Please approve this project as soon as possible. America and the world will need these metals soon. Thank you.

A M 16161

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, a s dorman Minneapolis, MN 55412

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, a s dorman Minneapolis, MN 55412

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Amethyst Harle A. Harle 1702 North 24th Street Superior, WI 54880 218 481 4318

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Aaron Bouchard 43 Clermont Cres Dartmouth, NS B2W 4N9

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, No mine . We need to think of our futures, not in a financial way, but one that considers all living things and the value they hAve This value may not be conducive with the cooperate world. However, this value is relevant to our ecosystems, our life. Being that I live just off the Mississippi River and down stream from this potential mine is disturbing knowledge. Any water affected by this mine will eventually make its way down stream to this area where I live. I am a concerned citizen of Wisconsin and Native American who feels this continual TAKING from the land for financial gain, will be our undoing. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Again, I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest, not in the leaSt Sincerely, Aaron Camacho S2861 Mustang Rd Fountain City, WI 54629-7533

To Whom It May Concern: As a resident of Northwest Minnesota, it may seem that I shouldn't have an opinion on PolyMet, but I feel compelled to share my concerns about this proposal as it will eventually impact the state of Minnesota as a whole. There are three main concerns that I have as a Minnesota resident: 1-) Instability of the industry; if the business collapses or goes bankrupt, won't it be the taxpayers left covering the costs of cleanup, unemployment, and reemployment. And what is the life expectancy of this mining operation 10, 20 or 40 years total. 2-) No health impact study has been conducted, and this industry has a propensity to be very dangerous to not just the health of employees, but to the general public in the surrounding area. If people become ill, (even much later, as what typically happens with other health conditions brought on by other environmental hazards), again, the state as a whole will be left to care for those that become ill. (It's not the caring for the ill that bothers me, it's the fact that it could have been avoided all together to begin with.) 3-) The proximity of the mining operations are very close to pristine and natural lands, that our state pride's itself on. They are natural wonders that draw people to come to Minnesota for our great tourism industry. What will happen to our state's branding, once mining is expanded and we destroy these attractions. As of now, I'm adamantly opposed to PolyMet. In all good concious, I don't know how the people (other than those in need of employment in the small region) could be expected to support such a proposal without all the answers and assurances. I also suspect that none can be given, and we are expected to proceed on blind faith. In that case, we can't, for the future of Minnesota, we just simply cannot allow PolyMet to happen. Respectfully, Aaron Lee Wittnebel Mayor City of Lake Park - Aaron L. Wittnebel P.O. Lisa Fay, EIS Project Manager MNDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St. Paul, MN 55155-4025
10 February 2014
Dear Ms. Lisa Fay, EIS Project Manager PolyMet Mining Inc. project
I don't think the Poly Met Mining Inc. project is a good idea. With all the harmful effects that could come into play.
1. The water could be contaminated with sulphate, metals, and mercury.
2. The project will affect the Indian reservations.
3. It will be moving the earth, and will have visual obstructions, noise, and dust.
4. It can affect the following around it: bodies of water, wetlands, vegetation, wildlife, and many other environmental features.
5. If there are buildings on the land would either result in closure and/or demolition.
a. This would result in people losing their jobs/businesses.
There can be some positive effects though too.
1. To make everything run smoothly they will need to hire people, so then there will be jobs for people.
2. The new resources: iron, copper and nickel.
3. It will boost the economy.
With that, I understand there are some positive effects, but with the negative ones I don't think they should be able to mine. Wildlife can be harmed, that includes animals on the threatened and endangered species list. There are too many things that can affect us and everything around us. I don't think it will be safe. I truly hope you can understand my thoughts, and will take my idea in consideration.
Sincerely, Abbi Evans

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Abby Andresen

500 Lafayette Road, Box 25
St. Paul, MN 55155-4025
10 February 2014
Dear Ms. Lisa Fay, EIS Project Manager
I do think that you guys have a good plan about what you are going to do, it is very exact and gives all the information you need to know about this process. But you always have to look at what the pros and cons to this situation are, and what they are going to affect. I think that Minnesota can benefit from this mining process because of all the jobs it will provide and all of the money that it will bring in. Some advantages to this process are ...
1. make a lot of new jobs
2. once we get the minerals then we can make more electronics and stuff we use in our everyday life
3. it will make a lot of money
4. they will grow the vegetation back
Some disadvantages of this process are ...
1. cut down forest area
2. it may pollute the water
3. it might affect some different cultural resources
Some cultural resources could be affected during construction and operations. The things that this could affect are, the sugarbush, a piece of sacred land of the Mesa be Widjiu, part of beaver bay, and a couple other things. I do agree with the Land Exchange offers because if they don't do it here where will they do it. They have to do it somewhere why not here where we know how to make it safer and not pollute as much. All these products (copper, nickel, platinum) are used in our everyday lives. Another thing is that even though they are going to cut down all this forest and vegetation, as soon as they are done mining they have to try and put it back so it is almost like what it was before. A reason why a lot of people say that it would be a bad idea to mine is because they think it is going to pollute the surface water. What they might not know is that you guys do so much to make sure that it doesn't, and if it does somehow then you guys have an emergency backup to either stop it or make sure the pollution isn't more than just a little. Another thing to think about is how this will affect everyone else. A way this could affect us is if you don't mine we might start running low in those few minerals and they won't be able to make all of those things that we use everyday such as: electronics, batteries watch bands etc. Thank you for taking your time to read this and I really hope that you take all of this into consideration before you make your decision, thank you again.
Sincerely, Abby A. Huset
South West Junior High 8th grader

EIS Project Manager Lisa Fay
500 Lafayette Road, Box 25
St Paul, MN 55155
Dear EIS Project Manager Fay,
I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. If you have children and grandchildren, this mine will impact their future. Please reject this mine. Sincerely, Mrs Abby Young
5878 Prairie Ridge Dr
Shoreview, MN 55126-5004
(651) 249-4519

Abdullah Ali

Dear DNR I don't like the idea of drilling to happen. Because after the mine is over the environment will be affected for a long time. The mine isn't worth disturbing the peace. There is so much copper you can drill from other locations. The copper isn't worth destroying our environment. It can affect the water. I can also affect the animals who live near the area.

aboges1@gmail.com

As a student attending high school in our beautiful state, I have had to sit by and watch as those older than me ran this state and this country with policies of denying global climate change, putting economic gain above environmental preservation and sustainability, and assuming that it won't affect anyone. Well, I am commenting to say that it does and it will affect me, my children, and so on, assuming that the planet is still liveable by then. This mine is just one more offense to the natural and beautiful world that I want to live in and share with generations to come, and regardless of what Glencore claims, mining companies have never given anyone a reason to believe for a second that they will clean up after themselves. Acres upon acres of our land and gallons upon gallons of our water all over this country are polluted because of mines that made the same promise and declared bankruptcy or used some other method to shirk responsibility, and letting them move into our beautiful northern regions and closer and closer to the Boundary Waters Area WILL have negative effects on our environment, and it is not worth it for a little extra money and a handful of jobs. Minnesota is strong, and we can survive not having a small economic gain, but we can't recover if we set this precedence of allowing big corporations to come into our state and destroy our pristine nature. Thank you for your consideration.

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Adaline Shinkle 4708 Eastwood Circle Minnetonka, MN 55345

Greetings, This message is in response to your January 13, 2013 opinion article, "Our View: Insist on civility at PolyMet hearings" <http://www.duluthnewstribune.com/event/article/id/288499/group/Opinion/> Thank you for anticipating and alerting readers regarding the "coming chaos" associated with the PolyMet Public Hearings. Surely this debate will mark a very historic event for the state of Minnesota and the Great Lakes region. I was, however, very perplexed why in this article you would include a very crucial piece of misinformation. You state: "An example of misinformation is a charge that PolyMet will produce polluting acid mine drainage. But 70 percent of the rock being mined is low in sulfate, Landwehr said, and can't produce the pollution. And the rest of the rock will be placed on a lined area where anything that runs off it can be collected and treated. This rock then will be dumped back into the mine and covered by water. Underwater, without air to mix with the water and sulfate, acid can't be produced." Emphasis on this sentence: "the rest of the rock will be placed on a lined area where anything that runs off it can be collected and treated" Had you actually read the Draft Supplemental Environmental Impact Statement prior to penning this article, you would have learned that on page ES-36, it is acknowledged: "Nearly all contact or process water at the NorthMet Project area would be treated at the Mine Site WWTF or Plant Site WWTP before release to the environment. At the Mine Site, about 10 gallons per minute of untreated water would be released during closure (all related to groundwater seepage), which represents less than 5 percent of total Mine Site water releases. At the Tailings Basin, about 21 gallons per minute of untreated water would be released during closure (all related to Tailings Basin seepage that bypasses the groundwater containment system), which represents less than 1 percent of total Tailings Basin water releases." The key points here being "NEARLY all." The DSEIS recognizes and acknowledges that not all untreated water can be collected and treated. In fact, 10 and 21 gallons per minutes, respectively, of untreated water are anticipated to bypass the groundwater containment system during closure. So, why would you make the statement that "ANYTHING that runs off it can be collected and treated". This is simply not true. I am very ashamed in you, and the Duluth News Tribune. I demand a public response to this misinformation immediately. Adam Wilke

Dear Ms Fay, I have done my best to research the Polymet mine proposal and come away with a number of serious concerns. Based on what I have read this mine is highly likely to damage the Arrowhead regions' ecology. I sincerely hope that your agency thinks long and hard about the tradeoff between 20 years of mining jobs versus up to 500 years of needed pollution control. Not to mention it now appears only half the jobs will go to locals and this project could get canceled as soon as copper prices fall below the needed threshold to make it economic. Polymet has a "plan" but no proof they can do this without polluting the regions' watersheds. I see they claim they will treat the tailings to take out the sulfuric acid content and use reverse osmosis water treatment. Yet it's clear this has never been proven on an industrial scale. This is especially concerning when one considers the fact that this is a low grade deposit that will produce 99% waste rock. The recent episode of "Almanac" on public TV highlighted pollution from tailings at the Minnesota DNR's very own test facility in the region. In my research I did my best to get the key points of view from both sides. It was interesting that after visiting the websites for Polymet and Minnesota Mining (the lobbying organization) they both cited the Flambeau Mine in Wisconsin as evidence this can be done. Yet a simple Google search on this mine revealed numerous reports of its runoff pollution in nearby streams. Furthermore the Flambeau Mine was tiny in scale to what is being proposed by Polymet. So once again there is simply no proof or strong evidence this mine can be done without polluting the area for decades to come. It appears there is no proposed trial run on a smaller scale for Polymet to prove this can work in a variety of conditions (I may have missed it given the volume of materials in the EIS). In the next 200 to 500 years we can be assured of some extreme weather including periods of flooding. How will their reverse osmosis treatment handle this. I hope your agency is looking critically at these issues. Also, are any alternate plans being considered that would utilize an underground mine where the tailings are kept well below the water tables. It is my understanding that determining the financial assurance needed is not part of this initial EIS and comment period. But let's consider some simple math that should bring the magnitude of the issue to light. Polymet says the ongoing treatment could cost \$3-5 to \$6 million per year and last 500 years. Using the midpoint of these estimates produces a liability of over \$2 billion not even accounting for inflation. The more important point is there is no way your organization can claim to know what the assurance should be. I do appreciate your agency has been given a very hard task in determining the right course for this very divisive issue. Yet we have one chance to do it right or we shouldn't do it at all. Since it's clear this project will result in decades of pollution risk versus a 20 year limited benefit I propose not doing it at all. Sincerely, Adam Benson Minneapolis, MN

Adam Ferris

7180

The comment I would like to make is that allowing this mine to proceed will only benefit all parties involved. Many would like to argue the impact this project will make over the next 500 years is enough to stop any progress, to this I can only say open your eyes and realize that when we as a people are faced with opposition we always work together to solve the issue at hand. How many disasters have we come together and found solutions for. There is nothing that can happen in this world that we have not been able to fix. As far as I can see the major issue that we have today is a lack of opportunity for many persons who are not only qualified to handle the jobs that may be created but also are highly educated persons who are problem solvers. To squander this opportunity would sadden me terribly.

Adam Fesenmaier

Feb 28, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Additionally, I have experience in the HIA process, and am involved in the MPCA's current HIA surrounding Emerald Ash Borer. Despite the differences between these two environmentally based issues, the HIA process can effectively address any public health concerns from activities involved in sulfide mining for non-ferrous metals. There are direct public health affects that can be strongly correlated and modeled through the HIA process, and I fully believe in the HIA process because it addresses any secondary or tertiary risks as well. I understand the DNR has conflicting motives, both set to make a profit and protect the environment, though I think the presumption that the PolyMet project, or any sulfide mining project can be done without public health issues is a dangerous one, and one that surely has a greater cost than what will come out in profits and tax revenue for the State of Minnesota. Sincerely, Mr Adam Flett 360 Robert St N Saint Paul, MN 55101-1503

adam hozempa

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, adam hozempa minneapolis, Minnesota

My name is Adam Sippola. A-D-A-M S-I-P-P-O-L-A. Alright. I grew up here and have lived in Minnesota for most of my life, enjoying swimming and fishing in our lakes, rivers and streams, and enjoying our high quality of drinking water. I am against the proposed PolyMet sulfide mine in northern Minnesota for several reasons. The potential for acid mined drainage alone is reason enough to say no to this proposal. If not, we risk long-term pollution of the surrounding wetlands, lakes and rivers, including the St. Louis River that flows into Lake Superior. And by "long-term," I mean that the water cleanup following the mine's closure is estimated to last up to or beyond 500 years. It is hard to imagine PolyMet still existing by then, paying for continued cleanup of the water that will be polluted and poisoned if this mining project is approved. No. Instead, that responsibility will fall to the citizens. 20 years of jobs, only 25 percent of which are estimated by PolyMet to be local jobs, cannot justify centuries of cleanup and billions of dollars in cleanup costs. As it is, Minnesota law calls for mines to be maintenance free after closure. And this proposed mine site is located in the Superior National Forest, where open pit mines aren't allowed anyway. We cannot begin making these kinds of exceptions for corporations at the expense of our natural environment and at the expense of pure, fresh water for generations to come. We must employ a longer view. The destruction of more than a thousand acres of wetlands at the PolyMet mine site would be the single largest loss of wetlands ever permitted in Minnesota. The sulfide mines have a horrible track record of bankruptcy and pollution. The EPA has identified hard rock mining as the nation's top toxic producing industry and mining companies are unable to point to a sulfide mine that hasn't polluted. Corporations don't have a conscience; therefore, it is our responsibility as human beings to begin a trend away from catering to corporations and toward catering to our environment, including the wildlife, plants, land, water and human beings that are a part of it. The PolyMet sulfide mine proposal should not be approved. Thanks. Let me include my address in there also. My name is Adam Sippola, 805 E. 13th Street, Duluth, Minnesota 55805. Thank you.

7721

Dear Ms Fay, Dear Federal and State Agency Leaders: First, opening the PolyMet mine seems like a bad business deal: We loan PolyMet our land for 20 years, less than one generation's time, and they will leave it polluted for 500 years. That means over 16 generations of future Minnesotans would be affected by pollution caused by the PolyMet Mine. If I tried to get a business loan and said I'd have it paid back in a speedy 500 years, I'd be laughed out of the loan office. Why are we even considering this mine as a plausible business idea. And that is if everything goes RIGHT. What if something goes wrong and we end up facing much more pollution than we were told to expect. I just can't trust a for-profit company to honestly have the environment's best interest in mind; ultimately it's about the bottom line, it has to be. So even if PolyMet tells me that this mine will have the newest safeguards in place, creating minimal damage to the environment, I still hesitate to believe them. And it appears to be for good reason: For example, one study found that, among modern mines in the US that predicted that no acid mine drainage would occur, 89% of those mines DID have acid mine drainage during operations or after closure. And just in case it's not clear, there are many reasons to fear acid mine drainage: acid mine drainage kills fish, wildlife and plants, leaving contaminated waterways devoid of most living creatures. Mining by-products such as arsenic, manganese and thallium, have been shown to increase the risk of cancer and other illnesses in humans. Make no mistake, there WILL be disease created by this mine. Are profits really worth anything if they're at the expense of human life. And, if 500 years of pollution somehow doesn't bother you, maybe the costs to the taxpayers will: Experts who have studied other mining projects across the country said even those that start with financial safeguards can end up costing taxpayers millions of dollars. In Montana, they underestimated the volume of water needing treatment after a gold mine had closed, and state taxpayers had to create a \$34 million trust fund to pay for it. Northern Minnesota cannot afford a miscalculation of that magnitude. Another study says that water treatment would cost between \$3-5 and \$6 million per year after the mine closes. Northern Minnesota cannot afford to foot that bill. Not for one year, not for 500 years. There are other, safer, better ways to grow our economy. For example, Maurices is soon expanding its corporate office, and they're slotted to create 600 jobs right here in Duluth. PolyMet will only create 360 full-time jobs, with HUGE liabilities attached. Let's focus on industries with less risk and more jobs. I vote as conscientiously as I can, I live as conscientiously as I can. My household, and my friends, regularly take actions to preserve the earth and our own health. And now a FOR-PROFIT company is hoping to come in and risk my health and the planet's vital water supply all for money I will never see. Where is the political, social, or moral justice in that. Will no one fight to protect our rights to live as healthily as we can. Well, I will fight for a healthier tomorrow, and I hope that all citizens of Minnesota, especially those with the most power, will stand up and oppose this dangerous, damaging operation. The risks are just too high to bring Sulfide Mining to Minnesota. Sincerely Adam Swanson Adam Swansom 617 N 11th ave E Duluth, MN 55805 218 343 4304

