result of Polymet Mining Inc.'s plans. I hope I have been able to shed some light on this matter. Sincerely, Stephen P. Jorgenson Jr.

Lisa Fay, EIS Project Manager Minnesota Department of Natural Resources Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Re: Comments on the NorthMet Project Supplemental Draft Environmental Impact Statement (December 2013) Dear Ms Fay, I am writing to submit my comments concerning the NorthMet Project Supplemental Draft Environmental Impact Statement (SDEIS). I am opposed to the proposed project of Polymet Mining Inc. for all of the reasons outlined in the Comments submitted by the Friends of the Boundary Waters Wilderness yesterday. (See 3/12/14 Letter from B. Daub to L. Fay.) I write additionally to emphasize my personal concern over the project's grave threat to Minnesota's clean water. Preserving clean water and sources of clean water will be one of the greatest challenges of the 21st century, as global and North American demand for fresh water will completely eclipse the supply. Long undervalued as a supposedly inexhaustible resource, both the economic and societal value of clean water are predicted to skyrocket in the coming century. That is one of the reasons that the Polymet project is so concerning. Even with its current scarcity and concern over the environment, the prospect of a project that would impair our clean water resources for 200 to 500 years is significant. But with the coming global water crisis quickly approaching on the horizon, the potential costs of this project are incalculable. I hope that the Department of Natural Resources will give this project the type of scrutiny that is required, and that it require whatever protections are necessary to protect future generations. Sincerely, Steve Safranski 6552 Cherokee Trail W. Eden Prairie, MN 55344 952-303-6768

Stephen Rossiter

44170

Stephen Cary Rossiter 74 West Golden Lake Road Circle Pines, MN 55014 Comment on PolyMet SDEIS – 2/28/2014 Dear Federal and State Agency Leaders: I ask you to reject the SDEIS for the proposed PolyMet mine on the basis of deeply concerning issues, from false modeling assumptions to inadequate financial assurance, that I will describe below. But first, I feel I am fairly well qualified to assess this issue. I've just received a master's degree in biology, which has impressed upon me the great potential influence that using false assumptions can have on modeling efforts. Also, I have had several seasons of ecological field experience as well as college courses in chemistry and geology. Furthermore, the proposed mine and its effects could affect me. I live in Minnesota and usually travel in the St Louis River watershed once or twice each year to relax, recharge, and hone my professional skills (botany, ornithology). Also, my, and my children's, future tax dollars could be much better spent than cleaning up this pollution if PolyMet goes bankrupt after they finish mining. I have no reason to trust PolyMet, and it seems that I am being asked to trust the word of PolyMet for several parts of the SDEIS. Given the great and long term potential consequences to wilderness and public health, trust is not something I'm willing to rely on. Certainly not when PolyMet's main motivation must be a return for their investors. And certainly not when PolyMet appears to be structured so that, besides this project, it has no other assets that could be recovered in the event that something goes wrong or cleanup costs become greater than planned for with the financial assurance package (compared to Glencorp owning the project directly). Issues: The public (ie the financial assurance program) should receive much more money up front. On page 3-66: "Long-term maintenance of the Category 1 Stockpile would include repairing erosion and removal of woody species and trees from the stockpile cover system." Is this maintenance included in the planning of the financial assurance package and how many years is "long-term". Any effects of pollution would be felt the most by underprivileged peoples. Both Native Americans and low income people rely on a clean natural world for food and water. It would be unjust to force them to accept the risks while others receive the financial benefits. Most economic benefits would go abroad while Minnesotans get a few low paying jobs over a few years but the permanent potential for pollution. Furthermore, due to carcinogenic nickel dust and other toxic metals that would be present at the sites, I ask that the Minnesota Department of Health do a Health Risk Assessment for the safety of mine workers, which so far this has not been included in the planning of this project. The SDEIS contains inadequate quantification of unintentional seepage from the mine site that could make its way beyond the mine perimeter thru the groundwater. Not only that, but in general, northern Minnesota is a very water rich area and attempting a project that requires containing and managing all that water to prevent unacceptable pollution seems foolhardy. I'm told that, of other projects in water rich areas with EISs that claimed there would be no water pollution, 89% of them ended up polluting. Relatedly, estimates of the rate of groundwater flow used in the SDEIS seem to be inaccurate and underestimated. A recent map of fault lines in the project area suggests there may be more routes for groundwater to move thru than acknowledged in the SDEIS and that there may be a greater threat to any aquifers below the site. The SDEIS says on page 4-47 that at the mine site "the hydraulic connection between surficial aquifer and underlying bedrock underlying is weak." But that assertion is not quantified in a meaningful way. Does "weak" mean effectively zero, or, overtime, will the polluted seepage add up to a significant level

Stephen Ryan

36511

To MDNR: I support the PolyMet project, it is good for Minnesota. This is our chance to have a first rate mine in a location that has the most qualified workers with the knowledge and experience to do nonferrous mining. The State Of Minnesota has laws and regulations that will require the owners to meet or exceed these regulations. We have an opportunity to do the mining in Northern Minnesota where we have done mining for many generations and would do it the right way. In reading the SEIS it looks like science says it will work so why would we not do it. This is a opportunity for Minnesota to show the rest of the Nation how to do this type of mining the right way. I ask for your approval so PolyMet Mining can go forwaRd Thank You Stephen Ryan 2829 Timberline Dr Grand Rapids Mn 55744

Stephen Snyder

46084

Dear Sir/Madam: I have followed the public discussions and have reviewed a copy of the SDEIS for the proposed PolyMet mine project in the Lake Superior watershed. Please accept these comments about that Supplemental Draft. 1- The SDEIS does not adequately address a scenario wherein the party that proposes a major mining project has never before operated a mine. PolyMet is a company that has never generated any revenue or income let alone operated any mine. It is just a front organization for the foreign money that is behind this project. That scenario requires particular scrutiny. The assurances made by a front organization should be given no weight. No business would ever be satisfied with assurances received only from a straw purchaser. The environmental review should demand commitments from officers of the actual companies that will be operating this controversial mine. 2- The SDEIS does not adequately address the material risks that are presented by the proposed mining of base minerals from sulfide-bearing ores in the wet environment of northeastern Minnesota. Models based on copper-nickel mining in dry environments have no application here. This issue is particularly important because the SDEIS is based on inaccurate projections of surface water flow. Exposure to water is the number one risk here, yet the SDEIS itself in its current form only addresses this issue within its margins of error. There also has been no attempt to study the actual ground water flows below the proposed tailings pond. 3- The SDEIS does not adequately address the impact on the nearby Boundary Waters Canoe Area Wilderness if the ground waters in part will leach in that direction. There is no impenetrable barrier at the continental divide. Since the route of the ground water flowage is only approximated from the surface flows, the SDEIS fails to adequately address other potential consequences. The wilderness character of the BWCAW is a fundamental asset to Minnesota and any potential impact on its watershed must be thoroughly addressed. An after-the-fact "sorry, we didn't know," is no substitute for a detailed map of the actual ground water flows below this site. 4- The long-term maintenance required during and almost forever after for this proposed mine presents an impossible modeling challenge. The SDEIS offers no adequate method to accurately project political upheavals, economic collapses, population changes, epidemics, climate change, wars, and the inevitable but unknowable other changes that will occur over the next 200 – 500 years. Can we model such an extended future any better now than Christopher Columbus' staff could have done when they set foot on Hispaniola to set up mines about 500 years ago. The agencies may be able to model the next 50 or maybe even 100 years with some confidence, but it is ludicrous to think that anyone could prepare an adequate model to predict how the massive byproducts of this proposed mining project will be maintained for the next 500 years. If we cannot model the future for this type of mining project, then how can we evaluate the future environmental degradation that will result from this project if it is approved. 5- The agencies bear a particular burden here to objectively evaluate the potential environmental issues from this proposal to extract minute quantities of minerals from sulfide-bearing ores. Proponents for this mine have loaded the record with their arguments based on reminiscences about growing up in ferrous mining communities. Politicians have also jumped on the "jobs" bandwagon with rhetorical flourishes. My own grandfather emigrated from Europe at the turn of the last century to work in the iron ore mines in Ely while my mother's inheritance from her grandfather's holdings in Pennsylvania coal country paid for her education and that of her siblings, but none of that has anything to do with a proper environmenta

Stephen Talty

17507

Ms Fay, I wanted to convey my concern over the plans for a sulfide mine in Superior National Forest area. We have enjoyed this area of the country for years, coming to hike, ski and fish. The potential for the long term destruction of the area is a huge concern for us. As you are fully aware of the hazards associated with this type of mining-hundreds of years of pollution and destroying of ecosystems and water supplies, please know that we hope this project will not move forward Minnesota is one of the most beautiful of our states and the vibrant natural resources should not be ruined all for the almighty dollar. It is not only the topical effect that concerns us but the water supplies that trickle down toward the Great Lakes where our water source comes from that is of concern. To risk contamination of water supplies that will affect so many people in so many ways-from abundance of wildlife to fishing to drinking water is irresponsible. Please prevent this. Respectfully, Kiv Talty 2403 Saranac Lane Glenview, IL 60026

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I'm wondering how these issues are being addressed. Sincerely, Stephen Wlosinski 1121 W Morgan St Duluth, MN 55811-4446 (218) 726-1911

Steve Adams

41841

Dear Environmental Review Unit MDNR Division of Ecological and Water Resources: We cannot believe that the DNR is even considering a project that will contribute toxic metals and sulfate pollution to the St Louis River watershed - for 500 years. The threat that this project poses to the environment, wild rice, and non-mining-related uses of the land should be enough to nip it in the bud. The mining industry's record of evading its fiscal and environmental responsibilities is shameful. The recent chemical disaster in West Virginia indicates what is bound to happen when public protection of water systems fails and private industry leaves us all with a toxic mess. Stephen and Barbara Adams 3351 Red Oak Lane Barnum, MN 55707

Steve De Bock

18201

Hello, and thank you for the opportunity to speak to you tonight. I came here tonight not with the intention of speaking, actually. I wanted to listen and hear what things are to be said. By the way, my name is Steve DeBock from Duluth, Minnesota. Currently, the director of manufacturing at a company called GPM, Inc. We are a heavy-duty submersible pump manufacturing company and provide pumps throughout the country, Canada, and we've even got some internationally outside the US. Along with our pump, we also manufacture a motor to go with it, and we all know Motor State Copper, so it's -- this is very important to us, and PolyMet is very important to us. I'm listening to a lot of people talk here tonight, and they're giving people a hard time about ceding their time. I'm not as eloquent of a speaker as most. I've never done this before, so please be respectful of when people do cede their time to somebody that has something that they want to say, be prepared -- be polite to them. Anyhow, I'm here to state that GPM currently is a vendor of PolyMet, and we fully support the study they've done, EIS, and we support everything that has been said about it to this point. We think that it's been done in a thoughtful, careful manner. It has taken a very long time to get to this point. We've been at this now for nine years, plus, and we wholly endorse this process and we believe in the science that's behind it, but we appreciate the time and effort that was put in by the DNR, the EPA, and fully trust in them to make the right decision. Only here can we sit in this state and make this process that we have and give people on both sides who sit next to each other and voice our opinions, so it's very much appreciated that that's allowed. And again, I apologize. I wasn't prepared to speak tonight. Maybe, if I would have been thinking ahead and known instruments were allowed, I could have brought my trombone with and broke out in a little song for everybody. Anyhow, I'd just like to sum up by saying that we fully support the process. We believe it can be done. That's one thing, I guess to touch on that, I hear a lot people saying it can't be done. Copper-nickel mining can't be done safely. We didn't get to where we're at in this country by saying we can't do something. There's a way to do everything. You just have to put the proper time into doing it properly and make sure it's done properly and safely. I believe that they've done that to this point, and we're ready to move forward. Enough is enough with this. We need -- we need to move on and to get this thing done. It's going to be great for jobs our economy in Minnesota, Northeastern Minnesota, Minnesota in general, and the whole nation, quite frankly. Let's put this thing behind us. I urge everybody to get behind this and finally let this thing go through, here. And again, I apologize for myself, I was not prepared to speak. Thank you for your time.

Steve Debock

18359

My name is Steve DeBock. Thank you all for the opportunity to speak to you tonight. And I appreciate the ones that have strong enough buttocks to still be here listening. D-E-B-O-C-K. I am currently the director of manufacturing at GPM. We reside here in Duluth. We are a heavy-duty commercial pump manufacturing company. We currently employ 60 people. In addition to the pumps that we make we also manufacture our own motor to go on them. And obviously anybody that knows motors knows they take copper and lots of copper. I'm here tonight to state we totally support and endorse the mining processes that are planned by PolyMet, and believe they will build and operate a mine that will comply with all the regulations and protect the environment at the same time. We embrace this project because of the hundreds and hundreds of new jobs that PolyMet will create either through direct employee instruction or new jobs with their vendors like us. This project is good for our region. I believe it's good for Minnesota. And quite frankly, I also believe it's good for our national economy. A lot of questions and challenges have been placed in front of PolyMet since they first announced their plans for precious metals mining in Northern Minnesota. They have answered and completed every one of them. In fact, they have done far more than what was asked of them to ensure the processes were safe not only in the short term but the long term as well. Anyone that says we cannot do this is wrong in my opinion. This country was not built on people saying "it can't be done." It can and it can be done safely. Management and directors at GPM believe that the EPA, MEPA, and Army Corps of Engineers that they have taken a diligent approach in examining the sciences and the processes that will be used by PolyMet. And we believe these processes will not only be safe but also carried out in a responsible manner. It would be irresponsible to disregard the time and effort put forth by PolyMet to ensure we can mine safely right here in Minnesota. For that reason GPM and it's employees fully support the EIS and its conclusions. We ask that you join us in supporting the issuing of the required permits and allow PolyMet to finally begin operations. Thank you.

For the sake of brevity I would like to raise two objections to the SDEIS in its current form. 1) The Canada Lynx is federally listed under the Endangered Species Act. The SDEIS acknowledges that the project will reduce lynx habitat and kill individual lynx through accidents etc (see Chap. 5). However, it claims that since the whole population in the mine area (perhaps 200 or fewer animals) wouldn't be lost but rather just a few, there is no problem. However, decades of conservation work around the world indisputably show that loss of habitat causes species to go extinct. A stray animal hit by a truck here and there is not so much the problem as the removal of habitat. I would also add that the area in question is home to an already at-risk population of moose. Moose, of course, depend on wetlands, some 8,000 acres of which will be destroyed. Promises of restoration, even should they be reliably fulfilled, will not come nearly in time to mitigate the destructive effects on the moose population. 2) The SDEIS is explicit (Chap 5-122) about pollution of the Partridge River continuing to be problem "in perpetuity." That is, forever. How can we possibly believe that Polymet will be able to take responsibility for treatment of this pollution in that timescale. In view of these two concerns alone I ask that the SDEIS be redone to include an analysis of alternatives to species loss through habitat destruction, and a credible plan for mitigating ongoing pollution over deep time. Respectfully, Steve Lechuk 3943 Bryant Ave S #9 Minneapolis, MN 55409

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Steve Gildersleeve 3789 PARKWOOD LN Vadnais Heights, MN 55127 US

I own and operate a canoe outfitting and retail outdoor store in Ely, MN. We service wilderness travelers going into the BWCA and Quetico Park. We have a number of concerns about the copper nickel mining proposals; 1- Protecting Minnesota citizens from future adverse effects of mining on environment with financial assurances, ie insurance policy, is critical. Requiring assurances to safeguard against company filing bankruptcy after damaging the environment is critical. Copper/nickel prices will rise and decline over the lifetime of this mining project. Mining companies have used bankruptcy as a business strategy to walk away from their failure to mine responsibly. As a tax payer, I do not want to pay for their mistakes. 2- What contingencies are or will be in place for major catastrophic failures in the mining process. If water processing fails, water holding ponds leak, electrical supply is offline for an extended period what is the action plan to protect the environment. Looking back 40 years to how Judge Miles Lord handled the Reserve Mining Case showed the company had legal contingencies in place well before any legal decisions were made. If the court implemented an action, the company already had figured out what it would do. Case in point was Judge Lord ruled the company to close. Within 24 hours Reserve was open and doing business. It appeared the Federal legal team had not planned out their response or next steps. The company had. 3- Is Minnesota mining policy and regulations sufficient to handle adverse mining effects 20-30 years from now. To think that policy and regulations of 2014 are all that is needed is short sighted. Processes change, markets change, unforeseen issues develop. How will our regulatory agencies handle these changes or future developing issues. 4- The BWCAW is a state and national treasure. Maintaining water quality is critical. Is the current technology, ie reverse osmosis, sufficient to handle any sulfide runoff. 5- No information has been included in the SDEIS concerning the epigenetics of increase consumption of sulfides, copper and nickel on local populations due to emissions and releases into local water system. I am not against mining near the BWCA as Minnesota and the local economy needs the jobs and increase to the tax base. However, mining responsibly is crucial. I want my granddaughters and their children to experience the BWCA similar to how it is today. Having financial assurances, contingencies in place to act if environmental damages start, and regulatory agencies ready to act in a timely fashion is needed. Best regards, Steve J. Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Public Servants and Caretakers of our Environment, Thanks for the good job you do in serving the public, and in protecting the environment for generations to come. Briefly, here are my comments regarding the proposed mining up north by Polymet. It is absolutely immoral to even consider allowing companies to place a mine near a wilderness area, solely for short term profits, and pollute our earth and water in the process, a long term consequence. Creating jobs is not a good justification; jobs can be created by wind farms, solar power, and many other sustainable industries that benefit the environment instead of destroying it. Of all of the many horrible things happening in the world, this ranks near the top of the liSt. Thanks, Steve Jorgenson 36901 Xenon St NW Princeton, MN 55371

PolyMet will "install and operate a system to capture at least 90 percent of the groundwater seepage at the proposed tailings basin and the permanent waste rock stockpile." Figures of untreated groundwater release have been estimated as such: 10 gallons per minute of untreated water at the mine site and 21 gallons per minute of untreated water at the tailings site during closure. How will this seepage of untreated water (up to 10% of total discharge) into the groundwater effect the potability of groundwater for surrounding residents, flora and fauna, including those in the connected watersheds. What type of groundwater contaminates would be introduced into the environment. Have there been longitudinal epidemiological studies of how they effect human and wildlife populations. I believe that the environmental impact statement that has been drafted is shortsighted. In the terms of potentially doing permanent damage to our environment, I believe that any amount of discharge of waste into the environment is unacceptable, both from the standpoint of a resident of Northern Minnesota and a person who survives off of natural resources from the region. Thank you for hearing my comments. Steven Karels 602 E 5th St #602 Duluth MN 55805

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Steve Kippen 11178 330th St Onamia, MN 56359-2172

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Steve Koschak PO Box 397 Ely, MN 55731

Steve Koschak

57335

My name is Steve Koschak, K-O-S-C-H-A-K, from Ely, Minnesota. I am a business owner in the town of Ely, a tourism-based business. I've been in business for 38 years. My business depends on clean water, clean air, a clean environment, and I am worried about what is going to happen with the advent of this sulfide mining in northern Minnesota in the lakes region. The SDEIS, in my opinion, fails to address a number of issues. First of all, permanent water pollution, not only will it be 500 years, but basically to the end of perpetuity, but water pollution from sulfuric acid and heavy metals is indicated. But in addition, not all of the polluted water will be captured for treatment. This is what PolyMet calls minimizing the water pollution in their marketing rhetoric. How is the SDEIS going to address using an antiquated tailings basin which is a leaker? Ten percent of the volume of water that there will be, the waste will not be going into any type of discharge pond. It will not be reclaimed. It will be let go out into the environment. Basically, if there were ten people standing in line to use the bathroom, the tenth person, his waste would go out on the ground. In essence that's what it is. Ten percent of the water is going to be wasted; not treated. A very discerning fact. Why does the SDEIS not provide a solution to this situation? Secondly, there is no plan for events or failures of PolyMet's water treatment system. It provides no details for what happens in the event of catastrophic accidents or failure for the system to operate for 500 years, during which polluted water is discharged. Daily operations are planned to treat some 6.2 million gallons of water daily. What is going to happen with broken pipes or tailings basin and human errors? What about an employee falling asleep on the job or not being attentive, and all of a sudden we have a major catastrophe. This mining plant is designed for a 100-year storm, and given the climate change, this design is lacking at best. Scientific studies suggested this facility should be designed for a 500-year storm. A 500-year storm is now occurring almost as often as a 100-year storm. The SDEIS provides no assurance or details on the impact of water quality, on wildlife or on human health if the treatment system fails or there is a breakdown, which is inevitable. I have another concern about the water quality analysis and how the samples and the studies were done. One of the water quality testings that they did was done in a dry season. There was very low water flow and they based their figures on low water flow, one of the lowest in decades, and this is what they based their study on. So, we'll have outflow from the water flow and waste not being adequately adjusted to reflect normal water conditions. Also, there is a lack of information regarding mercury contamination of fish and ultimately methylmercury in humans. There is an area of homes near to six operating taconite mines and there's already an alarming concentration of mercury and other pollutants. Every one of our taconite plants is presently operating under variances; basically a permit to pollute. I am afraid that with this copper mine we are going to have more of the same; a license to pollute. There is a lack of alternatives to the probable permanent destruction of some 8,263 (phonetic) acres of land, with some 918 acres being very high-quality irreplaceable wetlands in the St. Louis River watershed. There is no plan to compensate for thousands of acres of wetlands that would be indirectly harmed. The trade that is to take place with the Land Exchange will be a violation of the Weeks Act (phonetic). The Weeks Act (phonetic) was established to prevent open pit mining on federal land, and this land being the Superior National Forest. This trade and this exchange is going to be setting a precedent to other mining industries across the country, not only in the northern part of Minnesota, but anywhere in the United States where

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, steve markus 3976 gateway dr Greenbelt, PA 19104 US

Steve Morse

18173

Hello. I am Thomas Leaf from Center City, Minnesota. And I am giving my time to Steve Morse. Good evening. My name is Steve Morse, M-O-R-S-E. I am the executive director of the Minnesota Environmental Partnership, a non-profit coalition of 70 environmental conservation groups in the state of Minnesota. First, I would like to thank the DNR and the other agencies for running a great open and respectful process with these meetings. However, let me say I'm very concerned about the other parts of the process for the SDEIS. The 90-day comment period is simply inadequate for the public to really understand this project. Many people have already given up trying to figure out all the ins and outs of it, and instead are falling back and saying, "We trust the agency. It's too complex. We can't figure it out. We trust the agencies." That is not real public participation and a public process. Without 180 days this process is flawed. Secondly, there are a number of serious outstanding issues. I just want to touch on a couple of them with the SDEIS itself. First, the planning for accidents and emergencies. There is a complete lack of backup plans from if something goes wrong with the tailings piles and basins, the pumps, the pipelines, the filters of the water system that needs to operate for hundreds of years. Surely we have learned something from the oil wells erupting in the Gulf of Mexico, chemical tanks contaminating drinking water in West Virginia, and oiler-tanker trains exploding on the North Dakota prairies. None of this was supposed to happen. None of it was planned. Yet it did occur. Second, the SDEIS relies on unreliable water modeling, including the flow of water that will be treated and the time frame for continued cleanup of the water from the mining. The truth is there is no end plan for when the mine will not require cleanup. Again, there is no end plan. PolyMet indicates it will continue to clean up the water for as long as it takes, forever if necessary. They acknowledge that they really won't know the duration of the pollution until they are already mining. This is not an adequate response, and as a result the SDEIS does not present adequate information to fully assess the environmental impacts that should be (inaudible) in order protect the environment. I spent four years as a deputy commissioner of the Minnesota DNR overseeing the environmental review process. This environmental review process was one of my responsibilities. It is clear that the science that these studies are based on is very important, and tremendous effort has been put into this project. Sometimes an EIS presents a very clear picture. Other times not so clear. Major issues might be left outstanding and unclear and unanswered. In the end it is the leaders of these agencies before us that will be faced with the judgment call to determine if this SDEIS is adequate. And, yes, there may be loud political voices urging you to forge ahead and move this project to the next stage. But most Minnesotans aren't ready to go there. Given the many shortcomings, uncertainties, and unreliable data (inaudible).

Steve Olinger 43514

Steve Olinger 25 Deer Hills Drive North Oaks, MN 55127 While I understand and would hope for job creation in Northern Minnesota, I am concerned about how much we would be sacrificing to supply them. Looking at the mining proposal from PolyMet there are serious concerns: 1) There are no copper-nickel mining operations that don't have serious water pollution problems The Flambeau mine used as an example is really not a good example. It was a much smaller operation that did not stay in business and did have problems Other copper-nickel mines have serious problems 2) While there is an attempt to provide financial assurance, it does not seem realistic. Even the large amount of money designated does not seem sufficient to insure that water cleanup (even if the water treatment plant continues to work) would continue for the decades required. The public would be stuck with the bill. I do not see that we should grant the proposed permits.

Attached is a letter from Steve Rush regarding the above matter. Thanks. Shelly Schilling Legal Secretary Holiday Companies 4567 American Blvd. W. Minneapolis, MN 55437 DD: 952-832-8646 Fax: 952-830-1681 shelly.schilling@holidaycompanies-com

Steve Schreader 58052

Sulfide mining should not occur in Minnesota!! The risks are too high & far outweigh any & all possible benefits. With the main benefit being jobs, what happens when the mine closes & what economic impacts will the disruption of the BWCA have on the economy. There are too many questions, not enough answers. The track record of this Mining speaks for itself. It should not happen here!! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

The Polymet mine project should be stopped. Destroying pristine forest lands and risking the future of our water resources, including native trout streams and Lake Superior is just not worth the supposed 'economic prosperity' a new mine would bring the region. Preserving Minnesota's natural beauty and resources for our future generations is worth much more than any short term prosperity a mining operation would bring. Polymet is spending a lot of money in advertising in Minnesota in order to sway public opinion but they aren't being completely upfront and truthful with the public about the environmental risks of their planned mining process. They also appear to be having trouble producing an acceptable EIS in their rush to start mining our resources. These should be major red flags indicating serious issues with the Polymet project. The fact is, the metals they're after are not going anywhere. The mining of the so-called Duluth Complex or any other area in Minnesota should not be allowed until technology is developed that would guarantee no damage to our water and environment. Thank you, Steven Smith 512 Rose St Duluth, MN 55803 Member of Trout Unlimited Gitche Gummee Chapter Member of Surfrider Foundation MN/Superior Chapter

Steve Snyder

18181

My name is Steve Snyder. It appears from the names on the list that having "Snyder" as a last name is good for this lottery. This is the first time in my life that that's ever been an advantage. But it is tonight. I want to make a few comment initially about this Supplemental Draft EIS. Just a few pointed comments about it. One, there is no model in this statement as long as it is that would apply for a 500-year period. When Christopher Columbus got off his boat 500 years ago, he had no concept whatsoever as to what would be happening in the Americas over this period of time. In fact, he didn't even know he was in the Americas. But we're actually putting this forth without a model as to the changes that will happen in the Americas over that period of time that these pollutants have to be constantly maintained and treated. Also within this EIS statement there is very little that addresses the huge concern of operating a mine in a plant such as this in this very water-rich environment. This is not a dry and arid environment that we are looking at here. This is a very wet environment. Of course, it is the combination of the water and the exposure to the atmosphere to create the sulfuric acid that creates the leaching out of these very toxic metals. In my view it's not adequately addressed in this statement. And in fact, we have just recently found out that even the basic data with respect to the groundwater flows into the Partridge River are not accurate in this document. That's why the EPA gave the original draft an "F" for its failure to address these type of matters. And yet after that work we come back and have the same type of issue here that needs to be addressed. I would also note that the document does not address the fractures in the bedrock that will be below these mining sites, and what this is going to do with the leaching that occurs and where that is going to go and where that is going to end up. I have a couple questions I want to ask of PolyMet. Nobody from PolyMet has spoken here today. I have a couple question. And maybe if somebody does speak they can address these. We have the assurances supposedly from PolyMet about what they are doing in this plant. But if it turns out those assurances untrue, would PolyMet agree that this mine should be closed down or would it instead lead to hearing that somehow they have to be grandfathered in and be able to continue to operate because they've already done the damage? Second, we hear a lot of people from the trades that are supporting this. And I support the trades. I very much do that. But I would like to know whether PolyMet is willing to commit that it will use union labor on these projects or instead it will be seeking to reduce workers' pay and try to defend against any claims for illnesses that arise on this job site (inaudible).

--Original Message-- From: steve@urbanartbox-com [mailto:steve@urbanartbox-com] Sent: Monday, March 10, 2014 6:34 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: I think the arrowhead area and the Iron Range needs jobs. But this is way too risky. It's something that I believe will eventually be on the wrong side of history and future residents will think we were unwise to create such a black hole of ecological and economic problems If we're going to get stuck with a huge clean up bill, lets just take the money we would have spent on cleaning the mine pollution and invest it right now into business development and jobs. Or put the Taconite Tax Fund to work. I read that there's millions of dollars just sitting collecting interest when it could be used to create jobs, ie construction, public works, parks, subsidizing small business growth, etc I've been to Ecuador and Bolivia, Brazil and other countries that have already been down this road. The results are always the same. The corporation that owns the mine will promise everything, then they'll leave and not fulfill their obligations. It happens every time, regardless what they say to the contrary. We will end up with a hole filled with acid, and we'll have no one to blame but ourselves. Sincerely, steve stratman 4816 clinton ave Minneapolis, MN 55419-5659

I do NOT support mining. The forrest is eternal, jobs do not last just say no to mines. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

steve vennemann 40663

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr steve vennemann 1974 Castle Ct E Saint Paul, MN 55109-2881

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Steve Wentworth 3934 Denmark Ave Eagan, MN 55123-1451 (651) 249-1657

Steve Weston 43826

I believe it is unwise to approve any plan that requires ongoing active management of hazardous mine waste, such as treatment of toxic runoff, after a mine has been closed. The waste from such mines remains toxic not just for hundreds of years, but virtually forever. If the waste cannot be passively contained, but requires ongoing intervention for an indefinite period, there is too much danger that a change in legal, corporate, political, economic, or social structures could result in the treatment infrastructure being abandoned. We today are not capable of promising any action more years in the future than our republic has yet existed. Sincerely, Steven R.P. Weston 307 E. 42nd St Hibbing, MN 55746

To: Agency Decisionmakers The Boundary Waters is one of the crown jewels of our national park system. Like Yosemite, Glacier, and Yellowstone there are no other places like it on earth. Minnesota has recognized that fact for years. The many persuasive reasons to reject the Polymet proposal and all mining activities near the BWCA are well known to you. Any single one is enough to convince you to reject the incursion into the area. But, I urge you to reject the attempts and restate the principle that these wild places were set aside for all Minnesotans, all Americans, and all the world so there would be some places unspoiled for all peoples for all time. No economic argument to the contrary is worth consideration. There are no “hard choices” no “difficult balancing acts” when it comes to America’s Best Idea. Please restate the principle that it is your obligation, the obligation of all of us to preserve these very few wild places for all mankind.

I have followed the discussions about the pros and cons of the Polymet proposal to mine metals from sulfide bearing rock in northern Minnesota, near the BWCAW. I also attended the excellent public information session in St Paul, and learned a good deal more. I fear that the way organized labor and local Chambers of Commerce from the area rigged the public testimony is a good example for how they will try to use their influence to push the DNR in a direction that would be very unwise for the future of the wilderness, wildlife and water in that area. My brother worked on Superfund cases for the EPA in the west, where mining companies created a toxic mess, then quietly disappeared leaving scars on the land and taxpayers to pick up the tab. From his stories and my reading, it doesn't appear that sulfide mining has ever been done without significant, long lasting damage and toxic waste. Much of this kind of mining has been done in the west, where the vegetation and sensitive wildlife and aquatic systems are more sparse. In this case, even Lake Superior would be in danger. The reason for the environmental damage is simple: these companies have a fiduciary responsibility to their shareholders, not the area residents, or those who value the northern waters and wilderness. Every decision will be questioned by management as to whether there isn't a cheaper shortcut, and accidental releases will be inevitable. The mindset will be that it is easier to ask for forgiveness than to ask for permission. All of this risk (current estimate 100%) for a few hundred jobs for 10 years or so. And after 10 years, the area will have lost the new jobs, and potentially the pristine wilderness that currently draws thousands of people to northern Minnesota. Like many others, I have personally spent well over a thousand dollars in Ely every one of the last 10 years because of the BWCAW, and this source of revenue to the area should not be underestimated. The especially dangerous part of this proposal is that everyone in positions to approve or stop this proposal will be long gone when the issues inevitably surface. The easy thing to do, but the wrong thing, would be to bow to the pressures from the mining and construction interests. I urge the DNR and the state of Minnesota to stand tall and not allow this mining to go forward I understand that these metals are needed for numerous things we all depend on, but we will need those things in a hundred years as well. Where will the metals needed far into the future come from if we exploit everything we can find now. Maybe at a time far in the future we will have developed better ways to extract these metals and better ways to protect the crown jewels of our state from the clear and present danger that the Polymet project represents. I urge the DNR to not permit Polymet to put our wilderness and water at risk. Thank you for your consideration, Steven Broste 11027 Timberline Drive North Champlin, MN 55316

I am Steven Amundson, Amundson is spelled A-M-U-N-D-S-O-N, from Northfield, Minnesota. And my comment is that everything I've read about this sort of mining is that it has not been successful. It is that there have been very many environmental impacts; and therefore, I believe that this is a risk that is too great to take. Especially when you consider the pristine Boundary Water Canoe Area and all of our lakes in that area. I believe that this is a chance Minnesota should not take. The only thing that I would consider to be a viable risk would be one that ensures that PolyMet can actually guaranty that there is not only a system that would work to take care of the environment, but also that there would be enough money somewhere set aside to be able to clean up any issues well into the future. One of the problems I believe is that many companies like this, which are international companies, are sold or go bankrupt, and then the big question is, and then what? What do we do after that? So, if we were to move forward with this project, the only way that I would, as a Minnesotan, agree that it would be feasible, if there was enough money set aside for hundreds of years of cleanup, because I believe that's what will end up being necessary. That's everything. Thank you.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Steven Chesney 8172 Zenith Ct N Brooklyn Park, MN 55443-2749 (561) 561-2512

As an investment advisor, I help clients assess the potential reward to be gained from incurring an assumed amount of risk. What makes this risk/reward analysis possible is that the potential risks and rewards are both of the same nature, in this case financial, and both accrue to the same entity, in this case the investor. He or she will not profit while someone else bears the risk of loss. If what I have read is even close to accurate, in my professional opinion as an analyzer of financial risk, I assure you that the probability of any of today's existing raw material extracting enterprises to still be around 500 years from now is nearly 0%. What this represents, then, is an extreme divergence of risk and reward factors, where those who will reap the rewards of this type of mining will be dwarfed by those bearing the risks, financial and otherwise. If what else I have read is also even close to accurate, the environmental impact analyses have been shown to be inadequate multiple times. In my opinion, that is also because those to receive the primary rewards are not those who will bear the primary risks from these proposals. It's akin to talking to a mortgage broker in 2006 who assures you that "don't worry, you can afford this house; I'm sure your income will go up by the time the mortgage rate adjusts upward, and by my estimates it can't really go up that much anyway. Besides, houses only go up in value." By the time the true damage from these projects begin, those who have reaped the primary rewards will be just fine. I see it every day. As someone who has spent time in those very same woods, this is as tangible of a selling your soul for a few shiny coins moments as I have ever seen. Those woods are the soul of the state. No amount of money is worth the nature of the risks, especially when the risk estimates are in control of those who will get your soul.

Sincerely, Steven J. DeBoth

Steven Eli Kokotovich

57213

Before you approve a Polymet mine, you need to be extremely confident that it will not damage the environment. A mistake on your part could be devastating for generations. Also, enough money (from Polymet) needs to be set aside (securely) for cleanup and all future monitoring. This cost should not be paid by the taxpayer. If you cannot ensure these requirements, then I am against the mine. We should then wait until the technology has been proven elsewhere. The minerals will still be there 10 years from now. Steven Eli Kokotovich 2119 Allegheny St Duluth, MN 55811

My first response relates to the current generation of people, and the health of our future generations. My response is to not allow any type of mining that could directly or indirectly allow any type of chemicals into the vital, precious water sources. This pollution could last for either a split second, or for hundreds of thousands of years in the area of Northeastern Minnesota. My second response is that the people of past and current generations have not stopped or prevented themselves from the massive consumption of nonrenewable resources. This consumption includes items that can be made from the materials and minerals that the mining in Northeastern Minnesota is believed to be able to produce. My question is: Why should we stop, or pretend that we have the desire, will power, or ability to stop any type of mining that may or may not actually pollute or damage our vital and precious water sources and harm the natural beauty of this area of our state. I thirdly would like to congratulate and applaud the cooperation, communication, and participation of all of the people that helped complete the environmental impact statements. These statements, other documents and comments concerning the vital and precious water sources of Northeastern Minnesota were well prepared and show genuine appreciation, concern and foresight into the effects of the proposed mining project. Thank you.

Steven George

37819

Dear Ms Fay, Steven George 5970 Blesner lake Rd PO Box 535 Finland, MN 55603 Dear Federal and State Agency Leaders: My name is Steven George and I live with my wife Amelia and two young children outside of Finland, MN. We harvest wild rice from lakes in our area and I am deeply concerned about the environmental impacts that are likely to be caused by Polymet's proposed mine. Polymet's tailings pile will have toxic metals and sulfates and the SDEIS proposes the tailings basin will have no liner to contain these toxins. The waste will need treatment for a minimum of 500 years. The proposed tailing dump site is on top of old LTV tailings. This tailings dump was designed in the 1950's for taconite tailings and it was built on top of streams to allow drainage through the tailings. How will this pit that was designed to leak possibly manage to contain the toxins safely for 500 years. When the Polymet plan was first proposed, the "Scoping Report" said that the EIS had to evaluate "if all tailings will need to be managed in a completely lined basin." The SDEIS must be redone to analyze the alternative of a completely lined tailings basin. The lined tailings basin alternative should avoid wetlands and streamS The Polymet SDEIS claims that the tailings piles won't cause pollution (page 5-159). Polymet says the project will increase seepage at the LTV tailings dump from 2,202 to 3,380 gallons per minute. The SDEIS claims that with the use of pumps, all except 21 gallons per minute will be contained, which would be a 99-37% collection rate. As far as I can find, this collection rate would be unprecedented. The SDEIS doesn't name a single unlined tailings pile that meets these almost perfect results with the use of pumps. The SDEIS must be redone to analyze water quality outcomes if the tailings pile collection rate is not what Polymet claims Looking back at the Draft Polymet EIS in Figure 4-1-9, you can see there are at least three streams that ran under the LTV tailings site. One of those streams runs right under Cells 1E and 2E, where they plan to dump the Polymet tailings, and then into Spring Mine Creek. Water is likely to drain through filled over streams as these are the historic drainage routes. Spring mine Creek is already impaired for aquatic life as a result of past mining and has excessive levels of sulfate, aluminum and mercury. (SDEIS, p. 4-122, 4-238). The SDEIS assumes all tailings wastewater will seep to the north side where the pumps will be. The SDEIS must specifically analyze impacts on water quality of seepage that would escape following historic stream drainage beneath the tailings basin. It's well know that fractures beneath tailings basins can transport pollutants, however the Polymet SDEIS doesn't have a single word addressing the possibility that fractures beneath the tailings site would transport pollutants. One example of seepage through fractures is in the Chevron Molycorp Superfund remediation, the EPA concluded "The pathway for contaminant migration is the leaching of tailing seepage downward from the tailing facility to groundwater that migrates through fractures to surface water." Existing tailings seepage already exceeds groundwater standards and on the LTV site, adjacent to the tailings, the SDEIS has documented that Area of Concern #8 has a plume of pollution propagating through fractures. (SDEIS, p. 4-12). The SDEIS must anticipate that tailings contaminants will propagate through fractures and clearly disclose the impacts this leaching through fractures will have on surface and groundwater quality. A few decades of mining for 500+ years of contaminants seeping into our water sounds like a pretty bad deal to me. This sounds like an especially bad deal for my children and their children and their children's children and so on. Do we really expect Polymet to still exist and be paying for the cleanup and monitoring of the wastes in 500 years, or even 100 years fo

Steven Graupman

21784

Mar 5, 2014 Ms Lisa Fay MN Dear Ms Fay, I am very concerned with protecting our clean water, but I believe Polymet's plans to mine sulfide ore in northeastern Minnesota as described in the Supplemental Draft Environmental Impact Statement will. I believe that the SDEIS is sufficient and SHOULD be approved, because it details how new mining and processing techniques will be more than sufficient. PolyMet would provide many needed jobs and would finally end an economic depression for that area . Birds that depend on fish and other aquatic organisms for food might be affected, but their numbers will rebound after mine reclamation. I urge decision-makers to APPROVE this well planned proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you, Steven Graupman 7595 Hyde Ave So. I am concerned by the lack of details regarding the economic impact analysis. The claims regarding the number of jobs to be provided by the project are vague and lack any effort at substantiation. The study needs to be extended to include number, type, duration, and pay ranges for those jobs, as well as an analysis of the economic impact to the area surrounding the proposed sites.

Steven Johnson 19905

Just do it.. We need the jobs and economic benefits. This mining can be done in an environmentally neutral way with minimal affect on the Eco-system. Steven Johnson 8256 Pennsylvania Rd Bloomington, MN 55438

Steven Jorgens 4220

Lisa Fay, I am writing in to express my support of Polymet project. My Grandparents lived in Biwabik and my mom and uncle were born there. So I have a very large interest in seeing mining and jobs to return to that area. I have read the draft EIS and I am very impressed with the detail that was done and the extent that Polymet has gone to to ensure that our environment is taken care of. Polymet partnering with GE to have a reverse osmosis system is also very impressive. Please approve this project and return this great part of Minnesota to some of its past glory. Thanks, Steve Jorgens 1995 Juneau Lane Plymouth, MN 55447 HYPERLINK "mailto:Sjorgens@msn-com"Sjorgens@msn-com

Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota. It threatens rivers, lakes, streams and wetlands across the Arrowhead Region. I've canoed the BWCA many times. It is a state and national treasure that should be protected for the enjoyment of current and future generations. Anything that could contaminate such a treasure should go through tremendous scrutiny and exhaustive review. I have read that acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Why won't it do the same in the Arrowhead Region of Minnesota. I have major concerns about the impact of mining on our fragile environment. I also favor increasing employment whenever possible. But, why incur major risks and costs from sulfide mining which ultimately might far outweigh the short-term job creation benefits of the mine. Shouldn't ALL Minnesotans want to protect our natural resources and our public health. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Steven Kraemer 3924 Ottawa Ave S St Louis Park, MN 55416-3029

Date: March 12, 2014 Re: Addendum to Comment (dated March 11, 2014) on NorthMet SDEIS To whom it may concern: In connection with the gathering of data on which to base their Proposed Action regarding water quality, Polymet and the DNR also conducted long-term tests on the oxidation behavior of ore and waste rock containing various amounts and types of sulfide minerals, specifically to evaluate the potential for generation of acid mine drainage and release of heavy metals during oxidation at the surface. Based on these tests, they designed a strategy for storage of various kinds of sulfide-bearing rock that, in conjunction with runoff and groundwater collection and treatment, can be expected to adequately forestall acid mine runoff and leaching of heavy metals into groundwater or surface waters. This is a key concern regarding environmental impact of the proposed action, and Polymet is using a responsible, science-based approach in addressing it. Sincerely, Steven Losh Professor of Geology Dept. of Chemistry and Geology, FH 241 Minnesota State University Mankato MN 56001 Ph. 507-389-6323 Fax 507-389-5625

Date: March 11, 2014 Re: Supplemental Draft Environmental Impact Statement, NorthMet Mining Project and Land Exchange (dated November 2013) To whom it may concern: I support acceptance of the Proposed Action – the construction, operation, closure, and reclamation of the Northmet Mine and associated processing activities - as described in the SDEIS. Of particular concern to many including myself is the impact of mining and processing operations on water quality. The SDEIS shows that Polymet has done a thorough job of addressing these concerns. They have characterized in detail both geology and waters (both surface waters and groundwater) throughout the affected area: they have extensively sampled streams as well as a sizeable number of wells in the area of both the planned mine and the tailings basin. In addition, they performed multiple tests on wells to determine aquifer flow characteristics. They then utilized state-of-the art computer modeling in conjunction with geologic and chemical data to predict the quality of water leaving the site and to design a water collection and treatment plan that can safeguard the quality of both surface water and groundwater. Although there can always be more information gathered and added to the models (eg, bedrock permeability, which is likely very low, beneath the tailings basin), I am satisfied that the proposed action will remedy environmental impacts to an acceptable level. A double liner at the hydrometallurgical plant site will protect groundwater and surface waters from leakage from that source. During mining, Polymet will capture runoff from critical areas such as the waste piles and tailings basin, and route that water through state-of-the-art treatment facilities. Much of the water will be recycled on site, but the water that is discharged will for the most part be of better quality in terms of substances of concern (such as mercury and sulfate, as well as acidity) than the natural waters at the site. The proposed strategy for capturing groundwater that would otherwise exit from the tailings area – a cutoff wall to bedrock augmented with ditch and collection wells – appears adequate for ensuring water quality. The results of groundwater flow modeling show that, for reasonable conditions, discharge of waters of elevated concentration of various evaluated substances will be minimal to negligible. In the case of aluminum (one of the two substances potentially released at excess concentrations), the source of the excess substance is an already-existing reservoir that will be used in reclamation; in the case of lead (the other substance at potentially excess concentrations), the infrequent exceedances will be due to variations in water hardness rather than to actual elevated discharge of lead. Overall, as long as the proposed actions in the SDEIS are followed and monitored, water quality should not be adversely impacted. From the SDEIS, it appears that adequate steps will be taken to ensure water quality well into the future. Monitoring wells will be placed outside the perimeter of the tailings basin to further safeguard water quality, and can guide further remediation should it be necessary during and after mining. After mining is finished, Polymet’s reclamation plan appears adequate – among other things, the company will backfill pits with otherwise reactive waste rock to submerge it in water, which will isolate it from oxygen and prevent breakdown of sulfide minerals, cap the tailings area with bentonite to minimize oxidation and leaching of tailings, and continue to be responsible for meeting applicable water quality regulations for any water that does flow off site. The report is thoroughly researched and vetted by State and Federal regulatory agencies, which appear confident that the Northmet mine will meet if not surpass water quality regulations, and that environmental impacts of all the other aspects of the mining operations will be ade

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Steven Mayberry 4948 Emerson Ave S Minneapolis, MN 55419

I do not want sulfide mining anywhere in Minnesota. No one can replace our lakes & streams once they are destroyed. These are our recreation areas. Leave them alone.

Steven Schoenherr

37930

I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations. Steven Schoenherr 4783 Lindahl Rd Duluth, Minnesota 55811 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

First let me say I am a long time shareholder of Polymet stock so to that extent I am on the side of non-ferrous mining in Minnesota. I am also an environmentalist and see the damage done to the Mesabi Range by iron ore and taconite mining in the paSt That is not acceptable. Minnesota is poised to create a win-win situation for both the mining industry and the environment in northern Minnesota. It is called Polymet Mining Corp. Polymet comes to us possessing the technology to conduct non-ferrous mining at Northmet as well as the technology to protect the environment during the mining process. Reverse osmosis will treat the waste water to remove sulfides that meet the strict wild rice standard and not cause damage to water runoff at the mine site or in rivers and lakes, all within the standards set by the EPA. All of these technologies have been tested and are effective. Polymet possesses all these technologies and is committed to put them to use in a way that they can mine in a cost-efficient manner and protect northern Minnesota's environment at the same time. The only addition I suggest is the use of hydrogen fuel cells to generate electricity for the Erie plant as well as returning it to the grid. The byproduct of hydrogen fuel cells is pure water. There is no air pollution whatsoever. I can recommend Fuel Cell Energy (FCEL), of which I am also a shareholder, as the company that can be consulted concerning electrical generation at the site. Polymet has demonstrated they have the technology to mine Northmet in full compliance with guidelines as established by the Environmental Protection Agency, and will provide funding to continue these environmental processes long after mine closure. They have committed to leave the Northmet site cleaner than it is now and in full compliance with EPA standards for as long as it takes. With the above in mind it is requested Polymet be awarded their permits to mine the Northmet site. If permits are denied and Polymet walks away from this project, no other company is waiting to take their place. Non-ferrous mining in Minnesota will have no champion, and mining will be denied and the environment will remain endangered as it is now. Thank you. Steven M. Ulmen, Mankato, MN 56001

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Steven Wiese 2543 Nicollet Ave Minneapolis, MN 55404-4249 (612) 870-0029

Stewart Crosby

11339

Dear Sir/Madame, I have many concerns regarding the NorthMet Supplemental Draft Environmental Impact Statement (SDEIS). To sum up my concerns, I am not confident that the proposed water treatments will work over the timeframe needed to protect existing surface and subsurface water. It is too risky, in my opinion, to allow this kind of industrial mining in an area as environmentally sensitive as the surrounding landscape is in this part of Minnesota. I am opposed to any copper-nickel mining as proposed because I do not believe adequate protection of the surrounding landscape can be guaranteed and I do not believe Minnesotans should have to take such a risk for the benefit of a small number of corporations. Sincerely, Stewart Crosby 3965 Princeton Avenue St Louis Park, MN 55416

Stewart Mills

18112

Thank you very much. My name is Stewart Mills. And I'm from Crow Wing. And my story is very similar to the people of Northern Minnesota. Our family came to Northern Minnesota in the 1870's and worked the timber industry. My great, great grandfather mined on the Iron Range. And my grandfather was one of the last people to move logs in Northern Minnesota. And what we are about, why we came to Northern Minnesota is about natural resources and jobs and growing the economy and growing prosperity. And this project, PolyMet, is a great harbinger of things to come. We have tremendous opportunities to grow jobs, to grow prosperity, and grow our economy not only in this area but all across Northern Minnesota, because we have a very interconnected economy. But on top of working here and growing prosperity, growing our families, and becoming more interconnected, we also hunt, we also fish here. This is our backyard. And the PolyMet project is so well thought out and is so well engineered, and the oversight is so extraordinary, there is absolutely no reason why we cannot have both economic prosperity and clean water so we can hunt and fish and not only enjoy the economy but also enjoy ecology. Go PolyMet.

Stu Astleford

18283

My name is Stu Astleford from Minneapolis, Minnesota. I am anti open-pit mining. I believe that the water quality degradation is permanent to the environment and it is not worth polluting a pristine environment that future generations can enjoy for years to come. I frequently go to the Boundary Waters Canoe Area and I recognize this mine is near the Boundary Waters area. And it is just too risky to put a mine so close to the Boundary Waters, where it will do permanent damage, in my opinion, for generations to come. I guess that's it.

Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Stu Farnsworth 1646 Donald Ct Eagan, MN 55121

To Whom it May Concern, I would like to submit a comment in support of the Polymet SDEIS. I understand that this project will have an impact on the environment, everything we do does. However, I also trust that Polymet has met the State and Federal requirements regarding what they will do to safeguard the water and air. I understand that nothing is fool proof and there are risks. However, I feel that this project is too important on many levels to not move forward and trust that the agencies involved will do their jobs in monitoring and regulating this industry. It is time to move forward into the next phase of this project. Thank You Erika Bradach, 5172 Rd 54 Aurora, MN 55705

Stuart Chastain 47659

I believe that the proposed NorthMet copper/nickel mine is important both for its economic benefit to Minnesota and for its strategic/geopolitical value to the United States. However, there is one remaining technical issue relating to environmental protection that has not been satisfactorily addressed. Polymet's proposal to ensure there is no long-term seepage of sludge into aquifers is not adequately redundant. The redundancy of the actual sludge barrier is more important than any long-term financial arrangements to cover environmental damage. Thank you. Stuart Chastain

Sue Bowman 18108

Good evening everybody. My name is Sue Bowman. And I'm the general manager of the Country Inn of Hoyt Lakes. I was born here up on the Iron Range. First generation of Hoyt Lakes. My father came here from St. Paul working at the Whirlpool plant in St. Paul. Brought his five children up. I was the first born in Hoyt Lakes. And I have a younger brother also born in Hoyt Lakes. I wholeheartedly support moving forward with the PolyMet project. It is healthy when it comes to these kinds of projects and these claims. We are operating in an environment of tremendous knowledge and experience and technology. The EIS process is in place to ensure any and all projects meet Minnesota's tough environmental status. If you read the EIS, you will see that PolyMet has addressed all the potential issues and proves that copper-nickel mining can be both pro-environment and pro-jobs. PolyMet will bring some 360 direct jobs and hundreds more spinoff jobs to the area of the state that needs them. And, of course, managing a hotel in Hoyt Lakes this will provide many, many jobs. I'll be able to hire more employees. It will be filled every day. We all like that. And so even I can give jobs to a lot of people that wouldn't be working in the mines. We know how to mine in Northeastern Minnesota. And we do under the strictest standards. If we don't utilize this great resource of mining copper and nickel in Minnesota, these minerals will continue to be mined in places around the world that have little or no environmental regulations whatsoever causing massive pollution to the earth. They will be mined in places around the world that offer no safety protection to workers. Where employees are routinely put in danger by being forced to work in unsafe conditions, and where workers are exploited by being paid inhuman wages and do not allow them to feed their families. The alternative to mining in Minnesota is to mine in places that have none of our safeguards. Does that make sense? I have confidence in the co-lead agency conclusions. I believe they have been thorough and thoughtful and taken their time to get it right. Let's mine metals here where we need and want the jobs and we know we can do it right. Thank you.

Sue Carver 18271

My name is Sue Carver, like a wood carver. I live in Plymouth, Minnesota. I am speaking as a grandmother. I have lived many, many years and know that there is long-term consequences for what we do in our life. I would love to see what I do or can make a voice about in my life to protect the land for my grandchildren. I really feel strongly that we need to think long-term for the decisions we make. And in having lived this long, it makes more sense to me. I would like to say that I don't see the benefit for the majority of the people in the State of Minnesota for these sulfide bearing ore mines. I just don't see how it can possibly benefit us. The ore is going to be taken out and given to China. The companies that -- are owned by foreign nationals, who will benefit from the money earned. And a few Minnesotans in the northern part of the state will have jobs, but the jobs will be short-term. And I can see a lot -- I just can see what is going on in South Dakota and I can just see a lot of people coming in to the state to work up there that are not Minnesotans. So, that idea of having good jobs for Minnesotans is really going to be diluted by all of the people that are going to pour into the state to get those few jobs. And so in the long-term, I just can't see any benefit for us, except the long-term pollution that is going to happen that we are going to have to clean up and use our tax dollars for. And the loss of the pristine environment that is up there in the northeast section of our state and the beauty that is there for our children and for our grandchildren. So, I don't support these mines. And I would like to see them not get the chance to mine in our state.

Sue Evert 42036

Although I understand people needing jobs in northern Minnesota, I am wary about this risky mining proposal. Is it a US company. Are the standards very high to ensure no pollution of this area. Perhaps just saying NO and protecting this area is a better solution. I do not pretend to be an expert here, but the risks of contamination of beautiful areas and much needed wetlands seems too great to allow this proposal to go through. Best wishes on your decisions.

Sue Goodin 32510

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. As a child I visited my grandparents MN farm every summer. I remembered all my adult life the beauty of this state. Now I live here and am again discovering the care folks here have taken (ore mining notwithstanding) of their gorgeous inheritance. Please do not let greed destroy one of the loveliest parts of this state. Nor endanger its wildlife. Folks come here to remember or experience how beautiful the USA once was. Let us not be destructive of that beauty. Sincerely, Sue Goodin PO Box 295 Carlton, MN 55718-0295

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Sue Jeffrey 18296

My name is Sue Jeffrey. I am representing Friends of Cold Water. We are concerned about water quality. We think the PolyMet mine is a dangerous idea because the jobs really aren't there. They are only there for 20 years, and then 500 years of cleanup. What? 20, 500 years? The problem is that nature doesn't negotiate. Nature is not passive. There will be unforeseen circumstances that will be there and there will be unanticipated consequences, and corporate apologies for poisoning the water. We can't afford to do that. We also can't afford to have a lot of unemployed people. So, I'm looking for a middle path, a middle path between yes and no. We need good jobs. We need jobs for women, as well as for men, who are relatively the miners. More tourism. But mostly I would love to see the retrofitting of every single building in America. Do you think that's enough jobs? There is a middle path. We need to explore that. We need to get together. Because I speak for the 70 percent. I'm 70 percent water. The surface of the earth is 70 percent water. We are all 70 percent water. So let's get together and figure out a way to have full employment with retrofitting jobs and becoming more environmentally sensitive and being smart.

Sue Jensen 48179

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Sue Lommen 42156

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Sue Lommen 12479 River Rd North Branch, MN 55056-6243

Sue Ponsford 20069

--Original Message-- From: sue@thedatabank-com [mailto:sue@thedatabank-com] Sent: Wednesday, February 26, 2014 2:58 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: PolyMet would operate for 20 years but, according to PolyMet's own data, would pollute water for over 500 years at the tailings basin, and over 200 years at the mine pit. The modeling results provided in the SDEIS show that PolyMet and the DNR simply did not look beyond 500 years. The fact that the SDEIS does not say when the mine pit and tailings basin will stop polluting our water is a major and apparently intentional failure that needs to be corrected by the DNR. Please run the models . or require PolyMet to run the models . long enough to show when pollution of our water by PolyMet's mine would cease. Long after the mining has stopped, PolyMet would pose an ongoing risk to fresh water. The Embarrass, the Partridge, and the St Louis Rivers, as well as Lake Superior, are far too precious to be put at risk for so long by PolyMet in its present form. PolyMet should not be permitted unless, when the proposed mining stops, the groundwater and surface water is left in a clean condition, and surrounding streams, rivers, and Lake Superior are safe from risk of sulfide mine pollution. The PolyMet SDEIS suffers from many major failings. The SDEIS needs to be withdrawn, sent back, and fixed before it is returned for public comment. Sincerely, Sue Ponsford 4129 Portland Ave Minneapolis, MN 55407-3134

Dear DNR, I am an avid MN angler and BWCA traveler. I am writing to express concern about the proposed Polymet sulfide mine in NE Minnesota. I've read information about the sulfur mining process and it is scary. As a state that prides itself on its pure natural resources, I can't believe we are even entertaining the thought of sulfide mining (like we shouldn't allow frac sand mining in SE Mn). The risks that come with sulfide mining far outweigh any economical benefits proposed by Polymet. The major downside of sulfide mining is the water pollution risk (acid and increased mercury emissions). This includes drinking water and fishing waters. No amount of money can replace or "fix" our clean water supply and damaged wetlands. Our clean water is worth more than its weight in gold and we should be protecting it with our lives. The SDEIS acknowledges that water from the Polymet operation will need to be treated for at least 500 years. What if there are leaks. How do we sustain clean water and good quality natural resources with that risk hanging over our heads. That is a horrible legacy to leave for future generations. The DNR is supposed to help protect our natural resources, so preventing any sulfide mining would comply with that directive. Please help us. Sue Ramthun 117 18th St SE Rochester Mn 55904

Dear Department of Natural Resources, Having read a description of the probable ramifications of PolyMet's proposed sulfide mining, I am—and we all should be—appalled and leery of the five centuries of hazardous water treatment violations that will affect us. Proposed mines should keep Minnesota's waters clean and safe. Plans should put safeguards in place to avoid things going wrong. The plan should leave the site clean, maintenance-free, and should protect Minnesota taxpayers. May the DNR lead the way in safeguarding our people from the destructive dangers of copper sulfide mining. Thank you. Health. Susan H. Sojourner 315 N. Lake Ave, #501 Duluth, MN 55806 _____ HYPERLINK "<http://www.avast-com/>" This email is free from viruses and malware because HYPERLINK "<http://www.avast-com/>"avaSt Antivirus protection is active.

It seems a blindness comes over folks when there are some jobs coming to a community. It's happening again in Ely. It's unbelievable that mining anywhere near the Boundary waters is even being considered. Has there ever been a mining operation that has not caused long term damage to the land and a job situation that does not die after a couple decades. Anyway, though I don't live anywhere near the area considered, I can't see ANY sense in it. Please please consider the impact. Make us proud to live in Minnesota and stand up for our resources that would otherwise probably go over to China or at least out of the country. No Mining Please Sent from my iPad

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According to the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms sun cho 1207 Estates Ln Bayside, NY 11360-1141

39767

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms sun cho 1207 Estates Ln Bayside, NY 11360-1141

sun cho 39769

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms sun cho 1207 Estates Ln Bayside, NY 11360-1141

As a seventeen year old student in Minnesota I believe that allowing of the construction of this mine would be a grievous mistake. We stand the possibility of destroying that areas environment for centuries to come. Although the mine is not in the Boundary Waters its proximity to this state park should be concerning. The company might promise full responsibility for the mess it creates but it is not certain. If they can't clean up the mess like a lot of mining comapnies multiple generations of Minnesotans would be left to clean the problem. Please protect our future generations enjoyment of this areas natural wonders not leaving them with a disgraceful legacy. Kathryn Sent from my Samsung Galaxy S@4

Where will the money come from to ensure the waste water treatment plants will continue to operate for 200 at the mine site and 500 years at the plant site? How can we ensure the PolyMet will meet its share of these costs, and not for instance, default or go bankrupt or whatever, before it pays its share? Susan Armington 5005 15th Ave SoMinneapolis, MN 55417

susan bauer 39449

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Susan Boorsma 513 E 11th St Duluth, MN 55805-1319

Susan Claire Nelson 54559

An environment that is healthier than it is today should be our goal. But Americans will not stop using the minerals of the earth. Rather than despoiling a third world country and exploiting its people, let's do our mining here in our own backyard using the best science and environmental protections we can.

Susan Conlee 57881

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Susan D Blom 57940

I oppose PolyMet. The long term consequences to wildlife and public health are really not known, despite the research done so far. We love this part of the state for its beauty & would hate to see it destroyed. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept my comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. There is no history of sulfide mining in Minnesota for good reason: Acid mine drainage and heavy metal contamination pollute waters in all places where sulfide ore mining has occurred. I urge you to reject PolyMet Mining Corp NorthMet's proposal because such mining operations will pollute Lake Superior, jeopardize clean water and wildlands, and endanger public health. Approving PolyMet's proposal would give an unwise signal for more sulfide mining near Lake Superior, a vast freshwater resource unique among the Great Lakes, and endanger millions of acres of wildlands, including 1,000 pristine lakes and streams, and threaten the 1,500 miles of canoe routes, now a major recreational draw within the Boundary Waters Canoe Area Wilderness. Please act now to protect Lake Superior and the Boundary Waters Canoe Area Wilderness. Destruction of fish and wildlife habitat from polluted lakes and rivers, contaminated drinking water, immense cleanup costs and hundred-year recovery times make sulfide mining too dangerous for this region. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine definitely is NOT in the public interest Please reject this first and any subsequent sulfide ore mining proposals that industry may present and instead vow to protect one of the most important freshwater resources in the world. Thank you for considering my comments in your decision-making process. Sincerely, Susan D. Lannin 7100 N Greenview Ave Chicago, IL 60626-2629 (773) 381-9738

Susan Darley-Hill

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Thank you for the opportunity to provide comments on this SDEIS. This type of mining should not be allowed to move forward in our water-rich area of Minnesota. And rich is an understatement, given the prospect of an increasingly-shrinking supply of clean, fresh water within the next 50 years. Water is a resource far, far more precious than any metal - now - and especially in the future when nothing will be more precious or valuable to our descendants. This kind of mining poses a such a threat to our wetlands, running waters, and lakes throughout NE Minnesota. These mining operations have a proven track record of consistently producing destructive heavy metal contamination and acid drainage that causes irreparable damage to once beautiful and pristine waters. Those impacts persist long after the ore deposits have been exhausted and the mineral wealth extracted, benefiting the few while robbing the generations to come, whose fresh water "deposits" have been rendered worthless or at best impaired. It is a fact that, time after time, in every place where sulfide-rich rocks have been exposed through ore mining, the waters have been impaired. This project's potential impacts on Minnesota's natural resources and public health include direct damage through disruption of habitat of threatened species such as lynx and moose, destruction of wetlands, and impairment of water quality. And, secondarily but with even more widespread consequences for our descendants hundreds of years into the future, the burning of fossil fuels necessary to power the extraction and then maintain the system constructed to handle the acid drainage will release a staggering amount of carbon dioxide, particulates and mercury- all detrimental to the health of virtually every living thing. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Susan Darley-Hill 1710 E 7th St Duluth, MN 55812-1217 (218) 728-1139

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, We cannot allow more pollution into our Great Lakes. The Boundary Waters canoe experience must be protected. When you have the opportunity to bring city people up there, those that have never left the city cannot believe their eyes. The fishermen on Lake Superior and those who operate lakeside resorts would agree - allowing mining would negatively impact their lives and livelihoods. The purity of our lakes is a tremendous asset. Please do risk our drinking water and so much more. Sincerely, Susan Dunne 4308 Bobolink Ter Skokie, IL 60076-2004 (847) 982-1903

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Susan Faulkner 736 Currey Rd Nashville, TN 37217 US

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Susan Frame 1010 Washburn Ave N Minneapolis, MN 55411

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Susan Garado Minneapolis, Minnesota

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Susan Greer 3816 24th Ave S Apt 2 Minneapolis, MN 55406-3073

Polymet's SDEIS has numerous shortcomings. Among the most serious is the inadequate consideration of future risk. It is well known that open-pit hard rock mining produces sulfuric acid, itself a pollutant that also causes leaching of dangerous elements like cadmium and mercury. The Polymet SDEIS specifies that containment will be required for at least 500 years, and it details containment strategies. However, the plan does not adequately consider catastrophic possibilities—infrastructure failures, loss of funding for containment due to (inevitable) government change, changes to waterflow subsequent to usage and global warming, etc, etc None of these risks is directly foreseeable or calculable, but that is exactly the point: we cannot see 500 years into the future, so the SDEIS cannot adequately plan ahead. Given that the SDEIS cannot be adequate, given the 500+ year time frame for hazards and the unforeseeable risks, and that approval sets us down an unnecessary and dangerous course, the DNR should reject Polymet's SDEIS. Dear Ms Fay, My husband and I moved to Saint Paul in January 1994- The following summer, we discovered the BWCAW. Over the past twenty years, we have explored much of this special wilderness area in small, lightweight solo canoes, relishing its extraordinary beauty. We've also witnessed the obvious economic struggles of many who live just outside of this protected natural region and understand their strong drive for more and better jobs. We know that it's easy for us to reside in a comfortable financially secure situation here in the Twin Cities and question the wisdom of a copper-nickel mining venture that might mean at least a short-term boon to the northern Minnesota standard of living. The promise of 350 jobs for 20 years has to be a tempting possibility. But, weighed against the extreme environmental risks that inevitably accompany the Poly-Met mining proposal, the hoped-for benefits of sulfide mining seem hopelessly short-sighted to me. Pristine water is the essence of the BWCAW. From my understanding of the proposed mining processes, water quality degradation is almost unavoidable, and the company's assurances to remedy any and all resulting water pollution are simply unfeasible. However well-intentioned Poly-Met might be, adequate safeguards for protection of northern Minnesota natural resources is impossible to guarantee and the potential for environmental damage and its cost to the area is too great. While I do not possess technical mining expertise, some specific facts and simple common sense make it crystal clear to me that the proposed mines are undesirable, and, what's more, truly threaten the future health of those who reside in the vicinity of the proposed site as well as individuals who might work or visit this area when mining is underway and even after the mines have shut down. I would like to make the following points to support my opposing stance: 1- First, it is my understanding that Poly-Met's open-pit copper-sulfide mining plan does not include any analysis of potential risks to on-site mine workers from exposure to asbestos-like amphibole fibers, which have been linked to the fatal lung cancer mesothelioma, that are present at the site. In addition, the plan does not include a Health Risk Assessment of the effects of mercury, manganese, lead, arsenic and other pollutants on people who live downstream from the site, such as the town of Hoyt Lakes, downstream from the proposed site's waste piles. The sulfate discharge and deleterious impacts to wetlands of the proposed mining may result in an increase in levels of mercury to fish and contamination of drinking water with toxic levels of other substances that will jeopardize the health, particularly, of bottle-fed babies, children and the elderly. 2- Sulfide mining appears to be especially unsafe in a water-rich area such as our State. This type of mining has not previously taken place in Minnesota, and there appears to be a high probability of eventual pollution of the groundwater, which would require literally hundreds of years of treatment (even after the mines are no longer active) – if possible to remedy satisfactorily at all. 3- Poly-Met is highly unlikely to satisfactorily remediate environmental damage. This international firm has no great commitment to the proposed mine region. As we have seen in many recent environmental disasters, such as in West Virginia, the responsible corporate parties typically declare bankruptcy or find another "escape route," leaving local communities to contend with the devastation. 4- Finally, the idea that the proposed mining operation will provide a significant boost to the northern Minnesota economy is not a sure bet. There is no guarantee that all jobs will be filled by local workers – and the majority of profits from this enterprise will certainly benefit distant shareholders. Minnesota is the steward of an enormous amount of this

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Susan K Richfield, Minnesota

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I have been going to stay on islands in this area for 43 years, even spending my honeymoon there in 1970 at which time we were drinking pure water right from the lake. My husband's family and in-laws (Canadians) have roots back to the 1800's being commercial fishermen. This is a beautiful pristine place, where they made all of us American's who had cabins on leased land move out to help preserve it. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Susan Lanes 2321 Fairview Ave Johnsburg, IL 60051-2539

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, susan langston 5517 twin lake blvd. e. brooklyn center, MN 55429

DNR: When the completed EIS was first released, I expected pro-mining factions to take issue with the estimates that monitoring and water treatment at the site would last for centuries- 200 and 500 years, depending on location. Since they have not, nor have they taken issue with the estimate that the mine would be productive for a mere 20 years. So these number seem to be more or less firm. Since there is no copper/nickel mine with sulfide ore that has not polluted the water around it, we can assume this will happen to Minnesota, too. There is nothing that I have read to make me believe otherwise. It is nearly beyond belief that rational people are even weighing these facts against one another: a mine that will offer a few hundred people jobs for less than one work-life- a 20 year old man beginning at the proposed mine would be out of work at age 40- versus the pollution (worst case) or 500 year monitoring (best case) of a cherished wilderness area and the world's largest freshwater lake. Untold millions will be affected by a polluted Lake Superior, since in the centuries to come when fresh water is scarce, it will most certainly be looked to to provide drinking water. Come to your senses. Say no to those with limited vision who ask the state to maintain "their way of life" on the Range. A vibrant, thriving tourism industry today provides the best promise of continuing economic health in that region. Sue Leaf 314450 Oasis Road Center City, MN 55012

I live just north of the polymet site in Embarrass. They have sent out engineers to monitor our wells on our property and to install new ground water monitors. They sent me detailed analysis of the results of the tests. I am totally confident of their process and believe this will be done correctly. They have been very upfront when questioned. If I wasn't absolutely confident of the process I would not be writing this or would I support it. This mine will extend the long legacy of mining in the area and provide important employment for the young folks in the area. Mining has been ongoing for over a 100 years on the iron range and we can only hope it continues. Some of my best hunting and fishing areas are old mines that have grown in where wildlife and fish flourish. Sincerely yours Anthony Licari Embarrass mn Sent from my iPad

Before DNR issues permits to mine Cu, Pd, Ni, Pt at the Polymet site all measures to provide reclamation and recycling to outdated electronic gadgets should be instituted. Polymet may be able to mine as safely and environmentally sound as they propose but to allow a mining operation of this sort in the ecologically sensitive region proposed without a full fledged program to glean all used precious metals is mindless. I am not proposing that Polymet be forced to advocate this endeavor, this must be done by state government. Currently there is a half hearted program in operation to reclaim these metals but it is by no means adequate to retrieve all metals used to manufacture phones, computers, cars, etc. A deposit should be paid by any consumer when purchasing an item that necessitates the use of any of these metals in order to make sure that the item is fully recycled at the end of its lifespan. Without taking this action prior to the advent of a new mine we are acting without foresight and wasting the exact metals that are going to be needed as we continue to grow our technology base. This endeavor would certainly add to the workforce and send a message to the buying public that the days of throw away no longer exist. In addition the reclaiming would be done with strict environmental regulation much like the proponents of the Polymet plan are proposing. It needs to be done where the consumer decides the lifespan of the gadget is over. David Lick 36514 Birch Trl. Grand Rapids, Mn. 55744

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Susan M Smith PO Box 48303 Minneapolis, MN 55448-0303

Susan Maas

Dear Ms Fay, Dear Federal and State Agency Leaders: I understand that the economy in northern MN is in dire straits, and area residents are desperate for decent-paying jobs. I understand that finding new sources of employment in the region is imperative - and that new mining operations may be part of the solution. But not THIS project - NOT SULFIDE MINING. I'm flabbergasted that we can even be considering a project that, by all accounts, will require 500 years' worth of cleanup. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." As a Minnesotan, a wilderness lover and a taxpayer - history suggests we taxpayers will be left holding the bag for cleanup if/when the company folds - I am horrified by the PolyMet proposal. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Susan Maas 4846 33rd Ave S. Minneapolis, MN 55417

Susan McCabe

40259

Dear Ms Fay, Dear State and Federal Leaders: I am most concerned with the mercury contaminants which will be going into the groundwater and Lake Superior. It is not right for a company to be allowed to pollute our environment and harm our infants and children. Kids in this area already have a higher level of mercury in their bodies. It is very shortsighted to allow this to happen. We will be trying to contain this problem for centuries to come. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water. Sincerely, Susan McCabe St Paul Susan McCabe 1455 Grantham Street St Paul, MN 55108 651-642-9619

Susan Mcknight

excuse me, but what are you thinking. Is everything all about money.. If so, then realize the cost in cleaning up the leftover disaster when you are done destroying the pristine area. Remember the Love Canal. Remember the terrible state Lake Superior was in thanks to the Silver Bay Mining along with many others. We seem to have enough problems keeping our waters, wetlands, and our land in general pollution free. The people of Minnesota do not need to add another clean-up bill to our already high taxes. I vote NO. Susan Miner, 5040 184th Ave NW, Anoka Mn.55303: HYPERLINK "mailto:sminer110@hotmail-com"sminer110@hotmail-com Sent from Windows Mail

Susan Murray 14645

Susan Murray 5325 Highpointe Drive Bloomington, MN 55437 February 12, 2014 RE: \$650 million copper-nickel mine proposed by PolyMet in Hoyt Lakes. Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay: I write to express my opposition to the the \$650 million copper-nickel mine proposed by PolyMet in Hoyt Lakes. Because this region contains an underground aquifer, NO AMOUNT of money will ensure an adequate clean-up/disaster leak contingency plan. Make no mistake about it Ms Fay: potable, fresh groundwater is Minnesota's best, most profitable and most lasting natural resource. Allowing the PolyMet mine project to go forward in Hoyt Lakes.would be a huge mistake. Thank you for listening. s/Susan Murray

Susan Narayan 39974

Dear Sir or Madam: I'm a Minnesotan concerned about the impact of the PolyMet mine proposal. I urge you to reject this risky proposal to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you, Susan Narayan

Susan Newman 39682

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Susan Newman 1425 W 28th Street #508 minneapolis, MN 55408

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Susan Newman 1425 W 28th Street #508 minneapolis, MN 55408

My name is Susan Nordin. I live in Duluth. My background is I'm a family physician. I work here in Duluth and I also work in Virginia several times a month. My main interest is human health and the impacts that this mining project would have on the human health. There's been a lot of speaking about pollution and pollution runoff, heavy metals, and mercury. And this impact and the impact on human health. And I have a deep concern about that. I also have a deep concern about the complex ecosystems on which our health depends. Our health does depend on what goes into our bodies but also these ecosystems and the other living things that we share this earth with. One thing that is noted in the plan is that already there are currently 16 main thoroughfares for large mammals to traverse at this point remaining across the Iron Range area. This project would do away with two of those permanently. I would specifically like to speak about the permitting for the permit to destroy wetlands. These require more scientific data about that before approving that. This is a high-quality wetland that we're talking about. This is pre-settlement wetland that cannot be replaced. It's 1,000 acres. We're talking about trading that for -- trading land that is ours under the Forest Service for mine pits and low-quality wetlands, which is not going to be supportive of our health. I have one minute left. Okay. On the Forest Service website I looked up what their mission was because of this land exchange that is proposed, which I am opposed to; and their national themes when it focuses on projects states that they should shape, influence Forest Service land use on a scale in a way that optimizes public benefits from trees and forest for both current and future generations. They specify that these projects should have outcomes that protect and enhance water quality and quantity; energy is conserved; and air quality is improved, wildlife and fish habitat is protected, concerned, and enhanced. And people are connected to trees and forests and are engaged in environment stewardship activity. This land exchange does not appear to support that in my opinion. And I would please request that the land exchange not take place, the Permit 404 be denied.

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Susan B. Padgett 413 E. 16th Ave #2 Anchorage, AK 99501 Sincerely, Susan Padgett 413 E 16th Ave Apt 2 Anchorage, AK 99501-5255 (907) 258-1620

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs susan prom 189 Sag Lake Trl Grand Marais, MN 55604-2057 (218) 388-9930

Susan Rom Zuriff 20045

I'm no expert, but I grew up in Ely. I can't envision that any amount of economic development, especially toxic mining, can make it into thriving commercial center. It's too far from business activity, with only 2-lane road access, no commercial airport, no long-distance buses and no rail connection. It's sad, but to think that the only activity that will keep it going is mining that may pollute a national treasure for up to hundreds of years is senseless. The effect on long-range state finances is imperiled if that happens. And the number of jobs may be many fewer than anticipated with the expansion of technology, especially robotic. Susan Rom Zuriff 4300 W. River Parkway, #253 Minneapolis, MN 55405

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Susan Rowe 6401 Bethia Ln Brooklyn Park, MN 55428-1716 (952) 303-2902

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Susan Schurke

18080

My name is Susan Schurke. I'm from Ely, Minnesota. Most of us will never work for a copper mine, however -- most of us in Northern Minnesota, anyway. However, all of us are taxpayers. I'm very concerned about the financial assurance in the SDEIS. Who can ever figure out what the cost of the cleanup will be for 500 years. Who will pay this? Who -- what is the amount they could possibly -- that can be put forward to replace something that can never be replaced; our clean water that we desperately need? Copper mining in a watershed does not seem to be a good idea. The proposed sulfide mine and tailings dump would pollute streams, wetlands and drinking waters for hundreds if not thousands of years. I believe that issues that haven't been analyzed at all in the SDEIS, like impacts on workers' health, be studied before the EIS is finalized. I request that common-sense alternatives like putting liners under the permanent waste-rock pile and the tailings piles be analyzed before the EIS can be finalized. I am concerned that the high value peat lands on the mine site are irreplaceable. The vast majority of wetlands mitigation is outside the Lake Superior Basin and there is no plan to replace most of the indirectly-affected wetlands. I am concerned that cumulative impacts of the PolyMet Project, and other existing and expanding mines, would impair wild rice, fish and aquatic ecosystems and violate the treaty rights of Indian tribes to hunt, fish and gather in the Superior National Forest lands ceded to the United States. I'm concerned that PolyMet's water and air pollution from mine pit, waste rock and tailing piles, and PolyMet's excavation and changing hydrology and wetlands would increase mercury loading to wetlands and streams and increase mercury bioaccumulation in fish putting human health at risk. I'm concerned that PolyMet's discharge would increase carcinogenic arsenic in Hoyt Lake's drinking water and release arsenic, lead and manganese, chemicals that impair brain function, into the ground water. I am concerned that PolyMet's water pollution from the permanent mine site waste-rock pile would need treatment for at least 200 years and pollution from the tailings piles would require treatment for at least 500 years. Pollution seeping out of the pits would continue in perpetuity, forever. Who is going to pay for this and how can we ever replace our precious water? I am not against iron ore mining, but copper mining does not seem to be a reasonable thing in the watersheds of North America.