I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. The Boundary Waters is a place outside of the realm of day to day modern living in the western world. In much of the BWCA there are no motors allowed. The visitors have to follow strict guidelines to preserve this place. All these things combined with the peace, beauty, simplicity, purity make the BWCA a destination for people from across the country. These mines that are only miles away, are in complete opposition to the ideals that make the BWCA what it is. These mines threaten the purity and integrity of the BWCA. People visit the BWCA to experience PURE Nature, not a natural setting with a mine next door. The priority with a gem like the BWCA should be preservation. Please reject any and all proposals for any mining projects that endanger the BWCA. It is one of the greatest human resources we have in Minnesota. Sincerely, Adam Theis 203 Creekview DR Cold Spring, MN 56320

Adam Waxler 34014

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest (Hi my name is Adam R Waxler.) (i am an illinois Democrat voter.) (i already voted for the Democrats in General.) Thank you for your support. Adam R Waxler (P.S. i say Climate Change and Global Warming is real.) (i say Democrats Forever.) (i care about the Great Lakes since i live in illinois.) (my Drinking water is Lake Michigan and Lake Michigan is connected to Lake Superior so my Drinking water does matter.) Sincerely, Adam Waxler 7615 Church St Morton Grove, IL 60053-1618

Adam Wilke 42981

Attached. Please confirm receipt. Thank you, Adam K. Wilke

adam wright 38312

My name is Adam Wright and I live in northern MN (Hibbing to be exact). I have been following Polymet for years from an independent standpoint. After reviewing the SDEIS and hearing experts on the topic, it is very clear that this company will be responsible not just in the present, but in the future. There is a way to mine these materials safely and Polymet has show that they can do it. To be honest, I have many family and friends not just in the northern part of the state but also the twin cities who support Polymet. I have yet to talk to anyone against the proposed mine. We in northern MN live and depend on mines and without them, we are a ghost towns. Thanks for everything you have done Polymet and I look forward to the future mine. Adam Sent from my iPhone

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, adam youngblood Litchfield, Minnesota

Addie Welch

57181

My name is Addie and I am a youth activist and student in Minneapolis. I've had the privilege of visiting the BWCA and like anyone else who has been in the wilderness of this country, I can tell you how much that experience and the future of that experience means to me. Combined with other factors environmentally, economically, and socially, Polymet Mining is a dangerous idea that should not be executed in Minnesota. Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

The proposed mine is in a very sensitive watershed area. The polluted water can enter ground water effecting rivers, ponds and Lake Superior. The people proposing this mine do not have a good track record for cleanup. They get the ore we get stuck with the mess. Adrienne Beck 1045 Larpenteur Ave W #325 Roseville, MN 55113

Aidan Resh

44527

Hello, My name is Aidan Resh and I am currently a Junior at Prior Lake High School, in Minnesota. I am a chairmen of our Eco Team, and work alongside many members of our district in hopes to keep Minnesota and our world for that matter intact for not only my future but also yours and your children's future. In opening this mine, you would essentially be going against everything that Minnesota strives to protect. I would like to bring up a few points that came to mind while I was reading your proposal First off, as I understand it, this mining company Poly Net is brand new with little to no experience. As being financially backed by the company Glen Core, (chaired by Tony Hayward the man responsible for the BP oil spill) I have concerns about your track record in maintaining ecological standards. In another point, I appreciate your commitment to a five hundred year clean up plan, yet I have no assurance your company will even be around for that long How many companies do you know of that were established when Christopher Columbus landed in America. Your location is remarkably close to our nature preserve also known as the boundary waters. I understand you have hopes and aspirations of containing your runoff, but that is not the sole environmental degrader. Deforestation and the rampant use of fossil fuels have their own obvious adverse effects. I get that there could potentially be some reforestation attempts assuming you hold yourselves to your proposed plan. What do you plan to do about the displacement of native species. Because once they are gone, good luck getting them back. I believe it is the DNR's obligation to prevent companies such as this from destroying our nations largest investment. We must set an example for the rest of the world, by holding ourselves to a higher standaRd This decision weighs on your shoulders my friends. I hope for the sake of our future you make the right one. Sincerely, Aidan Resh

Attached is a copy of the TEP/LGU comments regarding the proposed wetland mitigation site in Aitkin County for Polymet. Becky Sovde Wetland Specialist/Compliance Officer Aitkin County Planning and Zoning 218-927-7342

Akilah Sanders-Reed 58090

The SDEIS is insufficient and should not be approved. The water contamination potential written between the lines is unacceptable. No details are provided on how five centuries of water treatment will be financed. The operation, maintenance, monitoring, and reconstruction of these facilities for over five hundred years is massive liability and financial investment. The plan readily admits that in addition to the five hundred years of water treatment necessary, millions of gallons of polluted water will seep off site, uncaptured and untreated. This is irresponsible natural resource management, as well as a serious human health threat. Further underlining the proposal's ecological incompetence is the U.S. Forest Service land exchange. Natural resources are not purely a tree-hugger hobby; those plants provide ecosystem services estimated to be worth significant amounts of money, performing tasks such as water filtration and retention, and soil protection. These resources are necessary for human occupation of connected ecosystems across the state of Minnesota. We are not immune to the damage of our environments. Finally, the Tribal Governments have shown that the water models used by PolyMet contain errors which may have vastly underestimated the hydrological damage that will be incurred by the mine. The disastrous impacts are unknown, and it would be irresponsible to pass such a proposal. There are sustainable alternatives that, when externalities are factored in, would be financially beneficial: increased recycling rates, or an underground mine, have both been proposed. The SDEIS is insufficient and irresponsible. Our natural resources are not trivial niceties but necessities. Please decline the Poly Met SDEIS and avert the ecological and economic toll it would take on Minnesota's future.

Al Conard 21881

I am very excited that the north area will be getting a new jump start in the economy. All the lives they will be helping with employment opportunities will be incredible. The area is used of mining so there will not be any major surprises. And Polymet's concern for safety and the environment seems 2nd to none. I totally support what they are planning for Minnesota. Al Conard Coldwell Banker Burnet 612-759-2338alconard@comcaStnet

Al DeJuliannie 5979

I attended the meeting in Duluth last night and was very pleased and impressed with all the information available. One problem was that I could see was the stuffing of the box by anti Mining people to get there speakers more time give there reasons against the mine. Idea for next meetings so it is fair is to have a box for people that want a chance to speak, one for Anti Mining and one for Pro Mining. Then pick speakers evenly from each box to give there comments. Also person picked should have to give there comments not like what I seen last night where the Anti Mining Group stuffed the Box and then would give there spot to one of there experts and we had to listen to the same lies over an over and I felt it ruined a good meeting. Over half the people exited early because like me we got tired of hearing there same information over an over. Like one person I talked to said I never knew there were so many Scientist in our area. We want a meeting that is Fair and People from both sides have an opportunity to say whats on there minds. This projects puts a lot of pressure on all of you involved in the Environmental Review Process to get it right because if not it will effect every ones lives. Like one speaker said last night we have to trust science. We need these good paying jobs on the Iron Range and whole country and world needs the metals. Thanks Al DeJuliannie

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Of all the stupid ideas that have been tossed at MN, this is one of the worst, if not the very worst At a time when MN is starting to take a lead in preventing more pollution, this is just plain wrong. It doesn't matter how many jobs it creates, how much in revenue MN will get from it. Why don't we just ruin every damn lake, river, and stream we have in this state, strip mine the whole damn thing and become the blight of the world. We don't because the people in this state have respect for what we have and want to see it become a leader in clean energy. This mine crap is the one thing that will ruin our standing in this country, in the world. We don't need it. What we need is to work on becoming the model environment that is the envy of the country, the world. The people of this state work hard at not only cleaning up the messes we already have, but in preventing new ones. This mine would destroy everything the people have come to stand for. It's a disaster in the making and everyone knows it. The people in this state deserve to be respected for all the work we have done already to achieve just that. We are proud of the progress we have made and what we will be doing in the future. There isn't a person in this state that wants more pollution at a time when we are struggling to get rid of what we already have This mine is just plain stupid and wrong for the people of this state. It's time to shut it down, permanently. Sincerely, Mr al eisentrager 11355 Kramer Ave NW Annandale, MN 55302-2967

40045

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

A. J. Martin 27518 County Road 3 Merrifield, MN 56465 218-765-4321 Mar. 12, 2014 Lisa Fay, EIS Project Manager MN-DNR St Paul, MN RE: Polymet mining comments Dear Ms Fay, I am writing about concerns I have over the Polymet mining project, proposed for northeastern Minnesota. I attended the informational meeting that was held a few weeks ago in Brainerd at the Central Lakes Community College. Some of the concerns I have could not be adequately addressed at the meeting, There is no way this project should move ahead until these concerns can be solved. The problems are too complex to include here in detail, but I would be happy to provide this information. In general, we have a foreign company, with a less than stellar record of following required procedures, wanting to extract the wealth that belongs to all Minnesotans. Being a for-profit company, they will naturally want to take every shortcut possible. It wasn't clear what measures could be in place to force this (or any other) company to comply with rules Minnesota sets up. There was no provisions to prevent Polymet from simply selling off their company's mining to other companies that may not have to follow the same rules. There will be environmental impacts immediately, and long term environment and pollution problems, possibly lasting hundreds of years, requiring cleanup and maintenance. A huge "damage deposit" must be required: cash in hand for Minnesota. It would be foolish to think that 50 or 100 years from now, if Polymet didn't return to address the problems, that Minnesota residents and taxpayers could simply send them a bill for any cleanup costs incurred by the people. Besides, at that point it would be highly unlikely that Polymet would still exist in a legal, solvent form, with sufficient cash reserves to pay for any such damages. Minnesota isn't new at this sort of thing. As George Bush tried to say, "Fool me once, shame on you. Fool me twice, shame on me." We went through all this with the taconite mining years ago. We can't trust to luck having a concerned and strong-standing judge in any future matters. I'm sure Polymet has studied this, and structured ways to get around any future 'environmental judges'. Try to imagine the huge cesspool Lake Superior would've become, had it not been for the force and determination of one man, Miles LoRd I used to drive up the North Shore for work in those days; the lake looked terrible, with streaks of mining pollution from Two Harbors almost to Duluth. These resources belong to the people of Minnesota, and if we leave them in the ground, they'll still be there later should we change our minds, or find more protective ways of mining. Any jobs from these mining activities, would soon dry up and be gone, just like the iron mining cycles. Once we mine it, the resources will be gone and we'll be back at square one. The May-June 2013 issue of "Minnesota Conservation Volunteer" had an article addressing some of the concerns of effect of Polymet mining on the Native wild rice crop, page 9- I submitted a response to it, which DNR asked if they could publish. It appeared in the July-August 2013 issue, page 4- I copied it here below: "Wait, now. "Wild Rice under the Microscope" (May-June) says lake sulfite levels have been under 10 ppm, and that even so, rice beds and production declined dramatically. But mining companies want to allow even more sulfite. More copper and iron mining will "generate millions of dollars". For who. A bunch of already wealthy investors. Let's nationalize mining, so any profits got to the people. Private pockets are already overflowing. It's nice to have copper and iron. But it's more important to have food to eat, and to preserve the means for food production. No one I know can eat copper or iron. Food, air, and water are basic necessities. Smartphones, DVD players, or cars are not. Mike Robertson, a consultant for the Chamber of Commerce, wants to "create jobs". That's not true.

Al Rudeck

18079

Good evening. I am Al Rudeck, R-U-D-E-C-K, and I am pleased to share my perspectives about PolyMet's land mine process and facility restart and associated land exchange and I thank and have full confidence in the abilities of our state and federal agencies who are experts in their field and well-qualified in how to apply sound science in the development of the SDEIS. See, I'm a professional chemical engineer licensed here in the State of Minnesota. I've taken the oath as an engineer to duly protect public health and welfare. I wear this stainless steel ring on my pinky of my working hand to remind me, daily, of the service oath. I use the science to serve humanity and by using the best of earth's precious wealth and I've reviewed the SDEIS and I believe it's fully formed, and well defines the current, and proposed developments. It's sophisticated modeling and engineered solutions proposed by the agencies and the company, in my professional judgment, will be enable PolyMet to perform at or beyond the stringent state and federal requirements to protect water quality on all fronts. In fact, the overall project will reduce background concentrations in sulfates and not increase them, as well as reducing mercury, and not increase them. Each of the proposed technologies, from advanced liners to reverse-osmosis systems are proven and reliable. No one can deny their applicability to perform as they're used countless applications in our region landfills, sustained county landfills, as reverse osmosis for the water treatments, used in water treatment facilities in many cities and also in many home drinking-water systems. And in terms of the water quality involved in the SDEIS, it is very robust in my view. Groundwater and surface water modeling was run into 2,400 and 6,000 time periods of simulated productions using a wide range of assumptions in order to stress the analysis. Because of the effectiveness of these engineering proposed plan and expected permit limits, I anticipate the real lifetime periods of water treatment will be a mere fraction of the two or 500 years noted. This company, this project, will always meet our stringent water standards, always. See, my family and I have called Aurora White Lakes its home for nearly a decade. While we currently resides in Esco, we own and enjoy property on White Water Reservoir right here on the Partridge River watershed. And as the former two-term Hoyt Lakes City Councilor around the time when LTV closed, I know firsthand how critical quality mining, maintenance and spinoff jobs are to the East Range. They provide basic living essentials for hundreds of families and I look forward to the prospect of job creation the PolyMet Project brings, and moreover, the high-quality metals to be produced representing important new and domestic sources of essential clean copper-nickel and other precious metals that fuel modern life, including wind turbines, hybrid vehicles and other modern necessities. Through the SDEIS's science and downstream permitting, we can have vital employment for our families, while having open access to the cultural, scientific and recreational charges of our area. Thank you.

Alaina Kelley

I have reviewed the PolyMet NorthMet supplemental draft environmental impact statement, and the Environmental Protection Agency (EPA) review of the SDEIS. As a Minnesota taxpayer I request that the SDEIS be rejected because it lacks accurate estimates of the economic costs of the proposed NorthMet sulfide mine. I see three potentially expensive side effects of the proposed NorthMet sulfide mine: 1. Active treatment of polluted water and other annual maintenance of the mine site and waste site for at least 500 years. 2. Known pollution resulting from untreated water that will be costly to Minnesota to clean up, or costly to leave polluted (loss of natural capital and health costs). 3. Expected pollution from the accidents that are most likely to occur in and around sulfide mines. SDEIS does not give a comprehensive estimate of how much these three side effects of the proposed NorthMet sulfide mine would cost. As a Minnesota taxpayer, I want to know if the potential benefits of the proposed NorthMet sulfide mine outweigh the potential costs. The SDEIS does not give a detailed, comprehensive and secure plan for how PolyMet or its financial backers will provide full coverage these three side effects, over a period of at least 500 years. Without such a plan, multiple generations of Minnesotans are at risk of being left to pay for the three side effects stated above. The SDEIS does not analyze the risk not fully pay for water treatment, site maintenance, pollution, or accidents. I request that the SDEIS be rejected and specific revisions be solicited: 1) Estimate of economic costs of the mining side effects stated above. 2) Analysis of the risk that PolyMet not fully pay for the costs of mining side effects stated above. Only with an SDEIS that includes these two revisions can the Minnesota state government and Minnesotan taxpayers make an informed decision based on cost-benefit analysis of the proposed NorthMet sulfide mine. Thank you for considering my request.

Alan Andreae

40380

From Alan Andreae 644 E James St Ely, MN 55731 I believe after reading the SDEIS that Polymet should be granted mining permits. The research done by the governmental agencies should be adequate to allow this project to move forward. The jobs are disparately needed in the Arrowhead region of Minnesota and with the scientific research that has been done I see no reason permits shouldn't be granted. After mining starts there will be sufficient monitoring by both the company and governmental agencies to guarantee the process will not affect the quality of the Arrowhead region.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest the boundary Waters Canoe area of northern Minnesota, And Lake Superior, are too important to our environment to risk a mining of any sorts in that area. This area has been used for generations for people to enjoy the great outdoors and have clean water and beautiful forests. Mining in this area would destroy something that cannot be replaced and pollute a beautiful Lake superior and its watershed. Please, do not even consider allowing this mining to happen, it is too important to even think about. Sincerely, Alan Engebretson 1008 Frontenac Ave Stevens Point, WI 54481-3233

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Lisa, it isn't rocket science Sincerely, Mr Alan Hughes 111 1st St Excelsior, MN 55331-1713

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Glencore Xstrata plc is an AngloSwiss multinational commodity trading and mining company headquartered in Baar, Switzerland and with its registered office in Saint Helier, Jersey. The company was created through a merger of Glencore with Xstrata on 2 May 2013-[3] As of 2013, it ranked twelfth in the Fortune Global 500 list of the world's largest companies.[4] As Glencore, the company was already one of the world's leading integrated producers and marketers of commodities. It was the largest company in Switzerland and the world's largest commodities trading company, with a 2010 global market share of 60 percent in the internationally tradeable zinc market, 50 percent in the internationally tradeable copper market, 9 percent in the internationally tradeable grain market and 3 percent in the internationally tradeable oil market.[5][6][7] Glencore had a number of production facilities all around the world and supplied metals, minerals, crude oil, oil products, coal, natural gas and agricultural products to international customers in the automotive, power generation, steel production and food processing industries.[6] The company was formed in 1994 by a management buyout of Marc Rich + Co AG (itself founded in 1974).[6] It was listed on the London Stock Exchange in May 2011 and was a constituent of the FTSE 100 Index.[8][9] It had a secondary listing on the Hong Kong Stock Exchange.[10] History 1974 to 2000 According to an Australian Public Radio report, "Glencore's history reads like a spy novel".[11] The company was founded as Marc Rich and Co. AG in 1974 by billionaire commodity trader Marc Rich, who was charged with tax evasion and illegal business dealings with Iran in the US, but pardoned by President Bill Clinton in 2001-[12] He was never brought before US courts before his pardoning, therefore there was never a verdict on these charges. In 1993, commodity trading and marketing company Trafigura was "split off from" Marc Rich's group of companies.[13] As physical commodities traders, along with Tr

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr alan johnson 129 pavilion hill somers, MT 59932 (406) 857-3343

Alan Knaeble

Alan Knaeble 311 Warwick St St Paul, MN 55105 HYPERLINK "mailto:hallermoses@gmail-com" "mailto:knaeb001@umn-edu" Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 March 12, 2014 Re: Public Comment submittal: Supplemental Draft Environmental Impact Statement, Polymet Mining, Inc.-NorthMet Mining Project and Land Exchange. E-mail directed to HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us" "mailto:NorthMetSDEIS.dnr@state.mn.us" Dear Ms Fay, Please consider the following comments with regard to the Supplemental Draft Environmental Impact Statement on PolyMet Mining's proposed NorthMet Project (SDEIS). I am a lifelong Minnesota citizen, age 64, and have worked in Minnesota for 31 years as a geologist, 8 years at an environmental engineering/consulting firm, and then for the last 23 years as glacial geologist for the Minnesota Geological Survey. My work as a glacial geologist entails mapping Minnesota's surface and subsurface glacial deposits to provide basic geologic information to citizens, community and government agencies, and businesses to assist them in understanding the geologic conditions for making decisions in regard to such issues as surface water and ground water use and protection. The following comments reflect only my personal perspective, not that of the Minnesota Geological Survey. Comments on the SDEIS 1- (addressing section 4-2-2-2-1) Surficial glacial deposits in the vicinity of the mine site and in the region are primarily composed of sand and gravel outwash and stony coarse-grained till deposited by the Rainy lobe, an ice advance during the most recent glacial period. The permeability of these deposits tends to be high. As stated in SDEIS they are relatively thin over bedrock. These conditions suggest that in this region ground water exchange between bedrock and glacial deposits is the norm. Lakes and streams are the surface exposures of the ground water, therefore they are interconnected with groundwater in the bedrock. I have two major concerns: First, the former mine pits that will be used to store mined waste material will be over 600 feet deep into bedrock. Ground water that accumulates in these pits will be contaminated by waste rock and will move following the regional flow through bedrock fractures and will have the potential to affect the entire water system down gradient. Second, since the hydrologic system (groundwater in the bedrock, ground water in the glacial deposits, and the surface lakes and streams) is interconnected, the potential for contamination and spread of the contamination, is very high. If the PolyMet project is permitted as outlined in the SDEIS I believe pollution problems will be inevitable. The only questions in my mind will be. How severe and how wide spread. 2- The public comment period for reviewing a document of this complexity and size, over 2000 pages, is inadequate. I would suggest extending the public comment period for an additional 90 days to allow more time for reading through the document and formulating comments. 3- The history of sulfide mining shows that environmental problems are pervasive and wide spread. There has been no acknowledgement of these facts or discussion about them in this document. Without addressing how PolyMet will avoid these problems for this mine, what assurance do the citizens of Minnesota have that these same problems will not occur again. 4- There is no Financial Assurance Plan. It is imperative that a comprehensive plan be presented to the public before the public comment period is over and before a permit is issued. As tax payers each Minnesotan may have to foot the bill if expenses due to remediation of mining problems are not adequately covered by a detailed Financial Assurance Plan. Thank you for listening to my comments, Sincerely, Alan Knaeble

Alan Muller

47778

Dear Ms Fay, Mr Bruner, and Mr Dabney: I have read much but not all of the 2165 page SDEIS for this project, as well as some of the previous iterations of draft EIS documents for this project. I have formed some impressions, described in a posting entitled "The unending PolyMess ." which is posted here: <http://www.alanmuller-com/the-unending-polymess/>. This posting or document is incorporated by reference into these comments. The essence of my conclusions are that, in spite of revisions to the original scoping documents, the present SDEIS fails to conform to the letter or the intent of the Minnesota Environmental Policy Act and the National Environmental Policy Act. The SDEIS fails to accurately describe the impacts of the NorthMet project as described by the applicant. Numerous deficiencies have been identified by Water Legacy and other commentors. The SDEIS lacks a meaningful evaluation of alternatives. The SDEIS fails to consider the impacts of, for example, electricity generation on the scale required to extract and process the volumes of ores projected-240 million tons over a period of twenty years. How many megawatt hours are involved and what would be the source. The impacts of generation .. Further, the SDEIS fails to recognize the probability that the NorthMet project would expand in size and duration subsequent to permitting. I address this in my "Polymess" posting by comparing the project description provided by PolyMet-and apparently accepted at face value in the SDEIS-with the projections by Edison Investment Research Limited. Edison notes: "We look for management to create additional value through expanding capacity or consolidating the Duluth Complex. In addition, we believe PolyMet might be able to optimise NorthMet's ore processing rate while staying within the permitted emissions level." Further, it is clear that several other copper-nickel mining projects are projected in the area. "The NorthMet Deposit is one of 10 known significant mineral deposits that have been identified within the 30-mile length of the Duluth Complex and just south of the eastern end of the Mesabi Iron Range." Thus, it is clear that looking at the NorthMet project in isolation violates basic principles of environmental review and cannot give us a trustworthy indication of cumulative impacts. The most recent comments by the US Environmental Protection Agency rate the present SDEIS as "Environmental Concerns-Insufficient Information (EC-2)" In my opinion EPA understates the deficiencies in the SDEIS, but clearly the agency does agree that the present document is unsatisfactory. It appears that the EIS process for this project began in 2005- At least 23 million dollars have been expended so far, by the Minnesota DNR and it's contractor, alone, yet environmental review issues with this project are no closer to satisfactory resolution in 2014 than they were in 2005- The closer people look, the more problems are seen. The time has come to make an "evidence based" decision, to recognize reality, and to shut this project down. These comments are submitted on behalf of myself and no other organization or party. Respectfully submitted, Alan Muller Alan Muller Energy and Environmental Consulting 1110 West Avenue Red Wing, MN, 55066 Box 69 One Stewart Street Port Penn, DE, 19731 302-299-6783 alan@greendel-org

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Alan Petri 12700 Dorchester Trl Apple Valley, MN 55124

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Alan Petri 12700 Dorchester Trl Apple Valley, MN 55124

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Alan Robinson 35 Calle Aragon Unit Q Laguna Woods, CA 92637

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Alan Sutton 4390 44th St NW Hackensack, MN 56452-2435 (612) 703-1396

Feb 17, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Governor Dayton and Lt Governor Prettner Solon After graduating with a master's degree in Civil Engineering from Delft University in 1953 I continued in 1954 at Harvard Business School to graduate with a MBA in 1956- After a first start on Wall Street since 1958, I have been in the investment advisory business, first in New York and later since 1967 in Geneva. One of my best professors at Harvard, General Doriot, Founder in the 1930's of American Research and Development and Digital Equipment inspired my interest in start-up ventures, and in my career I have on several occasions participated in interesting ones. Some of those have worked out in pharmacy and in the oil industry and now a "breakthrough" in Mapper Lithography in Delft. Since its foundation I have had an interest in Polymet Mining while following the painstaking efforts management made over a long period to obtain the permitting procedure; which now seems close at hand. Let me send you some observations. First from my investment experience, I learned that the most important thing is the management team Minnesota should be GRATEFUL to have an excellent team in charge.. Only highly experienced people can succeed in such a complex industry and as I have confidence in the PLM team all of whom joined from important positions because they believe in it I remain a long-term investor. My son is also in the investment business and understands the value of long-term investment. In view of my age (87) I leave my shares to my son and his children, who are already shareholders. For those who oppose Polymet operations they should consider that mining of copper is vital and that instead of importing from countries that do not have environmental standards equal to those in the US that mining is better done in the US. I find the reasons for obstructing the mining operations hypocritical. Those who oppose should realize that they need copper in their houses, cars etcetera. This approach is somewhat similar to CO2- Everything is concentrated on CO2 and no attention is given on the real dangers of pollution.. Trees cannot live without CO2-. So plant more trees. Stop pollution as they attack oceans, algae and reefs. The USA, India and Indonesia are among the most polluted countries. The Polymet project will create at least 1,000 jobs. Which is a conservative estimate in my opinion. The State of Minnesota will get substantial revenue. The surrounding communities will also benefit as PLM Management shows clear interest of community projects. With regards to environmental concerns, Polymet is committed to providing adequate financial assurance. All of us know that if you give a cookie to a dog he wags his tail for more. This looks to me comparable to some people asking constantly for more information in order to keep obstructing the permitting. With my best wishes, Albert van Daalen Champs d'Oisel Petit Sionnet 30 CH-1254 Jussy GE Tél.: +41 22 7591869 mob.: +41 79 6064772 HYPERLINK "mailto:avandaalen@bluewin.ch"avandaalen@bluewin.ch

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. ----- Albert van Daalen Champs d'Oisel Petit Sionnet 30 CH-1254 Jussy GE Tél.: +41 22 7591869 mob.: +41 79 6064772 HYPERLINK "mailto:avandaalen@bluewin.ch"avandaalen@bluewin.ch

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Alec Hendrickson 3219 west 44th street Minneapolis, MN 55410

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, alek roslík Minneapolis, Minnesota

TO: Lisa Fay, EIS Project Manager, and the Good Folks at DNR Dear Ms Fay: I write to point out deficiencies in the SDEIS prepared by the DNR. I am not part of any "Astroturf" campaign or organization. I am a MN citizen and extremely concerned by the proposed PolyMet mining. I outline my concerns. **THE SDEIS DOES NOT TAKE INTO ACCOUNT THE WATER POLLUTION THAT WILL RESULT IN POLLUTION OF RIVERS:** PolyMet states its mine will operate for 20 years, but will result in millions of gallons of polluted water, and this water may need to be treated for hundreds of years. The United States itself is just over 200 years old. PolyMet's own plan shows that millions of gallons of water will seep "offsite," untreated, during usual operations. There is no way it can adequately guard against toxic pollution of the St Louis River watershed, and Lake Superior itself, from pollutants such as copper, lead and sulfates. **THE SDEIS DOES NOT TAKE INTO ACCOUNT SEEPAGE INTO THE GROUNDWATER:** Polymet proposes some membrane liners and geosynthetic covers, but neither PolyMet nor the SDEIS notes that such liners will leak eventually. Additionally, PolyMet doesn't propose that such liners even be under all the tailings. The SDEIS evidently assumes the bedrock under the mine and plant sites is solid and will permit no seepage. This is nuts. **THE SDEIS DOES NOT TAKE INTO ACCOUNT AIR POLLUTION:** Extraction of copper and other minerals will require the waste rock to be ground into a fine powder. To the extent there are any mercury particulates, the pollution is a neurotoxin. Per the SDEIS, the waste rock will leach mercury at more than 4X the water quality standard This is per PolyMet's humidity cell testing. **THERE IS INSUFFICIENT FINANCIAL ASSURANCE:** The SDEIS is inadequate with regard to the financial assurance required of the company to protect the state of Minnesota and its taxpayers. You have asked for citizens to propose an amount. I will. \$100,000,000- Up front. One earlier draft in the newspaper suggested \$54,000,000- Those numbers are pulled out of the air, but will prove woefully insufficient once the pollution hits. Once the pollution occurs, Minnesotans can only engage in "reclamation"-a poor substitute for not polluting in the first place. **CONCLUSION:** I can only ask the DNR and other agencies take another look. I personally am very appreciative of the hard work done in preparing what turned out to be a 2200 page document. But these are critical defects. I am unaware of any other instance where large-scale, sulfide mining has been done without great damage to the environment. I want to say thank you for taking the time to read my comments. I know you will be conscientious, and as hard as it is to re-think what one has already done as an agency, we need to take a second look, and appropriately consider the costs and potential damage to the environment that are not accurately reflected in the SDEIS. Thank you again. Alex Andrea 2624 Windsor Lane Woodbury, MN 55125 [HYPERLINK "mailto:alexandrea@earthlink-net"](mailto:alexandrea@earthlink-net)alexandrea@earthlink-net _____

Hello Lisa, I am writing to you to express my concern over the proposed sulfide mine near Ely, MN. The proposed project poses significant, unpredictable, and functionally indefinite environmental health risks to both the humans and other biota of the area. I understand that proponents of the mine routinely cite the influx of jobs and taxable income that would boost the area's economy. I think that is a naive assessment of what this mine would accomplish over time. For starters, the mine, if all goes exactly to plan, will not be around forever. What happens when it must close. Additionally, I have not heard a satisfactory explanation of how polluted water, earth, and air might be treated in a fiscally responsible and ethical. I hope you will avoid advancing this dangerous and short-sighted proposal. Respectfully, Alex Christensen

I think it would be great to see the LTV site back in operation and a boon to the economy that the construction and operation of the proposed NorthMet mining operation would bring. I have been trying to understand the details of how this mine and processing plant will operate to better understand the issues involved with deciding whether this proposal should go forward or not. The benefits seem pretty straight forward. The possible hazards do not. From what I can understand the mines are three open pits that are up to 697 feet deep. This is obviously well into the aquifers that supply drinking water to the surrounding community and is connected to the series of aquifers throughout the area. I fail to see how during the mining process these aquifers are protected from contamination of the sulfides exposed in the mining process. The rock is obviously exposed to the air, which makes it reactive and the addition of water when it rains makes it seem likely to lead to contamination of the aquifer. The proposal of returning the waste rock, which is still reactive, to the pit also seems poorly determined. I do not see where a fool proof membrane is created whereby the reactive ores will not leach into the water table. Stock piling of some of the waste is at least above the water table, but of course allows the potential of runoff finding a way to the surface water ways. The plan seems to be saying it is allowing in surface water to help with the processing and then returning the wash water to the pit. This would seem to be putting highly acidic water into the unlined pit, allowing for an even greater chance of contaminating the water table. I don't want to pretend to be an expert in these fields, but I have some experience as a former septic inspector for Lake County where by I was charged with seeing that there was at least a three foot separation to the water table from any portion of a septic drain field. It seems this mine plan does not offer even as much protection from effluent that is far more caustic. The details of the plan seem troubling that, even if working properly, it will protect our water from contamination and even admits that both lead and aluminum will be discharged to a level higher than allowed. The plan seems to rely also on using reverse osmosis to treat the effluent. There is a good track record with some of these treatments, though mechanical difficulties can obviously lead to over-flows that would need to be addressed. I did not see adequate redundancies built into the plan for such mishaps or for the unforeseen weather events that are appearing to be the norm in modern times. What is most troubling is that there is an implied admittance that sulfides are a long-term contaminate. I see nowhere it is suggested that the wastes are ever to be rendered neutralized. I noted that the Flambeau River copper mine had used limestone mixed with the waste rock in an attempt to neutralize it. Apparently that has not worked adequately as the seepage now is above that allowed for sulfides and heavy metals. I won't pretend to know the chemistry here. I gather since limestone is not factored into this mining proposal that it is not considered a good solution, yet the fact there is nothing proposed to neutralize these contaminants suggests there is no known way to do so. The results of the Formosa copper and zinc mine in Riddle, Oregon suggests that the harm to the environment from the acid mine drainage is significant and not something we would want to see repeated. This PolyMet proposal does not ease my fears that something similar would not happen here. This anticipated long term contamination is dealt with by this plan by treating and/or monitoring the waste water for up to 200 years at the mine and 500 years at the processing plant using both mechanical (reverse osmosis) and non-mechanical means – which I would believe to mean simple containment. It is suggested that monitoring will dictate

6445

I would like to see that the decision on whether to allow the copper/nickle mining in the area near Ely be made within the context of a long range view. From what I have gathered the proposal is offering what may become 20 years of employment and profit from this mining venture while it is suggested monitoring of the mining may be necessary for up to 500 years. This alone does not suggest a favorable balance. Yet, also at risk is the altering of a sensitive, highly valuable eco-system that now supports the tourism industry for visitors to the BWCA and also visitors to the areas adjacent to the BWCA which caters to snow mobilers, motor boater, fishermen, hunters, berry pickers, etc Should sulfur pollution occur it could greatly impact this economy as well as possibly impacting the forest products economy of the area. Both areas of economic use are vibrantly alive today and are sustainable for the future. Mining is not sustainable. If the mining could be done with no chance of harming the other environments or economies I could support it, but from what I have seen I do not believe this is the case. Thank you, - Alex Comb Stewart River Boatworks P.O. Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

42026

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Alex Gillie Minneapolis, Minnesota

I am extremely concerned about the Polymet Mine EIS, especially the long term water pollution risks- There is not a realistic long term storage plan for the mine tailings; the the current plan has huge ground water seepage risks due to inadequate computer modeling based on optimistic best case scenarios. Minnesota has a tremendous resource in our water supply, we cannot let a single company's lack of planning ruin our economy of the future. We are talking about at least 500 years of waste storage so we should be talking about containment systems based on worst case scenarios. The current models are based on lower than usual water levels; a unusually wet year (which seems likely when we consider our changing weather due to climate change) could overwhelm the containment systems and lead to incredibly expensive and possibly irreversible groundwater and surface water contamination. In addition, these problems are likely to occur after Polymet has moved on/been turned into another company to protect the owners from financial liability. There are too many problems with the Polymet EIS to put them all in this email, in addition to what I said above, the Polymet Mine EIS allows risk to our fragile moose population, unique wild rice supply, local long-term tourism economies, local tribal economies and communities, and in general the Minnesota that we are leaving to Minnesotans hundreds of years into the future. Minnesotans 300 hundred years from now will curse our names if we let this company ravage our state. I was born in Minnesota, and i'll die here. I love this state, and what we are considering allowing is not in the long term interest of any Minnesotan, only the wallets of the multinational companies in control of Polymet. -Leo Alex Heegaard-LeGros 3451 18th ave S Minneapolis, Mn 55407 612 251 0663