Susan Shawn

Susan Solterman Audette

43313

Dear Minnesota Department of Natural Resources, I am writing to register my opposition to the permit for the PolyMet Mine. Northern Minnesota needs economic development that does not risk polluting surrounding surface waters with a mix of acid and heavy metal. PolyMet, as proposed in the Supplemental Draft Environmental Impact Statement, creates a new ongoing water pollution source in the headwaters of the St Louis River, the largest American tributary to Lake Superior, which contains 10 percent of the world's fresh water. PolyMet's own data show it is expected to generate water pollution for more than 500 years. Treating the polluted water requires a complex and untested mechanical system of pumps, pipelines, and filters, which would need to operate indefinitely. The plan does not consider the possibility of mechanical or human failure. PolyMet has no contingency plan for predictable mechanical problems such as pipeline failures, extreme weather or human error. These considerations remain unaddressed in the SDEIS and should not, ultimately, be overlooked by our State's designated environmental managers and stewards. Susan Solterman Audette [HYPERLINK "mailto:ssolterman@gmail-com"](mailto:ssolterman@gmail-com)ssolterman@gmail-com 651-260-7040

Susan Soule 38413

As a Minnesota resident and northern Minnesota native, I want to express my strong opposition to the Polymet mining project for the following reasons: WATER is a precious resource. Besides being the foundation for much of Minnesota's recreational industry, it is essential to the life of our entire ecosystem from the lowliest life forms to human beings. Its scarcity is already a source of friction, concern and conflict worldwide. Look at California's current and frequent droughts and past proposals that a pipeline be built from Lake Superior to the desert southweSt The idea that we would risk centuries of pollution and the staggering costs of cleanup (provided that is truly possible) to one of our most basic and essential resources for a few hundred jobs lasting two or three decades is beyond belief. The idea that we would allow Polymet and its affiliates to do this, with their horrendous track record, is equally terrible. I implore you to stop this project. Sincerely, Susan Soule 7324 West Shore Drive Edina, MN 55435

Susie Kleusch Parkhurst

40104

From: Susie Parkhurst [susieparkhurst@msn-com] Sent: Monday, March 10, 2014 3:10 PM To: *Info (DNR) Subject: SDEIS-PolyMet Lisa Fay, EIS Project Manager, MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155
HYPERLINK "mailto:info.dnr@state.mn.us"info.dnr@state.mn.us Dear Lisa Fay, My name is Susie K Parkhurst and after many years living away from the Iron Range, I have returned home and now live in Palo MN. I would like to submit my comments concerning the environmental impact of the proposed PolyMet Mining project. First I would like to say that while I am not an advocate of Local, State or Federal Government regulating our entire lives, I do trust and rely on entities such as the FDA, EPA and MN DNR to have done their due diligence to assure that they have done all they can to protect and preserve all that they are charged with protecting. An example would be that if the MN DNR states that they need to limit the number of deer hunting licenses because of an overall drop in the deer population, I trust that the MN DNR to have done their due diligence to impose the restrictions for the good of our eco system. I feel comfortable with the levels of guidelines that are currently enforced and that will be enforced in the future to protect our environment and the environment of the world. Currently we depend on foreign countries for so many of the precious metals that are vital for technology, equipment and industry. The more precious metals we can mine and process here in the United States, the less we are dependent on other countries to provide the vital precious metals. Those precious metals are needed for components that are used for such things as personal and business computers, iPads, cell phones, televisions and all manner of personal and industrial equipment. I am not comfortable with the levels of restrictions and guidelines enforced to protect the environment in other countries. The more we depend on foreign countries to provide vital metals the more we rely on them to be good stewards of our environment. The world is truly a small place. Consider the fact that the debris in the ocean from the Sendai Japan earthquake took just 1 year to reach Hawaii and California. It has polluted the Oceans and Seas and is having a negative impact on fish and mammals worldwide. The radiation of the Fukushima Power Plant arrived much more quickly. My brother lived in China for a time and saw mercury being dumped in a local river. It is better for the environment of the Iron Range, the United States of America and the entire world that we mine these minerals locally where we can be monitor whether we are being responsible stewards for the environment. The positive economic impact of a PolyMet Mine on the Iron Range and Minnesota relates to the environmental impact in that the more economically stable an area is, the more highly educated that population is. The more highly educated a population is, the more they become good stewards of their environment and humanity at large. Susie Kleusch Parkhurst 5660 Palo Rd 41 Aurora MN 55705 218-780-0628

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Do not do this in Minnesota-we should be leaders in clean environmental issues. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Suzanne Birch 16015 Elgin Ct Faribault, MN 55021-8568 (507) 334-3023

Suzanne Bowman

To Whom it May Concern: As the General Manager of the Country Inn of Hoyt Lakes, I would like to express my strong support for Polymet Mining to open a plant in Hoyt Lakes, Minnesota. I am very anxious to hire new employee's as the result of Polymet opening. Not only will the plant hire, but the vendors who supply the mine will hire, and we will see a much needed increase in hotel stays therefore I will be able to hire. I trust our EPA and other government agencies that we will be as environmentally safe as can be. I love the idea that the plant will be recycled from the old LTV plant. - Suzanne Bowman General Manager Country Inn of Hoyt Lakes t:218-225-3555 f:218-225-3234

18237

Suzanne, S-U-Z-A-N-N-E, Bowman, B-O-W-M-A-N. I'm from Hoyt Lakes. I moved away from Hoyt Lakes for quite a while, ended up going to Florida and to Pennsylvania because my husband worked in the mines and because of the difficult times in the '80s and him not being able to keep a job. My family became ill and I moved back and took care of them. Why I'm for PolyMet is because I am an environmentalist, also. I want to use the environmental statement that they did and trust the -- I want to trust the scientists and what they've done for the statement. I want to keep it in Minnesota where we have the strict environmental. I do not want it to go to another country where they'll pollute the whole world and they don't have environmental regulations at all. I believe that we need the precious metals very much and we cannot have it dependent on another country, especially China and Japan because they are looking to go to war between them. It was just announced. And I'm a cancer survivor and all of the copper and the precious metals that are needed for medical reasons, I really think that it should come from the United States and from Minnesota, especially with our strict regulations, and I think they did a wonderful job on the environmental statement. Thank you.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have spent much time in the wilds of Northeastern Minnesota over the 40+ years I have called Minnesota my home. There is no place on earth quite like it. I am terribly saddened by the prospect of possibly hundreds of years of environmental contamination due to this project. Although the project offers jobs in the immediate term, they are transitory. The long-term damage that such a project will inflict environmentally and economically on the area means that the legacy to future generations may be a loss of tourist income, illness and spoilage of the natural beauty of the area. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Suzanne Candell 15804 Holdridge Rd E Wayzata, MN 55391-2146

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Suzanne Dunham 518 S Blackhawk St Janesville, WI 53545-4204

Suzanne Glad 41949

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Suzanne Glad Bloomington, Minnesota

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Suzanne Ross 11840 Falls Trl Lonsdale, MN 55046-4530

Suzanne Sette

16169

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Suzanne Shuckhart 3169 230th St Marshall, MN 56258

Sven Hoaglund 44459

Dear Ms Fay, I am writing to show my opposition to the PolyMet NorthMet Mining Project. As someone looking to relocate to the Arrowhead, it's an important issue for me. I think that its great that for 20 years there might be a few more jobs in a pretty cash strapped region of our state, but in all reality it is not sustainable and after the 20 years of mining are up the residents of northern MN will be in the same place they were before this. It' also absurd that we might be cleaning up waste from these 20 years of mining for an eternity or 500 years which is close enough. None of this mentions the possible environmental effects, not just the ones we know will happen. I just don't think that it's worth it and I think that a majority of the citizens of MN agree with me. - Sven Hoaglund Wild Moon LLC C: (608) 799-9731 F: (270) 342-3505

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, sylvie carpentier aloe paris, ot 75018 FR

T & S Wright

38976

My Name is Shirlee Wright and my address is:315 S. 2nd St E., Aurora, MN 55705 I am totally and 100% behind Polymet and have been since the very beginning. Both my husband and I were born and raised on "The Range". In 1984, after the mines went down in 1981, and my husband had been laid off, and finished a 2 year program at the local vo tech, we moved to the Minneapolis area. Our dream was always to move "back home" to "The Range" but we never knew if it would ever happen or not, because economics on The Range in our area was very "Iffy" at beSt BUT after 26 years and our 2 daughters raised and through college .in 2010 we made the BIG move "back home" to Aurora. Especially because of where we've been and lived .I truly believe that PolyMet is vital to our region's longevity and the future is depending on Polymet to help breathe life back into the local economy that has NOT been here since the late 1970's.. Just take a ride down Main Street of Aurora or Hoyt Lakes any given Saturday night .OMG it almost makes this native Auroran cry to see such a desolate economy. And while I have no background in environmental in any way, I have to trust, and I do trust that Polymet has done all of the reasearch and environmental studies required to ensure complete safety in all areas of environment and personal well being for all involved. This company has invested so much money in this project by all of its studies, proposals and lobbying that I would find it hard to believe it would jeopardize that all by not being environmentally responsible in the end. Please, please, please listen to us that live here now and who have had to move away once because of economics, don't force us to have to do that again. We are here because we truly believe in this region and we too love this region for its woods, water and air quality and know that Polymet is doing all it can to help re-vitalize what our forefathers built and believed in also. Thank You..

I strongly oppose the idea of mining. The fact that we need to discuss and learn about how to clean up this toxic process and consider clean-up efforts for at least the next 100 years, likely more if it's possible at all, should be reason enough to stop this conversation here and now. Can anyone provide substantive proof that no harm will come to the areas proposed in the mining. I have not heard any such evidence. What I have heard is evidence that this type of mining allowed in other states has resulted in significant damage and pollution. We have taken far too much for granted in terms of our environment and now some people want to consider purposely harming and polluting it further. It seems to me the answer is obvious, stop it now and do not let the process of mining to continue. It will be a very sad day for MN and for human kind if this is allowed. Shame on us for thinking we can destroy the beautiful space in which we live without having long-term and significant consequences. This land and our environment belongs to everyone, not just those who want to profit from it regardless of impact. Thank you for your time and consideration. Tammy Olsen 1710 Broadway Street N Stillwater, MN 55082

Please accept these comments on the Poly Met Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose, exchange of federal land within the Superior National Forest, and cumulative impacts from mining. The proposed mine poses unacceptable risks to our waters and communities, and I support the No Action Alternative.

T Wilson

36936

Since we have spend billions chasing around Afghanistan, a country rich in Copper, why does poly met not go there and obtain the copper. Please show me a study which displays the demand for copper and the need to destroy our ecology for this myopic enterprise. Also, I feel the offshore companies should not be allow to mine on US soil. They too easily escape the responsibility for proper clean up after the rape has occurred. Jobs. the few actual jobs for the locals is far outweighed by the damage to the ecology for what 20 jobs. Nonsense. We know and see exactly what this is.. Shame on you, you greedy bastards Todd Wilson 130 Manor Circle Orono, MN 55356

The Supplemental Draft Environmental Impact Statement is Inadequate This mine will result in hundreds of acres of permanent habitat destruction. Important natural resources, from clean ground water to animals such as moose and lynx, will be permanently affected or destroyed. Many costs associated with this project have not been addressed: costs of health effects due to increased pollution in water and air, depressed real estate values (which has already occurred in the area), costs of future perpetual cleanup which will be born by taxpayers (this site will end up as a Superfund site costing billions of dollars), costs of lost influx of revenue (new residents/tax base, tourists), costs of road and other public infrastructure maintenance, costs of abandoned buildings/homes when the mining company stops operations, and all other costs that will be born by taxpayers. These and all other external costs must be calculated and defined in the SDEIS. Air, ground water, and surface water pollution will all occur if sulfide mining is allowed. No state or federal rule or law can prevent it from occurring. No company or government action has ever prevented water contamination from sulfide mines from occurring. No company has ever been able to completely clean up the contamination once it occurs nor is it possible for any company to continue with cleanup for the hundreds of years remediation would take. Once the ground water and surface water contamination starts, it will not be possible to stop it. The SDEIS does not address how contamination will be prevented, nor does it adequately address how clean up of the certain contamination will be handled. The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The SDEIS does not address how on-site or off-site spills or leaks of fluids, ore and waste materials and other accidents will be handled to prevent contamination. The SDEIS does not adequately address the prevention of air contamination from dust, particulates, emissions from machinery, and emissions from power generating plants. Just one of many examples as to how the SDEIS is inadequate and deceitful has to do with blasting and excavation. The SDEIS states “The NorthMet Project Proposed Action would cause noise, affecting some sensitive receptors. Nearby residences or other permanent sensitive receptors would not be affected, and some wildlife may avoid the area at times.” Yet the SDEIS also states that blasting will occur every 2-3 days. It is clear that sensitive receptors, including wildlife, residents, and tourists will be affected by the blasting and will permanently avoid the area, not just avoid the area “at times.” The SDEIS fails to provide details of how the monitoring and maintenance of pollution prevention measures would be handled for the hundreds of years needed to Minnesota Rules 6132-3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment. The stockpile covers and liners are not adequate to prevent migration of contaminants to air, surface water, and groundwater. The SDEIS fails to address how the pollution prevention measures would be maintained over the hundreds of years necessary to prevent contamination. Mining companies are notorious for abandoning projects once the ore is extracted, leaving cleanup to the taxpayers. The EPA currently lists 547 non-NPL abandoned mine sites on the CERCLIS list – these are mine sites that have had removal or emergency response cleanup action undertaken on-site. The EPA also lists 117 mining sites proposed for and listed on the NPL as well as mining sites being cleaned up using the Superfund Alternative Approach. These numbers do not include Superfund sites being handled directly by the stat

During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Tahir Hassan 464 Dogwood Ct NW Saint Michael, MN 55376-1020 (612) 532-0442

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. As a long time resident of Minnesota, I am saddened and frightened by the lax enforcement of environmental standards, and the weakening of our processes for oversight at the state, local, and citizen level. Please do not continue down the path of unsustainable damage to our environment and rape of our lands. Do not approve the PolyMet mine request Sincerely yours, Tamara McGehee Tam McGehee 77 Mid Oaks Lane Roseville, MN 55113

41864

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tamara Few Burnsville, Minnesota

Good Evening, Please do not mine for copper sulfides in the BWCA. It is a beautiful, pristine landscape, a treasure of our great state. This type of mining has never been done without pollution and our land cannot take the hit. Yes it would bring in millions of dollars to our state in revenue, but at the expense of one of the last remaining wild places. All of our children and their children need to experience this natural area at least once in their lifetime - do not take that opportunity away. Sincerely, Tami Limberg - Tami Limberg Great River School A2 Science Guide, A1 Occupations Guide

Tammy Ashley 40429

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Tanner Bailey 43742

To whom it may concern, I believe no mining should be allowed in our National Forests. Please keep the forests in their natural state. Thank you. Tanner Bailey 19476 Halwood Road Glenwood, MN 56334 Tanner J. Bailey Eagle Insurance Agency PO Box 217 Glenwood MN 56334 (P)320-634-5153 (F)320-634-4155

Feb 27, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (*Lynx canadensis*). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. The cumulative effects analysis section of the NorthMet SDEIS fails to adequately account for a number of reasonably foreseeable projects. Specifically, the Twin Metals and Teck American projects are listed as "speculative" in Section 6-2-2-1-21 and are not analyzed for their cumulative effects. No evidence or rationale for excluding these projects from the cumulative effects analysis is offered. In Section 6-2-3-6-4, the Gray Wolf is the only "Special Status Species" for which even limited analysis of cumulative effects is conducted, despite the Canada Lynx's status as a federally threatened species. Please take the following actions: 1) Include the Twin Metals and Teck American projects as reasonably foreseeable projects in the cumulative effects analysis in section 6-2-2, since the disposition of the NorthMet SDEIS and subsequent permitting decisions could make these projects more likely to be built. 2) Include the Canada Lynx as a "Special Status Species" in Section 6-2-3-6-4 and conduct a cumulative effects analysis of the impact on Canada Lynx. 3) Analyze and include mitigations such as tunnels and fencing to limit the possibility of incidental take of Canada Lynx by increased road traffic associated with the NorthMet proposed action. 4) Remove contradictory language in SDEIS about Canada Lynx utilization of roads as travel corridors. For example, on p. 5-628 the SDEIS states "Lynx utilize snow packed trails and roads as travel corridors," while on p. 5-366 it says "this species does not rely on roads for travel." 5) Analyze and include mitigation such as accelerated re-vegetation of the mine site after closure to decrease the amount of time the mine site would be inhospitable to Canada Lynx. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. We need to learn to share do not destroy my back country Sincerely, Mr Tanner Lucas 3070 202nd Ln NW Oak Grove, MN 55011-5011

Please, please, please do NOT approve SDEIS! As a mother, daughter, and grand daughter I am VERY concerned about PolyMet's proposal and the impact on Minnesota's water, Minnesota's environment, and Minnesota's citizens/guests for years and years to come! DO NOT TRUST their proposal!! Our water will not remain safe, clean or maintenance free! As a taxpayer of this great state I beg of you.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. Here below are my own words on the proposal: Last night my friend and I went to the hearing in Duluth, a first of three around Minnesota, about the proposal to let a big mining conglomerate, Polymet, leak sulfuric acid and a mess of other toxic overflow into the Lake Superior watershed in order to get at the copper, nickel, platinum and other mineral wealth that underlies this area our hearts draw sustenance from. She said we were witnessing a piece of history. It's left me with the same feeling I think I remember from when I first heard on TV that people are warming up earth's climate, or when as a girl I first heard my dad say the builders were coming sooner or later to put apartments in the pasture. Selfish, said one of the men who testified at the hearing last night, critiquing the motive of everybody taking a stand on whichever side of the debate, but I mostly disagree; I think everyone who takes a stand in a public controversy feels like a representative for some group of others who aren't vocal or privileged enough to be there. The others can be people or they can be manifold living things with whom we don't share a language. The non-profit organization WaterLegacy in a brief emailed review of the hearing pointed out that about two thirds of the testimony given was from opponents of the mine, and that while many opponents cited specific flaws or gaps in Polymet's supplemental draft environmental impact statement, the supporters just called on their faith or intuition that the review, the future mining technology or the industry in its great professionalism could be trusted. I was glad of the evidence that somebody else had been keeping track of opinions for and against the project, since I had been keeping my own tally on paper during the testimonies my friend and I heard from about 7 p.m. till nearly 10:00- For most of the evening I found that the opponents led by nearly two to one, but as the room emptied it seemed more and more the boosters for local mining were the people remaining. At the crux of the proposed mining scheme is that the various metals termed sulfides, including copper, gold, nickel and platinum become toxic, turning to sulfuric acid, when exposed to air and water after being dug from the open pit mines. I say mines because Polymet's proposed mine located near the Embarrass and Partridge Rivers, which would wash the pollution into the St Louis River and thence Lake Superior, is not the only proposed sulfide mine. Twin Metals is a joint venture between a Canadian and a Chilean company that wants to dig another mine barely three miles from the Boundary Waters Canoe Area near Ely, Minnesota. Yet-to-be-named venture capitalists are and will be watching. To them, sulfuric acid is a risk factor, an abstract liability in a bright-eyed betting game. Not vinyl, not clay, not metal set in the ground to hold the drainage in storage ponds or divert run-off from towering piles of dug-up rock, wood rubble and dried-out peat will keep the acid waste water from where we don't want it to go. The soils are largely sand and peat, boulder and gravel. The questions are when, how soon and how much effluent will make its way where-all and how far. No company, whatever formal arrangements it puts on record, will retain squadrons of river guardians or pit watch personnel past its own dissolution, or past all caring once the blue coldwater lakes of legend or the fishing streams are discolored or pretty well devoid of healthy aquatic life. Arguments made by citizens in favor of mining are that we need the copper that the region has, that no other mining region of the world has the robust environmental oversight found among Minnesota agen

48954

Mar 10, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. My whole life has been a love affair with this region. I cherish its spectrum of birds and wildlife, including fish, none yet driven to extinction. Also I use its fish for food in summer. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. There is every assurance that despite all promises and prescriptions they will here too. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health. This whole region is underlain by percolating water which will begin to run with soluble metals including mercury, getting into lakes, marshes and rivers, harming wildlife scarce already including the threatened lynx and our declining moose populations. The Polymet scheme is a rich corporate affair that in no way benefits anyone except those who measure well-being in dollars. A hoax is being perpetrated on the job-poor promising them work at the expense of everything else in the region. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Tanya Beyer 10431 Bachelor Square Rd Meadowlands, MN 55765-8103 (218) 260-6767

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

25 people recently add their names to Students Against Sulfide Mining 's petition "HYPERLINK "http://www.change-org/petitions/lisa-fay-tell-the-dnr-you-think-polymet-sulfide-mining-is-a-bad-deal-for-minnesota/responses/new.response=d218e047517bandutm_source=targetandutm_medium=emailandutm_campaign=one_thousand"Lisa Fay: Tell the DNR you think PolyMet Sulfide Mining is a bad deal for Minnesota.". That means more than 500 people have signed on. There are now 325 signatures on this petition. Read reasons why people are signing, and respond to Students Against Sulfide Mining by clicking here: HYPERLINK "http://www.change-org/petitions/lisa-fay-tell-the-dnr-you-think-polymet-sulfide-mining-is-a-bad-deal-for-minnesota/responses/new.response=d218e047517bandutm_source=targetandutm_medium=emailandutm_campaign=one_thousand"http://www.change-org/petitions/lisa-fay-tell-the-dnr-you-think-polymet-sulfide-mining-is-a-bad-deal-for-minnesota/responses/new.response=d218e047517b Dear Lisa Fay, Polymet's plan acknowledges that millions of gallons of polluted water will seep into the environment untreated, and the water they contain will need active treatment for hundreds of years. Polymet does not have a plan for mediating environmental disasters if they occur. Polymet's primary investors have a long history of environmental destruction and failure to clean up messes such as the BP oil spill. If any contaminated water is released (which Polymet acknowledges will occur), the wild rice crop will see severe negative effects. Wild rice is a cultural and economic staple to many native communities in Northern Minnesota. The majority of profits will not remain in the state of Minnesota, and Polymet provides insufficient details as to financial assurance needed to protect taxpayers in the future. Its not worth the risks, Poly-Met sulfide mining as currently planned should not occur in Minnesota. Minnesota's young people want a clean and vibrant future void of pollution. The youth say no to sulfide mining. 1- We use many products using copper/nickel 2- MN has deposits of copper/nickel 3- MN has a reputation for environmental integrity and oversight Unless you want to ban copper/nickel products in the state, MN needs to live up to it's responsibility to responsibly mine these minerals. It is hypocritical to use these products but declare it is unsafe to mine them. MN can do this better and safer than probably most states/countries in the world. I support the project with rigorous oversight applied. Ted Heller 1021 7th St S Waite Park Mn 56387

Ted Mattison 38954

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Ted Mattison 95006 Grassy Pt Tower, MN 55790-8470

Ted Mattson 23911

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Isn't it time we humans started thinking about the earth. Fresh water and topsoil give us life. Without them, humans would cease to exist All the money in the world will not bring them back. There has NEVER in history been a "safe" sulfide mining operation. Do us all a favor and find 10 mines whose operations were successful ten years after they closed up. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Ted Mattson N10794 Karnopp Road Wausaukee, WI 54177 Sincerely, Ted Mattson N10794 Karnopp Rd Wausaukee, WI 54177-9109

Ted Wahl 44589

As a young youth in Minnesota, building a mine close to the boundary waters that's only providing 50-100 jobs for the economy, is NOT worth the 500 years of clean up. I hope the DNR makes the right choice Thank you for your time. Ted Sent from my iPod

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, tegwin moye 3310 69th st e inver grove heights, MN 55076 6515527148

Name: Teresa Alto Legal mailing address: 21995 Mishawaka Rd, Grand Rapids, MN 55744 I felt it was important to write as a resident of the Iron Range who feels we must go only slowly, cautiously, and skeptically into copper and nickel mining in our region-if at all. It seems almost criminally shortsighted to go into a mining project forecasted to operate and provide jobs and extract resources for just 20 years and that requires a period of cleanup too long to adequately plan for. The mining of these metal resources threatens another resource: water and clean and healthy watersheds and watershed ecosystems, which are truly becoming scarce and invaluable globally. Not only should it cause us grave concern that the company has provided no information on its methodology and no explanation of its estimated projected costs, but it is patently impossible to plan for 500 years of cleanup, no matter how much funding the company puts aside as financial assurance. Five hundred years ago there was no United States, nor was there any significant European settlement in the Americas; democratic government did not exist in any developed society, and the population of the world was a tiny fraction of what it is now. How can we plan for continued cleanup for the next 200 years on some parts of the mining area and for 300 more years after that on other parts. Already, we know that aquifers and freshwater worldwide are dwindling and cannot meet the projected growth in demand. How can we know how that will affect governments and water resources even 100 years in the future. How can we know that we will have a stable economy and national government for all this time. And yet the rivers and lakes and land will still be here, and animals and plants and forests will still be here, and we hope that people will still be here. The land has a moral claim on our actions, and so do future people and the world they will inherit from us. Northern Minnesotans want economic opportunity and stability, but we also want to be able to fish and hunt and canoe and ski and enjoy the outdoors. People here have a strong culture of living in part off the land, and a strong culture of valuing the recreation, bounty, solace, and beauty of the land and water around us. It is the land and sense of community that make people want to stay here and to move here. The beauty and outdoors recreation are key to the economic and social vitality of our communities. And they are one of the most significant contributors to our economies through tourism and related industries. So this is not a "jobs v. the environment" issue, and I certainly do not believe the "jobs and the environment" image touted by Polymet. We are talking about short-term jobs, so the jobs are not offering long-term vitality to our communities. And we are talking about a necessary cleanup—according to the company's own materials—required for too long for human companies or governments to plan for or fund. The unknowns are impossible to account for. I am adamantly opposed to the Polymet mining project.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, teresa haskell 3800 14th ave D168 lacey, WA 98501 US

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, terra forshier Minneapolis, Minnesota

The idea that we would allow a project that may require 500 years of remediation is crazy. There is no way to guarantee that the money will be available in even 100 years or project what the costs may be at that time. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Terrence and Marge Smith

Polymet mining will provide a much needed economic boost for northern Minnesota lasting many years. As long as Polymet can prevent permanent damage to our lakes and streams, Polymet should be given the right to mine.

Regarding: Big Picture considerations and actions for immediate permits issuances for the Northmet/PolyMet East Iron Range Minnesota Project and all others similar. With over 1200 active volcanoes on Earth and over 25,000 miles of ocean volcanic rift emissions, all of humanities emissions are less than 1% of Earth nature's emissions. From Wikipedia on line, probably any encyclopedia and google search under "ocean rift volcanism", first two pages of 20 plus below. It is beyond foolish and extremely wasteful to remove toxins from industrial or any other human process unless they are a direct health threat. Or trying to clean or clean up 1% of any problem will not and can not clean up the remaining unrelated 99% natural pollution; leaving nature's 99% pollution still there causing the same problems. The EPA and the MPCA have now wasted over 8 years of study on a less than minuscule part of the less than 1% human part of the problem. This is fraud by any definition. Fortunately for these obstructionists, they will all likely be dead from old age before government agencies will be able to prosecute this fraud. But worse, future generations will look at this incredible foolishness and obstructionism with at least great disdain, probably outright contempt for acting so outside the law, or not accounting for the above reality in decision making. I urge all organizations everywhere to bring these facts out everywhere possible to help stop the foolishness and the fraud in air and water pollution control. Because nature is the 99% problem, except for direct health threats, humanity's pollution will never be an issue compared to the 99% pollution output of nature. Please urge everyone to demand the necessary permits for the Northmet/Polymet Project be issued immediately to put a stop to this environmental fraud and farce obstructing the Northmet/Polymet Project in Northeastern Minnesota and others. Open circulation of this letter and submission to the environmental reviewers is strongly urged to put a stop to this criminal obstructionism of the Polymet Project and others. Terry D. Welander 2 West Parkway Virginia, MN 55792 email: HYPERLINK "mailto:tdwelder@gmail-com"tdwelder@gmail-com Google Search below on "ocean rift volcanism", 2 pages below of over 20 available; for everyone's reference in support of the above letter. PS Snowfall in this area and other areas on Earth has around 50 parts per billion Mercury. Or after a dozen or so snowfalls, particularly during snow melt, the amount of natural Mercury can approach toxic levels for humans and animals. Why any consideration of human Mercury sources is irrelevant to the point of fraud. Rainfall in this area and other areas on Earth is around 25 parts per billion Mercury. Or after a rainfall season, natural Mercury levels can approach toxic levels for humans and animals depending on distribution. Also why any consideration of human Mercury sources is irrelevant to the point of fraud in nearly all instances. And with all the volcanic sourced atmospheric toxins raining down on the planet downwind from all volcanic eruptions, any human sources are almost always less than insignificant. Or in practically all instances, human sources of pollution are irrelevant compared to nature. HYPERLINK "http://www.elmhurStedu/~richs/EC/102/Lectures/PlateTectonicsII.pdf"Plate Tectonics HYPERLINK "http://www.elmhurStedu/~richs/EC/102/Lectures/PlateTectonicsII.pdf"www.elmhurStedu/~richs/EC/102/Lectures/PlateTectonicsII.pdf. http://www.google-com/search.client=safariandrls=enandq=oceanic+rift+volcanismandie=UTF-8andoe=UTF-8# http://webcache.googleusercontent-com/search.q=cache:4Rcwsa_1jecJ:www.elmhurStedu/~richs/EC/102/Lectures/PlateTectonicsII.pdf+oceanic+rift+volcanismandcd=1andhl=enandct=clnkandgl=usandclient=safari http://www.google-com/search.client=safariandrls=enandq=related:www.elmhurStedu/~richs/EC/102/Lectures/PlateTectonicsII.pdf+oceanic+r

NorthMet SDEIS The US Corps of Engineers jurisdiction is limited to commercially navigable waters. The closest being the Duluth docks and harbor 60 miles away from the project. Or the US Corps of Engineers does not and has never had jurisdiction on this project. The US Army Corps of Engineers needs to remove themselves on jurisdiction and other grounds as necessary. A completely acceptable mining and refining plan was in place before the MN DNR became involved in the Polymet project. And the MN DNR, not being or having pollution jurisdiction should not be involved in the Polymet permitting. Any land swaps must be treated separately, the sole reason the MN DNR would be involved; and at the sole convenience of Polymet. The MN DNR needs to remove themselves from this project permitting. Only the MPCA should be involved and should immediately issue permits based on the 99% pollution sources on the planet being the 1500 active volcanoes and their beyond huge emissions affecting practically all air on Earth. Nothing in the Polymet process even registers on the total pollution rained on the planet from these 1500 active volcanoes. Since the big picture and most relevant pollution problem of the 1500 active volcanoes on Earth have been ignored to date by this highly erroneous review process, the only realistic alternative is immediate issuance of the Polymet permits by the MPCA; all other entities not having any jurisdiction due to pollution considerations being the only relevancy for this project. Snow fall in NE MN and other places has 50 parts per billion Mercury; most likely from all those 1500 natural volcanic emissions. Or after a dozen or so snow falls and some snow melt, nature provides a nearly toxic environment making nearly everything humanity does irrelevant and less than miniscule on any total and big picture measure of pollution. A variety of other volcanic toxins precipitate out of the atmosphere during snowfall and rain further negating any consideration of the less than miniscule contribution of humanity to any pollution. Stop the foolishness and irrelevancies of humanities less than miniscule pollution emissions compared to nature now, now, now, not later, to keep future generations from viewing this process and the people involved in it with utter contempt for being so selectively biased and blind not considering the 99% natural Earth pollution problem silently and hiddenly causing death and destruction everywhere. Based on nature being the 99% pollution problem as detailed above, all government agencies except the MPCA need to remove themselves from this review process immediately. And the MPCA needs to issue the necessary permits for the Polymet project immediately. Terry D. Welander email: [HYPERLINK "mailto:tdwelder@gmail-com"](mailto:tdwelder@gmail-com)tdwelder@gmail-com 2 West Parkway Virginia, MN 55792 PS Google Search below on " Earth Volcanism", 2 pages below of over 20 available; for everyone's reference in support of the above letter. Negation and Refutation of the suggested Bonding Requirements for the Proposed Polymet/Northmet Hoyt Lakes Copper Nickel Project. Where is the accounting of the emissions from the 1500 volcanoes dropping toxins everywhere downwind (which is nearly everywhere on Earth) and on the surface in NE MN in particular. It has not been provided and is 99% source of the surface toxins problem coupled to natural daylighted (surface exposed) ore toxins. Where is the accounting of the emissions from the daylighted natural ore bodies in numerous locations in NE MN. It has not been provided and is part of the 99% surface toxins, particularly nitrates; and practically all other toxins of the periodic table of elements. Or nature or natural pollution is the 99% problem negating the need for bonding of any human projects. Nature has and will clean up all of human pollution problems over geologic time; as nature has cleaned up its own environmental messes over time. Also why bonding of humanities projects is not required. The deliberate ignoring of the 99% plus natural pollution problem from nature by supposed environmental groups is criminal negligence and needs to be exposed as high negligence of reality and needs to be set aside from consideration for ignoring the 99% natural Earth pollution problems in the Polymet/Northmet NE MN Copper Nickel project and all similar. Additionally; copper is a sanitizing (anti bacterial and anti viral) agent for all of the animal and plant kingdoms Or limited copper exposure as nature provides is a cleansing agent for all of the animal and plant kingdoms is highly desirable. Mimicking nature by adding limited amounts of copper to the environment will make it a better environment for plants and animals. There is currently no nickel mine in North America. Providing nickel production in North America is a national security requirement negating practically all of the environmental concerns. Nickel is a civilized world necessity from food tin can linings to any machine requiring heat resistance. Modern humanity can not live without a supply of nickel. Immediate issuance of the necessary permits by the MPCA to Polymet is urged in the strongest possible terms to make this review lawful and avoid formal criminal court complaint from local governments for the deliberate ignoring of nature's 99% pollution reality. Terry D. Welander 2 West Parkway Virginia, MN 55792 --- Forwarded message --- From: Terry D Welander Date: Wed, Jan 29, 2014 at 11:40 AM Subject: Additional Details on the Followup Plan on the Big Picture Support of the PolyMet East Iron Range Minnesota Project and all others similar- Urging immediate permit issuance by the MPCA and removal of all other government agencies from this process as detailed below To: [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us)NorthMetSDEIS.dnr@state.mn.us NorthMet SDEIS The US Corps of Engineers jurisdiction is limited to commercially navigable waters. The closest being the Duluth docks and harbor 60 miles away from the project. Or the US Corps of Engineers does not and has never had jurisdiction on this project. The US Army Corps of Engineers needs to remove themselves on jurisdiction and other grounds as necessary. A completely acceptable mining and refining plan was in place before the MN DNR became involved in the Polymet project. And the MN DNR, not being or having pollution jurisdiction should not be involved in the Polymet permitting. Any land swaps must be treated separately, the sole reason the MN DNR would be involved; and at the sole convenience of Polymet. The MN DNR needs to remove themselves from this project permitting. Only the MPCA should be involved and should immediately issue permits based on the 99% pollution sources on the planet being the 1500 active volcanoes and their beyond huge emissions affecting practically all air on Earth. Nothing in the Polymet process even registers on the total pollution rained on the planet from these 1500 active volcanoes. S

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Terry Ford 3404 Aldrich AveS. Minneapolis, MN 55408

This seems like a short-sighted project that could be very detrimental for our environment. There does not seem to be a reasonable plan for all the harm that could ensure. No one will be responsible for 500 years. This is not a reasonable or practical or responsible proposal. I would vote no until the company can find a way to mine without producing pollutants.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. Based on my reading, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my conclusion. Neither the SDEIS nor the sulfide mine project are based on accepted science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its optimistic predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real base flow is two to three times higher than the number used in the SDEIS. Base flow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone using a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Terry J. Williams 4170 Brigadoon Drive 4170 Brigaoon Drive, Shoreview, MN 55126 Shoreview, MN 55126

Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my conclusion. Neither the SDEIS nor the sulfide mine project are based on accepted science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its optimistic predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone using a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real base flow is two to three times higher than the number used in the SDEIS. Base flow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone using a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Terry J. Williams 4170 Brigadoon Drive 4170 Brigadoon Drive, Shoreview, MN 55126 Shoreview, MN 55126

Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The proposed Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The Supplemental Draft Environmental Impact Statement [SDEIS] does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights:

- Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines.
- Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value.
- Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes.
- Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish.
- Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected:

- The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands.
- The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense.
- The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lyn

To All Concerned: I am a small-business owner of a family-owned company in Hibbing that has been in existence for 50+ years, and am writing to you to comment on the SDEIS for PolyMet Mining's proposed NorthMet project. We are impressed with the great deal of depth contained in the completed study and are convinced it shows the safety and viability of the project. We also believe that the future of Northeastern Minnesota and those of us who choose to live and work here need this project to be allowed to go ahead in order to secure our future viability, as long as reasonable environmental safeguards are met. I am concerned that some media have misconstrued the data regarding the groundwater flow model, giving the general public the impression that the 200 to 500 year figures indicate that the project will still need expensive treatment 500 years from now. On the contrary, the thorough study indicates the extremely slow rate of travel that the water will filter down through the bedrock, and that water quality standards will still be met even that far out on the timeline. We are blessed with a rich deposit of minerals in northern Minnesota, and the minerals that would be mined by PolyMet are and will be in high demand by the world's economy. Let's not squander the opportunity to be the suppliers of these precious resources that will also bring to our state so many new jobs (360 full-time and 600+ related) and considerable added revenue for the State of Minnesota. Because of stringent oversight and federal and state regulations of our environment in Minnesota, as demonstrated by the thoroughness of this study, we in Northeastern Minnesota can produce and supply these needed resources in a much safer and more environmentally friendly way than anyone else in the world. PolyMet and companies like them that comply with all state and federal regulations should be granted the necessary permits to conduct their operations in our state. My review of the EIS and the great amount of detail included within it tells me that you have thoroughly evaluated this potential project and its impact, and I strongly urge you to permit this project to go ahead. Sincerely, Terry Miller