43206

Dear Lisa Fay and the MN DNR, I have a comment relating to health and the proposed NorthMet Mine, and a comment related to mining in the region in general. Thank you for hearing and responding to my comments. I believe that the PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. For other projects here in Minnesota, such as the Central Corridor LRT project in the Twin Cities, HIAs have been conducted as part of the environmental review. With 1 in 10 MN newborns in the Lake Superior basin born with unsafe levels of mercury in their blood (according to the MDH), we must make sure that the proposed mine and the associated energy production facilities that will be the source of energy to the mine and processing plant do not cause health harm to the population. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. We must make sure that the mine does not negatively impact the health of locals (especially tribal communities whose psychological wellbeing depends on wild rice and other water-related phenomena), or of others in the state. If Alaska can do it, so can we. We owe it to our people, especially vulnerable and tribal populations. The PolyMet NorthMet mine could serve as a precedent that will tell other mining companies whether Minnesota cares about its natural environment, or whether it is open for development. I understand that development in general is necessary, but I question whether we as a state (or as a DNR) will ultimately (especially in the 500+ year timeline) want to promote a new and much higher-risk form of mining (copper nickel sulfide mining) in a the Arrowhead/Superior/BWCAW region, an area central to our economy (with \$1-6B of nature-based tourism annually) and to our state identity. These are important factors that have not been addressed by the current EIS process, even in the cumulative impacts sections. Therefore please take the following action: Whether through a programmatic environmental impact statement review process, a state-wide voter referendum, or another method, please determine whether sulfide mining in the Duluth Complex will be beneficial to the long-term interests of the state, and whether the majority of Minnesotans support it. The unprecedented public involvement in this EIS process indicates that it is important to the people of Minnesota. Improved though the public involvement process for this EIS was over others in the past, I know that not all Minnesotans who wanted to be involved were able to participate. Thank you for the opportunity to provide input on the PolyMet (SD)EIS. Due to the problems with the draft mine plan outlined above (does not include a health impact assessment, does not sufficiently consider the area-wide cumulative effects of this and other potential mines as would be recorded under a programmatic environmental impact statement), I believe the mine should not be built as described. Sincerely, Alex Reich PO Box 145 Marine on Saint Croix, MN, 55047

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, As a native of the Great Lakes basin, I oppose this project. I will always consider this vast resource my home, and I feel moving forward with this mine will greatly affect my home in the most negative ways possible. Please do not allow the destruction of the Boundary Waters and Lake Superior to take place. The loss of the health of these great places is NOT worth the dollar amount that will be gained from this sulfide mine. So please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Alexander Rosen 2355 Glendale Blvd Apt 3 Los Angeles, CA 90039-3258

Alexandr Yantselovskiy

40403

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Alexandr Yantselovskiy Svyatoshyn'ska vulytsya Vyshneve, ot 08132 UA

Alicha Greenlee 18348

My name is Alicha Greenlee and I am so excited to be here to speak to the population that is under 25. All right. I grew up in St. Croix Falls, Wisconsin, which is right next to Taylor Falls, and this area here (phonetic) is very beautiful scenery, and you know it. So, naturally, I grew up with a deep appreciation of nature and its riverways. Also, I am representing myself, as well as an organization called CEPAC (phonetic), which stands for Clean Construction For Tomorrow (phonetic). I will get to that later. Okay. I am the president of an environmentally conscious organization and as well am an involved member of the community, and I think that the PolyMet project is a great asset to our community. Their safe technologies and their (inaudible) processes, they will be providing (inaudible) services, as well as, even more importantly, jobs for our state. I forgot to mention that I am a UMD student. I major in biology. All right. Because we all believe (phonetic) in conservation, specifically that our lands and forests should be managed responsibly, so that they can be enjoyed by future generations. The proposed mining project meets many of CEPAC's (phonetic) criteria. The first being, the elements being mined in Minnesota by PolyMet are in high demand and are presently being extracted in all the world by much less conscious operators in Russia and in China. We need these resources, and the more we can get responsible operators, the better off we can be. Secondly, clearly for prosperity and environmental protection, prosperous countries and regions can afford to protect their natural habitats. And this project will undeniably improve the economic conditions in northern Minnesota. I believe myself that my peers will create safe technology in the future to protect watershed issues that have come up in this debate. I also want to state that – excuse me, technology. So great. I also wanted to say that a lot of the copper and precious metals that are being mined, they are needed for technology, especially green technology that is so important to our society today. I think that we need to come to a compromise. I think that that is a balance between conservation and in providing economic opportunities for our state. That's all I wanted to say. So, thank you for the opportunity.

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. I understand that this is a tough issue but we are at a major crossroads. We have to make a major shift and stop this path of destruction. Please think about your children and their children. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Please dig into your heart and do what you know deep down is right. Stop this from ever happening. Sincerely, Mrs Alicia Newell 826 N 9th St Saint Peter, MN 56082-1264 (612) 229-0034

Alison Aune

44879

March 13, 2014 Dr Alison Judith Aune-Hinkel 5409 London Road Duluth, MN 55804 Dear Department of Natural Resources, I am writing to say NO to the proposed Polymet's sulfide copper/nickel mining in Minnesota. I have followed the reports, televised meetings, TV commercials, and newspaper editorials and it is clear: Sulfide mining pollution would forever change Minnesota. We cannot allow our natural wilderness, the animals that live there, the wild rice harvest, the Boundary Waters, Lake Superior, and other waterways, our air, and the health of our citizens to be put in danger. The Animals: I have read about the dangerous impact on moose habitat, but that analysis is lacking. We cannot allow thousands of acres of moose habitat to be destroyed; The Canada Lynx is listed as a threatened species under the federal Endangered Species Act. Lynx have been tracked on land adjacent to, and on, the PolyMet mine site. It is very serious if the PolyMet mine is built; it would destroy 1,450 acres of designated critical habitat for the Canada Lynx, habitat essential to the conservation of a threatened species. We must not allow the fragmentation and loss of habitat for moose, Canadian Lynx, and other wildlife. Wild Rice: Wild rice is sacred to the Ojibwe people, and is a symbol of our state. Wild rice beds downstream of PolyMet would become polluted with toxic sulfates. Millions of gallons of untreated polluted water will escape every year, and the mine plan predicts an increased chance that water exceeding the sulfate standard will be released at times, years after closure. Dirty Water: Minnesota is the Land of over ten thousand lakes. How can we risk the need for extensive water treatment of our waterways for hundreds of years. Who would pay for the cleanup. Taxpayers would have to pay for this and I do not support the huge cleanup bills when sulfide mining companies have declared bankruptcy or walked away from closed. Dirty Energy: PolyMet would be a huge consumer of electricity, using some of the dirtiest coal power plants in Minnesota. PolyMet would emit 707,342 metric tons of carbon dioxide into the atmosphere every year. This must not be allowed; it would contradict Minnesota's goal to reduce carbon emissions. What about The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- Scientists have already stressed that Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. Human Health: Exposure to air and water pollutants like mercury, asbestos-like fibers, and arsenic would have a significant impact on local communities. I have listened to the physicians who have spoken out against this mine to the very real health dangers it poses. Please carefully consider these dangers. Sincerely, Alison Aune-Hinkel - Alison Aune, Phd Professor and Area Chair Art Education/Museum Education University of Minnesota Department of Art and Design School of Fine Arts 317 Humanities 1201 Ordean Court Duluth, Minnesota 55812-3041 218-726-6216 <http://www.alisonaune-com/> (password aaune) HYPERLINK "<http://www.d.umn-edu/art>"www.d.umn-edu/art

The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Allan Bostelmann 3655 45th Ave South Minneapolis, MN 55406

Allan D. Henden 57882

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

18303

Allan Frink. The current system you have is being gamed mathematically by people bussing in large numbers of people. When they bus them in, they make sure everybody fills out a card. You have random people that arrive that aren't busted in. Only a small percentage of them put cards in. They all go into one pool. You have people who had their cards drawn, they use their entire time talking about nothing about these issues. Yet, other people that, apparently, when their name was called, can't do a filibuster during their time up there like other people. They say, "Oh, I want to defer it to the specialist, so and so," who is in the back of the room, and that person has to walk up to the front to use the time. So you have people that aren't doing productive comments during the meeting, consuming time, so that you can't have additional ones coming And it is all mathematics. And so what you really need is two bins for putting in things; pro and con. I realize that even though they are there, some people will put in the other one, so that you can improve your hit rate anyway. So pretend I'm for it, but I'm against, but so that it gets picked up. So then what you do is you take the same number out of both of these, you put them in the hopper and you mix them. You only draw a small percentage out of that hopper. You can either empty the hopper and do this again and then reply -- and then start over again by mixing parts of the ones together, or you can just add to it and take a small percentage. You will get a better distribution between the bussed in people and the people that came individually. What's happening out there is somebody who says, "I want to sell a gold field and I want to make my money as quick as possible, so I'm going to throw a few pieces of gold around places and salt it. They essentially salted the dialogue. Because they're gaming it mathematically. And I can see it. But I see math. I see everything. I read everything. I read people. I read books. In high school I even read one guy that always had to be white when we played chess and he would mix it up behind his hand, and I'd go, "I'll be black today," and "I'll be white today," and I was always right. He could never figure it out. He always squeezed the white one tighter, so he had white knuckles on the white. And I found it more fun than instead of always picking white, to mess with his mind. But he was -- he was ceding (phonetic), and I was able to observe it. I observed it in this meeting. I don't know what the ones were like up in Duluth or Aurora, but this being the third one, they've had one try, two tries, and they are very good at getting down here. And so you can't -- you can't -- you can't do this the way it is because it doesn't work mathematically. Any time that people bring a large group together, it doesn't work. Also, the paper here, this really should be a scientific study. That paper should have a summary. It should have what we did, how we did it, and 98 percent of it should be raw data. And the what we did and how we did it is telling you how we are using the raw data. What we have is incorrect data because one gauge was wrong. We have massaged data. We have no idea how it was massaged. And yet, we are supposed to use this as fact and make comments on it. We also aren't supposed to look at other things, like the fact that MinnTac is just a taconite mine, which has tailings ponds, which is just normal, and they're producing sulfite leakage into two different watersheds, and have been since 2004. That was in the paper today only because they were talking about they want to expand another 480 to 90 acres of mining and they are trying to say, well, they shouldn't have to do an EPA study for this because they have done two other ones already and they're working with state agencies attempting to reduce the pollution going out of their tailings. It's the same rock that this is. They can't handle it over here, where they've been in operation since '67? I think that's '67 when the construction was done. Because I think that's when my dad had friends that moved to Arkansas and worked construction. They left MinnTac construction for that. And they haven't solved the problem in ten years. And there was nothing in there about how much they actually reduced or trying to reduce, making an effort. That doesn't tell you anything in the paper. I don't expect that in the paper. But in a scientific study here, or whatever this is, that kind of stuff should have been there. And in the paper this week, there was the thing saying, oh, well, a different mine has a thing in the Partridge River and they're showing the water is running three times as fast as the one that was used here, before they massaged the data. Computer models just manipulate things. They want to put the rock in a hole where the groundwater runs into it, I mean from the ground, not running in. That will happen, too. But the water comes in from the old pits, from the bottom. It has for decades. They wanted to put the rock in there and cover it with water, so it doesn't have oxygen, but there is oxygen in the water. The water fluctuates through the ground, depending on how the aquifer moves. Stuff is going to go into the aquifer. They're not even looking at that. They're saying the water can't do that. If water can flow one direction, it can flow the other way. I used to live out by Biwabik. Biwabik had open air lagoons for their septic. We were -- we were across the road from the second lake downstream. Every time it rained, we could smell sewage in the lake. So, you can't even handle sewage, how are we going to handle sulfuric acid? I haven't seen anybody talking about how they are going to have the mercury that is in that rock and all of the other stuff, because there is all of the hard metals in it, too. That's why there is gold and the platinum, because there is lots of them. The problem is because it is low volume. But when you start crushing it all up, to powder like for makeup, which is what they crush that at, that's what they did for the taconite, too, all of that stuff is released. That is also the exact same rock that Silver Bay's reserve mining processed, and they dumped their tailings into Lake Superior. And then in 1970 Duluth had to put in a new water treatment plant because of asbestos like fibers, and we had to drink carton water, which the civil defense provided for a long time, and then dairies provided water free of charge because they were getting paid from the government somewhere to provide water that we could drink. So, once I saw what happened in West Virginia, I already knew that. I lived in Duluth when that happened. I still have my blue carton that says, "Civil defense," that I drank water out of. The first one. I kept it. And nobody is correlating stuff. And when they bring people in to talk

Alphabetical by sender's first name

about something, they talk in this little, tiny, narrow vein. It is like saying, "Yes, blue eyes, all babies are born with blue eyes mostly." And yet the discussion was on what the vision is. But, no, we just – because if you -- if you -- if you talk too wide, it is hard to lie. But if you talk narrow, it is easier to lie and still sound like you're telling the truth. And that's what I've seen out here. I've seen wasting. I've seen the gold field salted. I know it is the first time that you guys are doing this, it is actually the third time, but people are organized. Don't have one like this and prove it. I guess so. Unless you want me to talk about the Buell (phonetic) mine that is south of it. And when it was filling and everybody said, "Oh, we can't pump the water out of that and put it in the stream because it would go into the Mississippi and pollute it," even though they were afraid the water was going to run up and flood the town of Buell (phonetic), or Boguee (phonetic) rather. And of course it leveled off beforehand, so everybody was like, "Oh," and that. We already know the mines don't do anything because every mine, as part of their thing to do is that they have to put the bumps back into the holes. And I can count the number of holes that were filled in the mining industry over the entire time on my fingers, on my foot, which is zero. So, and I've seen -- I saw LTV go broke because they created a brand-new company. They shipped equipment to a different spot, sent that equipment back and said, "Oh, well, we're now broke." So, that's exactly what will happen here if they are not getting enough of this stuff out. The Swiss company is going to say, "We're not giving you any more money." And of course they won't have nothing. There won't be anything there to do any treatment or any repair. It will be as bad as when the reserve closed and we wound up with that mega toxic dump up in Silver Bay. You got to look at practices and know they repeat. Everything repeats. So I'm done.

Allan King

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Allan King 4109 Robinson St Duluth, MN 55804

Mar 10, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Allen Doran 210 College Dr Melbourne, IA 50162-1008 (641) 485-6992

Allen Killian-Moore 18386

Hello. I am Allen Killian-Moore. I would like to call for a 500-year comment period instead of 500 years of downwater pollution. I think the SDEIS inadequately addresses workers safety and inadequately addresses ground water pollution issues. And I think we need more time to look at those things. I would like to quote Jurassic Park. "Your scientists were so busy thinking about whether or not they should that they didn't stop to think" -- or "whether or not they could that they didn't stop to think whether or not they should." I'm a tenth generation working class Minnesota. I've been involved in three labor unions. And I will say as a working class union person I do not support the PolyMet. I do not trust them to have the rights of the workers in mind. And you should not trust them either. Thank you.

Allen Oberg 47195

Polymet should go ahead with providing upfront evidence of complete insurance coverage in event of a pollution incident with their mining operation since they are so sure the high-tech methods they use will not cause groundwater contamination. Allen Oberg

Allen Richardson 18342

I am Allen Richardson from Duluth, R-I-C-H-A-R-D-S-O-N, with an organization called Obard (phonetic). This is a matter that speaks to me personally. Of the many inadequacies and deficiencies in PolyMet's Supplemental Draft Environmental Impact Statement, I am going to focus on PolyMet's greenhouse gas potential. The potential of greenhouse gas emissions from the PolyMet mine, sulfide mine and processing facility are staggering, including the fossil fuels burned on site to run the plant. And the potential carbon dioxide emissions would be 707,342 metric tons per year according to SDEIS Page 5-405. So, to put this into perspective, I looked at the Co2 emissions for the entire City of Duluth from 2011. The whole city, commercial, industrial, and potential transported waste emitted 2.7 million tons of Co2 equivalent greenhouse gasses. PolyMet alone would emit more than one-fourth of the Co2 equivalent of the pollution of all Co2 levels (phonetic). Over a 20-year life plan, PolyMet would emit 15,790,752 tons of Co2 equivalent pollution, more than ten million tons from burning coal and running the processing. That's on Page 5-406. With that in mind, I request that the PolyMet project not be permitted without more studies, comparatives and standards changes to reduce Co2 emissions. The SDEIS should be done with more comparatives and alternatives that would reduce Co2 emissions, starting with changes in vehicle fuel and to reduce our reliance on coal power. Thank you.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. This is too hazardous to consider drafting the MpolyMet Mine in northern Minnesota. We have too many fragile natural plants and animals to say nothing for the environment as well, to consider this risky endeavor. Please do the right thing and look for those minerals elsewhere. We have too much at stake in Minnesota. It is imperative that a Health Impact Study be done to prove the reasons for my concern. Sincerely, Allene Burns Sincerely, Mrs allene burns 5708 Warden Ave Edina, MN 55436-2245

Allison Fischer 38957

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Allison Fischer 3240 Fremont Ave S Apt 103 Minneapolis, MN 55408-3570 (612) 401-4218

Allison Foy 42084

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Allison Foy Minnetonka, Minnesota

Allison Herreid 42986

Dear Lisa Fay, EIS Project Manager, I have attached my comment about the proposed mine and the SDEIS. Please take the time to read through what I have to say. Thanks for your time, Allison Herreid [HYPERLINK "mailto:allisonherreid@gmail-com"](mailto:allisonherreid@gmail-com)allisonherreid@gmail-com 11619 Edison St NE Blaine, MN 55449

Allison LaBonne 45521

Dear Sirs and Madams, Please protect our most important natural resource: fresh water. Surrounding water would be contaminated by the NorthMet Mine, and though it creates a few jobs and a some tax revenue, the bulk of the profits go to foreign countries. The risks for environmental degradation are too high. The risk that taxpayers will end up footing the bill for long term clean up is too high. The increased risk of chronic illness is too high. When it comes to acid mine drainage, a little goes a very very long way. Please protect our state. Thanks, Allison LaBonne

Allison Plathe 44324

Dear Ms Fay, Dear Ms Fay and Mr Bruner, I am sending this email to let you know that we do not support the PolyMet mine and we do not think that the PolyMet NorthMet SDEIS is adequate. In fact, we want you to reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. The PolyMet SDEIS is an inadequate assessment of human health impacts and the PolyMet sulfide mine and mine wastes proposal poses an unacceptable risk to the health of fetuses, infants, children and adults in Minnesota. Please reject both the PolyMet SDEIS and the PolyMet mine. We have a great environmental state here in Minnesota. I know that you are weighing the 200 jobs that this mine will bring to the area, but it is not worth it to destroy our natural resources. We need to find another way to help those 200 folks get work. Thank you for your consideration. Allison Plathe Allison Plathe 1905 Portland Avenue St Paul, MN 55104 651-491-1441

Allison Spoelhof 52297

Hello, I live in Duluth, MN, and am opposed to the Polymet mining project. I have a 2 year old daughter and another on the way, and for their sake and for generations to come, please do not allow this mine to happen. No mine like this has ever had a good environmental track record, and short term profits are not worth long term environmental and health costs. This would be an environmental and health disaster for northern Minnesota. Please do not let this happen. Allison Spoelhof 2118 Abbotsford Ave Duluth, MN 55803

The SDEIS artificially denies the effects of water pollution on the St. Louis River. The SDEIS fails to recognize environment justice effects of pollutants such as metal mercury and (inaudible) found in fish, game, and wild rice as well as water. And cause particular harm to tribal members and low-income families who rely on fish, game, and wild rice. Please take the following actions to protect the impacts of the PolyMet project: Redo the SDEIS to disclose mercury concentrations and loading release directly or indirectly into the surface waters from all PolyMet sources. Redo the SDEIS to assess mercury impact without unreasonable assumptions, like the off-site or Embarrass mercury increases, or the claim that 99 percent of mercury is never released from tailings. Redo the SDEIS to evaluate the metal mercury bioaccumulation from air emissions of mercury and sulfide, water discharge of mercury, an sulfate and hydrological changes resulting from the PolyMet project. Redo the SDEIS to require a separate and clear health risk assessment prepared in conjunction with the Minnesota Health Department to analyze impact of all sulfide mines and plant emission releases and accumulations on health, including a description of the known human health impact of PolyMet's emissions and discharges in language understandable to the public; assessment of potential impact on residential wells from tailings basin seepage; health risk assessment for onsite workers at both the PolyMet mine and plant; assessment of cumulative mercury risk including actual (inaudible) in lakes already impaired; assessment of cumulative cancer and non-cancer risks from existing and additional sources of manganese, arsenic, lead, nickel, and other toxic chemicals, (inaudible) health risk limit and federal profile health analysis; assessment of all risks using a 70-year lifetime for exposure; assessment of cumulative risks of multiple chemicals in exposure wells, drinking water, fish, wild rice, on infants, children, and the elderly; assessment of cumulative risk of mercury contamination of the fish in the St. Louis River (inaudible); complete a measure TMDL study for the St. Louis River before finalizing the PolyMet SDEIS; reject unacceptable health and environmental health impacts on family and tribal members who fish and hunt and gather.

Alyssa McGillivray

Ms Lisa Fay I am writing in support of the PolyMet project and the SDEIS. My family and I live on Sabin Lake (the 1st of the chain of lakes on the Embarrass River). We have been following the project for 9 years. I support the project. The SDEIS is comprehensive, informative, complete. It's time to move on to the Permitting process. Alyssa McGillivray 6525 Voyageur Trail P.O. Box 351 Biwabik, MN 55708

To whom it may concern: The proposal to bring Polymet into the pristine land of Northeastern Minnesota is a dangerous one, filled with short term as well as long term risks. As the granddaughter of a man who worked in the Iron Ore mines in Hoyt Lakes, I fully understand that this area desperately needs jobs to bring back a struggling economy. But I also know, as a passionate environmentalist, that this is a short term fix to a long term problem. PolyMet is promising things that have the potential to fail, and the pristine wetlands and unique Minnesota wildlife can't take that risk. Even more importantly, the health of the people who live up there as well as the health of fresh water sources is in danger if PolyMet is able to proceed with their plans. PLEASE, do whatever can be done to stop this unnecessary risk from entering such a beautiful and wild part of Minnesota, not only for us, but for our children, grandchildren, and the generations that follow. Thank you, Amanda Heuring 2168 Cleveland Lane South Cambridge, MN 55008

54170

My name is Amanda. I am from St. Paul MN. I am against the sulfide mining because they're owners and tourists that cares and are fighting against it too. It will affect the lakes and rivers that are around the areas. And also [ILLEGIBLE].The lakes has been untouched ever since 1978 Wilderness in MN. Another thing that the sulfide mining will also affect the living things under the water.

Amanda Goettig

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Amanda Goettig Luverne, Minnesota

Lisa Fay, I am writing to submit a comment on the SDEIS for the PolyMet mining project. I have been to all the meetings and I am for this project 100%. I trust that the DNR has done a thorough job and our water will be safe. This project will help our local businesses and schools which are both in desperate need and have been since LTV shut down. It will have hundreds of full time employees and also millions of construction hours. Our local people need good paying jobs or we will loose more of our communities to other places if they cannot make a living here. We have been mining in this area for many years and I trust that it will be done safely. From the meetings I noticed that a majority of people against this project don't even live in the area or maybe just come a few times in the summer to stay. The people who live here want to work and have their children be able to stay in the area instead of moving away because of a lack in jobs. Thank you for your time in reading my comment. Amanda Johnson 6441 E Barker Road Gilbert, MN 55741 (218) 750-1807 Amanda Johnson Office Manager Office (218) 229-0100 Mobile: (218) 750-1807 Email [HYPERLINK](mailto:amandaj@amptekcontractors-com) "mailto:amandaj@amptekcontractors-com"amandaj@amptekcontractors-com Amptek, Inc. 112 Main Street North Suite 106 Aurora, MN 55705

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. The Boundary Waters is my home away from home, and the truest form of escape that I can imagine. It is a wonderful and serene area where I have made my most cherished memories, and I simply cannot fathom not being able to experience it with my unborn children. In a world where technology is expanding exponentially and nature is becoming less relevant, oases like the Boundary Waters are absolutely necessary for many who still grasp the overwhelming importance of the Earth itself. Of all things for there to be less of in this world, areas like the Boundary Waters wilderness should not be one of them. Sincerely, Miss Amanda Kelly 1509 Waverly Ave Duluth, MN 55803-2618

Amanda Lingwall

16157

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Good Morning, My name is Amber Arntz 58 N Yukon Drive Ely, Minnesota 55731 I support the PolyMet Project because PolyMet will have dramatic, positive socioeconomic impacts to a region that exists merely because of mining. This project is located in an area that supports mining and the jobs it will bring. Looking into a future without mining advancements, having only an economy based on the current prospects and tourism has a grim and bleak future for our youth and the area itself. Thank you for your time, Amber Arntz

Amber Bastian

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Amber Bastian 3848 Nicollet Ave S Minneapolis, MN 55409

Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining releases toxic metals and can create Acid Mine Drainage (AMD), polluting our rivers and groundwater for hundred of years - long after the profits are spent and the products buried in landfills. PolyMet's own study says that the water from the mine side would need at least 500 years to treatment. 500 years of cleaning up toxic, hazardous waste is not in the public interest. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Amber Garlan 9 7th Pl W Apt 346 Saint Paul, MN 55102-1184 (651) 249-7286

7050

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. The SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Amber Garlan 9 West 7th Place, apt# 346 St Paul, MN 55102 651 249-7286

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this test PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142). The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction. Lastly, the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters. Keep rice free from pollution. Sincerely, Ms Amber Garlan 9 7th Pl W Apt 346 Saint Paul, MN 55102-1184 (651) 249-7286

19412

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Please increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. The plan for Minnesota's first ever proposed copper-sulfide mine is over 2,100 pages long and has more than 730 references. A thorough, independent scientific review by the experts and the public will take more time than the current 90 day public comment period. Sincerely yours, Amber Garlan 9 West 7th Place, apt# 346 St Paul, MN 55102 651 249-7286

Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Amber Maslonkowski 506 E 47th St Minneapolis, MN 55419

Dear Ms Fay, To Whom it may concern, I am writing to comment on the SDEIS for Polymet's copper-sulfide mine. I don't think that the environmental damage to the area is worth the jobs that would be created by Polymet's mine. I am definitely against Polymet's proposal to swap 6,650 acres of good land in the Partridge river headwaters. I came to northeastern Minnesota 5 years ago in order to live in one of the last unspoiled wilderness areas of the country. There are a lot of Minnesotan's who come here to hunt and fish and harvest wild rice and just generally enjoy the clean wilderness areas of this part of the state, and I think that this mine could be really bad for the tourist industry. Not only that, but the pollution that this mine will generate will definitely be bad for the health of the people, animals and plants that will be downstream of this plant. Also, I heard that Polymet's SDEIS water model is not accurate; that the actual rate of groundwater base flow is 200-300% higher than the rate used in the SDEIS. It needs to be redone. PLEASE REJECT POLYMET'S PLAN. Thank you for taking the time to consider my comment, Sincerely, Amelia George 5970 Blesner lake Rd PO Box 535 Finland, MN 55603 Amelia George po box 535 5970 Blesner Lake Rd Finland, MN 55603 2182268261

Don't put in any more mines. We need more resourceful answers that will not hurt our future generations. Amethyst Hare-Heim 1702 North 24th Street Superior, WI 54880

Amie Stone 54204

This mine project proposal for Northern Minnesota will in no way be beneficial to the people of this state of the BWCA. As an avid canoer and camper, the BWCA is the perfect place to do so. The watershed is 100% pure, I can dip my canteen in the certain areas directly into a lake or stream and just drink. There has been undeniable evidence regarding the pollution associated with sulfide mining. It releases sulfuric acid into the water, lowering the pH and therefore harming critters. The "economic benefits" will not at all influence the area surrounding the mine, other than the few, short-term jobs it will provide. The negative aspects completely outweigh the "benefits." This project proposal is bogus.

Amy Barankovich 39365

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Amy Barankovich 3219 18th Ave S Minneapolis, MN 55407-4803 (612) 722-3370

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, amy clauson Scandia, Minnesota

Amy Donlin 40169

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Amy Farland 15111 Greenhaven Dr Apt D41 Burnsville, MN 55306-6141 (952) 435-5676

Amy Freeman

43088

Dear Lisa Fay- I think an open pit approach is particularly problematic and the feasibility of continuing necessary water treatment for at least 500 years is quite questionable. The real issue in terms of long term environmental detriment is this (from page 988 of the SDEIS): With the addition of water pumped from the Plant Site, West Pit flooding is projected to be completed by approximately year 40- When the West Pit water level rises above the top of bedrock, there would be a release of pit lake water into the West Pit Surficial Flowpath. The affected groundwater in this flowpath would migrate slowly towards the Partridge River. Pg 989: The idea that this solution is sustainable on the long term seems unlikely: Surface runoff would be routed away from the mine pits using a combination of existing and new ditches. The WWTF would continue to operate during long-term closure, treating excess water from the West Pit and discharging the effluent to the small Partridge River tributary. A WWTP would be added at the Plant Site to treat Tailing Basin seepage through operations. The reality is that there would be for the long term a very polluted pit lake. Over and over the document says that the WWTP (wastewater treatment plant at the plant) and WWTF (water water treatment facility at the mine site) will remain active for long-term needs, but it is very vaguely stated. The reality is that there would be water that is significantly affected by sulfides and metal leachates associated with the exposed rock in the pit and the waste rock in the "stockpile" for a very long time. Pg 210: It is also hard to envision that the hydraluc barrier could really be that effective as is illustrated. Lots of things happen in soils--animal burrowing, roots that would make it very hard to maintain an impermeable hydraulic barrier. Pg 233: These long-term closure activities would be ongoing until the various facility features were deemed environmentally acceptable, in a self-sustaining and stable condition, and until it were shown that water quality standards were being met. The idea that the site would reach a self-sustaining stable condition by around year 40 doesn't pass the sniff teSt They are writing this as if somehow the WWTF that they present as being necessary to prevent long-term discharge of contaminants from the west pit could sustain itself a few decades out. How could this be possible. Pg 240: PolyMet has committed to conduct demonstration projects during the Life of Mine and reclamation phases to establish non-mechanical water treatment systems to be used at the Mine Site. The WWTF would remain operational until water quality monitoring results demonstrate that a non-mechanical system could produce an effluent water quality, which is shown by pilot-testing and modeling, to achieve future water quality criteria at evaluation locations without the need for mechanical treatment. I read this to mean that Polymet really doesn't know how they can come up with a water treatment strategy that is sustainable for the long term. And this next statement from the same page doesn't mean much given the timescale over which we are talking and the reality that resources companies come and go, go bankrupt, etc: PolyMet would be held accountable to maintenance and monitoring required under permit and would not be released until all conditions have been met. What I don't understand in looking through the documents is how they both state the need for the WWTF to keep operating long-term at the mine-site, but then also say that they plan to be able to do this: Pg 233: When all reclamation activities required by the Permit to Mine are completed, a Request for Release per Minnesota Rules, part 6132-1400, would be submitted. This request would provide the Commissioner of the MDNR with detailed information on the final reclamation status of the NorthMet Project area. Who then

Dear Federal and State Agency Leaders: As a resident of Northern Minnesota, a fisherman and a wild rice harvester I am greatly concerned with the proposed PolyMet sulfide mine plan. Trading two decades of benefits for polluting this water rich environment with potential contaminants like arsenic, sulfate, manganese and heavy metals for at least 500 years just doesn't make sense. I ask that a better job be done in studying the impact of mercury contamination of fish and the impact of untreated pit releases to surface groundwater on wild rice before the EIS is finalized. The SDEIS does not address who will perform the indefinite monitoring of the on-site constructed wetlands. The SDEIS must reveal wastewater volumes, pollutant levels and it must explore options if something goes wrong(fails) during long term water treatment. I feel that the SDEIS is flawed because the models for the amount of pollutants to be released are based on data from other sites and not on the current water data from the project site or it's surrounding area. The company did not study the type of rock or the structure beneath the wetlands. I ask that you reject the SDEIS as inadequate and please do not allow PolyMet a State permit to mine. Thank you, Marc Smith 6977 Cramer Rd Box 446 Finland, MN 55603

Hello, I'm a lifelong Minnesotan and have enjoyed year-round outdoor recreation throughout the state since my parents took me camping as a child. Our natural resources and opportunity for public enjoyment of them set this state apart, and people come from all over the country and beyond to visit the Boundary Waters Canoe Area and Lake Superior. There is nothing like it anywhere in the world, and when I visit the natural highlights of other states, I am reminded of how lucky Minnesotans are to have such relatively unspoiled wilderness areas and clean water. It appears that the DNR is so focused on allowing mineral extraction that the agency has forgotten that clean water is our most vital resource, and an increasing rarity here and beyond. In order to let an outside corporation access one resource, copper, for 20 years, the DNR appears ready to throw away a much more important resource, water, for a much longer period of time. How it is possible that we are even talking about poisoning our water for 500 years, in two of the state's most environmentally sensitive and important areas. This is beyond short-sighted, it's criminal. Polymet has not demonstrated that they will mine responsibly, nor have they communicated any feasible plan for cleaning up the site. They may not even be in business in 50 years, much less 500- Why are they being allowed to come in and destroy our natural areas, contaminate our water supply, and ultimately leave the taxpayers with a mess that will never truly be cleaned up. I do feel sympathy for the unemployed mine workers, but it is long past time for them to move on. They cannot sit around for generations waiting for the old days to come back. PolyMet has indicated that many of the jobs will go to outsiders. Even the local jobs that are generated are temp jobs. In 20 years, those people will be unemployed once again. Minnesota has a very strong economy. Those workers need to retrain, relocate, and move on. We can't subsidize their romantic visions of the past with 500 years of poisoned water. It is the DNR's job to protect Minnesota's resources, not give them away to outside interests. In this era of climate change, habitat destruction, and species decline, we need to focus on preservation, not corporate giveaways. This project will leave nothing of any lasting good for Minnesota. If PolyMet wants our resources so badly, don't give them away — at the very least, make the company work hard to come up with a better plan. No one will create a clean method of mining if they aren't forced to. PolyMet has the money to innovate better, cleaner, safer methods, but if we don't ask them to do so, they won't. Make them try harder, for the sake of Minnesotans today and 500 years from now. Or better, turn down their request to destroy our precious wilderness and waters. When it's gone, it's gone forever. Amy Goetzman Maplewood, Minnesota

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Many, many sulfur compounds have a TERRIBLE ODOR. This is another reason I oppose sulfide mining. Winds could move the terrible smell over several states and in to Canada, hurting international relations. I grew up in Minnesota and go back every year. I have talked friends into visiting the state. I love the pristine wilderness of the BWCA. Superior National Forest should be left alone. It is a national treasure. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Amy Stevens Burnsville, Minnesota

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Amy Strydom 1160 Dellwood st s Apt Cambridge, MN 55008

Amy Wilson 43608

Dear People, I am adamantly apposed to the proposed PolMmet mine because it will endanger our collective watershed and ultimately it will harm Lake Superior. There is a grievous lack of responsibility to allow a sulfide mine to be built for the profits of a few when the long-term effects will harm the many. Human wants for monetary gain cannot and should not take precedence of environmental health. Sulfide mines have proven to be disastrous for living ecosystem. This mine will cause harm. It is impossible to monitor the tailings ponds for 500 years even if it were a safe option. Please do not accept this proposal to let PolyMet build this mine. Sincerely, Amy Wilson 77480 Evergreen Rd Port Wing WI 54865

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, AmyLeo Barankovich 3219 18th Avenue S. Minneapolis, MN 55407

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, ana perez avenida de valencia valencia, AB 46130 ES

I am writing to put in my comment on the EIS for the proposed PolyMet sulfide mine. After weighing the pros and cons of having such a mine in Minnesota, I fully believe that the proposed mine does not sufficiently make its point that the mine is in the best interest of Minnesota. Keeping my comments more specifically aimed at the EIS—I see a general lack of accountability for PolyMet and its investors for the environmental issues that are sure to follow a mining project that produces such large quantities of waste. Who will be held responsible for the environmental impacts 200 years from now. Also is there any contingency planning in case the new technology for controlling the inevitable pollution fails? I would like to see a revision that makes proposed plans for how to deal with every conceivable contingency plan.