To Whom It May Concern: After reviewing the SDEIS and visiting the Polymet site, a former mining site, I support the regulatory process in approving the Permits necessary for Polymet to begin operations in the State of Minnesota. Further negativity from the opposition is unfounded. Polymet has more than answered all questions asked of them and addressed all regulatory requirements. Why should Polymet be further subjected to previously addressed issues and unfounded opinions. It is time the MNDNR, EPA, MNEPA and the USACOE move forward and provide Polymet with its needed "Permits to Operate". Allowing Polymet to operate will definitely help the local, state and federal governments fund further projects and aid with financial support from Polymet and local businesses through taxes created from the employment of the public. At this time in our age we need all the employment help we can get. PLEASE, ALLOW POLYMET TO HELP US HELP OURSELVES. Terry Nevalainen Civil Engineer 217 NW 10th St Chisholm, MN

---Original Message--- From: archtttmo@hotmail-com [mailto:archtttmo@hotmail-com] Sent: Thursday, March 06, 2014 10:30 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: The PolyMet Supplemental Draft Environmental Impact Statement (SDEIS) is fatally flawed . We should not burden future generations with toxic water pollution and cleanup costs from a sulfide mine. Once our sacred and natural Minnesota lakes, rivers and aquifers are polluted from a toxic spill, there is no way to ever recover what we lost PolyMet would operate for 20 years but, according to PolyMet.s own data, would pollute water for over 500 years at the tailings basin, and over 200 years at the mine pit. The modeling results provided in the SDEIS show that PolyMet and the DNR did not look beyond 500 years. The SDEIS does not say when the mine pit and tailings basin will stop polluting our water. This is a major and apparently intentional failure that needs to be corrected by the DNR. Please run the models . or require PolyMet to run the models . long enough to show when pollution of our water by PolyMet.s mine would cease. Again, we can not recover what we could lose from quality of life, natural habitat, economic benefits of tourism and the livability of the local communities. PolyMet proposes a complex mechanical system of pumps, pipelines, and filters that it says will capture and hold back the water pollution from getting into our rivers. PolyMet assumes the proposed expensive and complicated water treatment system will continue to operate effectively for long after the mining has stopped. Mechanical systems like pumps, filters and pipes eventually fail. In a 2007 report, an organization called Earthworks analyzed the records of 14 modern copper mines in five states found that 100% of these mines experienced pipeline spills or other accidental releases. 92% had failures of water collection and treatment systems that resulted in releases of contaminated mine seepage that significantly impacted water quality. Polymet's SDEIS lacks contingency plans for predictable failures in the proposed piping, pumping, and filtration equipment. By assuming that a complicated water treatment system will function indefinitely without fail, the SDEIS has failed to take the hard look required at the proposed PolyMet sulfide mine. In addition, if the company declares bankruptcy, who would be left to repair the damage and restore the communities and habitat. Please reject the SDEIS. Reject PolyMet's plans flawed with predictable failures in the water pumping and treatment system and the power supply to run that system. Reject the lack of fiduciary responsibility for a failure that is irreparable to OUR delicate balance in Minnesota. Long after the mining has stopped, PolyMet would pose an ongoing risk to fresh water. The Embarrass, the Partridge, and the St Louis Rivers, as well as Lake Superior, are far too precious to be put at risk for the profit of PolyMet. PolyMet should not be permitted. There is no way to guarantee when the proposed mining stops, that the groundwater and surface water would be left in a clean condition, and surrounding streams, rivers, and Lake Superior would be safe from risk of sulfide mine pollution. The PolyMet SDEIS suffers from many major failings. The SDEIS needs to be withdrawn and rejected. Sincerely, Terry Olsen 542 Pelham Blvd Saint Paul, MN 55104-4938

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404 " Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation " wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please: • Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance. • Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS. • Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions. • Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect " wetlands losses. • Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin. • Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands. Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Terry Richmond 2900 County Road 19 Maple Plain, MN 55359-9386

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. On a personal note, my son canoed in this area two summers ago and it continues to be one of his most memorable experiences as an adolescent. As an adult providing supervision to Boy Scouts on their trips into the outdoors, I am always impressed about the maturity they exhibit and the growth that happens when these young men are given the opportunity to govern themselves in wilderness areas. I don't know of any other place where this happens on this scale. All of our communities will be lessened to the extent that we allow the limited wilderness that now exists to be further diminished by mining and industrial pollution. Sincerely, Terry Williamson 768 Belhaven St Jackson, MS 39202-1705

The MN Department of Natural Resources must guard and protect our most valuable resource above all-water. Down the road the value of water will pale compared to "precious metals." Water is indeed precious. Unforseen, predictable and unpredictable incidents and accidents are not addressed in Polymet's proposed water treatment plan. All the financial assurance dollars in the world are not worth taking the risk of impairing MN waters. In light of this, I see JOBS as a four-letter woRd Don't let ~350 short-term jobs, the heft of big business, and dollar signs cow the DNR into submission. Sincerely, Tersenia Schuett 1410 Goodrich Ave StPaul, MN 55105

Hi there, I am a young student at prior lake high school. To be completely honest with you guys although this May look like a good idea now, I am way too nervous to take action. I don't trust the possible outcomes that this could create/affect in the long run. Thank you for hearing what I have to say. Sent from my iPhone

The Bremicker-Bartels 42963

the Maloney Family 43254

Opposed. Minnesota does not need the open pit copper-nickel mine. This potential mine is not a good investment in our state's future. Four hundred jobs for twenty years traded for a sulfide tailings is not worth it. It is not even going to produce that much in minerals. The mine is a short sighted silly idea. I have stood in the bottom of Bingham Copper Pit. Nothing grows around these mines. The pH is wrong for plants. The ore deposit is not going anywhere. Let us leave it for our future Minnesotans with improved technology to decide if they want to mine the ore. Ann Maloney 8293 Paradise Beach Court Brainerd, Mn. 56401

The Mowans 38548

A nightmare is about to happen if the Northmet Mining Project is approved. I cannot add anything to the science as a concerned citizen. I read the facts and listened to experts who will not profit financially, I am saying that the facts of science prove this project should never be allowed. History of copper mining must be included because the price was paid elsewhere and there is no going back. We are fools not to learn from the pain of others. Water is one of the most precious commodities on this Earth. This fact appears everyday in news reports when disaster after disaster created by human beings has spoiled our waterways. I do not believe any mining company should be permitted to desecrate the forests and watersheds of our beautiful state. 90% of everything mined will produce tailings in an untold volume. How many piles 20 stories high. How much water is used for the chemical bath. What are the chemicals in the bath. Is it a secret like the chemicals used in fracking which is legally kept a secret from the people whose land is being flooded. Right now tailing piles from the old LTD taconite site create pollution that is exceeding current MN water quality standards. Mercury has been found in children. What will it cost MN in health care for known health concerns. Polymet is the next "invasive species" leaving the increasing devastation forever and ever. Three-hundred jobs will never justify what the pits, up to 700 feet deep and the sulfur piles 20 stories high will do to the environment, FOREVER. After the 20 year run when all the wealth leaves this country these miners will again be jobless. Hy-Vee will build a grocery store in New Hope MN that will hire 400 employees. How can anyone with a conscience use jobs as an excuse to ruin MN. Only a few jobs for a few years what is left is the Hell that would be created in our Northland. The DNR should be the guardian of our natural resources for all Minnesotans. Lost to profiteering is unforgiveable. We need pristine places to live and retreat to. What has been saved for us took some warriors in the past Please don't be responsible for 500 years of destruction by sulfuric acid. The loss of forests that filter our air is another important factor in pollution. I do not believe any politician or state employee has the right to give away MN. I think of Judas, what price to pay for materials to manufacture products that will eventually end up in landfills. Why does Polymet a foreign corporation that has a history of ravaging the earth in Canada deserve the right to reap havoc here. Their financial backers have a history of illegal dealings and world wide pollution. These facts are a part of the entire package. F. Sigrid Mowan 4186 E Shamaineau Dr Motley MN 56466

December 19, 2013 VIA U.S. MAIL Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 Saint Paul, Minnesota 55155-4025 Douglas Bruner, U.S. Army Corps of Engineers- Saint Paul District 180 5th Street East, Suite 700 Saint Paul, Minnesota 55101-1678 Tim Dabney U.S. Forest Service- Superior National Forest 8901 Grand Avenue Place Duluth, Minnesota 55808 Dear Ms. Fay, Mr. Bruner, Mr. Dabney: On behalf of the Minnesota/North Dakota/ South Dakota Program of The Nature Conservancy, I request an extension to the public review and comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) for an additional 90 days beyond the current end date of March 13, 2014. The Nature Conservancy is a nonprofit conservation organization that works in all 50 states and 35 countries and has a membership of approximately one million. The mission of The Nature Conservancy is to conserve the lands and waters on which all life depends. The longer review and comment period is warranted by the length and complexity of this document. The quality of comments that the Conservancy and the public will be able to provide will improve with additional time. Sincerely, Margaret Ladner Minnesota State Director

Theo 43082

Do not allow the copper mines in Minnesota. It will wreck everything-such as the land, water and tourism. I worry about what it will be like when I am an adult, will the BWCAW still be the same. will I be able to go swimming and eat the fish I catch. No safe gaurd is 100%. The mines are also ugly and destroy the land. Theo Anderson (8th grade) 2150 Mailand Road St Paul, MN 55119

Theodore Gorney 39614

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Theodore Gorney 5572 Brookdale Dr N Brooklyn Park, MN 55443-3015

Theresa Flynn 38948

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Theresa Flynn 794 Holton St Saint Paul, MN 55104-1315

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I am proud to be a Minnesotan because of this state's history of valuing nature and the preservation of our natural resources. To allow copper nickel mining, especially when this mine's projected lifespan is only twenty years, destroys my trust in the DNR and makes me question the values of my fellow Minnesotans. It is the DNR's job to protect Minnesota's environment and take care of our natural resources, and allowing mining that has the potential to pollute for hundreds of years is a direct contradiction of this. I do not understand how anyone, especially a government agency that is supposed to put public interest first, can think that a relatively small increase in jobs and economic output for twenty years outweighs the potential for catastrophe and pollution for hundreds of years. Minnesota is known for its clean lakes and rivers, but fresh water is not an infinite resource and we should not be actively working to jeopardize the local watershed and Lake Superior, which is what would happen if the PolyMet mine is approved. I am extremely disappointed that the state government, which is supposed to act in the public's best interests, could consider this mine to be a viable option. It is absolutely not in the public's interest to allow mining that could pollute any watershed for hundreds of years. Even if there is some way that PolyMet could guarantee it can pay for clean-up of a catastrophe, Minnesota has only been a state for a little more than 150 years and it would be crazy to knowingly create a situation that leaves us cleaning up water pollution for twice as long as we have been a state. Sincerely, Theresa Gerber 817 Hilltop Rd Mendota Heights, MN 55118-4324 (651) 788-2484

57983

I don't understand how someone can look at the numbers objectively and feel it makes economic sense to go ahead with this project. How can the mining company guarantee that if something does go wrong, they can pay for cleaning water for 200-500 years? Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Theresa Johansen

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Theresa Johansen 10355 Greenfield Rd Greenfield, MN 55357

To The State of Minnesota's DNR, It is inconceivable to me that anyone who has any concern for the natural resources of Greater Minnesota, would allow or would ever think of allowing mining to occur in this irreplaceable environment. Please be a leader, please think of future generations, please think BIG .big enough to understand that the ways of the world are changing, and people need and want us to take care of our resources. And they are resources, it is why I live in this state. I spend \$1000 every year in Greater Minnesota exploring natural area's, patronizing local businesses and paying permits. So far I estimate I have spent \$20,000 in the BWCA area in my adult lifetime, and I plan to spend just as much and even more in my years to come. And let's be clear here, my annual salary is \$40,000 .I'm by no means rich, but choose to spend my money here in order to experience the BWCA as it is. BUT not if, I even think for a moment that the water is being contaminated, the animals lives are being compromised or the local economy doesn't value protecting this most incredible resource. Think about it, there is a lot at stake, and you and I am responsible for what happens. Say to NO to Polymet in Minnesota. "The eyes of the future are looking back at us and they are praying for us to see beyond our own time. They are kneeling with hands clasped that we might act with restraint, that we might leave room for the life that is destined to come. To protect what is wild is to protect what is gentle. Perhaps the wilderness we fear is the pause between our own heartbeats, the silent space that says we live only by grace. Wilderness lives by this same grace. Wild mercy is in our hands." - Terry Tempest Williams Sincerely, Theresa Nelson HYPERLINK "mailto:theresa.f.nelson@gmail-com"theresa.f.nelson@gmail-com HYPERLINK "http://www.linkedin-com/in/theresanelsonmn"www.linkedin-com/in/theresanelsonmn 612-655-5662

Dear Theresa, Thank you for contacting me about the proposed PolyMet copper-nickel mine. I appreciate your email and the Star Tribune article link. As you may know, the Department of Natural Resources (DNR) can authorize the mine without legislative approval. However, a project of this size is required to complete an Environmental Impact Statement (EIS) under state and federal law to evaluate the comprehensive effect of the project on the environment, local communities, and the economy. Currently, the DNR is taking public comments on the proposed EIS HYPERLINK "x-apple-data-detectors://0"until Thursday March 13, 2014- More information about the project, including submitting your comments, here: <http://dnr.state.mn.us/input/environmentalreview/polymet/index.html> Thank you again for your email. For my part, I will continue to support policies that protect our state's world-class lakes, rivers, and groundwater for generations. Best wishes, Debra Hilstrom >>> 2/9/2014 2:51 PM >>> <http://m.startribune-com/news/.id=244570531andc=y> Please refer to above article. My husband Dennis Johnson and I, Theresa Rokusek, are vehemently opposed to this or any other company coming into MN to do mining. They will promise to follow safe rules and policies should they be okayed to do so. Of course they promise all kinds of jobs to the financially depressed region. How many are guaranteed to US citizens. Allowing this potentially environmental killer into our beautiful state is ludicrous based on dollars and cents. Haven't we learned enough from the BP explosion, the recent chemical disaster in Virginia releasing deadly chemicals in the river nearby, and the opposition to building the KXL pipeline thru our country by a Canadian company. If it's so safe, why not build it through their country.. If we care anything about keeping our waters and lands safe, we cannot allow promise of big \$\$\$ to cloud Minnesota's safety and beauty. From: Theresa Rokusek and Dennis Johnson 2557 Brookdale Lane Brooklyn Park HYPERLINK "tel:55444-2336"55444-2336 763-560-0169

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Theresa Sprung Center City, Minnesota

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I submit these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement because of serious concern for the health of the Great Lakes region of the United States and Canada. Sulfide mining threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on the Great Lakes fresh water system, the Great Lakes region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, and the cumulative impacts from mining. It is not in the public interest or the best practices to protect our natural and fragile environment to allow a Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine. Sincerely, Theresa Zaydel 13967 Ashton Rd Detroit, MI 48223-3531

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Ms Lisa Fay and DNR, I am writing to express comments on the SDEIS for the proposed NorthMet Mining Project and Land Exchange. We Minnesotans have before us a proposed project from an outside company which stands to obtain large economic gain. This corporate gain comes at the expense of Minnesotans permanently selling off one of our natural resources. The benefits for Minnesotans are some construction jobs for a few years and a few mining jobs for a twenty year time period. There appears to be no pressing need at this time for copper and nickel. These metals are not being mined for use by our state. The detriments of this project as I see them are; We will soon be left with an abandoned mine, the transient jobs are gone and we have clean up and monitoring of the site for centuries. We will have spent our resource. The amount of money to be set aside has been only vaguely defined. It is quite impossible to plan monitoring and clean up for several hundred years. Recent water quality data regarding sulfate water contamination confirm original studies that suggest we have native wild rice and potentially many other species are very sensitive to increased sulfates in the water. We are contemplating the possibility of adding pollution to the largest freshwater lake in the world. The detriments in my opinion would appear to far outweigh the short term benefits. We do not have an economy that is so destitute that we need to consider this project. The decision needs to be based on science and a clear thinking view to our state's future, not to short sighted political or economic gain. Sincerely, Thomas A. PLEASE STOP THIS PROJECT NOW Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. We have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Thomas and Charlotte Mainz 210 9th Ave S Princeton, MN 55371-1723 (763) 389-1660

I believe the risks or potential risks are too great. Northern MN may be forever changed struggling with ground water pollution for hundreds of years. But I fear big money & promises to care for our land will win out! [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Greetings, Please do not approve the PolyMet sulfide mine plan. There are waaaay to many unanswered questions. PolyMet says waste water will need treatment for 500 yrs minimum. How much longer after that. Where are the assurances from PolyMet that treatment will be financed for a minimum of 5 centuries. Where are the contingency plans or financial guarantees in case of accident or emergency. I attended the 1/28/14 RiverCentre public meeting. I have read up on the issue. I consider myself well informed. I have concluded that those that supporting the mine are willing to risk anything for jobs for 20 years. The risks that sulfide mining poses are often acknowledged and not refuted. No sulfide mine has ever been operated without polluting. PolyMet should be required to prove themselves elsewhere prior to operating in Minnesota. Our state's heritage should not be put at risk in perpetuity for a mere 20 years worth of jobs. Do not approve the PolyMet sulfide mine plan. Thank you, Thomas Cahoy 16501 30th Ave N Plymouth, MN 55447 (612)616-0507 tommycaho@Q-com

Please reject the PolyMet mine. The economy of northern Minnesota is now built on tourism, which is based on the natural beauty of the area. PolyMet would undermine that beauty - and the economy that relies on it - for centuries. The Boundary Waters and surrounding areas are also a Minnesota treasure that, once destroyed, could not be restored in our lifetimes or even the lifetimes of our grandchildren. We need to think long term. We need to stop this mine before it starts. Tom Donaghy Saint Paul resident

I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations. Our society has come to expect a standard of living and quality of life dependent upon the critical metals PolyMet will supply. I believe it can be done right in Minnesota. Thomas Donofrio 3985 Willow Place Hermantown, Minnesota 55811
The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

My name is Tom Erzar and my address is 1163 Jesse L Blvd., Eagles Nest, Minnesota. My mailing address is 1163 Jesse L Blvd, Ely, MN 55731 I'm submitting a comment regarding the SDEIS for PolyMet Mining's proposed North Met project. I trust your agency will thoroughly evaluate the project and address any environmental concerns. I believe the environmental review process has been very thorough. I know that your agency and the federal agency will make sure that the project design will address any possible environmental impacts so it meets with all applicable state and federal regulations. All projects have risks. There are many kinds of risks but today we are focusing on environmental risks. I believe that PolyMet has addressed the environmental risks and with modern- day technology will mitigate those risks. State agencies will make sure that there is compliance with the most stringent regulations in the country. We have an asset of a world- class deposit of copper , nickel, platinum, palladium and gold . This should be mined; it is an opportunity that should not go untapped. PolyMet can mine these metals in an environmentally sound way with the use of modern technology. This mining project would create hundreds of jobs for the middle class and an economic stimulus for the local communities and the state of Minnesota. We need these jobs .We want these jobs. It is time to permit this project and enjoy many of the benefits it will provide. By the way I am a person who enjoys and uses the BWCA and Lake Superior and am not concerned that this project will have any adverse affect these natural resources that I love and enjoy. Sincerely' Tom Erzar

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Thomas Geiger Rr1 Box 1000 Kingshill, VI 00850

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Thomas Gille Cromwell, Minnesota

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Thomas Gretch 3030 Cavell Ave S Saint Louis Park, MN 55426-2916 (612) 735-5959

Ponder the SDEIS while reading the 2/3/14 Nation magazine article – page 22. After 100+ years the river in El Salvador runs red in toxicity. With several companies also waiting (Duluth NewsTab 1/17/14) we'd be overrun with such mining. Just as all the waters in northern MN are interconnected, Polymet's promo campaign and all the heavy hitters brought in to replace all form of CEOs and department heads are interconnected to push their mining through; sparing no cost, even to new/ads on AM radio touting that of 10,000 comments no question has seen unanswered. The greatest presumption is the kids hockey games shamelessly co-opted with their ads, and they're not even up and running yet. History repeats itself at the expense of the last of our clean water in a region held hostage by perpetual economic blackmail. Like all that oil being pipelined, trucked across the country and shipped off for profit to China while our gas prices only rise. Who is really getting the minerals and the profits. Thomas Jeffery Heinonen 101 Artavia St Duluth, MN 55811

I attended the January 16th meeting in Duluth and was not chosen to speak. I have read the portions of the SDEIS of concern to me and believe I have good understanding of what I read. My concerns are these: Past experience with mining companies has indicated to me that any entity engaged in sulfide mining will escape any responsibility, whether legal or financial, by simply dissolving or filing bankruptcy, as has happened in our paSt In the case of a projected 200 year or 500 year liability, I am saying that all entities will escape ANY liability with the simple stroke of a pen. There is no provision whatever to assure and insure that any entity of any kind will actually be forced to exist and remain liable for all costs that will otherwise be externalized as has always happened in the past and to date. The proposal is to use reverse osmosis for the removal of certain mining-caused pollutants from the water effluent. This process is clumsy, expensive and extremely high maintenance, as is resin bed ion exchange. I am distressed that more effective chemical buffering methods have not been proposed. At least one such method has been used in former sulfide mining operations in Montana. ref. CESR process of Hydrometrics, Inc., 2727 Airport Road, Helena, MT 59601; wateronline-com/doc/a-new-process-for-sulfate-removal-from-indust-0001 Why isn't any limestone placed with all sulfur-bearing rock to neutralize subsequent acid formation. Will any limestone be placed in the tailings basin. There is no mention of the location of the Poly-Met hydromet facility, where phase two nickel concentrate will be sent, nor any description of the chemical nature of that treatment and its wastes. Autoclaving of concentrate and oxidation under pressure is mentioned, but no description of the chemical nature of the solutions used. Limestone is apparently added to this spent solution, but what of the consequent sulfates. Pit linings are notoriously short-lived and leaky, as demonstrated by other pit linings. There is no mention of mitigation of other heavy metals that will be released in the water effluent, in excess of current water quality standards. The parent rock body will be fractured by blasting, and there is no mention of how to prevent ground water from entering these fractures and producing acidic drainage into the aquifer. I am a simple railroad track worker, retired. If a layman like me can find weaknesses and complaint with one small portion of the SDEIS, just how flimsy is the actual fabric of the entire document. The foremost and greatest weakness and objection is the inability to hold any entity responsible for the proposed duration of this enterprise - by its own definition, up to 500 years.. Reserve Mining evaporated out from under its financial obligations in less than sixty years. I am strongly opposed to the proposed sulfide mining enterprise mainly because I know that no one but the taxpayers will end up paying for the damages that will absolutely happen as a direct consequence of sulfide mining as currently proposed. Respectfully, Thomas V. Koehler

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Thomas Koehler 814 5th Avenue, Two Harbors, MN Two Harbors, MN 55616

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. The SDEIS proposes no mitigation for the direct impacts to the 900 acres of wetlands and indirect impacts to an additional ten square miles of wetlands. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Dr Thomas La Point 1900 Highland Park Cir Denton, TX 76205-6932

Hello, Please accept my support for this project and the economic impacts resulting from this investment in NE Minnesota. The reason below will highlight our general support for the acceptance of the SDEIS report and the next steps required to move the project forward I trust the DNR and Federal Agencies to study copper-nickel mining and keep our communities safe. The environmental review process has been lengthy and thorough; the supplemental draft EIS addresses potential environmental impacts and how to mitigate them. Copper-nickel mining will contribute to the local and state economy at a time when we really need the jobs and economic benefit. Copper-nickel mining will provide millions of dollars in local and state taxes to support our communities and education system. The SDEIS points out that cumulative impacts have been adequately reviewed. Thanks, Tom Lambrecht, LEED AP Manager Economic Development Services Great River Energy 12300 Elm Creek Boulevard Maple Grove, MN 55369 direct: 763-445-6105 / fax: 763-445-6905 / cell: 612-850-3660 www.GreatRiverEnergy-com * Please consider the environment before you print this e-mail. NOTICE TO RECIPIENT: The information contained in this message from Great River Energy and any attachments are confidential and intended only for the named recipient(s). If you have received this message in error, you are prohibited from copying, distributing or using the information. Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest I have personally been to Boundary Waters, and spent seven days there in a canoe. I have never seen a more pristine area before in my life and I believe that nothing should be allowed to jeopardize this. I am a 64 year old electrician at The City of Atlanta Aviation Department and have beautiful memories of my experience there. Recently I have had thoughts of revisiting that area with another canoe trip. To think that that area may not be there as I remembered would be devastating to me and I know may others. Don't let this happen PLEASE Sincerely, Thomas Latham 6530 Rivertown Rd Fairburn, GA 30213-2729 (770) 617-5549

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Thomas Rosch 1840 Wisconsin Ave N Golden Valley, MN 55427-3963 (763) 591-1610

Thomas S. Falkowski

14836

My Name is Thomas S. Falkowski, 12260 Ash Dr, Rogers, MN 55374 My Comment: I am concerned that the official report does not clearly identify the costs associated with the ongoing monitoring of both the mining site and the plant site, as well as what may be required as potential remedies if monitoring identifies problems The significant lengths of monitoring would require a financial reserve that would likely exceed both the revenues of the state from the mining company and any economic stimulus of employees that would pay state or local taxes. There should be adequate financial reserves that are both prepaid prior to initiation, and also accrued during the years of operation that account for all 500 years of MN tax payer exposure. I am also concerned that although the report identifies the communities and water sources that may be affected by the movement of water during and after operations, I did not see a clear statement as to the populations of the communities and the total number of people that could be affected for the duration of the exposure. By highlighting only the number of jobs to be gained for the relatively short productive years of the operation, the potential negative impact to many more people is not stated or estimated. Thank you.

Thomas Sullivan

9581

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Thomas Sullivan 3467 Wilshire PL NE Minneapolis, MN 55418

I'm very concerned over the prospects of copper-sulfide mining in Minnesota. Please consider your responsibility to safeguard the environment and to assure quality of life for the seventh generation. Our water is too precious to gamble with. I have little confidence in the promises of mining companies. Thomas Wallace Morgan 4801 Tioga St Duluth, MN 55804

Thuan Thai 54230

Dear Ms. Fay It has come to me and other students concern that the mining company drawing the map was not credible and was cut off of original map. The map was cut off so that the people look at the mine site and would think that the mine site would not affect other lakes, swamps or rivers. From that point of view, people would approve of the mining construction but the map was correct to the BWCA which is could affect to environment. And the mine releases phosphate to the swamp which will react with water and form sulfuric acid and if the sulfuric acid goes to the BWCA and eventually will pollute those BWCA. And as the student of Humboldt High School, I would really like to go to boundary water to visit and enjoy the nature. But if the mining begin the sulfuric acid would go to BWCA which could destroy the ecosystem. This is unacceptable to destroy the nature which and where we are living in. Sincerely, Thuan Thai Humboldt High School Student 449 Sherburne Ave Saint Paul, MN 55103

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, tiffany breiner minneapolis, Minnesota

Dear DNR, As a Minnesota journalist for nearly 20 years, I have traveled all over the state, reporting on the people and places that make this region special. And perhaps no place is more special than the Boundary Waters ecosystem that would be affected by the proposed Polymet mining. Those who support the mining in the Ely area remember the iron mines of a generation ago, long for those boom times, and in many cases feel compromised already by environmental protections that they feel have yoked them to a tourist economy. But as the environmental review makes clear, the proposed Polymet mine is not like the old Pioneer or Zenith mines. The costs are greater, the stakes much higher. The wilderness, if it's protected, is forever. The mine is for a few decades and the damage potentially forever. This is not just the wrong place, it's the wrong mine. It's not right to risk the benefits of future generations to appease the narrow, nostalgic demands of this one. Thank you for listening. Tim Gihring 241 Russell Ave S. Minneapolis, MN 55405

Tim Glenn

38785

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Tim Grebner

10196

I think it unwise to jeopardize water supplies for 500 years for short term jobs. Mining built the iron range communities and Minnesota has benefited from mineral extraction. But this type of mining is simply too risky. How can we sacrifice the water quality for 500 years. Who will pay for the ongoing water treatment. The length of water treatment is longer than our nation has existed. The proposed mine is simply wrong for our state and future generations.

I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Tim Haussner 205 Fireweed Ln Grand Marais, MN 55604-2153 (218) 370-2154

Tim Iverson 44267

Dear Sir or Madam - I am very skeptical that Polymet's projected environmental impact will be minimal. You can count me in as a citizen against the mine going forwaRd I am originally from the Iron Range, and actually worked for a period of time at the old Erie Mining Company located where Polymet wants to mine now. LTV took over the Erie mine. After LTV closed, 6-5 million has already been spent to deal with the sulfide runoff from the Dunka mine pit. The original estimate was far less, as I'm betting the same for the cost of environmental cleanup with Polymet. No one can be sure of the consequences when copper and other like metals are mined. The backbone of the Iron Range, the mining of iron ore, is far less passive than the natural oxidation of metal sulfide materials resulting in sulfuric acid. The Dunka mine proves that mining even iron ore can result in the release of sulfuric acid, due to trace metals in the exposed waste rock. So, we get 300 new jobs, in exchange for decades of inevitable cleanup of the water, soil, and probably air. That hardly seems like a good tradeoff. I've been told by my brother-in-law, who lives in Virginia, to butt out because I live in Duluth and the mining is done on the Range. Well, my answer to that is the exposed rivers, Partridge and Embarrass eventually flow into the St Louis River, which flows into Lake Superior, which Duluth is located on. Lake Superior is now just getting her health back after years of dumping by other mines and Honeywell barrels. And now we are asked to trust Polymet. Tim Iverson Duluth MN

Tim Johnson 42999

Dear Ms Fay, Last night a group of us met at our church as part of our faith in action work during Lent. We took time during worship to write letters about issues of particular concern. I have chosen to write to you about the PolyMet mining issue. That letter is attached. Sincerely, Dr Timothy M. Johnson Cherokee Park United Church 371 W. Baker St St Paul, MN 55107 cpuc@usfamily-net 651-227-4275 www.cherokeeparkunited-org

Tim Karst 38647

To Lisa Fay, I am writing this email in support of PolyMet Mining's proposed NorthMet project. The jobs that will be created and the taxes that will be collected are needed to keep Minnesota an economic leader. I am not from northern Minnesota but these jobs are needed for the livelihood of the families that live there. The Minnesota DNR has the most stringent mine permitting process in the country and I have confidence that this mining can be done safely with no damage to the enviroment. Hopefully this will be decided by good science and not be political. Thank you for the opportunity to comment. Tim Karst 3180 Abert Ave NE Buffalo, MN 55313

I have reviewed the scientific documentation regarding the PolyMet copper nickel mining proposal and I do not believe that approval of this project is in the best interests of Minnesota. As a supporter of iron and taconite mining, I understand the challenge of balancing of environmental concerns and local economic interests. The PolyMet mining proposal, however, has far more long range negative environmental impacts than iron mining ever has. Water quality will be impacted for centuries and we have no experience in knowing how to deal with this for such an extended time. The track record for similar mining operations in our country is filed with failures. These failures include serious water pollution, corporate bankruptcies, insufficient dollars for environmental remediation and mismanagement. It is folly to even suggest that the DNR or any other agency can develop a plan that will "guarantee" water treatment for centuries to come at no cost to the taxpayer. The relative few number of jobs this project would create and the fairly short life span of the mine do not justify the long term financial and environmental liabilities that this proposal would create for Minnesota's citizens. It is for these reasons that I firmly oppose this PolyMet project. Please reject this and all cooper nickel mines in this part of Minnesota for the good of all Minnesotans. Thank your for considering my views. Tim Lundahl Lakeville, MN Sent from my iPad

tim mikkelson 12156

TIM R. MIKKELSON, 813 Olaf Ave NW. Willmar, Mn. 56201 I will keep this short. I am greatly opposed to sulfide mining in northeastern Minnesota. This area is one of Minnesota's finest and is visited by people from the world over. To think that the mining would produce millions of pounds of material that would have to be monitored and treated for many, many lifetimes (and would most likely end up being the taxpayers responsibility, as with most mines) is TOTALLY UNACCEPTABLE.

Tim Minotas 23726

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt I simply can not let you pollute such a pristine lake and any water way. Everything on this planet is interconnected. Humans are not above everything else. We need the environment and its healthiness in order to survive in the long run. Enough is enough with dirty mining and energy practices that not only contributes to climate change, but damages many people's and species way of life and health. The Great Lakes and its surrounding systems are one of our most vital resources, we can't afford to degrade. Sincerely, Tim Minotas 3622 Oakmonte Blvd Rochester, MI 48306-4791

I work within the Environmental Remediation field; providing services, equipment, and technologies for removal of organics and inorganic contaminants from contaminated groundwater and surface waters for potable, non potable, NPDES discharge, and water reuse. In my experience, I have not seen ANY hard rock mining operations that have successfully provided treatment during and after their mining operations. The 30+ Superfund hard rock mining sites that the EPA has is testament to this. Though I make my living treating this contamination, it makes more sense to me to eliminate the contamination in the first place; ie remove or completely eliminate the source. The various hard rock gold and precious metal mines, dating back to the middle 1800's have proven that our human nature is to make a profit irrespective of the environmental impacts. And their legacy is being borne on the backs of taxpayers, based upon ARRA funding, local bond issues, increased local water costs, etc The ASARCO and Anaconda mines continue to be problems without (easy) solutions that, because of their chemistry, will continue to generate soluble heavy metals into already contaminated discharge. Only recently, the Pebble Mine, a precious metal mine proposed in Alaska, but located near a strategic salmon fishery, is being reviewed and/or delayed/restricted because of its potential environmental impacts. Why, I ask therefore, are the impacts to the Superior National Forest and/or the Boundary Waters Canoe area, if PolyMet is allowed to do their open pit mining, not of the same strategic value. Clearly, these were designated as strategic wilderness areas and in this evaluation, went through years of public and private scrutiny for this designation. The coals mines within British Columbia, operated by Teck Coal have contributed significant heavy metals contamination to the various watersheds that drain into Lake Koochanusa in NW Montana. Though this is not hard rock mining, the resultant heavy metals released into the environment are having a significant effect. This is also true for the phosphate mining occurring on the Snake River in ID. My point is that the mining industry is only recently working to start compliance with their discharges. Heretofore, it has been too easy for them to litigate for delays or claim insolvency to avoid their environmental responsibilities. I believe that PolyMet has included all of the "patently right" answers to questions in their SEIS review. These are more politically correct than environmentally correct. I don't believe that taking the waste sulfide-bearing rock and encapsulating it with water within a pit is the best or even a good alternative for disposal. There is no GOOD disposal alternative to eliminate the possibility of anoxic growth of sulfur-reducing bacteria, outside of maintaining an aerobic environment and/or presence of some sort of bacteriostat. I work with Reverse Osmosis systems all of the time and I can testify that they 1). Require a significant amount of maintenance, 2-) Have a long track record of plugging from precipitation of inorganics and silicates on the membrane surface, and 3-) Are prone to bacterial fouling, particularly in bacterially active waters, such as will be developed at this site. Without some sort of additives (pH control, sequestrants, cleaning systems, etc) which could impact the environment (I didn't see any discussion of this within the SEIS), they will fail. Without some form of redundancy, they are not reliable. The SEIS indicates that there will be no impact to water flow within the Boundary Waters - that all water flow will be to the St Louis river watershed and ultimately to Lake Superior. Given the volume of water to be used within this facility and the wastewater discharge points, there will be considerable reversal of flows within the various rivers, changing the hydrology of the area. There is proof of this in many of the hard rock mines that are presently operating and/or disch

Dear Minnesota DNR, My Wife Susan and I are unable to attend the St Paul River Center meeting concerning Polymet's Open Pit proposal for mining in Northeast Minnesota but we want to go on record in opposition to Polymet's proposal. As land owners in Lutsen Township in Cook Co., we know first hand how precious and fragile the water resources are in the Lake Superior watershed, the surrounding Superior National Forest and the BWCA. We oppose Polymet's proposal for the following reasons: 1) Polymet's SDEIS water model is seriously flawed. The most recent MN DNR report shows the actual rate of groundwater base flow is 200-300% higher than the rate used in Polymet's SDEIS. Accurate groundwater rates are crucial to predict pollution and seepage of waste into the Partridge River. The SDEIS must be re-modeled to make it accurate. 2) The long term treatment of waste water at the mine sites and processing plant of possibly hundreds of years and the cost of which that would be put on the backs of future MN generations is outrageous. The jobs that Polymet is proposing are far outweighed by the environmental cost of the cleanup that will have to take place over a very long time. 3) Lake Superior is an international gem bordered by exceptional lands in Northeast Minnesota. The Lake is under siege in so many ways. Water compacts between the Great Lake States and Canadian Provinces in the Great Lake watersheds are trying to protect these natural wonders. The BWCA is Minnesota's most pristine wilderness area. Why would we want to risk this truly special area to the degradation that this type of mining would certainly impose. Please extend the comment period and take a closer look at the true impact that Polymet and those mining companies that will follow on our state's precious water resources and our most pristine wilderness areas. Sincerely, Timm and Susan Frankowski 4928 Chowen Ave S. Feb 19, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Federal and State Agency Leaders: I lived through the Reserve Mining controversy of the 1970s and hope we will never see such abuse of our waters by the mining industry in our state again. The PolyMet proposal and others could create less direct but equally significant probleMs One issue that concerns me is mercury. The SDEIS briefly claims that that mercury will not leach into the Partridge River at the site of mines and waste rock sites, but the assurances are contradicted by admissions that metals could be affected by groundwater flow-which has not been adequately assessed. What really concerns me is the source of power for this very energy-intensive kind of mining. The state of Minnesota has clean energy standards that we should be striving to meet, including reducing emissions from coal-fired power plants in a part of the state that is already troubled with mercury in our waters. This issue needs discussion. Mining in Minnesota should make our state a better place. The mineral resources of our state could help us to achieve our clean energy goals. Owners of mineral rights do not have the right to pollute our land, air, and waters-directly or indirectly. The issue of mercury is not adequately described in the SDEIS. The PolyMet SDEIS is still inadequate. Thank you for considering this comment. . Respectfully, Tim Larson Duluth, Minnesota Timothy Larson 3113 Wellington Street Duluth, MN 55806 (218) 724-6963

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Todd Bergerson 3191 1/2 Domich Rd Ely, MN 55731-8405

I think the PolyMet operation, and all similar proposed operations do not adequately address the long term and short term impacts of the pollution that will be produced. I think these operations should not be allowed to proceed. We cannot build an economy on processes that destroy the environment. Thank you. Todd Ernest Barkus 4570 Merganser Dr Minnetrista, MN 55375

Todd Johnson

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Todd Johnson 322 River Woods Ln. Burnsville, MN 55337 US

Todd Lyden

7399

To Whom it May Concern, I am confident that the Supplemental Draft Environmental Impact Statement (SDEIS) gives regulators the information they need to issue PolyMet Mining permits to operate while protecting natural resources. The PolyMet project has been designed to minimize environmental impacts. It reuses an existing site (the old LTV mining site) and existing infrastructure, minimizes the disturbance of wetlands, and utilizes multiple safeguards to protect the environment. PolyMet will also have dramatic, positive socioeconomic impacts to a region that has been built on mining. This project is located in an area that supports mining and the jobs it will bring. An added benefit is the land exchange with the US Forest Service will open up new public recreational opportunities for all Minnesotans. Todd Flankey 19996 Rendova ST NE East Bethel, MN 55011 Bullet points that I feel are important and in support of Polymet are as follows: *I support PolyMet Mining and believe they will build and operate a mine that complies with all regulations and protects the environment. *PolyMet will contribute to the local and state economy at a time when we really need the jobs and economic benefit. *I'm proud that my investment dollars are being spent here in Minnesota by Minnesotans. Our economy needs these jobs. *PolyMet will be a domestic supply of critical metals needed in medical applications, electricity, catalytic converters, cell phones, computers and other essential products. *Enough is enough; let's get on with permitting this mine. We want jobs. Regards, Todd Flankey

Todd McGillivray 10721

Ms Lisa Fay I am writing in support of the PolyMet project and the SDEIS. My family and I live on Sabin Lake (the 1st of the chain of lakes on the Embarrass River). We have been following the project for 9 years. We built our dream home there 3 years ago. We support the project. The SDEIS is an amazing document. Comprehensive, informative, complete. It's time to move on to the Permitting process. One comment about the Public meeting system. I don't believe people should be allowed to speak when their presentation is full of lies and inaccuracies. Public comment at the meetings would be much more informative and useful if one or all of the lead agencies would have time to respond to the speakers presentation with factual information. The system that was used was very unfair to the PolyMet project. Todd McGillivray 6525 Voyageur Trail P.O. Box 531 Biwabik, MN 55708

Todd Saatoff 47150

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. P.s I was laid off last march after working in the printing industry for over thirty years. I am attending Hibbing community college and taking the industrial system technology program in hopes that I can find a local job in mining, we need these jobs. I can't count on getting unemployment like I was promised while I'm in a retraining program that I now can't afford thanks to my government. Having never drawn on unemployment, after working for over thirty years, where is my aid when I need it. I don't want a hand out, I want a job. Todd Saatoff 510 east 25th street Hibbing MN 55746 Sent from my iPod cause I can't afford an I

Tolvo Sober 54157

Poly Met's proposed copper-nickel mine has the potential to pollute our environment for hundreds of years, far beyond the life of the company. The mine should not be allowed. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Tom 20080

I am writing this email comment in support of the Polymet Mining project. I am a geologist who has worked in the environmental consulting industry for the past 20 years, and have lived on the iron range most of my life. Although my employer has no contracts with Polymet and I have not worked on any projects for Polymet, I support the project based on a review of the SDEIS documents. Minnesota has some of the most protective environmental regulations in the nation, and the SDEIS outlines how Polymet's mine and plant operations will meet these standards. I believe the plans for the lined stockpile areas, in-pit subaqueous waste disposal, and treatment of tailings pond effluent provide key methods for reduction of potential impacts of waste rock and wastes generated by the project. In addition, the land swap provides for mitigation of biologic and wetlands impacts. Financial assurance laws in Minnesota outline standards that will ensure Polymet will honor its responsibility for long-term treatment and reclamation of the site. As a geologist I see the value of mining these strategic metals, especially Ni, Co and PGE elements, of which the US does not have a ready domestic supply. The Polymet project will provide valuable jobs on the iron range, where metal mining has been conducted in a safe, sustainable manner for over a century. I believe that the Polymet Mine will be an asset to the state and the country, and can be operated with an eye toward environmental stewardship. Respectfully, Tom Muhich, PG, CHMM 7957 Horseshoe Lake Dr Eveleth, MN 55734

Tom and Dana Vogen 43570

Comments submitted by; Thomas Vogen 21621 Oldfield Ave N., Scandia MN 55073 I believe it is unconscionable to create pollution that would need to be treated for centuries if it can even be done effectively. If we make decisions based primarily upon jobs and money, the destruction of the earth will continue unabated. My opinion is that a healthful and beautiful planet will take care of us physically and psychically and I sincerely hope this mine permit is not approved.

Tom and Julayne Johnson 45248

The answer to mining for copper and nickel and other minerals by PolyMet is very simple: If they cannot 100% guarantee that there will be no environmental damage and especially to our water supplies and Lake Superior, then mining should not be and never be allowed. Even though employees will be living in the affected areas, I'm sure the upper management will not be and therefore not be affected by any damage. My drinking water comes before any job. Tom and Julayne Johnson

Tom and Mary Schutz 44295

Dear Ms Lisa Fay, I feel very strong that there should be NO MINING I support the MEPA and the Minnesota Environmental Rights Act (MERA) prohibit state agencies from permitting projects that will cause pollution, impairment, or destruction of the environment. Just because they can does not mean they should. Our country does not need this mineral. This is just another get rich quick idea that will leave pollution expense that they, the company, will not be around to clean up and pay for the pollution expense later. We the people, our country and the planet earth does not need this kind of waste and havoc to our land, water and environment. Thank you for hearing my concerns. Sincerely, Mary Schutz 03-13-2014

Three hundred some jobs for twenty years . For the trade off of polluted sulphite contaminated water that will possibly need to be treated for up to four to five hundred years The proposal would be laughable if it weren't being actually seriously considered. At what point do you just say no It is Minnesota Water Not some murky crappy silty Colorado River water. It is the North woods The Land of 10,000 Lakes NOT the land of 10,000 sulfite mining polluted lakes. Despite the "best" safeguards industrial accidents happen all the time. Spills happen. No matter how careful companies say they can and will be, there continue to be spills and accidents. Is one of the states most precious resources worth tainting and polluting. Since every living thing cannot survive without water, just how much pollution is acceptable for the entire ecosystem If you are truly the Department of Natural Resources, then you would do well to protect the RESOURCE that no living thing can live without . Water "The best way to keep the camel out of the tent is to not let him put his nose in to begin with." I say no to this kind of mining in the State of Minnesota. Most sincerely, Tom Anderson 10745 Penn Ave South Bloomington, Minnesota

Tom Anderson and Kathryn Hagen 36387

Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for your consideration. The Boundary Waters and adjacent areas are a precious natural resource benefiting the entire state and should be protected. Kathryn Hagen 4603 Drexel Ave Edina, MN 55424

Tom Bittinger 21635

Dear Ms Fay, Dear Ms Fay, I am writing to urge the rejection of the sulfide mining projects in northern Minnesota. It is extremely disappointing to me that something as potentially harmful to the natural legacy, health, and economic well being of current and future generations should even be considered by those with the responsibility of looking out for the interests of all citizens. The negative environmental impacts that result from these mines are more than common, they are almost inevitable. Allowing this activity in an area of such natural beauty and environmental uniqueness would be wrong even if only considering the protection of this important natural resource. To take these risks where so much of the area's economic livelihood depends on those unspoiled natural qualities seems unconscionable. The benefits of projects like these are temporary and most of them (corporate profits) go elsewhere. I would also like to express my belief that short public comment period on the Supplemental Draft Environmental Impact Statement (SDEIS), as well as the timing of the limited public meetings, certainly gave the appearance that there wasn't any real interest in what the public thinks about this issue and that a decision has already been made. Having such a short and limited opportunity for public comment on this long, confusing, contradictory and misleading statement was unfair. I am very concerned that this important issue will turn out to be another example of how those making policy decisions that effect everyone often operate in ways that benefit powerful corporate interests over ordinary citizens. Sincerely, Tom Bittinger 133 Sawmill Drive P O Box 186 Lutsen, MN 55612

Dec 23, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Thanks for considering my comments. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Tom Canning 511 17th St N Moorhead, MN 56560-2356

Tom Carious 18162

Hi. My name is Jim Leuthner, L-E-U-T-H-N-E-R. And I'm from Carpenters Local 322. And I'm going to yield my time to Tom Carious. TOM CARIOUS: Good evening. My name is Tom Carious. I live here in St. Paul, Minnesota. I want to thank each of the agencies involved for participating in this process, for producing this rigorous and thorough SDEIS, and for taking citizen input in consideration. One of the things that makes this a great place to live is the lively civic engagement, governmental transparency, and democratic participation that we enjoy. We also enjoy high standards of living, clean water, strong unions, a beautiful environment, and well-functioning, corruption-free governmental agencies. These are all things that I value highly. Other people have spoken tonight about the reason that we need copper, nickel, and other precious metals. So I won't go into detail, but I do want to point out that those of us that are concerned with reducing our carbon footprint specifically rely on copper for our wind turbines, for the solar panels in the parking ramp across the street, for the electric car charging stations in the parking ramp, and the power of the light-rail trains that will open this summer in St. Paul. In fact, we in the US are among the world's leading consumers of copper. We consume significantly more than we produce or can recycle. I haven't heard anyone tonight or throughout this debate deny this fact. There's no movement to stop the use of copper or any of these metals. So if it's a given that we're going to continue to use copper and other strategic metals, the only question is: Where should we get it? Right now some of the biggest copper mining countries in the world are Chile, Peru, China, Indonesia, Russia, Zambia, Poland, Kazakhstan, and Iran. I believe that we here in Minnesota and the United States are very privileged to demand that companies looking to open a new mine go through this very thorough process and be subjected to the level of scrutiny that all of us are applying to them right now. I'm concerned that some opponents of this proposal want to enjoy the benefits of copper without considering where it from, what the conditions for workers are in those places, what environmental regulations are in place there, or what the process is for citizen input those countries have. Do we think that public agencies in Russia, China, and Iran hold public comment periods and respond in a meaningful way to citizen input? Is it just or equitable to say that we can't produce the metals safely here in Minnesota while continuing to drive the demand for them. I believe that we here in Minnesota and the United States are in the best position to mine these metals. Better than any of the existing mines in any of the other countries that produce them. We have the strictest environmental regulations to protect our water; the strongest unions to ensure worker safety and good wages; we have public agencies full of technical experts controlled by democratic processes that value citizen input. I trust the DNR and the partner agencies to ensure that PolyMet mines responsibly in this state. I'm sure we can do it better than anywhere else.

Tom Casey 42960

Dear Ms Fay, Attached please find my client's comments. Please acknowledge receipt of this e-mail. Thank you. Thomas E. Casey Attorney at Law 2854 Cambridge Lane Mound, MN 55364 telephone: (952) 472-1099 e-mail: tcasey@frontiernet-net

Tom Clarke 57954

We cannot allow massive copper nickel sulfide ore mining in NE MN. The threat to air and water especially the St. Louis River watershed & Lake Superior is too great. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

I support the Polymet mining project. Tom Dokulil 3677 73rd Street East, Inver Grove Heights, Minnesota 55076

Tom Diener 44187

Hello, I would like to provide a few comments regarding the proposed Polymet Mine operation in Northern Minnesota. I have attempted to learn as much as is reasonably possible in order to understand the issues involved and the nature of the concerns, objections, and benefits. As an earth science teacher and a seasonal Minnesota DNR parks worker, I attempt to understand, and when required present the issues in an even-handed and balanced manner. I appreciate the care, rigor and science that has gone into the proposal. Broadly speaking, there is much at risk with this project. Taking a historically dirty industry and operating it close to a nearly pristine wilderness area seems absurd. If I could be assured that there is adequate protection in place I could support the plan but as I understand it, the level of funding for protection of the environment will be not be determined until after the plan is approved. It feels like a backward approach. Funding for unforeseen problems needs to be addressed now. Although it could apply to other situations, enforcement of regulations safeguarding the environment including water quality is an important consideration. Who will be the enforcement agency, several hundred years from now, to deal with harmful tailings runoff if they occur. Thanks, Tom Diener 5818 Morning Star Drive Duluth, Minnesota 55804

TOM DIMOND 43109

Tom Dimond 2119 Skyway Drive Saint Paul, MN 55119 March 13, 2014 RE: Comments on PolyMet - NorthMet SDEIS My family came to America in the early 1600's. Their survival was dependent on finding a way to make a living. Thankfully, our founding fathers and mothers did not choose to pollute the land such that we would still be working to clean up their mess nearly 400 years later. Part of my heritage is Mohawk. A strong Native American tradition is we are caretakers of mother earth and we should respect and protect our natural resources for the benefit and enjoyment of future generations. My comments are based on the understanding that the quality of our lives are in great part the result of actions of our ancestors and our actions will impact future generations. What we decide to do today will affect generations that are not born yet and have no voice in these decisions. They will however live with the pollution and natural resource degradation they had no say in. We must be their voice. Some have suggested we should create 500 years of pollution for short term jobs and the latest electronic gadget. We all have to ask ourselves if a gadget that is outdated in year or a job that disappears in 20 is worth polluting our State for 500- The negative impacts to our State greatly outlast the short term benefits. The SDEIS does not include the full economic picture. Tourism is a major employer in Minnesota. Attracting and retaining businesses in Minnesota is highly dependent on the quality of life and the natural environment. Degradation of the environment and potential financial liabilities from 500 years of cleanup could cause job losses that greatly exceed any temporary gains. The Cumulative Effect or Cumulative Impact has not been adequately considered. The proposal indirectly impacts 6,498-7,350 acres of wetlands, and directly impacts 912 acres of wetlands. The proposal impacts 1,741 acres of MN high biodiversity significance and 698 acres of imperiled or vulnerable native plant communities. The Federally listed Lynx will be affected by fragmentation. A large black spruce, tamarack, and cedar wetland, a lake, creek and river are impacted. The impacts can be 200 to 500 years or permanent but the jobs only last 20 years. In order to maintain the jobs it requires approving another project every 20 years. This would have a cumulative effect of 10 times the impacts of this project before any of the polluted site is cleaned up. This ever expanding area of pollution can have significant impacts on the attraction and retention of business in the State. These impacts are not adequately considered in the SDEIS. Cumulative effect also applies to the protected publicly owned land in the Superior National Forest Much of the proposed mine site is federally protected land in the Superior National Forest The Weeks Act protects this land. PolyMet proposes swapping privately owned lands in the Superior National Forest for the 6,650 acres of federally protected public land. This proposal is contrary to protection of the wetlands and natural resources within the boundaries designated. The land they want to trade is not currently threatened. If the US Forest Service does not agree to the swap the amount and quality of wetlands will not diminish within the boundaries of the Superior National Forest If the US Forest Service does agree to the swap there will be thousands of acres of wetlands lost or degraded within the boundaries of the National Forest This proposal does not call for the restoration of wetlands that have been lost The US Forest Service should not support a proposal that causes a net loss and degradation of existing wetlands. The Forest Service should consider the cumulative effect. State law calls for mine closure to be stable and minimize hydrologic impacts, release of substances, and maintenance free. The modeling for water flow and assumption that 99% of the flowage and seepage will be treated

The Iron Range is my favorite place in the whole world. We have a cabin on Lake Vermilion that has been in my wife's family since 1936- We took that property over in 1991- There are 3 different watersheds in the Duluth complex. Polymet has mitigated the problems in the watershed where they operate. This area is an economic wasteland without this project. This project will transform the area into a vibrant and sustainable economy with jobs and services for over 100 years, possibly 200 years. This area is mining rich with other projects on the horizon. They all depend on the same infrastructure and many of the same resources. As a result of the mining trust that benefits the public schools the MN department of education will become richly funded for a century or two. This deposit is possibly the largest in the world. Developing countries are starving for these raw precious metals. The timing could hardly be better to pursue this. India's electric grid failed 18 months ago leaving half the country dark for a week. They need trillions of copper. China consumes 38% of the world's supply of copper. India is going to consume MORE copper than China to meet their development goals. That will drive the price north. Petroleum and copper are sympathetic to each other in price, meaning one goes up the other goes the same direction. Exporting copper is a perfect hedge against importing oil although indications point to a massive surplus in the near future for the US. A commodity surplus is never a bad thing as long as there is a shortage elsewhere in the world. I believe Washington has recognized this as evidenced by their veiled support in the arrowhead area. Polymet is seeking a 20 year permit to mine. My understanding is they will be upside down at the end of the first 20 year because of the funding for product deal worked out with their primary funding partner. For that reason I am confident Polymet WILL ensure they are a model permittee in that first 20 years so they will receive a second 20 year permit. Don't waste our fantastic resource mining provides the great state of MN. The time to act is NOW. GRANT the permitting process and if Polymet meets those conditions grant them the 20 year permit to mine. HYPERLINK "<http://www.mytelepath-com/>"MyTelepath LogoTom Drill, MyTelepath, Inc. I am writing to register my opposition to the proposed PolyMet mine in northern Minnesota. I know the arguments for the mine and I do not minimize the need of people in that area to have good paying jobs. But the idea of putting our fresh water at risk for hundreds, if not thousands of years, for at most several decades of jobs, is utterly astounding. It rises to the level of madness. We're talking not just jobs but the very essential elements of life. Water - fresh water - is what makes life itself possible on this planet. We have a finite amount of water - earth is a closed system and more water will not be created. Recycled from form to form and place to place - yes. But once it is contaminated, it will take generations upon generations to gradually clear up. Hubris has been the downfall of every great civilization. We know that every great culture throughout history has overreached its grasp - all the time thinking that they were capable of controlling the world they lived in. Over the past millenium, humankind has come to think that it can always find a technical solution to every problem. But we can't - especially it we think that we can forecast what will be possible over the next 500 years. The United States has not even been in existence that long. Please, for the sake of my children, grandchildren, great grandchildren, and great-great grandchildren, prevent this mine from being created. Sulfide mining is notoriously environmentally hazardous. The last place to approve a mine like this is near environmentally sensitive areas. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Dear Sirs, In regard to the PolyMet NorthMet SDEIS: Polymet states that the actions it has agreed to take to mitigate water contamination are unprecedented in scope. However, this is not good enough-if mitigation efforts end before the threat to water quality ends. Polymet's modeling for contamination and mitigation stop at year 200 for the mine site, and year 500 for the plant site-ignoring the fact that contamination will continue after these end dates. Will the state of MN and its taxpayers then assume the burden of continuing the necessary mitigation actions. Furthermore, the SDEIS modeling of groundwater movement at the mine site uses a Partridge River estimated baseflow of 0-51 cfs, which is not realistic. Actual measurements east of the mine site establish a baseflow that is several times higher. As a result, SDEIS predictions for the amount of sulfates and other pollutants entering the river are probably low. Significant quantitative errors in the SDEIS need to be corrected, and the corrected document should then be subjected to further review. In addition, Polymet must guarantee adequate permanent funding for pollution mitigation actions, rather than assuming that the problem of water contamination by copper, lead, mercury and sulfates will disappear after some arbitrary end date. 200 or 500 years seems like a long time to you and me, but this is only the span of a few human lives. We need to consider how our actions today will affect future generations. Thank you, Tom Fiero 271 Devil Track Road Grand Marais, MN 55604

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tom Finholt 212 Timber Wind Dr Wildwood, MO 63011 US

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: This may be a form letter but it expresses my concerns perfectly. I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lyn

I don't think you should develop The project that you're proposing. I don't think it's in the best interest of the area or for the people living there and then the people using the boundary waters canoe area. This is extremely bad for the wildlife and water creatures. we need to protect our lands and natural areas. Tom Graham Sent from my iPhone

Feb 28, 2014 Ms Lisa Fay MN Dear Ms Fay, I have traveled by canoe and camped in the Boundary Waters area. It is a special place with rich biological resources and beautiful scenery. The waters were so clean that we could safely drink from any lake or stream. Places like that should be protected and preserved. Too much of our country is being polluted by chemicals produced by industrial processes. Many companies promise not to pollute, or to clean up the pollution they produce, or to "restore" the land to its previous condition. The record for fulfillment of these promises is replete with unsatisfactory results. Some of the companies go out of business before fulfilling their promises, others never live up to the promises - perhaps they never intended to, or didn't realize what the full costs of those promises would be. Too often taxpayers and local residents and local businesses are left to deal with the pollution problems and the costs of cleaning up - if, in fact, it is possible to clean up the damage in any meaningful way. With far too many pollution problems the damage can last for decades. In some cases, where livelihoods, living conditions, business opportunities, water resources, and biological resources are damaged, possibly for one or several generations, there is little that is done, or can be done, to repair the lives of those who have been adversely affected. We do not place enough value on our natural biological resources and on the clean water resources that nature provides. Those resources appear to be free of charge to us. We seldom think about the millions of years it took to produce those water resources or to produce the intricate and complex interdependent webs of plant and animal life that make up our forests and other natural habitats that provide us with many things that make our lives possible - and make our lives worth living. Once they are damaged, or destroyed, the value of those biological and water resources become more apparent. It is much easier, and more cost effective, to preserve biological and water resources before damage is done than to try to repair those resources after they are damaged. Once waterways are polluted with sulfates and heavy metals it will be a very long time before the adverse effects on fish and other aquatic life forms diminish. If fish advisories already exist for waters of the area, there should be vigorous efforts to reduce pollution rather than support for projects that will make things worse. I am very concerned with protecting our clean water. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. Wild-rice farming will be endangered. That will affect those who depend on those crops, as well as their customers. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of year

Tom Jahnke

47214

From: Tom Jahnke 3403 56th St NE Buffalo, Mn 55313 I am writing to express my opposition to proposed mining operations in NE Minnesota. I have worked as a professional forester for over 40 years within the state and have never witnessed a successful recovery of natural resources following any kind of mining operation. Statements to protect water have been misleading in all instances. The scar upon the landscape never heals. In my home county of Wright, there are at least 40 old gravel mines that have never been "healed" after the minerals were removed. It is disgusting and a waste of our treasured lands. If the rare minerals of northern Minnesota are truly so valuable, there best be a method by which those who operate the mines can safely protect the environment and afford to pay all expenses to recover the lost resources "up front". If that is not possible, this mining proposal should be stopped in its tracks. Travel to Ladysmith, Wisconsin and Sudbury, Ontario to witness firsthand the devastation created by these types of mining operations. I always lament the use of "BORROW PITS", as mining operations refer to their sites. They never return what has been borrowed. If they must borrow something from us, let them borrow our cats. That way, we might have a chance of a few of them getting back. Thanks for allowing me to express myself. Sincerely, Tom Jahnke

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I don't know, but it seems that \$rules over life especially our precious lakes and rivers..I know land has been mined on land near the Great Lakes for centuries. This effort seems to be an accident ready to happen. Try to live in an area like West Virginia or Ohio that was hill top strip mined for years and is still going on in W.VA. and Kentucky. The water is not safe to drink ..the latest spill in W.Va. had nothing to do with the mining but was directly related to not being able to drink the water in the in the first place as a result. Pollute the Great Lakes and see how much money you can come up with. Are the Koch Brothers in on this. Do they have as much money as PGandE. How many people in Minnesota are aware of this I wonder. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Tom Jordan 601 Lawton Rd Marietta, OH 45750-1123 (740) 516-8188

To whom it may concern: I am against the polymet project or any other project that starts sulfide mining near the BWCA and lake superior water shed. I don't believe we have the technology to safely do this kind of mining at this time. Also we do not need to tap into these resources and can save them for a later time when the need will be greater and the technology more advanced. We are responsible for keeping our water and lakes safe for our children. Starting the type of mining at this time will jeopardize that. We should not be making some corporations and people rich at the expense of our heritage Regards Tom King 7259 Old No. 7 Rd Virginia, MN 55792

Tom Kolodzinski

18295

Tom Kolodzinski. My concern is that the project has not looked enough at the impact on White Water Lake. In the small bay, by the diversion works, there is a potential drop of up to 12 feet of water in that small bay, when pumping into Colby, in the initial stages. So, as a homeowner in that area, especially if it is during drought time, that ruins our opportunities or that impacts greatly, severely our opportunities in enjoying the water and what we built. And that's my concern, that they haven't paid attention to what the impact is going to be or how they are going to address it. The statement that I wish to make is that it is a simple choice. Nobody wants to see damage to the area. The mine is certainly, with that kind of money, the mining company, 600 million, isn't going to want to see damage. And those that do not support the mine have not shown evidence that this model will cause the damage. So, my suggestion is just proceeding, because we don't know, and have the safe guards to control it.

What I have been reading and hearing about the proposed PolyMet NorthMet open pit heavy metals mine is of great concern. I have either led or participated in over 50 BWCA overnight canoe trips, including two successful moose hunts and two unsuccessful bear hunts, plus have hunted, fished, camped, backpacked, boated, and paddled in the Superior/Quetico region for much of my life, giving me great concerns about the known water quality issues associated with the proposal. Having read and listened to industry representatives and project supports, I find their comments to be shallow, short-sighted, and unsubstantiated. There does not appear to be a concrete water protection/treatment plan in place, but just vague promises that all will be taken care of. There seems to be no dispute of the number of years the mine will operate (20), the number of local full-time jobs (90), and the number of years requiring water protection/treatment (500). This is boom and bust to the max, and it does not add up. It's a ridiculous compromise to the 33,000-plus tourism jobs already in place, and that presently sustain many communities in the area. It is argued that iron mining was and is a vital part of that area of Minnesota for many years, and that the area still has clean air and water that draws many annual tourist to the area (a quarter-million annually to the BWCA alone). But this is different. The dangers associated with acid mining are astronomically larger and longer lasting than the iron and taconite mines, and the industry's track record is dismal at best – terrible in reality. We all want good jobs for everyone. I work in the HVAC industry, and we depend on plentiful work. But, again, this is different. These are very short-term jobs for a very low number of families, with the vast majority of mining profits leaving not just our state, but our country. Tom Koshiol Crow River Trail Guards "Connecting Kids to the Outdoors" Paynesville, MN 56362 [HYPERLINK "http://www.trailguards-org/"](http://www.trailguards-org/) www.trailguards-org 320-250-0464

The YMCA of the Greater Twin Cities (YMCA) offers life-changing wilderness experiences through a variety of year-round camp programs, placing thousands of young people and families every year in the public waters of the Boundary Waters Canoe Area Wilderness (BWCAW) and nearby lakes and rivers. This pristine wilderness area has clean water and healthy forests and it is in everyone's interests for the BWCAW to remain unspoiled and unpolluted. The YMCA is aware of proposals to mine sulfide ore in the watershed of the BWCAW. In considering the permitting of any proposed sulfide mining operations, we urge decision makers to be certain that the following clean water and environmental protection principles can be guaranteed: 1- BWCAW waters and nearby lakes and rivers remain safe and clean 2- Strong safeguards are in place in the event anything goes wrong 3- Mining companies must leave the site maintenance free (in accordance with existing MN mining rules) The YMCA is committed to preserving the natural environment in and around our camps and in the BWCAW, for generations to come. We are also concerned that one of our camps, YMCA Camp Warren, operating for 87 years on Half Moon Lake south of Eveleth, is within the downstream catchment zone of the proposed PolyMet Mining NorthMet Project Site. We strongly urge careful scrutiny of proposals that have the potential to disturb or pollute the BWCAW and nearby lakes and rivers. Comments and submittals will not be edited to remove any identifying or contact information; therefore, the Co-lead Agencies suggest that commenters not submit information that may cause the commenter concern if publicly disclosed.

Tom Lenarz

22052

My name is Tom Lenarz. My full address is 1123 Summit Ave Cloquet Mn 55720 I would like to submit a comment in support of the Polymet project. I have been following this process for the last 7 years. While I agree that keeping the environment safe is important, I think the management for this project has gone above and beyond to show that they can do this in a safe manner. I would like to see this comment period come to a conclusion and the permits needed to continue the project approved. Thank you for your time. Tom Lenarz

Dear Sir/Madam, Please be advised that I wholly support PolyMet Mining and their bid to open the NorthMet mine. Sincerely, tom lewis

Tom Lindquist 42443

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Tom Lindquist 1115 Magnolia Ln N Plymouth, MN 55441-4637

Tom McMullen 57719

I am submitting this e-mail in favor of the PolyMet project and other mining opportunities in the State of MN. I am an environmental engineer by trade and an avid outdoorsman. However, I feel the process to approve the PolyMet Mining project has been dragged out long enough. This is a valuable project for the state of MN, we have already lost enough jobs (tax base..) from our state. All of the so called "environmentalists" who are fighting this will never be convinced these mines are a good idea even though they sure enjoy their i-phones, laptops, etc the devices are all driving up the demand for precious metals. I feel the DNR has done an adequate job of holding the mining companies responsible, they have done their due-diligence, let's move forwaRd Sincerely, Thomas McMullen, PE Industrial Reps 112 Lookout Point Buffalo, MN 55313 Cell: 612-819-3591 e-mail: HYPERLINK "mailto:tom@industrialreps-com"tom@industrialreps-com

Tom Neiman 43798

I am adamantly opposed to the proposed copper mining site in northern Minnesota. Satisfying short-term business opportunities does not serve the long-term best interests of Minnesota/the upper Midwest or its people/land/animals/agriculture. Reserve Mining is a good lesson to keep in mind. Tom Neiman 3712 France Ave S. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Tom Pliska 5341 41st Ave S Minneapolis, MN 55417-2227

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Glencore should be a responsible party for financial assurance in PolyMet's mine plan To Lisa Fay, MN DNR, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. It's interim chairperson is none other than Tony Hayward, who led BP to the worst safety record among major oil refining companies. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billions in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. Annually, 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated. The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. Thanks,

Tom Roth

16609

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Tom Roth 1989 Wellesley Ave Saint Paul, MN 55105

My name is Jeff Huberty. I'm a business agent with St. Paul Plumbers Local 34, and I would like to concede my time to Tom Rukavina. Thank you. I am Tom Rukavina, R-U-K-A-V-I-N-A. I'm a third-generation Iron Ranger, and I've got a fifth-generation granddaughter who lives 10 miles from this mine and I want the same thing for her and all of our grandkids that I had, and that's a good middle-class American life, and on the Range, that means a good union mining job. We've been mining on the Range for 132 years -- I'll correct everyone tonight -- 132 years. We're proud of what we do and who we are. We are miners. And you know, right now, as we're sitting in this room, there's four mines in the Superior National Forest that are churning out all the metals we want. They do such a good job that you people who go up to the Boundary Waters, you drive right by them, and you don't even know they're there. So we're the best miners in the world, and for the next 132 years, we're going to be mining because Minnesota's been blessed with some of the richest mineral deposits in the world. Now, everyone in this room uses all the metals that we're talking -- and minerals we're talking about tonight. So we're all polluters, but we all want to be good environmentalists. Nobody's got a monopoly on the environment. This project, think about it, is the biggest recycling project in the history of the State of Minnesota. We're not talking about pop cans and beer bottles on the curbs here, folks. No, we are talking with a plant that has a coarse crusher – coarse crusher, fines crusher, concentrator, railroads, tailings ponds, pipelines, haul roads. They're already there. We're going to make a new mine on an old mine. What in the heck makes more environmental sense than that? Come on. You know. Here's the fact: In fact, because of it, this mine will pollute and harm Mother Earth less than any other mine that's past or present planned right now. So that alone should be a major factor for our regulators over there, whom I know a few of them, when they make the decision, because this mine makes the most sense environmentally. So let's work together. You know, we've got the brain power. We've got the technology. We even have the environmental regulations to make this mine one of the showcase mines in the world. PolyMet is the perfect fit for this mine. It's already there. You know, and for all you anti-mining folks in the room, I got a paper bag here, and my friends in the back of the room, we brought some for you. We'll collect your car keys and your cell phones and your iPads at the door because all of these projects, or all of these little gadgets that you have are made from minerals so, you know, you can export your pollution to China, or you can have slave labor in Africa, but right here, you can have good union mining jobs in the United States of America.

Attention: Lisa Fay I have followed the progress of the Polymet/Northmet proposal for almost 10 years, both as a citizen and former State Representative representing the area where the proposed mine would be located. I strongly support the project I grew up on the edge of a mine on the Northside of Virginia. At the time, Virginia had a population of 14,000 people. Almost everyone on our block had a father or grandfather who worked in the mines. Mining is what we have done on the Range for 132 years. And I proudly point out that while we have altered the landscape with our mining culture, we have not damaged the environment. In fact, people come to visit or live here because of our pristine atmosphere. A mine can only exist and operate if the metals are there to mine. Minnesota has been blessed with not only one of the largest iron deposits in the world, but also one of the largest deposits of copper, nickel and precious metals. It makes economic and environmental sense to locate this Northmet mine in the Hoyt Lakes/ Babbitt area. The towns that will house the workers are already there and are capable of accommodating the influx of workers needed to build and operate the mine. As a State Representative, I passed the law that preserved the infrastructure at the old LTV taconite mine for the day when a new mine would locate there. That new mine should be Polymet. When LTV (Erie Mining Company) was built, it was a 350 million dollar investment in 1952 dollars. Today that would equal around 2 billion dollars of investment. By using all the old course and fine crushers, concentrator, power lines and sub-stations, railroads, haul roads etc, the NorthMet project will save the environment by not having to mine for the metals that built this minesite the first time around. This should be a major consideration for all the agencies charges with approving this project. The human race and the citizens of the USA need the resources that will be mined at the Northmet site. In order for the human race to move away from the fossil fuels that cause global warming, we need the copper and nickel and platinum, palladium etc that will be mined at this site. We know how to mine on the Iron Range of Mn and we know how to do it correctly. Modern technology and modern regulations will insure that this mine will be one of the most environmentally sensitive mines in the world. We can not bury our heads in the sand and pretend that the mines that are currently supplying all the metals we use in our daily lives are doing it properly. We know that here in the USA, you regulators will make sure that we put all the safeguards in place to make this mine the safest in the world. The experts at the Natural Resources and Research Institute at the University of Minn/Duluth, have indicated to me that we can mine the Copper Nickel etc ores safely and properly. They have indicated that the reverse osmosis process proposed by Polymet to treat their waste water will work and not pose a threat to our area. In fact, many of the communities on the Range get their drinking water from the old natural iron ore pits. The sulfides in those pits has not turned to sulfates. People drink this water and don't get harmed. People in the Eveleth/Virginia/Gilbert/Mt.Iron area live under the shadows of three different mines operating near their communities and they live healthy long lives. The U of Mn has completed a 5 year/ 5 million dollar study on mesothelioma and found our air is cleaner than the air in downtown Minneapolis. We have not polluted our environment. Please approve the NorthMet project. America needs to make and manufacture things in this country. We need to mine the resources we all use in this country, not export our desires for these metals to another place where the environment will be abused. Iron Rangers are hard rock miners. Don't destroy or try to change who we are and what we do. We have mined correctly for 132 years. We have the resources to mine for hundred

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tom Sharkey 2 Arrowwood CT Granby, CT 06035 US

Tom Steigauf

4874

To who it may concern, Thank you for the great work the MN DNR has done in the past and continues to do today. I am proud to say that I'm from MN "The land of 10,000 Lakes". I believe our DNR has done an incredible job of conserving and maintaining our natural resources. After all, these resources don't belong to us we are leasing from our children and grandchildren. I wish to voice my concern about the PolyMet mining proposal. This type of mining; often called sulfide or acid mining has never been conducted in a way that preserved the natural landscape, habitat, or wildlife in the adjacent areas. That track record speaks for itself. People travel from all over the United States and even the world to visit MN for our lakes; the BWCA being a prime example. They don't travel here to see our mines. My in-laws have a lake home in Ely. We regularly host friends and family up there from all over the USA and Germany. The PolyMet mine will create jobs but how many and for how long. PolyMet will run the mine for 10 years or so then leave. The jobs will be lost and MN will be left with the environmental mess. The fact is a relatively small number of jobs will be created and most of the money will leave the state. Companies will promise anything and everything to get their way. Remember the repair hub and call center Delta promised to build in the Range. It would be far better to develop tourism and create jobs around tourism. These would be long-term jobs that would continue on for generations. I realize this makes it seem I don't care about the people living on the Range. The truth is I do care. I care a great deal about them. That is why I have the courage to challenge them and you to reject this easy way out. The PolyMet mining operation will damage our beautiful natural resources. It is that simple. People deserve to have jobs but not at this awful price. The mine will create very few jobs in the grand scheme and damage the number one major resource we have; our beautiful lakes and forests. Thank you for your time and consideration. Best regards, Tom Steigauf 6944 Stevens Ave So Richfield, MN 55423-2410 763-526-6362 HYPERLINK "mailto:tom.steigauf@gmail-com"tom.steigauf@gmail-com

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Please extend the comment period for the Polymet Northmet Supplemental Draft Environmental Impact Statement from 90 days to 180- The Statement is not something that most people can just read overnight or even several days and understand. The time allotted included one of the busiest holidays of the year for people and some of the most frigid and snowy weather seen in many years. Many, including myself, live out in the areas being impacted where life has slowed because of the weather. Getting chores and going to town to do errands has been more time consuming. I have a Duluth address but live 30 miles north of it and must drive there to do business and shop. The Polymet Northmet project will have extensive impact on lives. Having quality time to investigate this document is important. Please extend the time period to give adequate time to go over this huge document. Thank you for your consideration. Tom Thompson 1370 White Lake Drive Duluth, MN 55803

Tom Uphaus

40617

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Tom Uphaus 2650 N Pine Creek Rd La Crescent, MN 55947-9619 (507) 895-2152

To whom it may concern: Greetings. I'm a long-time resident of Minneapolis, but a frequent visitor to northern Minnesota. I'm writing to add my voice to those opposing the PoyMet Sulfide Mine. For a time I lived on site at an abandoned copper mine in Washington State, which now more than 50 years after its closing is still a Superfund site with toxic danger surrounding it. That experience has caused me to err on the side of caution when considering permit requests for future large mines. As the SDEIS analysis point out, strip mining brings with it a host of environmental damages that are not worth the number of jobs that PolyMet promises: Danger to water quality Discharge of sulfates Harm to wildlife Destruction of wetlands We have been given an incredible gift of amazing natural resources in Minnesota's Arrowhead Region. Let's not pollute it for the sake of some jobs, but rather let's do the harder work of finding more jobs that don't have such a harmful effect on our environment. Thanks for listening. Thomas W. Witt 2416 E. 22nd Street Minneapolis, MN 55406 [HYPERLINK "mailto:tw Witt@gmail-com"tw Witt@gmail-com](mailto:tw Witt@gmail-com)

We cannot continue to make short term decisions that have long-impacting and negative repercussions for our future. I understand that people need work in the Range. Let us put our efforts toward finding work that does not ruin the water we drink and the soil from which our food comes instead of spending millions of dollars on lawyers and studies to try and make something that is clearly bad look not so bad so a ruthless corporation can make more money for their shareholders. We the people are becoming educated and we are tired of politicians who are in the pockets of these businesses on the one hand and wanting to quickly assuage the need for gainful employment for their constituents on the other hand coming up with “fixes” that fix nothing. Put this project up for a vote by the people – all the people who will be affected by the project, during the next election. That would be democracy. I guess you know how I would be voting. Thank you, Marie Malanaphy-Sorg 165 Western Avenue N. #205 Saint Paul, MN 55102

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Toni McCray 6329 Brightlea Dr Lanham, MD 20706-2865

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Toni Watt

18238

My name is Toni Watt, T-O-N-I, W-A-T-T. And I am a proponent of no mining allowed in the Boundary Waters. I really don't think it's safe, and I don't think they can guarantee that the water there will not be polluted. I don't think it's a good investment to look for 20 years worth of jobs, maybe, and 500 years worth of pollution, you know, and there's -- and the mining companies do not have a good track record, and we raised our children in the Boundary Waters for summer trips and it's a very beautiful, pristine wilderness, and I really -- and if Minnesota doesn't keep its Boundary Water Canoe Area, it's going to lose big time, financially, and the country will lose that beautiful asset that we have here. We need to be very, very cautious about preserving the waters of Minnesota. We are at the beginning point of three different river shed areas here, and we can't afford to pollute our water. Thank you.