Andre Leavitt 18248

Andre, A-N-D-R-E, Leavitt, L-E-A-V-I-T T. It's hard for me growing up when I did in this state that we're even considering letting this mine open, jeopardizing the watershed of Lake Superior. That is just madness for 20 years of jobs. I'm sorry, you got to move and find work elsewhere, start a business. Figure it out. But it's just -- I grew up in a different time. I'm just appalled by this, that the short-sightedness of 20 years could be looked at, and they never -- when companies come in it never works out the way they say. All we have to do is look at Delta Airlines and Northwest before them and see the jobs that came. It'll be -- anyway, it's madness, I'm against it, and I think if it comes to it, put it to the state and they will lose because a vast majority of people do not want this. Enough.

andre lima 42

Please do not let this highly risky mining operation potentially devastate our water and air. The only way to guarantee the safety and cleanliness of our water and air is to not allow mining. The EIS cannot account for all scenarios that could occur in real life, for example power outages, major winter storms or tornadoes that could damage the waste water treatment facilities leading to potential environmental contamination. For this reason I urge you to not permit this project especially being so close to our national treasures known as the BWCA and Voyageurs Park. Sincerely, Andre Lima 4140 Lakewood Ave St Paul, MN 55110 651-592-6321

Andrea Childs 42060

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Andrea Childs 2240 Devin Ln Long Lake, MN 55356-9475 (952) 476-1595

Andrea Girtz

20660

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceable we

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Andrea Sather 420 1st St Apt 4 Two Harbors, MN 55616 218-724-4355

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Miss Andrea Sreiber 5 Nassau Ave Schenectady, NY 12304-1819

Andrea Thompsom

39785

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. There is only one Lake Superior and wilderness area. Sulfide mining can ruin it for all times. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Andrea Thompsom 7717 Penn Ave N # No2 Minneapolis, MN 55444-1848 (763) 560-9090

Andrea Unga-Smith

54153

Do Not! I do not support this. Mining repercussions cannot be reversed & we need to work in better ways to care for our children's future. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

I support PolyMet because, I believe they will generate millions of dollars in local and state taxes to support the MN communities and educational system. PolyMet will also create hundreds of jobs that will support families and I believe that they can produce these metals in an environmentally sound manner. ~Andrea Vail 651-208-3171

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Andres Moreno 4015 Standish Ave Minneapolis, MI 55407

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Attention: Lisa Fay, DNR: OVERVIEW The following comment has four core arguments summarized here and provided in detail below: 1) Interpretation: the SDEIS is inadequate because it too narrowly interprets “cumulative effects” and “reasonably foreseeable,” thus inappropriately categorizing numerous proposed mines as “speculative.” Both CEQ and Minnesota Rules suggest a broader interpretation. 2) Polymet and the BWCAW: Polymet is currently south of the Laurentian Divide, but post-closure Polymet will be a part of the BWCAW watershed. The broader interpretation of “cumulative effects” will allow a revised SDEIS to more accurately present how mining operations will change the geography and shift the Laurentian Divide southward. 3) Scenarios: in the revised SDEIS one scenario of the cumulative effects analysis should include all proposed mining operations from Polymet to Spruce Road and a further scenario should include the assumption of mining operations along the entire basal contact zone from Polymet to Tuscarora Lake. 4) Full Information: the revised SDEIS will provide the opportunity to take a broad view of mining on the Duluth Complex, now, before it commences, based on full information available today of what the area will look like in 150 years or 500 years if/when Polymet to Spruce Road or Polymet to Tuscarora Lake is fully mined and closed, with water treatment either ongoing or prematurely ceased – and to allow Minnesotans to consider if this is their vision for the state and if the reward justifies the risk, or if a permanent moratorium is the better choice. And since this impacts the border lakes, the Canadians should have a voice in this as well. NOTE: This comment makes reference to the 2004 Bedrock Geology Map (Figures 1 and 2). Various explanatory illustration overlays of this map (Figures 1-14) are attached to this email submission as a single pdf. An attempt has also been made to write the comment so that it can be understood without the figures. But for a close technical reading, please refer to both Figures 1-14 and an actual copy of the 2004 Bedrock Geology Map. A printed copy of the map can be obtained through MNGS: Bedrock Geology of the Ely and Basswood Lake 30' x 60' Quadrangles, Northeast Minnesota, by Mark A. Jirsa and James D. Miller Jr., 2004, Minnesota Geological Survey (MNGS), prepared and published with the support of the US Geological Survey as part of the 2003 State Geologic Mapping Program Element (Statemap) of the National Geologic Mapping Program. INTERPRETATION SDEIS and Council on Environmental Quality (CEQ) Guidance The SDEIS states (page 1623): “Resource-specific spatial and temporal boundaries are used to identify past, present, and reasonably foreseeable future actions that would likely affect the same environmental resources as the NorthMet Project Proposed Action. MEQB, CEQ, and USEPA guidance allow for a fairly broad interpretation of “reasonably foreseeable” to accommodate project-specific conditions, but indicate that actions that would be considered “speculative” should be excluded.” So the SDEIS, therefore, excludes Teck American, Twin Metals and others from the cumulative effects analysis by labeling them as “Speculative Actions.” The document Considering Cumulative Effects under NEPA by CEQ, January 1997, page 19, however, states: “Whenever speculative projections of future development are used, the analyst should provide explicit description of the assumptions involved. If the analyst is uncertain whether to include future actions, it may be appropriate to bound the problem by developing several scenarios with different assumptions about future actions.” “In general, future actions can be excluded from the analysis of cumulative effects if · the action is outside the geographic boundaries or time frame established for the cumulative effects analysis; · the action will not affect resources t

Attention: Lisa Fay, DNR: The December 2013 Polymet SDEIS is inadequate because it suggests that there could ever be a cessation of financial assurance as it does under section 3-2-2-4-3: MDNR would release PolyMet from the responsibility to maintain financial assurance when the MDNR determines, through inspection of the mining area, that: all reclamation activities have been completed in accordance with the Permit to Mine, conditions necessitating post-reclamation monitoring and maintenance no longer exist and are not likely to recur, and corrective actions have been successfully completed and monitoring of those corrective action is no longer needed. By saying that MDNR will somehow make a determination on what could be cast in court as subjective measures is inappropriate. A burden of proof has been put on the state to prove that a risk remains. The risk of some problem developing lasts for all time. For example, the idea with subaqueous containment is that the process of creating sulfuric acid is shut down (or significantly slowed down) by limiting air contact. If a subaqueous containment strategy fails in 2000 years, then the water level will drop and the creation of sulfuric acid will begin with the exposure to air. And as another example, the need to cut woody material off of the Hydrometallurgical Residue Facility will last for all time – during any time frame in which trees can grow in Minnesota. Solution: Rephrase the financial assurance section in the SDEIS so that there is clearly no cessation of financial assurance under any circumstance. Further, state that Polymet and its parent, assigns, successors etc remain responsible for the financial assurance for all time. Otherwise there is a risk that a legal maneuver could be taken to force the cessation of financial assurance – which would then place the burden onto Minnesota taxpayers instead. Attention: Lisa Fay, DNR: The December 2013 Polymet SDEIS is inadequate because it does not include analysis of uranium in the waste rock, tailings etc The Eagle Mine in Michigan had trouble with uranium contamination of drinking water. So it is reasonably foreseeable that the Polymet mine could as well. Rock with up to 7 ppm of U was one potential cause of the uranium problems at Eagle Mine. See this study of the Dunka Road area by Theriault, Barnes and Severson: The influence of country-rock assimilation and silicate to sulfide ratios (R factor) on the genesis of the Dunka Road Cu-Ni-platinum-group element deposit, Duluth Complex, Minnesota. Robert D. Thériault, Sarah-Jane Barnes Département des Sciences Appliquées, Université du Québec à Chicoutimi, Chicoutimi, Québec, G7H2B1, Canada and Mark J. Severson, Natural Resources Research Institute, Duluth, MN 55811, USA. The Theriault Severson study (page 170) shows uranium levels in core samples as high as 7 to 23 ppm. In some cases the higher U levels correlate with higher Cu levels. Solution: This issue should be studied and if necessary discussed in a revised SDEIS regarding how to protect ground water and what needs to be done for proper disposal of any uranium collected. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Andrew Hernandez Hopkins, Minnesota

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Andrew Jansen 1155 Menke Cir Shakopee, MN 55379-3225

The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Andrew Kuncel 4227 Harriet Ave S Minneapolis, MN 55409

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Andrew Mutchler W10892 Blackhawk Trail Fox Lake, WI 53933 US

Andrew Pankaw 58038

I am opposed to Sulfide Mining in Minnesota. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Andrew Papale 42467

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Andrew Papale 1715 Roselawn Ave W Roseville, MN 55113-5757

Andrew Paul 58135

My name is Andrew Paul and I'm from Grand Rapids, Minnesota. I'm a representative of Minnesota Power and our parent company ALLETE. I care about the environment. I have a Bachelor's degree in Biology and I am employed as an Environmental Compliance Specialist with Minnesota Power. I live in the Northland, I have many co-workers and friends that are from the East Range area and I hunt, fish, and camp in and around the Iron Range. SKIP. Two of my Great Grandfather's left their agricultural roots in South Dakota and Southern Minnesota to move North and work in the mines. After World War II mining allowed my Grandfather to return home and earn an honest and good living that led to all four of his children and six of his grandchildren having the opportunity to attend college. I support the Polymet project for many reasons, one of those being the potential economic impact this mine could provide. An impact of nearly 1,000 sustained good paying wages! To me that equates to at least 1,000 families being better suited to provide themselves and their future generations the same opportunities to pursue their goals and ambitions as mining has provided my family. Secondly, with my professional background in Environmental Compliance I am well aware of the science and technology committed to mitigating the water quality impacts from the Polymet site. We as Minnesotans have always pushed for stringent water quality standards to ensure we protect our valuable freshwater resource. With that in mind, one of the key topics of water quality concerns with Polymet has been the sulfate standard and impacts the project may have on Wild Rice. Polymet has committed to the proven and effective technology of a Reverse Osmosis Treatment System which will allow them to meet and exceed the sulfate standard. I commend the Environmental Stewardship Polymet is showing by implementing this technology and eliminating the sulfate issue as a concern for their process moving forward. Lastly, from hockey games, to softball tournaments, to camping trips, to work commitments I have spent a lot of time in the Eveleth, Gilbert, Biwabik, Aurora, and Hoyt Lakes communities. These small town citizens have been waiting almost ten years for the opportunities that a project like Polymet will provide. From a health and environmental protection standpoint I can see no reason that Polymet will not protect the citizens and natural resources of the area. Polymet and the people from the East Range should be able to move forward with this project. It is their livelihood they are trying to enhance, there will be no impact to the BWCA, and there will be no acid rock drainage. Thank you to the DNR, the U.S. Army Corps of Engineers and U.S. Forest Service, for doing such a thorough job on the Supplemental Draft EIS and thank you for allowing these comments to be heard. I urge you to view this from a scientific and ecological standpoint and ask that the agencies find the supplemental Draft EIS acceptable and move forward with the permitting process.

Andrew Phelan 19873

From: Andrew Phelan, Minneapolis Given the risks and long term liability, I support not granting approval to the Polymet mining project. Sent from my iPhone

Andrew Slade

18130

Hi. Good evening. My name is Andrew Slade. I live in Duluth, Minnesota. As we have been waiting for the last, really, two years for this SDEIS to come out, I was really hoping that this would be a good project; that it would be something that I could rally behind, but unfortunately, for a lot of reasons, the project, as proposed, has some real problems. I'm not going to go into that right now, though. I would like to talk about some structural problems with the EIS document, itself. First of all, we've seen some proof tonight that the 90-day comment period is really too short. There's been lots of folks coming up to these microphones and saying, "I don't understand this. I can't understand this. It's too long." And what that's meant for them and this is what they've said, "I'm going to rely on the agencies to have done this correctly." And I appreciate that sentiment, but I think that flies right in the face of what this whole process is set up for. This was not set up so people could not read it and just trust the people who did it, if that makes sense. The other thing I would like to talk about, and I think this is more important, is that the project, fundamentally, the EIS document does not present -- presents very few alternatives. The only alternative is the size of the land exchange from the forest service. There was, buried in EIS, the rejection of an alternative which I really think should have been considered more seriously and that was the alternative of an underground mine and here's why I think that should have been considered. For one thing, it would have reduced the impact on wetlands of 900 acres, 900 acres less of high-quality wetlands impacted, but it also would have made for a more complex project; a project which would have led to more employment. Now, we all want jobs. An underground mine would have provided more jobs. However, the reason that it was rejected out of EIS as an alternative was pretty simple; it was too expensive. Based on copper prices of today, it would have been "too expensive," and I put that in quotes, to do the underground mine. Which means that the company has said it's too -- we don't want to have that complex of a project where we need to hire more people to do it. We're going to do it cheaper and quicker and not wait, for example, until copper prices go up, which raises another bigger question. I'm sorry but what -- what will happen to this project if and when copper prices go back down again? I think we're setting ourselves up to do a poor project and we're doing it too soon. So I just want -- I feel that the EIS is missing a very important alternative that should have been included. Thank you.

Andrew Smith

18938

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Andrew Smith 2220 Ridge Dr Apt. 31 St Louis Park, MN 55416 612-790-0681

Andrew Sterioff 39988

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Andrew Sterioff 4800 Pleasant Ave Minneapolis, MN 55419-5441 (612) 827-2527

Andrew Thorsen 38652

i support polymet being issued a permit. I believe the sdeis addresses all the concerns about the environment and that they have a solid plan in place to mitigate any issues that may arise. Andrew thorsen 232 Guilford rd Hoyt lakes mn 55750

Andrew Turke 18291

My name is Andrew Turke, T-U-R-K-E, from Ely, Minnesota. I just want to voice my opposition to the mining proposal, so, based upon the 500-year projection of that water filtration requirement. It is just a very high risk. I just wanted to make myself heard.

Andrew Urban 18103

Hi. My name is Andrew Urban from Eagles Nest Township near Ely. I am opposed to the current PolyMet SDEIS as it is a highly flawed document. It serves as a wonderful public relations tool, but does little to protect the areas' wetlands, lakes, rivers and watersheds. The SDEIS learns nothing from past problems. It pays little heed to the concern of other agencies and is based on a best-case scenario, rather than on hard historical data. This is a "business as usual" and PolyMet will build in the expected costs of fines and lawsuits that will result from expected contamination. According to Patricia Engelking (phonetic) of the MPCA, since 2010 there have been 12 water quality enforcement actions against eight metallic mining operations, which we know how to do. The settled cases resulted in fines of over \$113,000. The companies paid the money, but the pollutants remained. In 1999 Herzog Engineering Company prepared a report of well and groundwater contamination for the U.S. Army Corps of Engineers. The easy cleanup of the old Air Force station in Finland, Minnesota proved not so easy, as frequent fracturing had allowed groundwater and well contamination. Contaminants polluted private wells, the municipal well in Finland. The SDEIS says little about the problems posed by fractures. Pollution of groundwater and wells doesn't happen under a best-case scenario, but in July of 2012, after a record-breaking rainstorm, Duluth learned that nature doesn't always follow best-case scenarios. The Minnesota Department of Health in August 2009 pointed out that mining activities in this area puts at risk private and public wells because, and I'm quoting, "Wells in this area are a public health concern because the aquifer exhibits sensitive geologic conditions. Here there are no protective layers of fine grain materials, such as clay or shale, to prevent the movement of contaminants into the aquifer. The SDEIS gives a best-case scenario for a double osmosis system that has never been tested with these particular contaminants and at this proposed volume. The SDEIS is built on best-case scenarios, with skewed data to support them. The SDEIS promises robust economic benefits, with little or no environmental damage. History tells us otherwise. Thank you.