There needs to be a balance in regard to the ecology and the economy. The SDEIS for the Polymet mine project does exactly that. Ten years of DNR work has gone into this document. After ten years it is time for this project to move forward. The Range, the state of Minn., and the United States need the excellent paying jobs that this Mine will provide. Minn. has the strongest Mining environment laws in the United States. It will be done safely. Everyone in the state will take nothing less. Thank you Anthony M. Colarich 1011 East White St Ely,Mn. 55731

Tony Jordan

9845

My Name is Tony Jordan, and I live at 3754 Rustic Place, Shoreview, MN 55126- Although it has been 8 years since I've been to the BWCA, I know it to be a true "water world". The flow of the visible water through passages connecting lakes for 100 miles or more is a sensitive provider of all forms of life in the area. The flow of the water that we can't see underground is even more intricate and sensitive. The minerals are not going anywhere and their value will only increase. We should wait for technology to be developed to offer the possibility of mining them without the accompanying destruction that future generations will pay for. I am against the mining proposal because of the irreversible damage that will be done to the area. I am in favor of an additional user fee for the BWCA that would be shared with the residents of the area to compensate for their not getting the 300 some jobs that come with the destruction of the area. Thank you, Tony Jordan (651) 482-9608

Tony Nelson 10266

As the Chair of the Dakota County Planning Commission, I understand the push for more jobs. Especially in an area that needs them. But, I am also the Habitat Chair for the Twin City chapter of Trout Unlimited and I understand the community's desire for clean air and water. The technology is there to extract the minerals but there are no known examples of a case where the waste is handled in a safe way. This type of mineral extraction will leech sulfuric acid from the tailing sites. There are no examples of an existing mine that does not have this problem and the timeline to control this is for hundreds of years. Are the mine owners willing to put the money up front to cover the entire cost for this cleanup. We must not get caught in a situation where the owners file bankruptcy after the mine is played out and the citizens are stuck with the bill. I know there will be extreme pressure placed on all the agencies to push this through, but the people of Minnesota are relying on your agencies to look at the science and the limitations of the existing technologies to make a decision that protects the land, the water and our children. You are caught between a jobs and profits over-rule all and a "NIMBY" mindset but you must rule on the facts that you have. Can you permit a mine and preserve the water quality that currently exists. The decision is yours. Both sides want you to do your jobs, so do them. What does current science tell you. Tony Nelson, 890 Redwood Drive, Apple Valley, MN 55124; 952-486-2282

Tony Terwey 41891

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tony Terwey Richmond, Minnesota

My name is Tonya Kjerland and I am from Northfield, Minnesota. I am a graduate student at the University of Minnesota. I have done extensive studies with wild rice in the field. And I would like to state that in order to determine what a rice water is, the state should consider simply the presence of wild rice. Looking at historic data, such as it is, is very difficult at this time since we have not yet collected enough density data to determine how wild rice populations change over time. I know from experience of looking at the data that does exist from the 1854 Treaty Authority, it is clear that rice can fluctuate extensively in density as well as spacial presence. I would also like to say as a native person that the wild rice is more than just a plant. It is a sacred medicine. And that this is not just for the native people, it is for everyone. Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tracey Smallwood 1322 harwich dr Waldorf, MD 20601 US

Tracy Alfson

16995

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Tracy Alfson 6037 Country Club Road Houston, MN 55943

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness and Lake Superior Ecosystem. It does not provide enough economic benefit for the cost to our quality of life. There are other, more economically effective paths to follow. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Tracy Fredin 4506 Nawadaha Blvd Minneapolis, MN 55406-4036 (612) 729-3802

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tracy Kraemer Blaine, Minnesota

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Tracy Mallon 4136 Freeland Ave Philadelphia, PA 19127 US

Travis Barnes

The mine is a bad idea. It will cause a lot of pollution and kill a lot of wildlife. You could mine somewhere not important like Canada.

Travis Durkin

20017

I am against the new mine. I live in Ely and I am very concerned about our watersheds. I do not feel that there is sufficient evidence to keep our waters safe from pollution. Please do not approve this operation. Thank you. Travis Durkin 16 N 8th Ave E Ely, MN 55731 - Travis ;-)

I don't think they should build the mine because there is many places to mine besides doing it right next to a wildlife area. The mining will destroy fishing, the water, the sulfuric acid will destroy all most everything in the water that would be another wildlife destroy. Just because they want to get copper and nickel. The wild habitat will be destroyed we need animals to survive like fish and other animals. The acid will make the [ILLEGIBLE] the go down.

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, When I first moved to Minnesota in 1968, a controversy arose about the dumping of taconite tailings containing asbestos into Lake Superior. The practice was finally stopped, but only after tons of carcinogens were put into the water. I beg you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr Trilby Busch 2648 Emerson Ave S Minneapolis, MN 55408-1222

Trish

As someone who has studied natural resource economics, environmental policy and biogeochemistry a fair amount I know that these issues can involve many important stakeholders with conflicting but valuable objective functions where policy makers face difficult tradeoffs and non-pareto improving solutions. This is not one of those times. As I'm sure you know, unlike iron ore mines, the impact of which is huge but containable, sulfide mining tailings produce highly acidic runoff. The upper Minnesotan hydrological system is so interconnected that this would mean centuries of catastrophic and un-manageable ecological costs in what might be the combined most beautiful, ecologically valuable, and visited lake ecosystem in the Union. Which is to say nothing of the negative externalities imposed on anyone who has ever gone or will ever go to the BWCA in this or any coming generations. But they'll clean it up, right. Even if they DID commit the appropriate amount of fund (which is probably, you know, hundreds of billions of dollars since the runoff would need essentially indefinite treatment), there is a nearly flawless record of companies like this almost immediately raiding those funds/hiding behind bankruptcy protection. Then who pays for it. No one. But what about the jobs. The few thousand jobs created over the next decade will be nothing compared to the job and revenue losses in the tourism industry that will almost certainly result as people are less inclined to visit a lake system with a pH of 5. Obviously I exaggerate. The pH wouldn't be that high. But it would be too high for fish. Like walleye. I love walleye. These companies aren't even American. Which might be the WORST possible reason to reject this mine but the money isn't even staying in the state. It's going to some international mining conglomerate acting through shell corporations.. I didn't even know that was actually a thing. What is this a Jean le Carre novel.. Anyway. Please. For once, can the good guys win. Please call me if in any way I can help convince you to take the high road. Seriously though, I'm 23 and I'm gonna have to explain this shit to my kids. Cheers, Tristan

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years and beyond. I was born and grew up on the Iron Range. After living away from the area for a number of years, I recently made the decision to return to MN and have since moved to Duluth. As a young professional with specialized skills, my career aspirations have long implied that I should seek out opportunities in a larger urban center on the East or West CoaSt However, return trips to visit family and friends over the years have convinced me that the place I want to be is in Northeastern MN. Foremost among my reasons for wanting to return to the area to live, work, and grow my small start-up company are the pristine lakes and waterways of the Arrowhead region. I know many peers of my generation with similar stories. Motivated, energized young people who have stayed or returned to the area, inspired by the unique and treasured natural recreation opportunities afforded by the area's forests and lakes. I am a firm believer in the potential for this region's innate cultural and recreational resources to usher in an era of economic revitalization for the Arrowhead. I also believe that short-sighted decision making based on short term profits for the few can undermine and negate this potential. As such, I view the PolyMet project as currently proposed, planned, and outlined in their SDEIS to be a major threat to Northeastern MN's long term economic vitality, rather than as an opportunity. Specifically, I agree with WaterLegacy's findings and assertions, as outlined below: The PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant f

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms tye block PO Box 19 Cordova, SC 29039-0019

Tyler Lies 47423

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. I have camped in the Boundary Waters multiple times with friends and family and every time I visit I discover something new in the area and within myself. This is only possible due to the pristine condition this natural area has been preserved in. I'm also an Environmental Geoscience major at UND though I live in MN, and I understand the type of effects that this could have on the environment, though not to the degree as the people doing the testing. I would love to have the ability to continue visiting this area in the condition that it's in for years to come, and this won't be possible if it becomes polluted and disrupts the ecosystem that is currently in place. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Tyler Lies 716 169th Ln NE Ham Lake, MN 55304-4891 (612) 423-1282

Tyler Nord 18334

My name is Tyler Nord. I live here in Duluth. I am also a taxpayer and also study political science and economics at UMD. There is a lot to be said about this in regards to the economic situation, the amount of waste copper, scrap copper that we are exporting that is highlighted by the Bloomberg Business Group, the same people that audited the Federal Reserve Bank. They have shown that we are sending (inaudible) scrap copper to China to fuel their growth. Since 2007 they fueled the majority of their growth from our scrap copper. The economics aside, I would like to address the SDEIS. I would like to request that it is rejected and reanalyzed. I would ask that Section 404 is rejected and reanalyzed. And I would like to ask cumulatively that at that point there is no reason for the Land Exchange until these other things are stopped. When you take a wetland out from one area, you can't just have another one happen somewhere else. Any technologist can tell you that. Any geographer can tell you that. It might be a similar size of wetland, but the service it provides to your economy isn't the same, if in a specific location, you filter more water than in another location. So, just adding more wetlands somewhere else while destroying the wetlands on the other line won't work. Now, in the SDEIS -- in the EIS they demonstrate that they will be using the LTV site. (Inaudible) it drains from the bottom into three separate streams. It was designed that way. They are just going to pile a different type of waste on top. I will remind you that this type of mining has never been done safely and we live in a high-water content area, however you want to say that. Now, what we are looking at here is when we had that flood a couple of years ago, whatever year it was, it doesn't matter, it was a 500-year flood, it was a 200-year flood; well, I'm from Fargo, North Dakota. They are putting in a diversion. Lots of stuff going on with the water management there. Now, they said it was a 100-year flood in '97. Oh, then it was a 200-year flood in 1999. Oh, now it's a 500-year flood. Now, PolyMet doesn't acknowledge 500-year floods or 1,000-year floods, 2,000-year floods at the site. It doesn't matter. The main flaw in the EIS, the acronym that applies here, it is that it doesn't show what happens if the pumps at the edge of that tailing pond fail. It doesn't show the alternative scenarios. It doesn't show that 21 gallons per minute that leaks from the LTV site, that they admit will be leaking 21 gallons per minute, that is -- first of all, that's never been demonstrated before. They acknowledge that untreated water will be leaving the waste site. Thank you.

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Tyler Reid 34232 N Bluestem Rd Round Lake, IL 60073-5245

Tyson Nguyen 41919

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Tyson Nguyen Brooklyn Park, Minnesota

Dear Sir or Madam, Please see the attached letter from the United Transportation Union, Rail Division of the Sheet metal, Air Rail and Transportation Union, (UTU-SMART-TD). This letter has also been hand delivered to the DNR Offices in St Paul. On behalf of our 1200 active and many retired railroad workers in Minnesota, we support the acceptance of the proposed Polymet Mining Environmental Impact Statement without any further delay. Please add our UTU-SMART-TD letter dated March 8th, 2014, to the DNR, to the public comment docket. Thank you. Phillip Qualy UTU-SMART-TD SLD Minnesota 651-222-7500

V Brandt 40336

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, V Brandt 28 W.10th New York, NY 10011 US

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Wisconsinites consider canoeing in the Boundary Waters area to be the pinnacle of recreation. This pristine wilderness is the last frontier for midwesterners to explore. It should be protected at all costs, as there will never be another. In addition, fishing/canoeing opportunities are being squeezed by development in other parts of the midwest Our great lakes fishery is also being threatened on multiple fronts, including Chicago carp. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands (flooding.), harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Valerie Mellerop 1052 E Gorham St Madison, WI 53703-1608

Dear DNR, I am writing to let you know I am completely against the proposed Polymet mine in northern MN. Mining destroys the land and water that we rely on for survival and recreation. Even if it could be cleaned up, the clean would be required for hundreds of years, at enormous expense, an expense that may or may not be paid for my the mining company. And there will surely be irreparable damage. The area if miner, would never ever be the same. I believe no potential number of jobs is worth destroying this priceless, beautiful area located near the pristine BWCA. Once it's gone, it's gone. It is not worth it. Thank you for considering my comments. Valerie Murphy White Bear Lake, MN

Valerie Stoehr

45005

Dear Ms Fay, Federal and State Agency Leaders: I am writing to urge you to reject the PolyMet SDEIS and deny permits. I am concerned about the lack of return on investment given that the cost of environmental safety hazards may dwarf the economic benefits. In particular: 1- Copper and nickel mining is better suited to an environment different from the projected northern MN site. 2- Polymet's revised draft (SDEIS) is inadequate. There is no consideration of alternate methods (like underground mine, putting liners under the waste dumps), no guarantees of who pays for routine monitoring/treatment after mine closes—and no consideration of spills, etc 3- The computer model for treating wastes and handling pollution is based on poor data and requires revision. I am working with our elected representatives to urge consideration and adoption of other methods to bring economic opportunities to the Range. PolyMet is not in our best interests. Please deny the permit. Thank you for your attention. Sincerely, Valerie Stoehr Afton, MN Valerie Stoehr PO Box 395 Afton, MN 55001

Valkyrie PenDragon

17068

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Valkyrie PenDragon 3802 Polk Ave Bemidji, MN 56601

Vance Anderson

57336

Vance Anderson, from Cromwell, Minnesota. I am a business representative for Roofers Local 96. I support the PolyMet mining and believe them that they will build and operate a mine that complies with all regulations and protects the environment. I trust the multiple state and federal agencies involved in preparing the document. Okay. Based on the extensive documentation as outlined in the SDEIS, I am confident that impacts to the air, water and land will be minimal, if any, and that the land post-closure will be reclaimed to protect natural resources over the long-term in compliance with the law. The SDEIS demonstrates that PolyMet can develop this resource in a sustainable manner and there will be logical engineered solutions proposed for potential impacts. I am impressed by the extraordinary precautions proposed by PolyMet, such as a reverse osmosis, and look forward to having them as a new neighbor. The SDEIS shows that mining, recreation, tourism, and other land and natural resources can be -- can co-exist. The PolyMet project has been designed to minimize environmental impacts, reusing the Brownfield site, reusing existing infrastructure, minimizing disturbance of wetlands, and utilizing multiple safeguards to protect the environment. PolyMet will control and manage stockpiled water and use proven technologies found in liners, water collection systems and cover systems. PolyMet will not discharge water to the environment that has not been treated with reverse osmosis. PolyMet will provide financial assurance to cover all closure costs. PolyMet will utilize the best available emissions control devices on mobile mining equipment. Some foreign suppliers of metals PolyMet will provide don't necessarily follow the sound environmental practices, creating a greater global environmental impact. That's a mouthful there. PolyMet has demonstrated they can produce these critical metals while following Minnesota's strict environmental requirements to protect air, water and land. PolyMet will be a domestic supply of critical metals needed in medical applications, electricity, catalytic converters, cell phones, computers, and other essential products. I use these metals every day. If we are to maintain our modern way of living, we need to continue to find and extract these metals. And just as well we do it in Minnesota, where we find them in abundance, where there are sound regulations in place and where we have a ready and available workforce. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity expanding and diversifying our mining economy. PolyMet can produce these metals in an environmentally sound manner and create hundreds of jobs that can support families and sustain communities. I trust the multiple federal, state and federal agencies in preparing the document. The Minnesotans trust the DNR to do the copper-nickel mining and to keep our communities safe. PolyMet will produce these metals in an environmentally sound way that generates significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. Copper-nickel mining will provide millions of dollars in local and state taxes to support our communities and our educational system. It is irresponsible to import these metals from countries that do not have strict environmental standards, when Minnesota has an opportunity to mine responsibly. The environmental review process has been lengthy and thorough. The Supplemental EIS addresses potential environmental impacts and how to mitigate them. It is irresponsible to import these metals and export jobs, when we can mine safely here in Minnesota.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Vanessa Hooper 2358 Cedar Crest Blvd Dallas, TX 75203 US

No BP in BWCA! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

First, in a macro sense, the observation (and evidence) that no sulfide ore mine, anywhere, has been operated without serious or extensive water pollution problems, demands that regulatory agencies invoke the "Precautionary Principle," that is, that it is incumbent upon the mining company to prove unequivocally PRIOR to mining operations that that pollution standards will not be violated. The Northmet SDEIS, with its probabilistic/statistical modeling, does not satisfy this common sense standard. The stakes are simply too high — especially within this water rich environment — to allow a "trial and error" approach for demonstrating that pollution incidents will not occur. An additional factor exacerbates this concern: The SDEIS is replete with statements (indications, admissions.) that water quality problems (violations) are, indeed, likely to occur, or could occur. What follows those statements is what is really egregious, and that is the repeated, summary if not "dismissive" comment: "if detected, adaptive water management measures would be implemented." Another variation of this statement which is "arrogant" in tone within the context of this critical question of protecting water quality within a precious environment, is the phrase, "If actual NorthMet Project Proposed Action effects were found to be higher than predictions, then steps could be taken to reduce those effects." "Steps COULD be taken." As a citizen, I am insulted. I demand that the company declare their commitment that "steps WILL be taken" to not only reduce (another weasel term) but to mitigate the problem such that water quality criteria are, indeed, met. Examples of these statements occur on Page 5-98, Page 5-144, and Table 8-0, Sections 1, 2, 9, and 13 (Page 8-4 to Page 16) to cite only a few. The SDEIS contains no detailing of what these "adaptive water management measures" or "steps" would consist of. Additionally, and more importantly, there is no assessment as to the efficacy of such adaptive measures. Thus, the Polymet SDEIS is grossly incomplete (inadequate). This is tantamount to giving the mining company a "back door" to escape designing and validating not just the preventive but the remedial measures in the event a water quality standard is violated. To repeat, the SDEIS narrative conveys the general sense that there is a significant likelihood that water quality violations will occur. This is all the more reason to invoke the Precautionary Principle. ie, "prove it first." Vern Simula 5491 Bluebell Avenue Mt. Iron, Minnesota

My name is Vern Simula, S-I-M-U-L-A. I live in (inaudible) US Steel and Minntac Plant. Many of my neighbors work there and the various mines in the area or mining business. Many of my neighbors, especially young working, are desperate for jobs in our Iron Range communities. Our downtown businesses also depend upon a strong local mining base. We need those jobs desperately and deservedly. That's why so many mine workers are here tonight. But the need for such short-term jobs, or more precisely the asserted economic contributions they propose will be provided, the 20 years, must be considered irrelevant for the purpose of this hearing. That issue is out of bounds. Not germane. Because the fundamental issue here is what is at the proposed mining project can be done safely without harm to the natural environments or to human health. Again, the fundamental issue is the safety of the mining -- the proposed mining operation. And to look at that question, that's a highly technical question. And I for one -- many of us as citizens we really don't have -- you know, miners and folks that have come here tonight we really don't have the expertise to look at the very complex issue of the various scientific questions surrounding will this mine pollute or not. Additionally, a number of citizen organizations have retained professional scientists in various areas and expertise to address the many aspects. And the resulting reports distributed by these organizations gave enormous doubt whether this mining project can be done safely. And also, even the EIS itself is not conclusive. In chapter 8 it contains a litany of major differences of opinion. If indeed there are doubts or disagreements, unanswered questions, or probability that if one of the criteria of the safeguards cannot be met then the only reasonable, prudent decision for our regulatory agencies is to invoke what I call a precautionary principle. According to my handy-dandy Wikipedia, a precautionary principle states that if an action or a policy has a suspected of risk of causing harm to the public or the environment, in the absence of scientific consensus that the action or policy is harmful, that the most prudent type of thing is to invoke (inaudible).

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Two thoughts: 1- There has been tremendous political pressure urging approval of the SDEIS, because the Northmet Project will create "jobs" for the Iron Range. The pressure is so clamorous that leads one to think that the "Range" is solely dependent upon this project for additional jobs. Not so. The Iron Range Resources and Rehabilitation Board (IRRRB) just in the last three years has, according to their report, created 1,894 permanent jobs, supplemented by 2,800 construction jobs, jobs that do not contribute to potential serious environmental hazards. 2- Numerous statements in Chapters 5 and 8 of the SDEIS "admit" that water quality violations will likely occur. These statements are followed with the rather "flippant" comment that in the event of such occurrences, measures will be taken to remediate the violation. There is no description or evaluation of the efficacy of such remedial measures. This is unacceptable. It gives a potential polluter a free pass. Please reject the SDEIS on a "No Action" basis. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Vern Simula 5491 Bluebell Ave Virginia, MN 55792-4009 (218) 591-5722

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Verna Alt 5115 42 AVE S Minneapolis, MN 55417

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Lisa, I'm writing to submit a comment on the Supplemental Draft Environmental Impact Statement (SDEIS) for PolyMet Mining's proposed NorthMet project. First, I want to express my confidence in your agency to thoroughly evaluate the project, and its ability to design the mitigation for potential environmental impacts. I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. Additionally, I'd like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out – all the more reason to support it. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country. Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. We cannot afford to miss this job opportunity. This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Based on my review and the level of detail included in the draft EIS it appears that a thorough evaluation of the project and potential impacts has been completed. Sincerely, Vern Baker Chaska, MN 55318

I don't think you should mine in the area of the boundary waters. The sulfur in the rock mixed with air creates sulfuric acid. Acid kills most aquatic life. This means no more fishing. Many people go to the boundary waters for peace and quiet, but the drill noise along is hard on the ears. This area has been protected since 1989, and if you plan to mine for 20 years, it will do damage to our water for much longer than that. The contamination from this mine will threaten all water bodies connected to it. The PH of the water will be 4, 3, 2 even 1. Aquatic life dies below a PH of 4. These are just a few reasons you shouldn't mine near the boundary waters.

Veronica Smith

57344

My name is Veronica Smith. I am from the Fond Du Lac Reservation. I am a band member. And my concern is, of course, is the waters and the streams and the lakes that come down from where the mines are going to be. What I have the most concern about is the wild rice. Our Manoomin -- the creator has given us manoomin. Do you need to know how to spell that? M-A-N-O-O-M-I-N. And that's what is my concern. It is the waterfowl and the plants, and of course my concern is the state grains in Minnesota, protecting that to the fullest. And that's what my concern is. Alright? Thanks.

Vicki Andrews

In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Vicki Andrews 31135 Sunny Beach Road Grand Rapids, MN 55744

45098

I am writing to urge you to reject the PolyMet proposal to build a copper-sulfide mining operation in Minnesota's Lake Superior Basin. This plan is bad for the environment, a potential disaster to Minnesota communities, residents, land and water. PolyMet's proposed location increases risks of pollution and harm to public health - 99% of what is dug out of the ground will be waste. It would impact irreplaceable high value wetlands in the St Louis River watershed- destroying 913 acres and indirectly affecting another 7,228 acres. Tailings will be dumped in an unlined tailing basin. It is almost certain to result in contamination of surface and/or ground water with sulfates and toxic metals. The risk to the environment is simply not worth it. We need to protect Minnesota's land, water, and communities. Please reject this proposal. Protect Minnesota. Thank you, Vicki Andrews 31135 Sunny Beach Road Grand Rapids MN 55744 218-259-4254

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms vicki Bonk 5629 45th Ave S Minneapolis, MN 55417-3018

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Vicki Culver 8200 38th Ave N New Hope, MN 55427-1113

Sulfide ore mines providing employment is a RELATIVELY SHORT TERM FIX of a problem. Sulfide ore mines polluting water and wilderness is LONG TERM DESTRUCTION of a precious MN resource. Clearly, this kind of mining is not the same as taconite mining. It has more long-lasting and serious consequences to the land and water. It is not possible to guarantee safe mining practices. Once the damage is done, we can not back up on this decision. MN needs to provide incentives for non-destructive industries to move north to provide jobs. Vicki Effertz 8086 Curtis Lane Eden Prairie, MN 55347

I have concerns about the runoff from the holding ponds to the Embarrass River watershed & the 100 mile swamp. Those regions articulate with the Boundary Waters. Please protect them! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Aletemative.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Vicki Everett 11 Elizabeth St #26 Duluth, MN 55803

Dear Sirs:Minnesota is one of the most beautiful states in USA. I have focused on keeping it that way my whole life. I do dispose of dangerous chemicals properly, recycled everything I should. I never litter, etc etc. I know we need to keep our water, air, etc clean of any dangers. It is all we have. Our children, grandchildren deserves better. They are our future. We need to focus on ways to stop toxic pollution and anything that will threaten our water supply, air or land. Sulfide mining in northeastern Minnesota will be a very big mistake. Please protect our children. This mine could create more illnesses that could lead to death. Anything toxic will destroy life. MN will not benefit from sulfide mining. Thank you and I apologize for my messy letter. Vicki M. Gustafson 121 Carlisle Ave Duluth, MN 55803

Why do we need to move ahead with the permitting of the proposed copper mine. We do not have to do so We should understand by now that the resulting damage to our environment does not let us even consider such an effort. What can possibly keep the mercury contamination from eventually moving into the groundwater and causing major changes in the quality of the groundwater involving a huge part of our natural world. We need to look far ahead and try to understand what will be critical for our quality of life in the future. We may be forced to live a much more basic existence where technology will not be as much a part of our lives. The quality of natural resources such as our water will take on new meaning for our existence. We should begin to put more consideration into living with and carefully maintaining much of what already exists, particularly in our corner of the world. Vicki Sanville Duluth, MN

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Victor Hemmy III 771 Kealahou Street Honolulu, HI 96825 US

Victor Walter

40812

Hi, my name is Victor Alan Walter. I live at 18975 Valley View Road in Eden Prairie Minnesota, 55346- I have lived in the Twin Cities area most of my life. I was born in Virginia Minnesota in 1956- I live in the Cities but my heart lives in Northern Minnesota. I can't afford to live up there. I have a family down here. I know most people that live on the range have one or two jobs to support their family. Travel is horrible in the winter. All stores are far away and the produce sucks. But there is a reason people live up there. The beauty of the land. Easy access to forests, swamps, open fields, rivers, lakes and swimming. People live up there for a reason. Because they love living there. The water moves as freely as the air. Life is not easy, financial security is not easy. We don't need more mining jobs in northern Minnesota. Our tourism will be worth much more in the long run for our states financial security. Any degradation of our water will be a slow death for our state. Please do not mine for copper in Northern Minnesota. I love our state. I want to stay here. I want to live here. I want to visit my homeland. Please.

Victoria Bloch

42454

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents completely unacceptable environmental risks it should not be allowed under any circumstances. This dangerous sulfide mining operation threatens to pollute Minnesota's water with sulfuric acid and heavy metals for 500 years (or so, give or take a decade or three), and endangers both clean water and habitat in the Lake Superior basin. Lake Superior is a precious national resource, as is every significant body of fresh water in our country. With fresh water at a growing premium, any threat to water represents a threat to our economy, our citizens' health, and our nation. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Victoria Bloch 2556 Granville Ave Los Angeles, CA 90064-2804

Victoria Morrison

39763

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Victoria Morrison 74 Noland Dr Clyde, NC 28721-9299 (218) 341-8294

Victoria Oakey

14370

Feb 13, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting their clean water. I and they have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This irresponsible trade-off is not worth the risk. Sincerely, Miss Victoria Oakey 18 Cogges Hill Road Witney Oxfordshire, None OX28 3FP 4401993708832

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, I'm not a Minnesotan. I live in Washington State. But I am a part of the planetary ecology, and this proposed mining project is of some concern to me. If our landfills were mined for precious metals, and manufacturers pressed to create more from recycled products, there would be no need to open new mines. There would be no need to risk the health and home of all living things. Open pit mining is (or should rightly be) obsolete. Hold the line. Say no to PolyMet. Sincerely, Ms Victoria Singer 705 Lyle Ave # 1 Lyle, WA 98635-9061 (509) 557-5456

Victoria Turke

18254

My name is Victoria Turke, V-I-C-T-O-R-I-A, T-U-R-K-E. The supplemental draft environmental impact statement is inadequate in several areas and should be gone through to thoroughly answer questions in detail. We cannot let this report define the future of our clean water. The SDEIS uses a small bit of data from 1984 to address the water flowage and its impact concerning the issue of how much and how fast our groundwater, streams and lakes will be polluted. The report is using data that does not reflect what the conditions actually are at the proposed site. The report does not reflect the impact that this project will have on our clean water. This report does not adequately answer the question of how this perpetual need for taking care of the polluted waters is to be paid for, and when questioned, they say those details will be addressed during the permitting process. This just is not sufficient. This is our time to voice our concerns about the PolyMet mine that is proposed. We deserve to have all of the details now, not when it's too late. These questions are far too important to put off. The SDEIS does not answer these questions and should be sent back. Thank you.

19527

My name is Victoria, V-I-C-T-O-R-I-A, Turke, T-U-R-K-E. I live at 1004 Trenton Circle North in Plymouth, Minnesota, Zip Code 55441. I'm concerned about the PolyMet sulfide ore mine that is being proposed for the Hoyt Lakes area. Computer models show that the water from the mine and processing plant will be contaminated with toxic metals and sulfate. I spend most of my time in Northeastern Minnesota and own property on a beautiful lake. I am concerned that PolyMet will not be able to capture and treat all of the contaminated water before it reaches the St. Louis River and Lake Superior. A great majority of us are downstream from this project. We need to ask more questions about how PolyMet can possibly keep its word about protecting our waters. PolyMet's own plan admits that millions of gallons of polluted water will seep offsite. The SDEIS does not completely address this subject. How will PolyMet be able to treat the polluted water for 500 years? How will they pay for it? We need more answers. Thank you.

Vincent Graziano

48718

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I would like for once the State and DNR actually protect the natural resources that they are supposed to protect and not just hand over our future to corporations and especially foreign corporations. Examples are the Minnesota River, one of the most polluted in the country, moose hunting when moose are going extinct, wolf trophy hunting, not protecting wetlands, on and on and on. Their own simulations say pollution for 500-years, in other words FOREVER. If this kind of mining does ever become safe (which I doubt), then it will be worth even more in the future. To the unions who I usually defend: not every job is worth doing if it destroys your future. Northern Minnesota has the golden goose. Defend it, don't blindly pander to the "jobs" message. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Vincent Graziano 121 Otis Ave Saint Paul, MN 55104-5635 (651) 644-4388

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Vincent Trovato 7501 Ontario Blvd Eden Prairie, MN 55344-1889

I am a native of north-central Minnesota and have been camping, hiking, skiing and working in the area near the Polymet site for 44 years. I worked as a wilderness guide in the BWCA. During my time in the northland, I have become familiar with its fractured geology, clean waters, and extremely fragile biomes. Essentially every body of water there is connected to every other body of water, both on the surface and in the subsurface. It is simply ludicrous to suggest that any amount of human engineering, or any amount of money, can prevent a disaster from occurring, resulting in the acid mine drainage entering the surface and underground waters in the area. Apparently the duration of necessary treatment is subject to some debate, but from what I have read treatment will be necessary for many decades, if not several centuries. No human-devised system can stand up for the period of time needed to treat this water. Northern Minnesota's lakes, streams, marshes and bogs are an irreplaceable resource. The short-term economic gains from sulfide mining are far outweighed by the long-term risk. I urge you to reject any permit for sulfide mining in northern Minnesota. Thank you. Vincent W. King 1941 Ashland Ave St Paul, MN 55104 Please consider your environmental responsibility before printing this e-mail. Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms virgene haas 1057 26th Ave SE Minneapolis, MN 55414-2643 (612) 331-2877

I am an enrolled member of the Lake Superior Band of Ojibwe at Nett Lake Reservation in the State of Minnesota. I express grave concern for our water, wildlife and fauna of the northern region of the Arrowhead landbase. Culturally this is our medicinal, hunting and wild rice harvesting territory. The Federal Government and State government has a fiduciary responsibility to honor the rights our grandfathers were promised in the Treaty of 1854- Sulfide mining profits will benefit only the Glencore XStrata Corporation and the Polymet Mining subsidiary company. We do not have to trust their words on keeping our environment safe. Toxic waste labelled as reject concentrate is approximately 99% of the earth they will dig up to extract less than 1% of copper and other precious metals. Keep in mind that the released toxins will disseminate in the water and the air in every direction. The Polymet Environmental impact statement is submitted for public comment prior to March 13, 2014- I'm not a scientist but treating the poison water for 500 years is not financially or ecologically sound advice for Native Americans, Iron Rangers, tourists, wildlife or wild rice. Clean water is paramount to all life. Our brother the wolf has been hunted and trapped for two winters now, our moose population has declined to the point of decision where the Grand Portage, Bois Forte and Fon du Lac tribes are not allowed a ceremonial use permit for a moose. Our lakes are the source of the fish populations. Our wetlands were left here by the receding glacier of the Ice age. We can not reduplicate this process. We as Anishinabeg stand together as stewards of Mother Earth. In review of the SDEIS, the fact that there are inaccurate data and the need to keep our National forests sustainable; I urge you to reject any and all plans for sulfide mining. Miigwech, Virgil D Sohm PO Box 662 Tower, MN 55790

---Original Message--- From: dalev1@earthlink-net [mailto:dalev1@earthlink-net] Sent: Monday, March 10, 2014 10:45 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Virginia Dale 2430 Irving Ave S Minneapolis, MN 55405

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Virginia Mattson 4917 Andrew St St Bernard, OH 45217 US

Virginia Nichols

I will be brief - this plan is short sighted, and will irrefutably negatively affect the waters that Minnesota is famous for. It is astounding to me this mine is even under serious consideration, given the obvious risks. Virginia Nichols 330 S. 4th St Ames, IA 50010

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Lake Superior is connected to the other 4 Great Lakes; together they hold one-fifth of the world's fresh water supply. It would be CRIMINAL to allow a corporation to risk polluting this vital resource, only for a business to make a short-term profit. Millions of people rely on the Great Lakes for their drinking water, and there is also a large (billions of dollars) fishing industry that requires clean water. Would we acquiesce to the risk if such open-pit mines were to be opened on Canadian shores. NO, we would not. We cannot permit these open-pit mines to operate on the shores of the Great Lakes. Thank you. Sincerely, Virginia Rosenbaum 1133 Judson Ave Evanston, IL 60202-1314 (847) 864-5514

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I don't think having a mining project by the boundary water is a good idea in the long run. I personally enjoy sightseeing in the boundary water and canoeing in that region. Having a mine up there can potentially damage the aquatic ecology and the natural habitat of many species. Also, I would like you to review and take a look at the mining project extra cautiously. Thank you in advance!

W Clinton Jurgens

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, W. Knox 3156 23rd Ave S Minneapolis, MN 55407

My name is Wade Christensen. I am a long-time member here, in Northern Minnesota. I believe to GPM, Incorporated. We have a number of our guys here supporting this project. I want to thank the Army Corp of Engineering, the Department of Natural Resources, and the -- there's another one in there, I know. I can't remember which one it is. I want to thank you for your due diligence in this project because this is very important to us. I was going to come up here and talk about financial assurance as it relates to what PolyMet has to do to get this project off the ground. I'm going to do that in a little different way and I'm going to ask a couple guys to stand up. One of them is Bill Moraski. Bill, can you stand up? Adam Christianson. And David Hughes. Stand up. This is my vision -- Bill, please, no, stay standing. This is my vision of financial assurance. Number one, I do have to point out, it's amazing how Bill, at 75, looks younger than Dave. I wanted to point that. Here's what financial assurance looks like to me. I called on Bill 25 years ago and I probably haven't seen Bill in 20 years. Adam, my son up here, will be calling on Dave, and you could replace any one of us with 20, 30, 40 other vendors that are here tonight, and it's the same process. It's the process that financial assurance is that the Iron Range is evolving. Taconite is always going to be here, but we have the opportunity, with PolyMet, to do something completely different, and to take that next step in the evolution of mining. We support PolyMet 100 percent. We thank you for the commitment that you've done in good science and preparing them for this project. So thank you, and thank PolyMet for being a part of this. BECKY SAHR I'm Becky Sahr and I defer my time to Bud Stone.

Wade Johnson

40443

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. There is enough destruction taking place on this planet already for the sake of easy money. When it gets to the point of sacrificing our environment as the Polymet proposal does, it must end. I have enjoyed lots of time spent in northern Minnesota and hope to continue to do so. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Wade Johnson 4720 13th Ave S Minneapolis, MN 55407-3558

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, Northern Minnesota is a special place because of its clean water and valuable wildlife habitat. I am fortunate to have visited several times, and I hope to do so again. Therefore, I have major concerns about PolyMet's plan to mine sulfide ore in the region as described in the Supplemental Draft Environmental Impact Statement. I believe the SDEIS is insufficient and should not be approved because it proposes no mitigation for indirect damage to wetlands and is lacking vital information about long-term water treatment needs and how they will be paid for. This information is necessary to fully assess the environmental impacts of this proposal. PolyMet seeks to mine in high quality wetland habitat that is presently in federal (that is, public) ownership as a part of the Superior National Forest. The mine, if built, will destroy more than 900 acres of wetlands, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream and into Lake Superior, an important resource in itself. Beyond the inadequacy of the SDEIS cited above, the damage to wetlands and forest habitat will affect many kinds of wildlife directly, including four bird species identified as of greatest conservation need: spruce grouse, black-backed woodpecker, northern goshawk, and boreal owl. In addition, birds that depend on fish and other aquatic organisms for food, including belted kingfishers, hooded mergansers, common terns, and common loons, will be harmed by the decline in water quality both locally and downstream. For these reasons, I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this dangerous proposal by PolyMet to mine sulfide ore. Thank you for considering my comments. Sincerely, Mr Wallace Elton 36 Curt Blvd Saratoga Springs, NY 12866-8913

COMMENTS ON POLYMET SDEIS JAN 22, 2014 Revised 2/26/2014: Only 10% of the water in the world is fresh water. The second largest fresh water lake in the world is Lake Superior. Fresh water is essential to all forms of life. We cannot survive without fresh water but we can survive without precious metals until they have proven technology available to insure non-pollution. New high temperature and acid leach extraction techniques make precious metals mining doable and profitable, but also polluting. The POLYMET representative stated that the acid is absorbed by the metal – is this true. The MPCA should halt mining production immediately once the pollution hits a minimum level if Polymet is allowed to mine. Lake Vermilion is already considered an impaired lake with fish consumption advisories regarding mercury. Also the Vermilion River. The pollution levels are already above minimums due to the Minntac mine. I would like to know if and how many mines the MPCA has stopped from production when the pollution minimums allowed are reached. Stopped until the problem was solved. How many precious metal mines are there in the world that have pollution problems The one in Finland is one for example of sulfide mining having problems If Polymet is interested in the environment, instead of all their advertising, they could have spent the money cleaning up the two polluted ponds at the mine site. This would have been a much better advertisement to show their interest in the environment. It would please me more to see greater effort to develop non-polluting technology before beginning mining. Thank you, Marcie Moe 3331 Nisen Dr Tower, MN 55790 P.S. I really would like for the St Louis River be tested for pollutants to establish a baseline. Plus, it makes no sense to use all the taxes Polymet will be paying to pay for the cleanup of the pollution left behind. The effect of mines in Finland at the present time: Talvivaara Mining Company plc ([HYPERLINK "http://en.wikipedia-org/wiki/Finnish_language"](http://en.wikipedia-org/wiki/Finnish_language)Finnish: Talvivaaran Kaivososakeyhtiö Oyj) is a [HYPERLINK "http://en.wikipedia-org/wiki/Finland"](http://en.wikipedia-org/wiki/Finland)Finnish-based [HYPERLINK "http://en.wikipedia-org/wiki/Nickel"](http://en.wikipedia-org/wiki/Nickel)nickel mining business operating in [HYPERLINK "http://en.wikipedia-org/wiki/Finland"](http://en.wikipedia-org/wiki/Finland)Finland. Listed on the [HYPERLINK "http://en.wikipedia-org/wiki/London_Stock_Exchange"](http://en.wikipedia-org/wiki/London_Stock_Exchange)London and [HYPERLINK "http://en.wikipedia-org/wiki/Helsinki_Stock_Exchange"](http://en.wikipedia-org/wiki/Helsinki_Stock_Exchange)Helsinki Stock Exchanges, the company is a constituent of the [HYPERLINK "http://en.wikipedia-org/wiki/OMXH25"](http://en.wikipedia-org/wiki/OMXH25)OMXH25 index. Sulphate emissions vastly exceed limits. Neighbours complain about dust and odours from Talvivaara mine print this "Are we supposed to sit quietly and suffer from the dust and odours. Our houses, land, and shoreline are worthless", says Salme Kananen, 67, as she bakes bread in her house in the village of Taattola in Sotkamo in the east of Finland. Nearby is Lake Hakonen, whose surface has started to bubble in a strange manner. The Talvivaara nickel mine is five kilometres away. "There are three large anthills on the shore of the lake. Last summer all of the ants disappeared. I have walked along the lakeshore since I was a child, and I have never seen anything like this", Kananen says. Salme's husband Juhani Kananen, 68, shows the rainwater collectors in the back yard Kananen says says that samples are taken from the collectors once a month. "Not much has been found. In the winter the snow is like a layer cake with layers of black graffiti dust The prevailing winds are from the southwest where the mine is located." When the smell is strongest he will not even venture out to the mailbox. He says that the hydrogen sulphide aggravates his asthma. "We were hoodwinked when they set up the mine. They promised that the extraction of metals involves a closed cycle, and that nothing would spread beyond the mine area", complains neighbour Alpo Partanen. Partanen is a member of the Sotkamo municipal council. The council visited the mine on Tuesday bec

I am Walt Moe. First, I want to thank everybody for the efforts they put out the SDEIS. I downloaded that into my computer. It was quite lengthy, all 2,169 pages of it. But searching the SDEIS, I have found no concrete actions being proposed to be taken in case of things going wrong at the PolyMet mine causing irreparable harm to the waters of the Embarrass and Partridge Rivers, river watersheds and surrounding thousands of acres around these watersheds. The mining operation is predicted to last 20 years, and the remediation efforts to last at least 200 years, more likely 500 years, or even into perpetuity. To me, this is a poor tradeoff for the people of Minnesota. Murphy's Law states that if anything can go wrong, it will. Having spent my working life as an electrical engineer, dealing with making sure that if Murphy's Laws comes true, which it will, in whatever we do, we must have fail-safe triple-redundancy backups to avoid catastrophic disasters. My questions are how much monitoring is going to be required? For how long? How will it be handled? How quickly is a response going to occur? Who's going to make the decisions to curtail operations, and who's going to decide if it operations are allowed to presume -- or resume? As I understand the procedure, the above is to be spelled out in the actual permitting process, which I'm not sure will be subjected to the same scrutiny as the EIS. If it isn't, I would certainly like it to be. Again, I think that the approximately 300 jobs for 20 years versus 200 to 500 or more years of remediation is an extremely poor choice unless other alternatives can be explored. I don't think we're in a do-or-die situation yet where we can't exist without mining these precious metals. Thank you.

Walt Niemiec

38933

This is an amazing story and I'm bewildered at the potential of this becoming reality. The DNR gets into such a tizzy about slot limits on walleyes to the point of total buffoonery yet something as deliterious as this mining operation seems to be a definite possibility. I'm for economic development, people need jobs, but this cost is far too high. I believe it should wait unless and until a less obtrusive mining procedure can be developed. Walt Niemiec 16740 Upper 1st st so Lakeland Shores, MN 55043 651 436 5650

Walt Seibert

It's Walt, W-A-L-T, Seibert, S-E-I-B-E-R-T, 345 Edgewood Avenue South, St. Louis Park, Minnesota, 55426. My comment is that I don't want us to stand in the way of progress, but I also want to be very sure that we know that the standards that have been created are correct and will prevent damage to the either land, rice, water, air, and I guess also I'm concerned about the sound pollution, as well. And that's it. I just want to make sure that the standards that have been created have been created in a thoughtful process, and have been signed off on by all of the appropriate agencies with the needed knowledge. And of course, I am out of the '60s and I'm skeptical. Thank you.

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Walter Prentice 1850 Vermilion Rd Duluth, MN 55803-2509 (218) 730-9973

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. People need to vote unacting authorities acting irresponsibly to future generations and living creatures out of occupations once and for all. **ENDLESS GREED FROM ECONOMY and HELPING AUTHORITIES HAS TO STOP ALL KINDS OF DESTRUCTION TO THE ENVIRONMENT and LIVING CREATURES BY APPLY STRONGEST JUSTICE TO THE RESPONSIBLES. DEMAND ALL INITIATORS ACTING IRRESPONSIBLY TO PAY REDEMPTION TO FUTURE GENERATIONS.** "It is horrifying that we have to fight our own governments to save the environment." Sincerely, Waltraud Usahanun Treustr. 63 / 6 / 12 0 Vienna, None 1200 4316503612290

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Wanda Ballentine 1181 Edgcumbe Rd 314 St Paul, MN 55105

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Minnesota has never permitted a project that would destroy this many acres of wetlands. Wetlands are of enormous value and so many have been destroyed throughout the US. They are PARTICULARLY necessary as we are getting both more floods and drought. Wetlands can hold water during floods and maintain water during droughts. Further, they filter the water and increase it's purity. And then, the idea that following the close of the mine would require hundreds of years of treating polluted water.. Always there is the statement that jobs are the necessity for any proposed business. How long will the jobs last - a lot at first, but much fewer later - relative to the years of treating the polluted water. Will PolyMet PAY for treatment. Or - as so often happens - will they go bankrupt and leave it up to the taxpayers . The decisions about PolyMet will have ramifications right up to the edge of the Boundary Waters Wilderness. There is sulfide mine exploration and development happening along the South Kawishiwi River and on the shore of Birch Lake right now. If Minnesota allows this industry with an unbroken record of water pollution into this area, the pure water that is the lifeblood of the Boundary Waters would be severely threatened. According to what I read, PolyMet's studies contain inaccurate water data that must be corrected - this lack is true of I don't know how many extraction proposals made in this country. They always come through saying there are minor risks - but major risks are found after the fact when it's too late. I keep thinking of Fukushima, Duke Energy, Freedom Works in West Virginia, etc Likewise, the mine plan lacks analysis of human health impacts from mercury and asbestos-like fibers - then I think of Deepwater Horizon and the health disasters caused the people there - though they were told everything was safe, or the fish from waters near Fukushima - but also to California, of the tremendous problems caused by "fracking"with water and air pollution. Governments and corporations will always swear things are just fine, but observing all the health and environmental disasters that occur regularly, there is no reason to believe them. Sincerely, Ms Wanda Ballentine 1181 Edgumbe Rd St Paul, MN 55105 (651) 200-3093

Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Wanda Ballentine 1181 Edgcumbe Rd 314 St Paul, MN 55105

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Warren Fries 2941 Corte Diana Carlsbad, CA 92009-5913 (949) 487-0830

The monitoring of the mine site will required hundreds years of support. The mining co and the government will more than likely not fulfill its obligations for cleanup and mitigation This is the pattern for most mining and industrial pollution sites historically. The trace off is too great ... 200 jobs and 20 years of extraction vs centuries of pollution and destruction. I do not trust the corporation to fulfill its obligation once it has extracted all the metal wealth ... short term \$ long term problems.

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Dear Mrs Fay, I am greatly concerned with the future prospect of what the Polymet Mine means to our great states water resources and the overall health of our states environment. I understand that there is a great need for high paying jobs in the northern iron range area, but I feel that the potential costs that the Polymet proposal holds are so huge that the possibility of several hundred high paying jobs for twenty years pales in comparison to the enormous negatives that this project represents. At a time when the world is running out of drinkable water, we are looking at the possibility of one our our states watersheds being poisoned for potentially hundreds of years is absolutely insane. I feel that the potential costs of this project are so large that the process of reviewing the proposal should be stopped immediately. But I also understand that the corporations, both domestic and foreign, hold so much sway that our regularatory agencies cannot simply stop and protect the public without a lengthy review. That being the case I would like at a minnimum that the DNR do the following: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." I do not want the resources of our state to ber squandered for this and future generations so that a twenty year windfall can be realized by a few interests.

58107

The proposed project by PolyMet Mining is a rash and irrational proposal. The questions raised by the speakers regarding the inaccuracies of the watershed in the area around the proposed site need to be addressed and possibly investigated as to why the watershed was not shown correctly. The insanity of this proposal and the cost environmentally of proceeding with this project far exceed the benefits that will be realized for an estimated 20 year period.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, wayne sheridan custer sf, CA 94124 US

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I believe you shouldn't build a mind because it's gonna pollute the air and also flood the lake with mud and bad chemicals. It's gonna hurt people and ruin the nature. It affects lakes, rivers. Over just getting copper. You can get copper somewhere else.

Wehr Jeff

21355

I have owned land and fished the ely area for the last 20 years. Big birch lake was one lake that was mined over the years and since then the fishing has been bad. These people did not bring the jobs that they claimed to bring to the state. I no longer fish that lake because of the mining. What makes you think this company will bring any jobs to the area. Problem with big mining is the ones setting back collecting all the cash do not care about and they don't come out and look what they have done to the state environment they just sit back and laugh and lie to people. We as the people of this great state of Minnesota should have learned long ago about these people instead of letting big money win all the time. The walleye is the most reason why people come vacation to the state. Are these waste ponds going to be controlled for runoff. The problem with that is by the time we find out about runoff it is to late and giving them a fine ha they have so much money they don't care. I am going to go to one of these public meeting to see if I can put one of these people on the hot seat and see what the answer are. These mining people do not care about the state and we need to send them on there way and they can mine in there own backyaRd Thank You. Jeff Wehr

Wendy Griffin 18146

My name is Wendy Griffin. G-R-I-F-F-I-N. I live in Lake Elmo, Minnesota, which is on the east side of St. Paul. I am a natural resource specialist. And for the better part of my career I have been doing water quality testing on the east side of the metro area. And I'm sure we're all aware of some of the water issues that are going on down here in the metro. People that live east of me have been dealing with bad water, groundwater, for a number of years as the plume is moving closer to the Saint Croix. I'm asking that the state step up their control and oversight on the PolyMet site. If the state can step up and do their job, it should be a good go for both of us. The state was built on the backs of agriculture, tourism, and mining. I would like to think that we in this state, who voted for an increase in taxes to keep our water clean and clear and useable for our future, would be able to get through this issue that we all can get along peacefully and still make an income and keep our clean water. I'm speaking behalf of a friend of mine who is from Stillwater, Minnesota, who is now living in Spain. They had a television program that said, "If you had 24 hours to live, what would you do?" She said, "I would get on a plane and go to the Boundary Waters for the last eight hours of my life." It's a great place to go. It's peaceful. It's wonderful. It's a gem. One of the gems of the world. And I would like to see it stay that way. But I would also like to see the fact that we would be able to keep people employed not only in the mining area but also out in the outstate of Minnesota, who people in agriculture are also losing jobs as their young people are moving to the metro. Thank you. And thank you all for coming.

Wendy Haldorson 6196

I truly would like to see the permits issued and to have this project move forward I grew up in Silver Bay MN and my father was a miner all of his life. Having come from a family with six children and raised on the wages of one mining job, all six of us kids work and pay taxes in the state of MN. We are all married, have children and all of our children also work and pay taxes in the state of MN. I own my own company in Duluth MN, operated it for 21 years as of today. I have has several employees through the years. My oldest brother founded/owns a company in MPLS for the past 30 plus years, employing over 100 employees, mostly high paying engineers, all paying state taxes, etc Again, all from the one mining job my father was blessed with for nearly 43 years. If it was not for that one mining job, we would have potentially been raised in another state where mining is more accepted and I can guarantee we wouldn't be living in this state as we probably would have stayed in the state we were raised. It is extremely important to let PolyMet prove the can mine safely in this state with the technology we have today. Not only does our state need jobs and revenue, our country needs this. Thank you, Kirk D. Haldorson Sent from my iPad

Wendy Hansen 44397

I am writing to state that I am against the proposed PolyMet Copper Mine in Northern Minnesota. I don't feel that putting jobs ahead of public safety can be justified. I have made my living in Grand Marais, Minnesota and our economy is founded on clean water. Please don't let a company from India put our safe, clean water at risk. Thank you. Mark Hansen, boatbuilder 1217 Old Shore Road Grand Marais, MN 55604

Wendy Jerome 4190

Dec 22, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The public may be easily misled into welcoming sulfide mining into the state, since we have a long history with iron ore mining and taconite. However, sulfide ore mining will change the face of northern Minnesota forever. Our watersheds are huge porous underground resources that sustain a world-celebrated wilderness. 100% of sulfide mines leak toxic carcinogens and sulfuric acid. The ancient Greek and Roman mines around the Mediterranean are still leaking today. We can count on the death of aquatic life and the terrestrial life - including human beings - dependent on it, if sulfide mining is allowed in Minnesota. Some think that sulfide mining would bring jobs to MN. On the contrary, it would bring a few hundred part time and full time jobs, that would be intermittent, given world ore prices. The mining would last 20 years. Minnesota would loose a slowly, but steadily growing recreation economy - and wilderness that is a world treasure for the world. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Rev. Wendy Jerome 37 Upton Ave S Minneapolis, MN 55405-1943

58111

Thank you for the care and detail in the studies done to date. I believe permitting sulfide ore mining in MN is a risky undertaking that is nearly certain to destroy a growing recreation economy, water quality, wildlife, plant life and aquatic life and a natural heritage we preserve for the world. 100% of mines leak. Exchange of mine lands for private lands still robs wild life and future human visitors. They lose ultimately, irretrievably with land exchange.

Wendy Moylan 40188

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. I am very sympathetic to the need for jobs in northern Minnesota, however I strongly urge to you stand strong in supporting ONLY projects that will move forward the goals to reduce greenhouse gas emissions. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Thank you for your consideration of my position. Sincerely, Ms Wendy Moylan 800 Lakeview Ave Saint Paul, MN 55117-4022 (651) 731-5370

Please accept my comments regarding The PolyMet NorthMet Supplemental Draft Environmental Impact Statement (“PolyMet” / “SDEIS”). As an organic inspector I constantly observe and work with the push and pull of utilizing natural resources rationally, reasonably and as sustainably as possible while simultaneously maintaining productive and successful businesses. The organic agriculture industry provides examples which show that with good intention it is possible to find reasonable middle ground. It is clear that natural resource extraction such as mining and logging are necessary and it is quite clear that there are better and worse ways of doing them. Equally, if not more important, is that there are better and worse places to do these activities. We do not log the ancient Sequoia trees or other timber in our national parks. Likewise, mining sulfide containing ore in a wet, pristine environment like northern Minnesota is akin to grazing dairy cattle in the deserts of Arizona - some things just don't make sense. Obviously technologies and circumstances do change over time making things possible and reasonable where they were not previously - for example where 200 bushel corn was unheard of decades ago, it is common now. But there are too many concerns and not enough changes in technology or circumstances to experiment with mining in a place as spectacular and unique as northern MN. First I would like to say there are parts of the proposal that I do very much appreciate - including the re-use of the existing mine buildings, and the use of Reverse Osmosis, however there are simply too many open questions and issues to allow mining to proceed as proposed. Among my concerns are: 1- PolyMet would pose an ongoing pollution threat to the St Louis River and Lake Superior, long after the mining stops. The company’s own models show that hundreds of years after the mine closes, water at the site will be polluted with heavy metals and sulfates from the mine. Unless all of this water can be captured and treated, the mine will pollute groundwater and surrounding streams and rivers. Unfortunately, even the company admits that millions of gallons of polluted water will escape untreated every year. And it is my understanding that fractures in bedrock have not been adequately addressed. The SDEIS has no contingency plans for mechanical breakdowns in the complicated filtration system that PolyMet proposes to treat the polluted water, even though that system would have to operate for centuries. PolyMet's water treatment system isn't prepared for the super-storms that are growing more frequent due to climate change. Planners used old climate models to assess impacts of heavy rain on the operations and pollutants. As the 2012 flood in Duluth showed us, we need to be prepared for much more severe storms to happen more often. Worse, PolyMet’s model doesn’t even prove that the pollution stops after 500 years. Instead, the company simply stopped modeling at 500 years. In other words, the pollution could go on for even longer. 2- In the PolyMet mine plan fails to discuss financial assurance adequately - there are no details of the amount and type of damage deposit adequate to cover the cost of treating polluted water for hundreds of years. Minnesota has never permitted a mine that would require hundreds of years of expensive water treatment. This public comment period is the best chance for the public to weigh in on whether the financial assurance required of PolyMet would be adequate, but there is only a brief mention of it in the mine plan. 3- The tax estimates in the PolyMet mine plan lack detail and are full of discrepancies. From one draft of the mine plan to the next the estimated taxes jumped 500% without explanation. This is important, since the state taxes that would apply to a copper-nickel sulfide mine have never been used before. The copper-nickel mining industry is exempt from several state and local taxes, s

Wendy Robertson. R-O-B-E-R-T-S-O-N. I am trying to sound as clear as I can with a bit of laryngitis, but I am a retired Duluth educator for the Duluth schools and also was a coach for the St. Louis River Watch Program, where I supervised students that work with monitoring the St. Louis River, with help in various scientific projects hands on. I currently live in northern Fairbanks Township, which is south of the PolyMet mine site, St. Louis River. I am also concerned and alarmed of the SDEIS plan to mitigate the 930 million (phonetic) acres that wasn't previously mentioned. The wetlands that will be eliminated by PolyMet's infrastructure, mine, waste piles (phonetic), et cetera, it is crucial that we take a look at it. The Federal US Army Corp of Engineers' mitigation role requires that (inaudible) before mitigation, which replaces the loss of wetlands, function within the same Hydrological Unit Code, HUC. The word to focus on here is "function." And the digit code refers to the St. Louis River Watershed and the Lake Superior basin. With this plan, functions of the wetlands will be lost by having the mitigation outside of our area. Having the compensatory sites in Simm (phonetic), Aitkin and Hinckley will not replace the loss of wetlands' functions to nature and the public. We are losing the services of these wetlands, which took nature thousands of years to develop, by accepting this plan's proposal to have 60 to 70 percent of the wetlands replacement in credits (phonetic) and other areas. The lands surrounding these wetlands are also indirectly altered and these will not be even considered in the total. The loss of wetlands' function will be a part of rampant and ongoing human and wetland destruction that is happening worldwide. I urge the Army Corps of Engineers to reject this SDEIS and require that Section (inaudible) insist on proper mitigation for the disturbance and destruction of these wetlands within the St. Louis River Watershed. If the people regard public input as vital to their decision making, I also request that the lead agencies extend the time for public comments by three more months; 108 days. And 2,000 plus pages is a lot to digest and make educated comments. Lastly, I protest having these three public hearings in January, which is the coldest winter month. The cold and icy weather may impair comments by the elderly, sick and the disabled. You are disenfranchising these groups. A public hearing does not expect to be disenfranchising the public.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Polymet SDEIS Commentary This brief commentary addresses several omissions, failures, shortcomings, and oversights within the Polymet SDEIS. First, this document fails to place the prospective mine within a larger historical, economic, and environmental perspective-the big picture (tbp)-necessary for comprehensive understanding and evaluation of its proposals; without such contextual broadening the document is reduced to a mere roster of data. Indeed, the SDEIS itself eschews any such contextual analysis (p. 6-1, "It is not possible, however "). Second, and as a result of the first, it fails in a host of particulars. TBP: AWOL from the SDEIS The primary failing of the SDEIS is that, seen from a broader perspective, it is internally inconsistent, reflecting a larger social schizophrenia wherein we demand both economic growth and a functional environment. Because the planet is already over-populated and over-engineered, environmental impact must inescapably accelerate as function of economic growth. The proposed mine is but an increment in both these latter processes. All economic activity necessarily involves material and energy transactions with our environment. These are three: 1) sourcing materials and energy (depletion), 2) spacing (eviction of nature), and 3) sinking (pollution). These requirements follow from the first two laws of thermodynamics, to which all technology is subordinate. That is, to manufacture any material object one has to source the constituent matter and transformative energy from the environment (the conservation law), make room for it within the environment (the conservation law), and release a compensatory waste stream into the environment (the entropy law). Each of these imposes environmental impact. Historically environmental impact has been of sufficiently small scale-reflecting a smaller human population and its required supporting economy-so that the impacts of the above transaction streams have been of little concern and have imposed few to no costs on the human population. With the meteoric growth of industrial society and the resulting impact, it has become increasingly evident that a degraded environment has serious implications for human well-being. At some scale the costs of growth outweighs the benefits and additional economic expansion becomes irrational: we end up poorer rather than richer, worse off rather than better off. This is happening because many costs are not being internalized, primarily, though not exclusively, environmental. The function of the SDEIS is to give the conditions under which mining is permissible, namely, that external costs will be adequately internalized. Approval of the SDEIS is neither a denial nor a mandate to mine. It is up to Polymet to make that decision-to balance expected costs and revenues under the stated conditions of the permit document. Only upon the condition of cost internalization does the interest of the company reflect the interest of society. If all costs could be internalized, the profit motive would be an effective "hidden hand" assuring that society's interests are being met, but costs-especially environmental costs-are complex and difficult to quantify, even difficult to understand and predict. Also, there is a historical complication to consider. Except for a passing remark in reference to iron mining (6-92, first full sentence), the SDEIS fails to explain the historical and geologic dilemma which all non-renewable resource (herein, nrr) extraction faces. Most people have heard of "peak oil" but do not understand the reasoning behind it, nor realize that this same reasoning applies, not just to petroleum, but to all other nrrs. Humans have been extracting and employing nrrs for thousands of years. As these are geolog

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
March 8, 2014 I live in NE Minnesota just SE of the Polymet mine and processing site. I harvest wild rice, venison, waterfowl and have an organic garden to sustain my family for the year. I live 1 mile from mineral exploration drill sites on land in the Superior National Forest For 33 years, I taught science in the Duluth Public Schools and supervised the St Louis River Watch Environmental program that provides monitoring and water quality bi-yearly as an after school program in co-ordination with Fond du Lac College. The focus is water chemistry and macro-invertebrates studies related to the health of the river and streams that are part of the St Louis Watershed. I was honored by Friends of the St Louis River as their 2006 educator of the year. The SDEIS has several issues in watershed mitigation that are not addressed. I related these concerns during the public hearing in Duluth at the DECC. I was fortunate to be selected as one of the 80 plus speakers to give testimony. Given that many others did not have the opportunity to speak only reflects the insufficient amount of time for public comment at hearings and the refusal to extend the comment period on this SDEIS. I am asking that the agencies involved to extend the comment period for an additional 90 days. The SDEIS does not address the cumulative effects of the additional mining companies that are waiting in the wings for future permits. They are watching to learn what happens as the Polymet process breaks ground in asking to be permitted. By ignoring this glaring omission, I can only conclude that you are not reading the investment brochures of mining companies that are seeking worldwide investors currently. Please read excerpt from next page. Excerpt from: press release 3/3/14 Duluth Metals Limited [mailto:HYPERLINK "mailto:info@duluthmetals-com"info@duluthmetals-com] Duluth Metals Continues to Identify Additional PGM Mineralization in the East Shore Area of their Exploration Lands Duluth Metals Limited is committed to acquiring, exploring and developing copper, nickel and platinum group metal (PGM) deposits. Duluth Metals has a joint venture with Antofagasta plc on the Twin Metals Project, located within the rapidly emerging Duluth Complex mining camp in north-eastern Minnesota. The Duluth Complex hosts one of the world's largest undeveloped repositories of copper, nickel and PGMs, including the world's third largest accumulation of nickel sulphides, and one of the world's largest accumulations of polymetallic copper and platinum group metals. Aside from the joint venture, Duluth Metals retains a 100% position on approximately 40,000 acres of mineral interests on exploration properties adjacent to and nearby the Twin Metals Minnesota LLC joint venture. I am asking you as a taxpaying resident in obviously the "emerging mining camp area of NE MN" for the state to not permit Polymet project. The SDEIS is inadequate in addressing the cumulative effects of additional mining proposals in the Lake Superior Basin. To deny that other national and international mining companies are just waiting to be the next in line for this extraction of finite resources is a crime of untruthfulness. All permitting agencies need to subscribe to the publications of the "Economist" magazine and Mining News if you doubt my comments. Respectfully submitted, Wendy Robertson 1998 Fairbanks Rd Brimson, MN 55602 218-848-2940

Dear DNR friends, I am writing to express my strong opposition to the PolyMet mine for the following reasons. 1- ENVIRONMENT Natural beauty and a healthy natural environment are not only important to the health and well-being of Minnesotans, they are also a crucial component of state, local and regional economies. A. Duluth recently reported \$7-6 million in total tourism revenue in 2013- Certainly the primary draw for these tourists is natural beauty. Duluth is merely one of Minnesota's many tourist destinations. B. In the coldest winter in 139 years, over \$10M has been spent by visitors of the Apostle Island ice caves, because of the powerful human desire to get outside and the human thirst for clean and beautiful places. These are but two small examples. Minnesota boasts countless beautiful natural spaces; it is what draws people to Minnesota and what holds them here. Therefore, preservation of clean water and wilderness will provide a more sustainable economic stimulus to state, local, and regional economies than mining. 2- SHORTSIGHTED ECONOMIC BENEFIT History has proven that mining is a boom and bust industry. With so many uncertainties surrounding this project, why would we take this risk with the potential burden falling on such irreplaceable forces as clean water, robust ecosystems, and human health. A. There is a tremendous market for copper scrap metal. A copper scrap metal recycling project would be a sustainable alternative to the boom and bust cycle of mining. Copper scrap metal fulfills 1/2 the US demand for copper. The US provides 23% of the world's supply of recovered copper. B. PolyMet "promises" jobs for iron range communities. How many of these jobs are a guarantee. What percentage of these jobs will actually be allotted to local workers. What percentage of the vast profits of mining will actually fall into the hands of Minnesotans versus a few wealthy individuals who arrive along with the mine and leave when it closes its doors. Minnesota does not deserve to bear the burden of so much risk when likely so little lasting benefit, economic or otherwise, would exist 3- BURDEN ON INDIVIDUAL MINNESOTANS The current PolyMet review fails to address in particular what potential burdens the individual Minnesotan might bear as a result of the mining project. A. TAXPAYER BURDEN - Once again, there are many unanswered questions here. Hundreds of millions of dollars have been spent in efforts to clean up industrial pollution of the St Louis River and cleanup is still not complete. Meanwhile, as a part of the Great Lakes Restoration Initiative, momentum has been recently building for significant federal funding (TAXPAYER DOLLARS) to be directed towards Great Lakes cleanup projects. Despite these ongoing projects, we are mulling over the possibility of a mining project that we acknowledge will pollute regional waterways for a minimum of 500 years.. B. HUMAN HEALTH RISKS - Mercury contamination is already a problem in area lakes, posing a major problem to humans and animals who consume fish from these waters - we already know that this is especially dangerous to pregnant and nursing mothers, infants, and young children. Sulfide mining is known to increase mercury levels in water. C. HEALTH RISKS TO POLYMET MINE WORKERS - The WHO lists 10 chemicals of major public health concern. Sulfide mining involves 5 of them: mercury, arsenic, lead, asbestos, and air pollution. All Minnesotans could potentially suffer the ill effects of these chemicals, but this is especially of concern to potential future employees of the mine. The current review is insufficient and leaves many unanswered questions, most specifically in regard to human health, environmental impact, duration and nature of cleanup and how the cleanup will be funded. Without knowing precisely what the risks are to the health of Minnesotans, the health of Minnesota's beautiful forests, wetlands, and waterways, and the burden on taxpayers, it would

On behalf of the Babbitt City Council, we strongly support the PolyMet copper-nickel project. We have utmost confidence that the State and Federal Agencies involved are extremely competent and thorough in their studies. We are also confident that the mining company and its entities will be in compliance in every aspect to promote this very important and necessary economical job source to Minnesota. The City of Babbitt also thanks PolyMet and the State of Minnesota for being open to the advanced technologies and compliances adhered to for fulfilling and challenging employment opportunities the mine will provide. Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Department of Natural Resources, Please do not issue mining permits to Polymet. I am concerned and quite fearful of the multiple negative impacts that the operation will have on our state. About a year ago I drove to North Carolina through West Virginia and was so saddened to see the economic and personal degradation that mining has left in an otherwise beautiful portion of our country. Several weeks ago, I narrowly missed being personally poisoned when I chose to drive to North Carolina circumventing West Virginia because of weather and road conditions. Listening to media reports of the impacts to the region during the week I was in North Carolina and now seeing that the leaks are far greater than initially reported is horrifying. My first concerns are about water supply both current and centuries long, and I shudder to think that Minnesota would invite an industry into essentially pristine environment on the short-term profit of so few when we know the consequences are so drastic in the multiple times this has happened to our neighbors in West Virginia. Please have the courage and confidence that you are backed by many, to say no. Thank you very much, Wendy Smith

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Once the resources are affected cumulatively, short-term, and long-term, it takes a long time for recovery. Permanent damage stays with us for a long time, especially in the ground water and seeps into the food chain. It's not just the purity that's lost but the quality of all life as well. Try to think about this in terms of the land as having its own right to exist because it is the land who takes care of us. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Wenonah Skye 2537 Mutchler Rd Fitchburg, WI 53711-7011 (920) 857-8401

I am writing to register my total opposition to PolyMet's proposed copper-nickel mine near Hoyt Lakes. My wife is originally from West Virginia where they have so many dead rivers and creeks due to acid mine drainage. These rivers and streams ran clear, beautiful, and brimming with life for thousands of years until companies came along and extracted a couple decades of short-term profits from the land. The jobs and companies are long gone, but the rivers still flow dead- and in some cases yellow and orange. We CANNOT risk this happening in northern Minnesota. The short-term gains (the vast majority of which will go to out-of-state shareholders) are absolutely not worth the risk to our state's clean and living waters. Thank you, James Wesley Bailey 2505 Elida Dr Grand Rapids, MN 55744

March 13, 2014 Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit Dear Ms Fay ~ My comments on the PolyMet mining proposal tell a different story than the two being told. My story does not now question the accuracy of information provided by the SDEIS and environmental groups, though it might in the future. It is not meant to sway you and the DNR one way or the other. Rather it is meant to ask you consider a third story. One of the existing stories is about environmental damage and a tourist-based economy. The other story is about economic vitality brought by hard rock mining. 31% of Minnesotans in a recent poll published by the Star Tribune (Feb. 21, 2014) say we are not sure of either story. So I am asking you to consider a third story. This story is about patience Minnesota used to get it right without doubt. It is a story about sulfide mining in Minnesota that is being done without any concern of acid mine drainage, because hard rock mining techniques and technologies have been refined and proven many times over elsewhere. It is a story about northern Minnesota communities having attracted job creation industries and businesses with the help of environmental groups that finally understood they must be a part of the solution to job growth. It is the story about how an antiquated 1872 Mining Act was finally abolished and how Minnesota reaped far greater profits from its minerals. It is the story about how the Minnesota DNR took a stand against impatience, and how it was able to say to Minnesotans that in the realm of the copper and other precious metals under our northern lands, a few or twenty more years will make no difference, but getting it wrong now will. And, it is the story about how environmental groups finally did something about the greatest threat to our natural treasures on our northern lands and waters, and helped find jobs that could compete with hard rock mining jobs. Sincerely, Wever D. Weed 2582 County Road 24 Long Lake, MN 55356 763-218-1849

White, Paul

15792

I am a proud graduate of the Ely Voyageur Outward Bound school. I have canoed, hunted and hiked in the area for decades. My sisters live in Embarrass and Edina. It is time to have jobs in the USA again instead of exporting our jobs and importing metals from foreign countries that pollute our planet. We cannot be a debtor nation for ever. We need jobs for all Minnesotans that want to work, not public aid because the government gets in the way of progress and employment. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its operations are legal and safe. The project should proceed. Thank you, Paul White 1104 Sanctuary Lane Naperville, IL 60540

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. To Lisa Fay, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differ

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action To Lisa Fay, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit B

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. To Lisa Fay, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. To Lisa Fay, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (*Lynx canadensis*). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. The cumulative effects analysis section of the NorthMet SDEIS fails to adequately account for a number of reasonably foreseeable projects. Specifically, the Twin Metals and Teck American projects are listed as "speculative" in Section 6-2-2-1-21 and are not analyzed for their cumulative effects. No evidence or rationale for excluding these projects from the cumulative effects analysis is offered. In Section 6-2-3-6-4, the Gray Wolf is the only "Special Status Species" for which even limited analysis of cumulative effects is conducted, despite the Canada Lynx's status as a federally threatened species. Please take the following actions: 1) Include the Twin Metals and Teck American projects as reasonably foreseeable projects in the cumulative effects analysis in section 6-2-2, since the disposition of the NorthMet SDEIS and subsequent permitting decisions could make these projects more likely to be built. 2) Include the Canada Lynx as a "Special Status Species" in Section 6-2-3-6-4 and conduct a cumulative effects analysis of the impact on Canada Lynx. 3) Analyze and include mitigations such as tunnels and fencing to limit the possibility of incidental take of Canada Lynx by increased road traffic associated with the NorthMet proposed action. 4) Remove contradictory language in SDEIS about Canada Lynx utilization of roads as travel corridors. For example, on p. 5-628 the SDEIS states "Lynx utilize snow packed trails and roads as travel corridors," while on p. 5-366 it says "this species does not rely on roads for travel." 5) Analyze and include mitigation such as accelerated re-vegetation of the mine site after closure to decrease the amount of time the mine site would be inhospitable to Canada Lynx. To Lisa Fay, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (*Lynx canadensis*). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage To Lisa Fay, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. To Lisa Fay, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. The SDEIS acknowledges that amphibole fibers are present in the rock to be mined, that crushing the rock for processing releases these fibers, and that these fibers are suspected of causing mesothelioma in workers. The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the PolyMet mine and plant site. A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process. Specifically, the DNR should: 1) Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length 2) Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure 3) Revise the SDEIS to eliminate inaccurate characterizations of the University of Minnesota mesothelioma study. Specifically, eliminate statements that imply that commercial asbestos is the primary risk factor for mesothelioma risk To Lisa Fay, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity To Lisa Fay, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." To Lisa Fay, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment To Lisa Fay, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this test PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142). The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction. Lastly, the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters. To Lisa Fay, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this test PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untre

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. While receiving and looking at other research and the current Polymet Environmental Review, the danger of pollution brought on by sulfide mining is something that needs to be closely examined in the review. In the review it is stated that potential exists for the release of amphibole mineral fibers from the proposed operations, which could pose a potential public health risk of uncertain magnitude” this is extremely alarming to me. The fact that, that statement can be made in a project’s Environmental Review should let alone be the deciding factor in not approving sulfide mining in Minnesota. The health risks from mineral pollution isn’t accurately reported in the review, but should be required from Polymet, for the health of my state depends on it. Whitney Morgan 1220 – 102nd Ave West Duluth, MN 55808

57249

While reviewing and looking at other research of the current Polymet Environmental Review, I believe the detrimental effects from mercury that would be emitted is not accurately reported. In a letter approved by many Duluth area physicians it is stated that the review doesn’t report the amount of mercury that will discharge into our local watersheds. Due to this lack of information, the review is not complete for mercury pollution is extremely dangerous to our communities health and eco systems. Being a lifelong citizen of Duluth, I am so grateful for Lake Superior and its water supply. It is unjust that the quality of our watersheds would be threatened due to sulfide mining. Whitney Morgan 1220 – 102nd Ave West Duluth, Mn 55808

57250

While reviewing and looking at other research on the current Polymet Environmental Review, I believe the health effects of sulfide mining is not accurately reported. Many Duluth area physicians have come out to state that the review doesn’t properly deserve all of the health impacts that would come with sulfide Mining. As a lifelong citizen of Duluth and current UMD student, sulfide mining would threaten my entire communities health by exposing lead, arsenic, lead, asbestos and mercury pollution into our air and water. These threats need to be included in the projects environmental review, along with the major health impact they will have on my family, friends, and community. Whitney Morgan 1220 102nd Ave West Duluth, MN 55808

Will Mayer 39869

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Will Mayer 1883 N Ruby Ct Eagan, MN 55122-2173

To: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Rd St Paul, Mn 55155-4025 To submit comments by email, send to: [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us)NorthMetSDEIS.dnr@state.mn.us Attached please find my written statement stating opinions and recommendations on the NorthMet SDEIS. Sulfide Mining Testimony Comments to the Supplemental DEIS February 12., 2014 Presented by: Will Munger 401 Snively Road Duluth, Minnesota My name is Will Munger and I live in Duluth, Minnesota. I own and operate the Willard Munger Inn in West Duluth. This business has been in our family for over 50 years and depends upon people coming to Duluth to experience our natural areas. These activities include but are not limited to fishing on the St Louis River, hiking the Superior hiking Trail, Bicycling the Willard Munger State Trail, skiing and other out door recreational activities at Spirit Mountain and birding on the Western Waterfront Trail. Being in the hospitality business I fully understand the need for the encouragement of job creating development in our area. At the same time I fully understand what makes this area attractive for people to live here, visit here, and grow business here. Those qualities are, the abundance of clear clean water, beautiful albeit diminishing unspoiled forest areas and a natural habitat which produces bountiful and varied wildlife. In our country's short history there are fewer and fewer places within the continental United States where you can still experience vast wilderness areas that are available to large population centers. One such area is the water rich area of Northern Minnesota. This fact must be considered when we consider permitting any activity that will effect this. One way I have chosen to work for the preservation and protection of our beautiful North Country is by serving as an active member of the following organizations: Save Lake Superior Association, St Louis River Alliance, Issac Walton League, Clean Water Action and the Superior Hiking Trail Association. While I do not speak now for these organizations I can say that the vast majority of the membership of these organizations share my concerns about the effects of Sulfide mining on this area. While all contamination of our water and air is and should be a concern, a specific concern that I would like to voice is in regard to the Lower St Louis River which very much impacts everyone who lives in Duluth. Currently we have fish advisories on this portion of the river which recommend consumption limits for eating Walleye and other game fish caught in the river because they already have high levels of Mercury. I am concerned that with the introduction of Sulfide mining this problem will only be exacerbated. With this in mind, I would like to see the EIS specifically address issues that can assure us that conditions, with specific regard to water quality, can continue to improve or at least be maintained on the river if permitting of sulfide mining is approved. It is my understanding that the Minnesota DNR was originally put in place to manage and protect our states natural resources. It is unfortunate that the DNR, is often now perceived, rightly or wrongly, as an agent or advocate of pro-mining interests. The DNR is perceived to willingly weaken it's own regulatory powers. With this in mind I would like to call for the contracting of an objective third party consulting firm to evaluate all aspects of the permitting process to insure that a fully objective evaluation process for approval or disapproval is done. As part of this I would like to request that a cost benefit analysis be done of the proposed North-met Project to determine if the benefits of sulfide mining outweigh the seeming high risk experienced with this kind of mining and the known impacts that such mining is known to hAve While I have many concerns about the EIS as presented, I have not been to the propos

Water, not minerals, is the real resource of Northern Minnesota. I am concerned that over time pollutants will leach into the water and work their way into Lake Superior and other water systems in the area. I read in the reclamation section that PolyMet will engage in "Capturing and treating affected water using mechanical and/or non-mechanical methods for as long as needed". And that "Financial assurance (provided by PolyMet) would ensure that environmental management, including planned water treatment needs, would occur for as long as needed to meet environmental standards". I have several concerns with the "as long as needed" part of these statements: How, exactly, for the long run of years necessary to fully reclaim this site, will PolyMet remain financially available to pay the continued costs of reclamation. Will there be the political will to continue the monitoring of this site into the future. Will there be an economic downturn that leads to siphoning the funds for other needs or a drying up of the funds. As much as I respect engineers and what they do (my daughter is a civil engineering student at the U of MN) we all know that the best laid plans sometimes can go awry. Things fall apart or don't hold up. What can we learn from the 35W bridge collapse. What can we learn from the collapse of the dam above Jay Cook State Park. Was it natural wear and tear, lack of political will to engage in up keep, inherent engineering miscalculations or shortcuts, design flaws, economic downturns that bled out repair and upkeep funding, or a perfect storm of multiple impacts. Will there be a climate change that leads to unforeseen impacts. The plan looks good on paper. But we are talking about long-term impact on a precious resource in exchange for short-term gain. I think there are too many areas in which something could potentially go wrong for this project to occur in this vulnerable area of our state. Sincerely, Will Perry 13415 Europa Ct. N. Unit 8 Hugo, MN 55038 651-246-0084