Comment on North Met SDEIS Help the struggling Northeast Minnesota moose population. Help protect the habitat of the Canada Lynx. Refrain from fracturing contiguous forest to promote healthy habitat for nesting warblers and insure unimpeded corridors for wildlife. Plant native species and trees to create an ecosystem where invasive plants do not thrive. Offer the public low cost seedlings of native trees and shrubs to increase proper habitat for wildlife. Maintain the public trust of public lands. All of the above are worthwhile objectives of the National Forest Service. I have read about each of these things in various publications. Yet, all are to be thrown out to allow a foreign company to spoil a beautiful and important segment of the Superior National Forest Besides being contrary to much of the mission of the Forest Service, such an act would be foolish, immoral, short-sighted, and grossly betray the public trust A land swap of this kind is supposed to be land of equal value. But where has this been established in this case. What is the criteria. Does the proposed swap have equal value for the wildlife. Does the proposed swap help the Forest Service achieve its environmental goals. The reason this swap is necessary is the proposed site for the open pit mining is on land that is protected from open pit mining. It is transparently immoral and a breach of public trust to now swap that land so that a mining company can make a profit off it. You ask me as a property owner to do things to protect the life of the forest But you allow your actions to be sold to the highest bidder. Andrew Urban 1347 Walsh Rd Ely, MN 55731

Andrew Van Hauer

45550

To whom it may concern; My name is Andrew Van Hauer, 2101 24th Ave S., #1, Minneapolis MN 55406, and I am writing today to express my strong opposition to the northmet mining proposal by PolyMet. First, I am deeply concerned that neither EIS nor the SDEIS accurately portray the drainage, watershed, or borders of the 100 mile swamp. This area is of critical concern for migratory birds, and there is no land that exists that would be able to replace this ecologically unique piece of land. Further, the amount of wetlands in the swamp do not even come close to totaling the benefit of this one wetland. This wetland is designated as an Area of High Biodiversity Significance by the Minnesota Biological Survey. Another concern I have is that this company has NEVER operated a mine before at all. The fact is, no open pit copper nickel mining project in the world has been successfully completed without significant environmental harm. Often, the nearby waters are polluted with high concentrations of sulfuric acid, requiring hundreds of years of water treatment. What waters would be affected. Lake Superior is downstream from the St Louis, Embarrass, and Partridge Rivers, all of which would be affected, as well as the 100 mile swamp draining into the BWCA. Since Lake Superior drains into the other great lakes, so this project has the potential to contaminate over 20% of the entire WORLD'S above-ground fresh water supply. This is not a risk we should be willing to take, especially with the fact that the trailing basin they are proposing to use at the abandoned taconite facility is already leaking contaminated water, is unlined, and there is no plan to repair, replace, or line it. We have a rich deposit of precious metals, copper, nickel, and rare earth minerals in Minnesota. We should wait until a company has proven that it is capable of operating a mine elsewhere in the world, without significant environmental impact, before allowing them to operate here. We are lucky enough to have some of the most beautiful and pristine wilderness areas in the country, and we have a duty to preserve these for future generations. What is the point of even having protected wilderness area if we allow mining companies to destroy them. Another concern I have are the companies involved. PolyMet's only interest is in this mining project. As I mentioned, they have never operated a mine before. They are not owned by Minnesotans, or even by Americans, but based in Canada and the majority ownership is in the hands of Glencore Xstrada, possibly the world's worst international mining conglomerate. This company has been found to have violated the UN trade embargo in Iraq, traded with the Ayatollahs in Iran including buying their oil and supplying them with material crucial to their nuclear program, and skirted US embargoes in Cuba and Libya. Not to mention employing children as young as 10 years old in the mining industry, as well as rampant fraud and tax evasion. This company should not only be denied permits to operate in Minnesota, but should be banned from operating a mine ANYWHERE. Finally, Glencore Xstrada has a whopping 76% chance of bankruptcy in the next two years. This is not a company we want doing business in Minnesota. This project should not be approved. Thank you for your time. Andrew Van Hauer Sources: <http://www.nwf.org/What-We-Do/Energy-and-Climate/Drilling-and-Mining/Mining-Loopholes/PolyMet-Mine-MN.aspx> <https://secure2-convio-net/mnlcv/site/Advocacy.cmd=displayandpage=UserActionandid=372> <http://www.miningtruth-org/sulfide-mining-minnesota/polymet-mine-proposal/#.UyEAjzko5dl> <http://www.tcdailyplanet-net/news/2014/03/12/community-voices-it-s-whopper-polymet-s-myth-9938-tailings-seepage-collection> <http://www.aljazeera-com/indepth/features/2011/05/20115723149852120-html> <http://www.samachar-com/Glencore-lists-fraud-criminal-case-among-IPO-risks-lfevLadgedj.html> <http://www.independent.co.uk/news/uk/home-news/glencore-traded->

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, andrew young ***, Minnesota

Andy Boyum

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Only after the last tree has been cut down, the last river has been poisoned, and the last fish has been caught. Only then will you find that money cannot be eaten. This quote sums it all up. Yes we need to mine metals, elements and other natural resources for humans to survive, work, play, invest in the future, and enjoy activities in the past couple of centuries. But only because most people think that everything on this planet is endless, expendable and have the greed for money and quick profits. But what happens when after the mining, and the chemicals, and the refining, and the advertising to sell he product. It usually gets used sparsely for a few years or days and dumped in the landfills or burned. Nobody thinks about where it came from, or how it got their. Or hey i can recycle this. What damaged it caused to their planet or their future grandchildren. The irreversible effects for a quick want, or got to have it hot item. This mine will effect generations forever and the only REALL return will be for the very few who will make a lot of money and move on. Not giving a crap, lying, bribing, and buying there way out of whatever trouble may come. Long before 1858 we did not need this mine why do we need it now. And why do we need to destroy such a pristine, rare, and beloved area for it. Oh yea I forget, we were talking about money, business, and politics again. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Andy Johnson 22 4th Ave N Sauk Rapids, MN 56379-1706 (715) 338-8686

From what I've read, I believe PolyMet should be allowed to proceed with their mining operation. New jobs have a trickle down affect and it appears this company has done it's homework. I support PolyMet and believe they will follow all established rules and regulations. Andy Wamstad

angela christensen 15920

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, angela christensen 4613 cedar ave s minneapolis, MN 55407

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, This is a step in the wrong direction. Economy is not more important than the environment. The only mining we should be doing, is digging in recycling bins. I want a state and country that consumes less, and requires less. In return, we can have a simple and healthy population. Prestine, clean, untouched wilderness and less garbage and construction. Where will the destructive cycle end. This generation is not stuck in the Industrial Age. Please do what you can to keep the mining out of Minnesota. Thank you. Sincerely, Dr Angela Livieri 3233 48th Ave S Minneapolis, MN 55406-2337 (612) 703-8909

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. We can learn from our neighbor Wisconsin and from Europeans: Ban all potentially toxic mining until each proposed mine has been proven safe. Do not sell our future for short-term profits. Let us not be recorded in history as the Land of 10,000 Toxic Lakes. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Angeline Dufner 29665 Island Lake Rd Saint Joseph, MN 56374-9640 (320) 363-8407

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Angie Iverson Owatonna, Minnesota

From: Angie Nichols [mailto:nichols360@gmail-com] Sent: Friday, February 14, 2014 6:45 AM To: Dabney, Tim -FS Subject: Mining and Land Exchange Letter Hi Tim, I'm writing to you as a concerned private citizen about Polymet's proposal for mining and the proposed land exchange described in the attached letter. When I heard the presentation by Water Legacy's Legal Advocate, Paula Maccabee, it occurred to me that we as human beings have come to a place in time where economic interests of the state and the physical and spiritual health of our land must reach a compromise. To me, the fact that our water supply has needed a lawyer to protect its rights from monetary interests of corporations that claim a right to destroy the environment while staking a claim to it's resources seems like a crime to me. I'm not a lawyer, and I'm not enrolled in a tribe, but I do think that the people and animals inhabiting the state all have a right to a healthy environment and we have a right not to be forced into spatial "swaps" that compromise existing wildlife habitats. Why would we make such compromises. If you and I "are" the people who would hypothetically inhabit this land in 350 years wouldn't it be a blessing to know that our ancestors fought hard to protect our natural resources so that our hunting and fishing would be productive and our game would still thrive and our water would be healthy. We are those ancestors of future generations and I would like to ask you to consider not the immediacy of today's profiteers, but the responsibility to care for the environment and our duty to also uphold the rights of tribes so that the future is secure for the people and wildlife at the mercy of our advocacy today. Thank you for your time, Tim. Sincerely, Angie Nichols 925 N. 14th Ave East Duluth, MN 55805 This electronic message contains information generated by the USDA solely for the intended recipients. Dear Ms. Lisa Fay, EIS Project Manager, My response to the Northmet Mining Project and Land Exchange is that they should go through with it. Having another mine up in the north would create more jobs for people. This will help people create better lives for their families and themselves. There are many advantages to going through and completing this project. One of the advantages I came up with is we will get more natural resources, like copper, nickel, and platinum deposits from mining in this area. These products will help fuel our economy by providing our economy with construction material, electrical equipment, and more. However, along with having advantages there come disadvantages. One disadvantage is we will have a lower air quality, water quantity and quality. This would cause slight problems with our ecosystem. Another disadvantage is with the land exchange, it will most likely cut off river flow and may kill some large black spruces, tamaracks, and cedar wetlands. Without this mining project, the land remains a part of the Superior National Forest. As one can see, by creating this mine there will be more jobs for unemployed people. They will be able to take better care of themselves and their families. They will be able to provide more things that their families want and not just what they need. Overall, I think that they should go through with the plan to mine this area. Sincerely, Angie Pedersen, Eighth Grader at Southwest Jr High

Angie Simonson

47273

Northern MN has a rich history of industry in mining and timber, yet we still have the most beautiful environment in the state. I believe we can continue that tradition, we can have both. The knowledge, technology and funds are in place to make this a successful venture for Polymet and the state of MN. Some people, many in the cities, would love to believe that the world turns by those sitting behind a desk, not realizing how insignificant their role in society is. The industry is what keeps us moving forward both economically and developmentally. Creating more industry based jobs will support not only those working directly for the mines but hundreds of supporting jobs. The need for precious metals is not going to decrease anytime soon, if we don't mine here, it'll be done elsewhere and likely with less regulation and concern for the environment. Our biggest concern should probably be that Polymet accidently digs all the way through to China (that's how ridiculous some of the concerns being addressed sound). Support this amazing opportunity for our state and our future. Stop drawing lines in the sand and start shaking hands, together we can do this right. Angela L. Simonson MAIN IDEA CREATIVE www.facebook.com/mainideacreative Angie@mainideacreative-com 218-427-2350 9669 Crooked Creek Rd Meadowlands, MN 55765

I am Anita Gille from Duluth, Minnesota. I am concerned about water quality and especially tailings pilings that will be located on top of the old taconite tailings basin that was designed in the 1950's before there was environmental safeguards and on top of streams to allow drainage through the tailings. If you go back and look at the draft EIS in figure 4.1.9, you can see that there are at least three streams running under the old LTV tailings site. One of those streams runs right under cells 1E and 2E where they plan to dump the PolyMet tailings and then into Spring Mine Creek. Even when the stream is filled over, water is still flowing under the channel where it has been draining for thousands of years. And Spring Mine Creek is already impaired for aquatic life as a result of past mining and past excessive levels of sulfate and mercury. The SDEIS just assumes that all tailings wastewater will seep into the north side where PolyMet will have a row of pumps. But the SDEIS must specifically analyze impacts on water quality of seepage that would escape following historic stream drainage beneath the tailings basin. I also question the methodology used for creating the EIS and the summary document. I have attempted to read the summary and I found it very unclear. My husband is a soil scientist. He had a hard time with it. How is a layperson supposed to understand what this is? We know it's very complicated, however; and I can't understand the ultimate levels, such as mercury and sulfide. And I would like to recommend a performance bond be required of PolyMet to cover all damages to the environment.

36532

Dear Ms Fay, To: Lisa Fay Dear Miss Fay, Federal and State Agency Leaders: The US Environmental Protection Agency , in 2010, gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” I believe the PolyMet SDEIS is still inadequate. Claims are unsupported by facts. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Page 5-122 of the SDEIS states: “These untreated pit releases would include East Pit backfill pore water into the East Pit Category 2/3 Surficial Flowpath (beginning year 21) and West Pit lake water into the West Pit Surficial Flowpath (beginning year 33). These releases to surficial groundwater would continue into perpetuity. Groundwater in these flowpaths would flow downgradient and eventually reach the Partridge River.” The SDEIS should include a cost-benefit analysis of the PolyMet sulfide mine proposal over the long term, considering all of the potential long-term costs. I do not want to see the taxpayers of Minnesota stuck with clean-up costs for centuries into the future, all for promises of up to 360 jobs for only 20 years. This also assumes copper prices remain high and cheaper mining locations do not materialize. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely, Anita Gille 4117 West 8th Street Duluth MN 55807 Anita Gille 4117 W 8th St Duluth, MN 55807 (218)428-7232

Anita Kovacich

Jan 25, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. We must LEARN from our environmental mistakes, not perpetuate them. Let us learn from West Virginia is teaching us at this very moment. First, the rich run the country's economy into the ground. Then, bit by bit - they take advantage of our desperation by convincing the masses to help them to not only dismantle the labor force protections, but also the necessary environmental safeguards. Indeed, they portray these safeguards as responsible for the stagnant economy. Twenty or so extra jobs now are not worth 500 years of pollution. And, as West Virginia also illustrates - bankruptcy by the offending company is the usual "out" for them. This needs to stop, and it needs to stop NOW. We do not want to be in the headlines as is West Virginia. We Minnesotans are better than this. WE ARE NOT WEST VIRGINIA. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Anita Seeling 13126 Murdock Ter Eden Prairie, MN 55347-5264

Feb 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries.

Jan 25, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. We must LEARN from our environmental mistakes, not perpetuate them. Let us learn from West Virginia is teaching us at this very moment. First, the rich run the country's economy into the ground. Then, bit by bit - they take advantage of our desperation by convincing the masses to help them to not only dismantle the labor force protections, but also the necessary environmental safeguards. Indeed, they portray these safeguards as responsible for the stagnant economy. Twenty or so extra jobs now are not worth 500 years of pollution. And, as West Virginia also illustrates - bankruptcy by the offending company is the usual "out" for them. This needs to stop, and it needs to stop NOW. We do not want to be in the headlines as is West Virginia. We Minnesotans are better than this. WE ARE NOT WEST VIRGINIA. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Anita Seeling 13126 Murdock Ter Eden Prairie, MN 55347-5264

Anita Suzanne Tillemans 42951

Included with this email, I am sending a digital copy (final pdf) of my comments sent by first class mail on March 7, 2014- Respectfully, Anita Suzanne Tillemans 4021 Chowen Ave So Minneapolis, MN 55410-1013

I am writing to ask the MN DNR to consider the consequences of pollution to the watersheds in NE Minnesota and to not approve the PolyMet project because of the following questions: As I look at the map of the mine site it is surrounded by wetlands and lakes. Would any other project requiring dangerous unproven chemical processes be approved by the state of MN if it sat in this location. How does the State of MN and PolyMet protect the water treatment for 500 years in any known or proven method both financially and chemically. If we can't agree on Yucca Mountain for storage and transport of nuclear waste treatment how can we do this correctly and perfectly. What is the financial value of the current clean watershed over 500 years. Have economists reviewed this contingency of 500 years of water treatment in weighing the value of the minerals, cost of the project for 500 years and the potential value of clean water in 500 years. When human beings are involved in any engineering processes there are always mistakes, unforeseen consequences, catastrophic accidents. Do the principle leadership of PolyMet and their contractors have a record of lax and ignored oversight of environmental risks and laws. This region is a porous, literally water permeable area where the seepage of toxic waste can not be allowed to happen. Please answer these questions as part of your deliberations and publish them in all the state newspapers. Anita Zager, 5369 N Shore Dr, Duluth MN 55804

As a land owner in Itasca County, I appreciate the economic base and value that mining has brought to the region. That said, I also appreciate that the region's future will rely more and more upon sustainable resource management and an emphasis on the natural world that attracts tourism and retirement dollars to the area. I currently live in Monticello, MN, but own property in Itasca County and plan to move there in retirement. I am concerned about the long-term environmental impacts of the planned Polymet sulfide mine, and feel that the current plan does not do enough to protect our waters. PolyMet's models, used in their proposal, indicate that waste water will need to be actively treated for more than half a millennium. In particular, expecting the company and/or the state of Minnesota to have the economic resources and the political will to treat mining waste water for more than 500 years is utterly untenable. The time frames about which we are speaking make the average life expectancy of US corporations look transitory. It is highly unlikely that PolyMet, as a business, will be here to keep paying for and executing on any water treatment requirements. Rather, taxpayers will pick up the tab. This plan does not do enough to ensure that the necessary financial resources, to treat waste water and remove sulphur contaminants, will be secured and reliably sufficient. Failure of such mitigations would have far reaching and permanent impacts. Further, the current plan is already insufficient in its planned water treatment scope. At the mine site itself, each year more than 5 million gallons of untreated contaminated water will seep into our ground water. At the tailing basin, more than 11 million gallons of untreated contaminated water will seep into our ground water each year. Never in the history of mankind, has a successful environmental mitigation plan relied on the potential sustained commitment of future generations 500 hundreds of years into the future. The plan for waste water treatment is not based upon best practices; it is based upon hope and pretense, and should not be permitted. Ann Burns 1517 West River Street Monticello MN 55362

Hi, I would like to give my input on the proposed Polymet mine. I've lived in Bemidji for the past 37 years. It's just been (I am ashamed to say) the last 8 years that I have been visiting the BWCA area and Ely. In those 8 years I go up at least 3 times a year for a week at a time. Summer, winter it doesn't matter. The BWCA is the most beautiful place on this planet. It truly is the end of the road. My family lives in Wisconsin and I have brought them up to visit and they too have fallen in love with the area. I am extremely upset at even the thought of desecrating one of God's magnificent creations all in the name of money. I understand it will create jobs but at what cost 500 years of clean up.. For 20 years of employment. We are witnessing first hand in Bemidji the million dollar cleanup of Lake Bemidji due to Georgia Pacific polluting the lake and that is not even close to what the cleanup will cost never mind the destruction of one of the most incredibly beautiful land masses in our state and country. And then to top it all off we have Tony Hayward investing in the mining business, didn't learn anything from the gulf debacle. I just wanted to let you know how opposed I am to the construction of this mine. Thank you for your time. Ann Campbell 3420 Lake Ave NE Bemidji, MN 56601