Will Tajibnapis 7202

Dear Ms Fay, Dear Federal and State Agency Leaders: Amid the swirl of data, claims and counterclaims, one fact that no one disputes stands out: the pollution from mine tailings and waste heaps would last for at least 500 years. Setting aside money and resources, and making plans to control pollution for 500 years or more is simply impossible. So I propose that at this time permits be denied and the plan to mine copper be scrapped. I am confident that in the not-to-distant future technology will become available to mine the copper in a safer manner. Then the mining can commence. The copper isn't going to go anywhere. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Will Tajibnapis 3722 Grand Ave South Minneapolis, MN 55409

Willa Caldwell 42073

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Willa Caldwell Minneapolis, Minnesota

William (Bill) Gramer 43358

Dear DNR It appears that the SDEIS thoroughly vetted all the key environmental issues to insure Minnesota Environment is protected. Great work. I believe now the approval for initial permitting should be accelerated in further assist Minnesota environment through new form of tax revenue as the IronRange Job market experiences the positive economic multiplier effect of new safe jobs. Please contact me if you have any further questions. William (Bill) Gramer 7144 Jenner Bay S Cottage Grove, MN 55016-1373

From: wforsyth@hensonefron-com [wforsyth@hensonefron-com] Sent: Monday, March 10, 2014 5:23 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, William And Karla Forsyth 2212 Irving Ave So. Minneapolis, MN 55405-2523

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Dear Ms Fay, I request that the MDNR allow a longer time for public comments on the SDEIS and a correction of the document to address issues of water flow measurement and mapping as well as the lack of convincing financial assurance for several centuries of monitoring and treating effluents from the project. Since 1970, I've been following the proposals to mine copper, nickel and other precious metals from deposits along the edge of the Duluth Complex in northern Minnesota. The mining companies always say they have "new technology" that will prevent pollution from escaping from the mine site, but I don't believe it's true. I've visited Sudbury, Ontario; Butte, Montana; and other former copper mining and smelting sites to see to see the effects of this process on the environment. I believe there has never been a sulfide ore mine that didn't eventually cause catastrophic pollution to its surroundings, and I don't believe the PolyMet mine will be any different. PolyMet says it will provide adequate insurance to treat effluent from the mine for hundreds of years. I don't believe it's true. Historically, once the ore has been plundered and the profits extracted, mining companies declare bankruptcy and simply walk away, leaving the public to clean up the mess. I think that's going to be the case if PolyMet is allowed to proceed. Glencore, the parent company of PolyMet has an extremely poor history of environmental, human rights, and labor abuses. This is an even greater reason to view PolyMet's claims with suspicion. The company has neither the reputation, financial resources, or responsibility to monitor and ameliorate pollution from their operation for centuries. It's especially important to get this decision right because there are other proposals, as you know, waiting to be submitted once they know PolyMet's fate. If PolyMet is allowed to go ahead, it will be much harder to stop other mines that are closer to the BWCA. It is criminal to consider polluting the water in Lake Superior, and it is even worse to consider poisoning the water flowing through the BWCA. Sulfide releases from mining and processing this ore will destroy important wild rice resources and violate treaty agreements with Native American tribes. The state of Minnesota should enforce strict sulfide pollution standards in all wild rice waters. There are technical problems with the Draft EIS that make it imperative to do a new and more thorough job of assessing the environmental impacts of this project. The fact that water flows in the Partridge River were miscalculated mean the the water model used in the Draft EIS is flawed and needs to be redone. Furthermore, I think there's an error in assuming that no water will flow out of the mine site and processing area into the BWCA. Groundwater contours in the "One Hundred Mile Swamp" where waste rock will be stored, show drainage into Langley Creek, which is a tributary of the Kawishiwi River, which flows through the BWCA and along the Canadian border lakes. Pollution of this waterway is an international issue as well as an environmental disaster. Thank you, William P. Cunningham 1764 Lindig St Falcon Heights, MN 55113

William Daniels

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. I have a strong connection to the region, having worked as a dogsled musher and fishing guide in the area. The thought of ripping a hole in the ground and the other environmental risks that go along with it really make me cringe. Please make a wise decision. Sincerely, Mr William Daniels 1201 Elm St Northfield, MN 55057-2907

Feb 17, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

As a citizen and taxpayer of Minnesota, the available evidence leads me to strongly oppose the proposed PolyMet copper mine. I'm all for creating jobs on the Iron Range, but a simple arm's length look at the situation should lead anyone to the conclusion that the short term projected benefits (mainly geographically specific jobs of dubious long-term value) could not possibly justify the long term likely cost externalities (mainly perpetual environmental costs) associated with the proposal. Unsustainable (one-time) resource extraction industries are precisely the type of industry that MN should be trying to get away from, I would much rather have my tax dollars spent on investing in the people of Minnesota, rather than on consuming our natural resources - and would gladly do so. Furthermore, corporate or business promises of paying for the cleanup are irrelevant - as soon as the mine is no longer profitable it will be closed and the shell company will just be bankrupted leaving MN with the damaging legacy of this project. Even if this were not the case, most companies today that do not employ practiced bankruptcy as a SOP simply do not exist long enough to pay for this type of coSt William Fischer 1070 11th Ave SE Minneapolis, MN 55414

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

My name is William Hane. "Hane" just like the underwear. I'm a concerned citizen. I certainly know that we need jobs. It's nice to have a high-skilled job. I was a high-skilled worker. I'm now a low-paid worker. So I understand that scenario. There's never been a copper-nickle-cobalt mine that didn't pollute. We can't afford the pollution. That area is well polluted enough. Global warming is definitely affecting it and will continue to affect it well into the future. If the mining is so valuable, let's wait a while until we are really desperate and it will be even more valuable.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, William Herzberg 1541 Sheridan st 6971 Cramer Rd Ely, MN 55731

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: This is an urgent matter that will negatively impact Minnesota's water quality. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. The attachment is the same as below in case there are any problems. Comments and Questions on the PloyMet SDEIS Full Disclosure I had a fortunate childhood growing up in Buffalo NY because I spent eight summers at a camp just outside Algonquin Park north of Toronto. This camp provided the opportunity to take canoe trips all over the park and instilled in me a deep love and appreciation for the beauty of the natural world. When I moved to Minnesota, it was because the Boundary Waters are here, and we purchased land outside Ely before purchasing a house in the Twin Cities. Now the Boundary Waters are threatened, and I am extremely upset and angry about it. My opinion is not humble. I will begin with general comments on the SDEIS and then move to more specific comments. A Comment about the Oral Comments I am a strong advocate for lotteries, having argued at length that we should be selecting members of the legislature by lot. (Dustin, 1999) However, there was a provision that allowed a speaker selected by lot to cede his/her speaking opportunity to another person. This provided the opportunity for a group of people to enter the lottery with an agreed upon plan to cede their speaking opportunity to a particular individual. This gave that particular individual much greater odds of getting an opportunity to speak. Since there were groups that attended more than one of the public meetings on the SDEIS, it is quite likely that this strategy was employed, particularly at the last of the three meetings. A Comment about Jobs No corporation is in the business of creating jobs. Jobs are just a cost of doing business. However, every rent seeker uses an appeal to job creation and national security (which politicians suck up) to obtain special favors such as tax breaks or the use of a resource. A Comment about No Action There is a built in bias against the No Action Alternative because the idea of no action is unheard of in capitalist economies. If anything, they are hyperactive in using the earth as both a source of raw materials and a sink for the pollutants resulting from their use. It is estimated that we need between three and five earths to support our current levels of consumption. A more nuanced conception of no action is found in the Chinese concept of wu-wei in the Tao Te Ching. (Star, 2001) A Comment about a Permanent Fund The mineral resources in question here are being given away for the permanent benefit of an alien corporation and a temporary economic benefit for a relatively small, but extremely vocal, group of Minnesotans. What has not been addressed is that the proposed action violates the ethical principle of generational equity. Future generations will be deprived not only of the use of the minerals, but they will be handed the negative externalities resulting from the pollution of the environment and opportunity costs in terms of enjoying the beauty of northern Minnesota and seeking recreational and spiritual opportunities therein. Since this low grade mineral resource is not going to get up and walk away, I suggest that, at the very least, permitting be suspended to allow the citizens of Minnesota to consider a constitutional amendment that would establish a permanent fund to compensate future generations for these losses. The fund would work as follows: Any corporation making a profit on the exploitation of Minnesota's resources will be required to make annual royalty payments into the fund. Corporations exploiting non renewable resources would contribute a much higher amount such as one half of their gross revenues. Corporations exploiting renewable resources would contribute a lesser amount, perhaps one quarter of gross revenues. The fund will be managed and audited by entities that are completely isolated from political control. Once the fund has accumulated sufficient assets, it will begin the payment of dividends to all citizens of the state. This will compensa

Mining with sulfide in northern Minnesota would be a short-sighted action that would deteriorate the health of the ecology and quality of life in the area. Long after the resources are tapped, our children will still be dealing with the toxins left behind. William O. O'Neill 1702 North 24th Street Superior, WI 54880

William R Whiteside

18307

My name is William R. Whiteside. I am from Hibbing. I'm pleased be able stand here today in solid support of PolyMet and the crew of people who have been working so hard to make this a successful venture. They've spent \$50 million or more trying to satisfy the demands that this kind of a project requires to assure that we are able to do this in a safe and efficient manner. I'm really pleased that the people who at PolyMet are local people of the highest caliber of talent in mining. It's very comforting to know that we have such fine people working there. And I'm very happy to see as we're looking forward the huge amounts of money -- billions of dollars -- that are going to be available to young people not only of the Iron Range, not only of Duluth, Northeastern Minnesota, but all of Minnesota to assure better educational opportunities, more solid infrastructure, better bridges, highways, hospitals. All the things that are necessary to a healthy and a good environment for people to live in. I still have a minute left. Seems like a long time when you get up here. So I think this is a great opportunity for all of us. I think it's a great opportunity for the people of Northeastern Minnesota. I'm glad that the glaciers have left for a little while and made these resources available to us. And I hope we can go forward as a state and as communities into a future -- I'm very confident in the water quality issues that will have been addressed, all the work that has been done. Thank you very much.

Comment: PolyMet Supplemental Draft EIS From: William Brewster Robbins 2277 Stillwater Avenue East Maplewood, MN 55119-3621 Supplemental Draft EIS is full of general information, but very short on details, especially details relating to control of water pollution and airborne dust pollution. I suggest that the lack of details would not allow a decision maker to know and understand enough to make an informed decision on this project. Control of water pollution: Reverse osmosis (RO) is given lip service in the Supplemental Draft EIS as the "cure" for water pollution. RO could help improve the situation, but only if the RO system is properly engineered, properly operated, constantly monitored and rigorously maintained. Of course, RO only separates the water into a cleaner stream and a more concentrated waste stream. Choice of operating pressure in the RO sets the ratio of flow of cleaner water to flow of wastewater. Without knowing the design operating pressure, a decision maker would not know the following: How much wastewater will have to be stored or treated by secondary methods. The intended size and cost of the RO system, including pre-filtration equipment. The costs of long-term maintenance, monitoring and repair of the RO system. Without adequate maintenance, monitoring and repair, the cleaner water stream will soon cease to meet even the minimum water quality standards. There seems to have been a focus on controlling water effluent from tailings. This is important, to be sure, but the huge amount of water, both meteoric and ground source water from the open pit will likely dominate water flow which needs to be treated, so sizing of the RO system needs to accommodate large, erratic flows from storm runoff. I understand that agencies that write permits and regulations often are expected to resolve many questions relating to operational details, but I suggest that such details are often overlooked by such regulating agencies. Control of airborne dust pollution: All the following generate airborne dust: Removing overburden, mining, transportation, milling to reduce size preparatory to froth flotation, and tailings storage. I found little mention in the Supplemental Draft EIS of sources of dust, design of equipment and engineering processes to minimize dust generation and remediation procedures to contain and dispose of dust. Boom and bust nature of the mining business: By planning for a 40-year period of mining, rather than a 20-year period, the removal rate of copper/nickel would need to be reduced. I understand that the up-front costs would be recovered more slowly, and this would generate reduced profits. Benefits to the long term economy, the people in the area, and the environment would result, and those uncertainties would decrease, issues associated with the long term needs of maintaining the site after active mining operations cease.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. This has happened within years, not decades or centuries and the impact of this pollution is devastating to our environment. The short form of the environmental impact statement could easily say " the unique and delicate environment of Northern Minnesota will be damaged. Mining companies have been unable or unwilling to do what is required to prevent pollution caused by such operations in the past and there is no reason to think that this mine will be any different " As someone who grew up in Duluth and who has spent considerable time in Northern Minnesota, the Superior National Forest, and the Boundary Waters I have grave concerns about this project's potential impacts on our region's natural resources and public health. I appreciate the desire of those living in this area to have an opportunity for economic advancement if only for a limited time but the cost in permanent damage to this land and these waters is simply too high. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, William Rudie 4985 S Las Mananitas Trl Gold Canyon, AZ 85118-1853 (480) 288-5429

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining should not be allowed in Minnesota as it will threaten wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. If Lake Superior is affected so too will the rest of the Great Lakes. We know that acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. There is no reasonable expectation that a different outcome will be seen in Minnesota. With this great danger, I ask that this mine be stopped. It is not in the long term best interests of the United States, or Canada for that matter. As the leader of the World, the United States must take the lead in supplying long term solutions to environmental issues. Sincerely, William Simmons 6326 Van Buren Ave Hammond, IN 46324-1238 (219) 933-7477

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr William Turek 2372Como Ave,#2 Saint Paul, MN 55108 (651) 645-7671

I support the PolyMet mining plan assuming all safeguards to the environment are in place. This is a big assumption, but I trust the agencies and regulatory bodies have done thorough due diligence. I would not support the PolyMet plan if there is a 1% chance that MN could end up with a disaster like what has happened to the Upper Clark Fork River Watershed in Montana as described in Brad Tyer's book Opportunity, Montana. PolyMet must prevent, with 100% certainty, any "oops." in the form of water or air contamination, or any breach to the complete, long term containment of toxic byproducts within the mining operation. We do need copper, and I would prefer it be mined under close government scrutiny in Minnesota, than in other parts of the world where such oversight is missing. Regards, William K. Wenger, PhD 500 Robert St N Unit 619 Saint Paul, MN 55101

William Wilton

We cannot let economics or oil exploration and mining of our resources decide whether we will live or not. There is no question that unless stopped, life will end or be badly mutated. Research to recycle and reuse what has been already extracted can bring many jobs is just a start. Remember tailings dumped in Lake Superior! Corp's fought responsibility. NO PolyMet! Please protect you and I and everyone. William Wilton 524 Anderson Rd Duluth, MN 55811

William Youman

As a M.D. physician and BS in Wildlife Biology (MSU) my research and education on this issue concludes the mining should NOT go forth and be NOT approved due to wildlife, water quality and health issues for local residents and all of MN and the water resources.

Dear Ms Fay and Mr Westlake: MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement ("PolyMet SDEIS") fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates. The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate. For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project. We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Ass

My name is Paul Schurke, from Ely, MN, and I'm deeply concerned about recent revelations of a fatal flaw in the PolyMet SDEIS. The situation brings to mind the pivotal scene from the Apollo 13 mission: "Houston, we've got a problem." We've got a huge problem with the PolyMet SDEIS. But this problem is not rocket science. This problem is so alarmingly simple that we should all be pushing the eject button on the PolyMet impact study. For 5 years PolyMet and various government agencies have studied the potential impacts that the nation's most polluting and toxic industry might have on the nation's most water-rich ecosystems. For 5 years, we've been told to trust the science. Don't worry, they've told us, PolyMet's models will get it right. These models will determine whether a mine slated to operate for just 20 years is likely to pollute a headwaters of the Great Lakes watershed – the world's most significant freshwater resource – for hundreds of years if not forever. But now we learn that PolyMet's models got it wrong. They based the study on the wrong data. Their key parameter, stream flow volume, was incorrect. It's simple: to determine how much pollution might travel from the mine site to Lake Superior, you measure the flowage of the headwater stream that connects the two – the Partridge River. But the scientists we are asked to trust did not measure the flowage. They simply guessed using computer models. They guessed wrong. New data shows that at least 3 times as much water flows down the Partridge River than was wrongly assumed in their study. And here's the kicker: For 5 years scientists with native American tribes who know the lay of the land better than any of us warned the agencies that PolyMet's stream flow data was incorrect. The warnings of the tribal scientists were ignored. Why. Is it because much greater flowage might mean much greater pollution treatment costs than PolyMet is willing to pay. Is it because much great flowage might spread the pollution to a much larger area than PolyMet is willing to clean up. Is it because PolyMet's proposed treatment plants will have to process larger volumes of water for hundreds of years than any financial assurance package could ever possibly pay for. If the agencies that prepared this SDEIS could not get a simple key parameter correct – the amount of water currently flowing from the mine site – how can we possibly trust them to accurately predict the impact of this mine on our watershed hundreds of years from now - when it will still be releasing toxins into our surface and groundwater. Because of this fundamental flaw, this SDEIS is fundamentally inadequate. We're told to rely on science to get it right. How can we if the agencies that are doing the science got it wrong. Let's start over before we risk permanent damage to Minnesota's lakes and streams and our nation's most significant watershed."

To Whom it May Concern, Please reject the Polymet proposal as it would destroy the natural environment and compromise our waters. This cost significantly outweighs any short term financial gain that may result from the copper mine business. Thank you, Leila Jindeel

Wynter George

54182

Dear DNR, I think building a mine is a bad idea because it will effect our environment. It will destroy our rivers and are boundaries water.

Xa Peter Vang

54209

I am a student at Como Senior High School. I think we should not turn the boundary waters into a mine. I believe we should protect an environment that holds such beauty and serenity. The boundary waters is our last and biggest ecosystem in Minnesota. Pollution is a big problem all over the world and we all want to stop pollution, so why build something that will create more pollution. Sulfide mining will have a large impact to the environment; sulfide will turn into sulfuric acid and pollute the boundary water. We even created a low to protect the boundary water. The boundary water has been our largest wilderness since 1978 and it should be kept like that. The boundary waters is the icon behind Minnesota.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Yancy Rowlette 2749 polk St N.E. 28 th ave N.E. Minneapolis, MN 55418

Dear Ms Fay, Dear Federal and State Agency Leaders: The Environmental Impact Statement doesn't tell us how much mercury pollution will be seeping out of the PolyMet tailings into surficial waters. The bottom line is that we need MORE INFORMATION. Our children's health is at risk and people in the North Land aren't willing to risk that kind of potential harm. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Yasmina Antcliff, Honors Student at UMD, Mother of a seven year-old little girl, INFORMED VOTER Yasmina Antcliff 602 E 5th St #203 Duluth, MN 55805 2182607048

18870

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Yasmina Antcliff 602 E 5th St #203 Duluth, MN 55805 218-260-7048

Dear Ms Fay, Dear Federal and State Agency Leaders: I believe PolyMet's open pit mine plan is deeply flawed and my concern as an old Minnesota resident is the long term potential harm to the environment.-water and air pollution from the mine site, leaching of heavy metals into wetlands and lake drinking water, loss of public lands in Superior National Forest, destruction of irreplaceable wetlands. PolyMet should be denied a permit to mine until the potential impacts of their proposal receive further study, and questions such as-will mercury loading in wetlands pose a risk to fish, to human and animal health; what are the actual costs of treating the water pollution from the permanent mine site waste rock and how long will PolyMet pay for it. The groundwater flow rates in SDEIS are inconsistent with "real world" date. What is PolyMet planning to do if their modeling predictions of no risk of water pollution from seepage both from the waste rock pile and the tailings pile do not hold true. I would ask the SDEIS analyze and study the potential impacts of some alternatives to an open pit design-like underground mining, putting liners under the permanent waste pile and the tailings pile. The opportunity to provide employment from the PolyMet project has strong appeal to some residents in the area-and jobs are are a real concern BUT I think the short term benefits of these few jobs are vastly outweighed by the longer term and possibly permanent damage to health and environment of Minnesota residents. Surely there are other better ways to provide employment. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely, Yvonne Eckstein yvonne eckstein 1912 dupont ave so #407 minneapolis, MN 55403

Jan 6, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Let me say immediately that as a new resident to northeastern Minnesota, I am strongly opposed to the proposed open pit mine and land exchange. My husband and I retired to Duluth in 2013 to live near natural and recreational areas and to be closer to our cabin in the Superior National ForeSt We did not move here anticipating that an open pit mine and its processing facilities would open in the Arrowhead region and pollute the area. Whatever short-term economic gains might accrue regionally are simply not worth the long-term risks to the environment, to residents' health, and to the local tourist economy. I would like to remind decision makers that in the past, the taconite industry put private economic gain over health and environmental protection and dumped waste into Lake Superior with disastrous consequences. It has taken years to deal with that mess. The location of PolyMet's proposed NorthMet open pit mine is near important tributaries such as the Embarrass and Partridge Rivers. Therefore, the potential for acid mine drainage polluting the St Louis River and, crucially, Lake Superior is significant. In addition to the mine itself, the nearby Erie Plant, formerly a taconite facility, will be used for additional processing and will connect to the mine by a private rail system crossing public lands. Even worse, the mine and associated facilities could be expanded later because other deposits exist in the surrounding area. Allowing construction of the NorthMet mine is an open door to further expansion. I am also opposed to the land exchange PolyMet has proposed which would zero out critical federal environmental protections such as the Weeks Act. Strip mining is not permitted on Weeks Act land, so special legislation removing environmental regulations would be necessary in order for PolyMet to move forward with the process. Protection provided by the Endangered Species Act and the National Environmental Policy Act would also be removed by the exchange. Shame. Further, if this project goes forward, we could see legislation in the future that would fast track a land exchange largely to benefit multinational mining companies. The NorthMet Project would occur on land that has never been mined before. I understand that the Swiss corporate mining giant, Glencore, financially backs PolyMet and plans to sell the metals globally. This company, which owns approximately 25% of PolyMet, faces accusations of human rights abuses, environmental damage, and labor violations elsewhere. In short, the proposed pit and land exchange are not benign and will not benefit the area in the long run. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Zabelle Stodola 131 N Hawthorne Rd Duluth, MN 55812-1934

Jan 6, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Let me say immediately that as a new resident to northeastern Minnesota, I am strongly opposed to the proposed open pit mine and land exchange. My husband and I retired to Duluth in 2013 to live near natural and recreational areas and to be closer to our cabin in the Superior National Forest. We did not move here anticipating that an open pit mine and its processing facilities would open in the Arrowhead region and pollute the area. Whatever short-term economic gains might accrue regionally are simply not worth the long-term risks to the environment, to residents' health, and to the local tourist economy. I would like to remind decision makers that in the past, the taconite industry put private economic gain over health and environmental protection and dumped waste into Lake Superior with disastrous consequences. It has taken years to deal with that mess. The location of PolyMet's proposed NorthMet open pit mine is near important tributaries such as the Embarrass and Partridge Rivers. Therefore, the potential for acid mine drainage polluting the St Louis River and, crucially, Lake Superior is significant. In addition to the mine itself, the nearby Erie Plant, formerly a taconite facility, will be used for additional processing and will connect to the mine by a private rail system crossing public lands. Even worse, the mine and associated facilities could be expanded later because other deposits exist in the surrounding area. Allowing construction of the NorthMet mine is an open door to further expansion. I am also opposed to the land exchange PolyMet has proposed which would zero out critical federal environmental protections such as the Weeks Act. Strip mining is not permitted on Weeks Act land, so special legislation removing environmental regulations would be necessary in order for PolyMet to move forward with the process. Protection provided by the Endangered Species Act and the National Environmental Policy Act would also be removed by the exchange. Shame. Further, if this project goes forward, we could see legislation in the future that would fast track a land exchange largely to benefit multinational mining companies. The NorthMet Project would occur on land that has never been mined before. I understand that the Swiss corporate mining giant, Glencore, financially backs PolyMet and plans to sell the metals globally. This company, which owns approximately 25% of PolyMet, faces accusations of human rights abuses, environmental damage, and labor violations elsewhere. In short, the proposed pit and land exchange are not benign and will not benefit the area in the long run. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Zabelle Stodola 131 N Hawthorne Rd Duluth, MN 55812-1934

Zac Cerwinski

Dear Ms. Lisa Fay, EIS Project Manager, I am writing this letter to let you know that I don't want the NorthMet Mining Project approved. The reasons I do not want the mine is because I am worried about the environment, especially the loss of almost three fifths of our wetlands on the proposed site. Wetlands can decrease flooding, remove pollutants from water, recharge groundwater, protect shorelines, and provide habitat for wildlife. Wetlands act as natural sponges that trap and release surface water over time. This ability to store water during heavy rainfall means that wetlands can help prevent flooding. Wetlands along the Mississippi River used to be able to store at least 60 days' worth of floodwater, but now can only store 12 days' worth of floodwater because most have been filled or drained. Without this natural flood protection people will also have to buy flood insurance. Wetlands have the ability to improve the quality of water by filtering runoff, removing sediment, pesticides, metals, and other types of pollutants. Wetlands act like a strainer that filters out the bad stuff. When this stuff enters a wetland, the wetland plants will take many of the harmful substances into their roots and change the harmful substances into safer ones before they are released into the water. As amazing as wetlands are, they do have their limits. A partially filled or damaged wetland can't fully control floods, or help to improve water quality. A badly degraded wetland can lose its ability to remove excess sediments, metals, pesticides, and other pollutants. Wetlands have the ability to provide environmental benefits, but they are not indestructible. If we want wetlands to continue to perform their ecological functions, then we have to do our part to protect them, and this is why I don't want the NorthMet Mining Project to be approved. Thank You, Zac Cerwinski

Dear Ms. Lisa Fay, EIS Project Manager, I am writing this letter concerning the PGE mining in Minnesota. I have read the Project and Land Exchange Overview, Cultural Resources, And Water Quality Fact sheets on the DNR website. I think PolyMet mining has a good plan. I think they should find a way to minimize the Cultural resources effect They should change their plan so they do not bother the Ojibwe people. I think this mining will benefit Minnesota by creating jobs and getting us needed resources to use or export. Some disadvantages though would be the affect on the Ojibwe people by inconveniencing them during construction and ruining some of their historic land. Also another disadvantage would be the possible affect on water quality and the surrounding area. Some advantages of this project would be the creation of more jobs. Also getting resources that we could export if needed. This will affect cultural resources because it will affect three of five historic places during construction, excavation, filling, etc...Also the 1854 treaty specifies that its reserved for fishing, hunting, and gathering on this land that would be affected. I do agree with the land exchange offer although its affects on the Ojibwe. This will most likely not affect me right now. Depending on the affects of the project and possible pollution there is a possibility it could affect me later when they finish the mining. Although there are disadvantages and advantages of the project, I am in favor of the mining. I think it is good because it will create needed jobs for at least twenty or more years, depending on how construction goes. 8th grade student, Zac Kenoyer

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Zac Quandt Rochester, Minnesota

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Zach Insheep

54190

Building this mine will bring us both positive and negative outcomes. We would be getting a large amount of copper, but the type of mining, sulfide mining, will pollute our watershed. In the process of building the mine we would be destroying natural water filters, wetlands, peat. Which would you rather have, clean drinking water or water that polluted by sulfuric acid? Worldwide we only have 0.024% of clean drinking water. We should not take our water for granted even if it is for copper.

Zach Kunkenborg

54193

I believe that we shouldn't mine – especially if the consequences are going to be bad. I mean we have one of the most pure watersheds up there, near the boundary waters and all, so why would you put a sulfuric mine up there and risk tainting the water? Also you get a lot of waste from this mining, think of all the waste this will create. I want my kids to grow up in a waste free world.

Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuri

To whom it may concern, The polymet mine would jeopardize sacred manoomin (wild rice) which Is almost exclusively here in Minnesota, Wisconsin, and parts of Canada. not only that but the polymet mine would have an effect on the serene beauty of the boundary waters. It is one of the last serene places in Minnesota and the country. A high stakes mine such as polymet is not worth the risk. Thanks, Zac Mitteness 609 Bemidji Ave Bemidji, mn 56601

Zachary Behnke

54219

Dear Ms. Fay: I am Zachary Behnke, a 10th grader who attends Humboldt High School. I am writing about PolyMets proposal to start mining. If I don't stand up and take care of the environmental impacts, we aren't really a democracy. PolyMet has many problems with their plan and environment impact statement. One of the major problem with PolyMet, is that they re-drew maps to disguise the fact that the runoff from the mine waste piles will enter the BWCA. Not only do they need to get new, ACCURATE maps from the DNR, but they also need to test how much waste will flow to the BWCA and how long it will take to get there. Another major problem is the environmental impact statement shows the water will have toxic levels of metal at LEAST for 500 years. That will need constant treatment to make it safe. The MN DNR needs to get a water model that is capable of telling how many years it will take for the waste water metal levels to drop to the safe range. That being said, the environmental impact statement is a set up deal. It's a way for PolyMet and people to provide jobs for 20 years at max, for at LEAST 500 years of toxic pollution that will destroy not only BWCA, but also destroy any natural parts of Minnesota left. I hope you do not allow these scandals to ruin generations of the great outdoors, and take away from the Minnesota culture. If you have any questions, or comments, please contact me at (651)-373-6605 or send mail to 2520 Rose Ave East, Maplewood, MN 55119.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The moose is a truly iconic symbol of the Northwoods in Minnesota. The population is already in drastic decline with studies just getting underway to search as to the reasons why. Further decline in moose numbers may also impact the wolf population. Without the moose as a food source the wolf population will possibly rely more heavily on the white tail deer. If the numbers of white tail deer decline that will impact hunters and the amount of revenue that the area receives. Cause and Effect, period. Sincerely, Mr Zachary Blankenheim 3014 142nd Ln NW Andover, MN 55304-3242 (763) 432-6155

Dear Ms Fay, Dear Federal and State Agency Leaders: Back in the 1950s and 60s, there was a push to put dams in the Grand Canyon. Yes, you read that correctly, the GRAND CANYON. There were actually people who thought it would be ok to flood a large section of one of the world's most magnificent landscapes. Why. The promise of jobs and money of course. And, of course, the American public yelled and screamed and protested, and finally after a fight of nearly twenty years, the plan was dropped. Today, just the thought of flooding such a sacred place is almost laughable. How dare they put a price tag on the Grand freaking Canyon. It's America's Sistine Chapel. Well, that's exactly what is happening in the Northland today. One of our holiest landscapes is being threatened by people who just want to make a buck. The Boundary Waters Canoe Area Wilderness, yes, our beloved Boundary Waters, is being threatened by the scourge of Sulfide Mining. Now, it's taken a while for me to speak out against this, because frankly, I didn't think it would get this far. It is the BOUNDARY WATERS after all. I thought the people of the Northland would rise up en masse and scream, "Oh, no. Not here. You can take all your foreign money and mine or drill somewhere else." But apparently dangling this golden carrot has blinded some people to what is really at stake. Now, I could get all into the science behind how this form of mining has never been proven safe and what it could do to wildlife, wild rice, water, etc, but all of that has been written about time and time again. Even with all the evidence, some people are still not listening. There are still money-hungry zombies with dollar signs in their eyes. But I think there is a very simple way to snap them out of their trance and make them understand what is at stake. Just take them there. Take Governor Dayton, Senators Klobuchar and Franken, Representative Nolin and any other person with a stake in this issue and bring them to the Boundary Waters. Put them in a canoe and have them paddle for a week or two - let them listen to the loons, see the northern lights. Have them smell pine needles baking in the sun, feel the fantastic strain of a portage - let them live the "strenuous life" that shaped Theodore Roosevelt into our greatest president - a man who over 100 years ago created Superior National Forest and who would be appalled at the thought of destroying this very land. After spending some time paddling and portaging; sleeping under the stars and sitting quietly upon a rock; returning to their basic primordial rhythms, no one would think any sort of risk to this special place would be a good idea. I dare say that even Tony Hayward himself, the villain of the Gulf oil spill and chairman of Glencore (PolyMet's largest investor) would even say, "Blimey. We need to leave this place alone." Once, while skiing in Utah, I rode a chairlift with a family from Maryland. When they heard I was from Minnesota, the first thing they asked was, "Do you live near the Boundary Waters. We go there every year. You are so lucky to live there. It's our favorite place in the whole country." There are many people around the nation who feel the same way. We may not know it, but many around the United States put our BWCA on the same level as Yellowstone, Yosemite or the Great Smokey Mountains. If we screw this up, it will be a national disaster. It'll be like we flooded the Grand Canyon. Sincerely Zachary Johns 7 Southview Dr Apt 7F Hibbing, MN 55746 218 340-8954

Dear Minnesota DNR, I am a resident of Minnesota who is 17 years old. I love the work you do and all the resources and wildlife refuges that you manage and care for. I am an avid hunter and fisherman and love to see what you do to keep the pristine wilderness healthy. However, recently I saw on the news that mining in the boundary waters might take place. I have taken it upon myself to research what kind of mining would be permitted and what the effects on the Boundary Waters may be. When mining in Areas near bodies of water it is inevitable that chemicals will reach and contaminate the water. When sulfuric acid leaks out from the metal mines it contaminates not only the lakes but also the groundwater. I can remember from the time I was young how clear the waters of the boundary waters are. I love to fish and have often found that fishing in the boundary waters is some of the best fishing I have ever had. Much of the reason is due to the abundance of fish in the lakes. If the lakes were to be poisoned by chemicals, much like many city lakes, the fish population would surely decrease. I couldn't help but research the effect that mining has had on other wilderness areas and I have found that in all the cases the measure taken to keep the chemicals out the lakes were only practiced at the beginning. No situation ever was able to have the wilderness back that they lost. I ask you to carefully contemplate the risks that you are taking. Will the Boundary Waters still be the same. What will happen to the wildlife. I know that you care a lot about the environment and I hope you can see why I have expressed concern. I love our state and hope that you do too. I wish that you will make the right decision, and help keep the integrity of our Department of Natural Resources. file:///C:/Users/JL-Home/AppData/Local/Temp/msohtmlclip1/01/clip_image002-jpg Here is a Picture from my last trip to the Boundary Waters, I hope when I return it will be the same and I hope that it would stay the same for future Minnesotans. Hello, my opinion is to not go ahead with the mine. The reasons are short and simple. First think of this project in the long term. The US is only 238 years old. At 200 years of clean up, we would just be finishing up Revolutionary War era mining projects. Secondly, the "jobs" created would be short term and would put Ely in the same position as Duluth in the 80s when it was dependent on mining and almost died when the industry fell through. Lastly, it is your purpose to protect the environment, period. We only have one northern Minnesota, please help us keep it amazing. Thanks Zach Nelson Duluth, MN Sent from Zach's iPhone

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Zachary Pera Cole 3522 Newton Ave N Minneapolis, MN 55412-2314

Hello I am writing to you today as a concerned Minnesotan on the subject of the potential Polymet operation in Northern Minnesota. After doing my own research on Polymet, sulfide mining, and the environmental impacts I must voice my objection to this type of mining in Minnesota. My wife's family has deep roots in the Hoyt Lakes and Aurora and thus I've spent quite a bit of time in the area. Her Grandfather and many other family members have and had worked in the mines for years so the mining concept is not unknown to our family. What Polymet is looking to do has not worked in other locations and has almost always ended in huge environmental catastrophe for the area surrounding the mine. This part of our state is beautiful and raw, we cannot afford the hundreds of years of harmful effects for maybe twenty years of jobs. This is a short term fix to a long term problem on The Range and will not serve or state or economy well in the future. Please stand with me and help bring light to the realistic reality of Polymets proposal. Thank You, Zackary Heuring 2168 Cleveland Lane South Cambridge, MN 55008 763-913-6905 Sent from Yahoo. TO: Minnesota Department of Natural Resources HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us FROM: Zdenek Mestenhauer, 4800 Lyndale Ave S, Minneapolis, MN 55419 HYPERLINK "mailto:mesten2958@msn-com"mesten2958@msn-com DATE: 2/24/14 I attended the public comment event on Jan. 28 in St Paul. This event was rigged with an intent to skew the outcome. It did not allow equal time for true public comment vs. industry comments. The DNR set the event up to favor industry input by allowing the unions to submit requests to speak, when there was actually no intention to speak and provide public input. The intention was to cede their time to industry leaders and elected official with prepared remarks. Industry has their time to present their side. This invalidated the public input and limited public. The public hearings have to be repeated to allow true public input in order to be valid. It would be immoral to approve this plan that promises the endless pollution of water and our environment. The PolyMet SDEIS has been shown to rely on an inaccurate water model and provides incomplete information about the health and environmental consequences of its proposed sulfide mine in Minnesota. I feel strongly that Minnesota DNR must require PolyMet to provide a plan that addresses the following: 1- Is water value estimated. Value of clean water is not calculated for the next 500 years. Climate/drought will make water more valuable. Climate change impact was not considered in the SDEIS. This need to be analyzed to better understand the long impact such a mining operation would hAve Several scenarios need to be considered. Raising sea levels will displace population; raising temperature will make Minnesota a better place to live. More severe and extreme storms will happen in the future. Calculations for 5,000 year storms need to be considered in the study. The water treatment plants have to be able to withstand those. 2- Reliability of water treatment addressed. As an engineer, I am quite aware that designing a machine with a life span of 20 years is typical. 30 year reliability is difficult. It is virtually impossible to design a system that will last 500 years. The plan has to address this topic to a great detail in order for experts and the public to assess if the design of such a facility would be adequate. The cost of such a facility has to be estimated. 3- Are industry assurances that it could be done safely valid. PolyMET claims that this process could be done safely. PolyMET has to show facts to support this claim. Research shows that there is not a single sulfide mining operation that does not pollute. There is certainly not one operating in such a water rich ecosystem. No approval should be granted unless the technology proposed is shown to be reliable operational for an extended period of time, such as 10 years. Perhaps a demonstration project in a reduced scale to something like 3% of proposed size should be approved firSt Only after this technology is validated on a much smaller scale, could that be increased in small increments. Such a controlled approach is the only responsible way to mitigate the extent of damage to our environment. 4- Is fish mercury contamination evaluated correctly. The DNR currently limits the amount of fish humans can safely consume. The proposed mining will increase the contamination of water with heavy metals including mercury. The SDEIS does not adequately estimate the impact of mercury contamination of fish downstream and including all the great lakes. The cost of mercury contamination in fish and other aquatic species could not be estimated. 5- Does the proposed mine plan keep Minnesota's water safe and clean. The USEPA gave the proposed mine its lowest ranking: Environmentally Unsatisfactory and Inadequate. Polymet's SDEIS clearly shows that after 20 years, there will be three enormous pits up to 696 feet deep full of water polluted with sulfuric acid and toxic heavy metals.

58127

Based on available information, pollution of clean water is inevitable. Today, we are advised not to eat fish because of mercury pollution. It will only get worse. Financial assurances are insufficient! The cost of investigating pollution will be up to the public. It is not worth the risk. This technique has never been used successfully. Please do not gamble with our natural resources! Do not permit this mining plan. It could not be done safely. Clean water value goes up and will be going up with climate change. Let's not damage it if it is not necessary.

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Please reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Zindzi McCormick 1128 Portland Ave Saint Paul, MN 55104-6941 (651) 983-5011