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Ann Cary 4309 28th Ave Minneapolis, MN 55406

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ann Diers 4807 Lake Ave White Bear Lake, MN 55110-2848 (651) 476-8145

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. As a former District Ranger in California's "gold country" (Nevada City RD, Tahoe NF), I know that mining is highly toxic, degrades soil, water and wildlife habitat, and it generally excludes other uses of an area. I also know that there are many competing and compelling demands on national forest resources. Exchanging land or allowing sulfide mining on Superior National Forest will be at the expense of too many of the other "multiple uses" the forest was established to provide. Please do not go forward with this proposal. Sincerely, Ann Dow 3401 Dee Hwy Hood River, OR 97031-8435

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. My personal statement: I attended the first comment session in Duluth. The DNR made it clear they wanted perspectives on the draft EIS, not "emotional" arguments. While proponents of both sides spoke, it was apparent to me that those who opposed the mine had actually read at least parts of the EIS, and were basing their comments on science - as directed. The pro-mining advocates were largely concerned about jobs. While jobs are certainly important, they are not a scientific argument based on the draft EIS. Those jobs will benefit a few, while the after effects of open-pit sulfide mining will potentially impair thousands of acres of watershed and the Lake Superior basin for HUNDREDS OF YEARS. Given mining's history of destruction and denial, I wouldn't bet on this mine operating benignly for 20 years and beyond. The decision to protect Minnesota's Lake Superior basin and the thousands of people who live here should favor science and the environment, not jobs that will benefit a few. Sincerely Ann Galbraith Miller

Ann Meany 43351

Dear DNR: Back in 1970 I and my family spent a winter and spring at Holden Village an abandoned copper mining village located on Lake Chelan north of Wenatchee, Washington. The former mine site had been sold by the mining company to the Lutheran Church for one dollar and had been converted into a retreat center. Besides the camp buildings: cottages, dining hall and assorted living structures were the remains of the mining operation plus vast tailings piles, covered by snow in the winter but in the spring and summer left to blow in the wind. These tailings were huge three or four football-sized fields and absolutely devoid of vegetation. This is a toxic operation. There is no way that copper sulfide mining can be compared to taconite iron ore mining. To allow something as toxic as sulfide mining anywhere in Minnesota, let alone right next to the Boundary Waters Canoe Area is insane. Please, someone stop this madness. I believe that the Holden Village mining site has now been listed as a Super Fund Site. Philip Meany, 5672 North Shore Drive, Duluth, MN 55804 Janet Meany, 5672 North Shore Drive, Duluth, MN 55804 Ann Meany, 3006 W. 44th St, No. 1, Minneapolis, MN 55410

Ann Possis 10115

Dear Ms Fay, Dear Federal and State Agency Leaders: I am writing to express my concerns about the PolyMet project, and to urge you to deny the permits for this mine. It's not worth the risk and possible destruction of our precious natural resources in northeastern Minnesota. We must be able to come up with livable-wage jobs without trashing our natural environment. Twenty years of jobs, many of which would be filled with people brought in from outside our area, are not worth hundreds of years of pollution of an irreplaceable part of the world. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

We saw what happened in West Virginia with their water. I understand that we all walk a fine line – we want jobs for people but what good are the jobs if everyone's water is contaminated. Human beings can live without a lot of things but we must have water. We Minnesotans live upstream. We have a responsibility to protect the lakes and rivers we hold so dear. Please help us and reject PolyMet's plan Sincerely, Ann Reed Minneapolis, MN Ann Reed 3432 35th Av S minneapolis, MN 55406

Ann Sandler 39605

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ann Sandler 9833 West 101st Terr Overland Park, Ks. 66212 Sincerely, Ms Ann Sandler 9833 W 101st Ter Overland Park, KS 66212-5431

Ann Schley 41854

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, As Minnesotans we are privileged live among beautiful wetlands and forests. As part of that privilege, I believe it is our responsibility to protect those resources for the future. As such, I urge you to reject PolyMet's request to mine. There is just too much risk that dangerous chemicals will be released now or in the future from the mining operations. Our resources are much more precious as natural recreation area, than as mines. Sincerely, Ms Ann Schley 1120 Winthrop St S Saint Paul, MN 55119-5609 (651) 398-7012

Ann Snodie 11044

Attention: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environment Review Unit 500 Lafayette Road, Box 25 St Paul, MN. 55155-4025 I am writing to you to speak out against the NorthMet Mining proposal to let Polymet mine copper-nickel in Northeastern MN (on superior national forest land). A few things to consider is whether our future WATER quality is worth more to us in the long-run (some predict 100's of years of possible damage) then job creation in Northern MN. And this is coming from somebody who has been unemployed for a while. I don't think we should take that risk. Historically, mining reclamation, in the end, cost the tax payer money for clean-up, long after the corporation, who created the mess, is gone. The Office of surface Mining Reclamation and enforcement (OSM) has not been effective in other states where mining has been destructive (West Virginia, Kentucky, Wyoming, Pennsylvania. etc) I wonder if Kentucky was at a crossroad between job creation vs. water quality and protecting their natural resources. Why do they still have water quality issue in Kentucky after 20 years Initially, were they told the same thing as we are being told about the safety today. Let's keep Minnesota the beautiful state that it is and protect our precious water. We don't need this in Minnesota.. Sincerely, Ann Snodie

Ann Vreeland 57337

My name is Ann Vreeland. That's "V," as in Victor, R-E-E-L-A-N-D. I live in Hoyt Lakes, Minnesota. I have lived -- I was born and raised in Hoyt Lakes, Minnesota and I currently live there with my husband. I am a family nurse practitioner at the Aurora Hospital at Northern Pines Medical Center. And I have had an opportunity tonight to review the various information that has been put out by various government agencies about the permitting process for PolyMet mining. I feel very confident that they have done due diligence as far as their safety for the water and for the environment. We need the jobs up here and we need mining, and that has been our lifeblood for over 50 years, and I support it 100 percent.

Anna Blaine 54174

I believe this mining should not be introduced in MN. It's degrading to our land and water! The water and area around where this mine is supposed to be is too precious to our environment to be compromised for this mining project.

ANNA FRENCH 43064

Some effects of the proposed PolyMet sulfide mine plan are immediate and easy to predict. For example, it is known that the mine would impact our dwindling moose populations and the already endangered Canada Lynx by destroying their habitat. Other impacts, such as those to air and water quality, are still uncertain. The plan is incomplete and has not been carried out thoroughly. An example of this is the lack of a health impact study. For something that could have impacts 500 years into the future, it seems like we could take a little more time analyzing consequences. Anna French 16425 39th Pl N Plymouth, MN 55446

Anna Guldner 54527

If it threatens our lakes, rivers, streams, and groundwater, I will not support Poly Met Mining Co.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

To: HYPERLINK "mailto:info.dnr@state.mn.us"info.dnr@state.mn.us Cc: John and Debbie Woerheide Dear Minnesota State and Federal partner links for the preparation of this DEIS: Unfortunately we were not able to attend the public meetings for various reasons beyond our control, including the weather, and resulting road conditions. So our comments need to be expressed in this email. As residents of the Minnesota Arrowhead country, we certainly hope that these comments are considered. We are full time residents of the Minnesota north country, living at Lutsen for the past 26 years,at 5171 Highway 61, and 103 Caribou trail. The very things that attracted us to this gorgeous country include the beautiful boreal forest, clear streams and inland lakes, and of course the unequaled beauty of Lake Superior during all seasons of the year. We didn't come here enticed by new jobs being offered by any resource gobbling industries. We came here and created our own jobs, offering services that the people living here, or coming to visit needed. We have all lived in various parts of the country, such as south central Missouri, southern Illinois, the mountains of New Mexico, the mountains of Colorado, and the spectacular coast of Alaska, So we have seen other beautiful parts of the country, but none to top the Minnesota Arrowhead, Lake Superior country. The father/grand father of this family, John Woerheide served the US Forest Service for 35 years. Various jobs included preparing proposals for designating Wilderness Areas, lands and minerals management, timber management, silvicultural research, recreation resource management, and public affairs. The whole family has witnessed the results of metals mining for such metals as lead, zinc, copper, gold, silver, and many other metals as well. We lived on various National Forests, mostly in remote back country areas. When we lived in Southern Illinois on the Shawnee National Forest we often visited the fluorspar/lead/zinc mines of that area. such as Minerva Number One, and the Crystal mine. At many of these mines the fluorspar was the retained ore mineral, and the lead, zinc, and other metals often made it into the tailings of these operations. That was back in the late 1950s, and of course the people of the area could only see the benefit of the jobs the mines provided. As a result of the careless surface disposal of metal ores, there is now a great deal of water pollution at and around disposal sites, leading to health alerts for such areas as the Minerva No 1 site (see HYPERLINK "http://www.atsDradc-gov/"www.atsDradc-gov. Minerva Mine No1) When we lived on the Santa Fe National Forest at Pecos, New Mexico we used to make many trips up the Pecos River to the site of the old Terrero Min about 12 miles north of Pecos . This was an old deep mine under ground where zinc , copper, lead, gold and silver were mined in the past, There were about a dozen other trace minerals involved as well. Waste rock material was spread out in an area about 20 acres in size at the mine site. Higher grade ore was sent by tramway to the Alamitos Mill at Pecos, New Mexico, where the ore was processed, and waste tailings were fed into tailings ponds. Both of these sites have been discovered to be highly polluted. Unacceptable levels of pollutants present in surface areas, and extreme pollution of ground waters are present all the way as far south as Carlsbad on the Pecos River. Water at camp grounds along the Pecos River has been polluted. A person can not even go near the old mine site, or the mill site. There are chain link fences and keep out signs around the areas. As a reference see - New Mexico Geological Society guidebook, 52nd Field Conference, Geology of the Llano Estacato, 2001 = Long Term monitoring of the Geochemistry Of Surface Water, and Stream-Sediment Samples from the Southern Pecos Wilderness to Brantley Dam North Of Carlsbad. Eastern New Mexico - Year Nine. It is absolutely amazing how long this pollution has

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Anna Newton

Protect our water. Hooded Mergansers swim in northeastern Minnesota's pristine marshes, ponds, and rivers, feeding on fish, crayfish, frogs, and insects. PolyMet Corporation is proposing to destroy thousands of acres of pristine habitat to mine sulfide ore at the headwaters of the St Louis River - a major waterway that flows over 180 miles to Lake Superior. PolyMet's proposal calls for 20 years of mining, and they acknowledge that 500 years of toxic runoff will need to be collected and treated. Just like the Hooded Merganser, our children and grandchildren all deserve clean water. Let clean water be our legacy - not toxic pollution from mining. There are SERIOUS issues with this proposal.

Anna Peterson

43809

To whom it may concern, I believe the proposed Poly Met mine should not go forwaRd. The SDEIS has not shown that mining of precious metals in rocks with sulfide can be done safely in the watery environment of NE Minnesota without serious contamination and destruction to wetlands and habitat. Thank you for your consideration of my comment. Sincerely, Dr Anna Peterson - Anna C. Peterson, PhD Conservation Biology University of Minnesota 763-370-1639 Tell me what is it you plan to do with your one wild and precious life. -Mary Oliver

Anna Runestad 44598

I wake up every day knowing how I choose to live my life will affect my future and those around me. The long term effects of choosing to open the Superior National Forest to mining is a choice that I don't agree with. It has short term benefits that do not out weigh the long term cost our state and our natural water habitats will suffer for years. Anna Runestad

Anna Russel 58146

I am appalled that Minnesota would even consider putting in this mine so close to the boundary waters. The lives of countless plants and animals will be impacted, not to mention the entire ecosystem as a whole. The profits are not worth the risks involved. We are NOT dependent on copper! Throw away your cellphone and take a walk in the woods! We need to be putting minds together to figure out actually proven environmentally safe processes to achieve our goals. Create more jobs to plant new trees and wetlands on the proposed sites. I will be ashamed as a Minnesotan if this mine passes. Someone needs to give a voice to the creatures who cannot speak the trees, the water, the birds, the wolves. We need to learn to coexist, the water, the birds, the wolves. We need to learn to coexist, even give back positively to the environment. Now wouldn't that be crazy.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, annamarta dostourian 1970 san pablo ave berkeley, CA 94702 US

Anne Calderwood PO Box 2244 Murphys, CA 95247 (also: 3496 N. Arm Road, Ely, MN 55731) March 7, 2014 Dear Ms Fay, I urge you to reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. I urge you to stand up for the interests of the public and the known facts about this type of copper sulfide mining and the destruction to human and environmental health that it leaves behind. The BWCA and the clean water that is its hallmark is a national treasure. My family owns property in the Ely area and spend time each summer enjoying the BWCA and surrounding lakes. Our drinking water comes directly from Burntside lake, and we eat the fish and wild rice from the local area. It seems ironic that the DNR is vigilant about rules for local homeowners living near the water, but a huge project with the potential to create longterm damage to the ecosystem of the area is being actively considered. I would encourage your agency to just say no to this potential disaster of scale. The BWCA is famous for its fishing opportunities. Mercury is an ongoing concern in the area. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. Why would a public agency allow a known source of mercury pollution to conduct such a business in such a interconnected water rich area right next to the BWCA. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. It is easy to make pronouncements but what are the facts related to this type of mining. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. How will they be captured without liners. What happens when there is episodic flooding. Was an alternative explored by Polymet that does not impact wetland areas. It is irresponsible to gamble with the health of the region. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. Even 30-40 years is too much of an impact to the area. The burden should be on Polymet to design mining plans with no risk to the drinking water in the area. I am confident that you would not allow a homeowner to conduct a business in the BWCA area that would jeopardize his/her neighbor's well water. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. Too much has already been taken from the n

I am confident that you would not allow a homeowner to conduct a business in the BWCA area that would jeopardize his/her neighbor's well water. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. Too much has already been take

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Clean ground water is essential. Please don't risk something that can't be recovered, except by extraordinary means and centuries of time for short term prosperity. Sincerely, Anne Clark 708 N 1st St Minneapolis, MN 55401-1133

Anne Elizabeth Haugan

To whom it may concern at the DNR Office . . . I am very opposed to PolyMet's proposal for copper/nickel mining in Minnesota's Arrowhead Region. It's a NO – BRAINER. Do we provide several hundred construction and mining jobs for a few hundred people for twenty to thirty years and pollute the watershed basin flowing into our great Lake Superior for hundreds of years, as well as polluting the air. Or protect this valuable watershed environment for hundreds of years. Another great concern is dealing with Poly Met, a small new company, which has little accountability and the likelihood of the mining operation being turned over to Glencore Xstrata. This scares me as Glencore Xstrata has a poor environmental record, as well as treating their employees unjustly. Let's find alternatives that will provide jobs to better the Northeastern Minnesota economy, such as the solar panel industry on the Iron Range, tourism industry, or forest products industry. Thank you for taking my comment, Anne Elizabeth Haugan 1161 Oakcrest Ave Roseville, MN 55113-3219 Phone: 651-484-3856

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, anne nelson minneapolis, Minnesota

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Annette Price 1817 Ford Pkwy Apt 101 Saint Paul, MN 55116-2170

Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Living in Duluth, I am so fortunate to have the largest surface area of freshwater nearly outside my door. We would like to keep our wonderful freshwater resources in this area. After over 30 years of clean up, we are almost able to say that the St Louis River is not polluting our great lake. That time period compared with 500 years seems quite small, and yet that clean up has affected all of us in this area. I also grew up during the time when we needed to drink bottled water due to the tailings in Lake Superior. It seems we should be more careful into the future with our water resources, especially when we already know about some of the ramifications. Sincerely, Ms Annette Strom 1512 Boulevard Pl Duluth, MN 55811-2719

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Annie Bien 29 Tiffany Place Brooklyn, NY 11231 US

To Whom It May Concern; Copper cobalt mining has proven itself to be filthy and I am highly skeptical that this will be the first clean copper mine ever. Do not pollute our Great Lakes for imperial greed. My full name is Anne Carlin and mailing address is 6901 Hillcrest Lane Edina, MN 55435- It was the governments job in WV to monitor and maintain safe water for their civilians but they didn't and they still haven't. I do not support this copper cobalt mining venture and its highly probable irrevocable damage by exposing toxic contaminants to our water. Please do not allow this venture to proceed any further. Sincerely, Annie Carlin Sent from my iPhone

Annie Gardner

40055

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Annie Gardner 1906 1st Ave S Minneapolis, MN 55403

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are there

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

57978

Sulfide mining is a dangerous and risky proposition for the future health of Northern Minnesota's environment. PolyMet has not shown that they can adequately protect Minnesota's environmental resources, especially our invaluable water resources. Mining is not good for the future of Minnesota. PolyMet cannot be trusted to complete its cleanup and financial responsibilities. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Annie Kieffer St Charles, Minnesota

Annie McMahon 48166

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Annie McMahon 421 Geary Hgts. Dr Clarkdale, AZ 86324

Destroyed the RiverBecause of the EnvironmentBig Whole in the Ground, PollutionIt's a wonderful ecosystems for [ILLEGIBLE] animalsSpecial part of who Minnesotans doneSecond [ILLEGIBLE]Dear DNR, I don't think you guys would bid a mine only for your benefit and there is other places you can find copper in [ILLEGIBLE] just because that whole is going to be in the ground for the next 20 years and we'll have to deal with these problems years after that after closed and I think it's a wonderful ecosystem for the animals and it's a quiet, sacred place for Minnesotans and I think the word would look bad without any preservatives in nature environment. Also I'm against the mine is because of the pollution. The affects are environment would be negative and you could put it somewhere else.

54332

Dear Ms. Lisa Fay, EIS Project Manager,I am writing to you because I would like you to know my opinion on the possible PGE mine being created by the Boundary Waters. I think you should allow this mine, because it would be of great benefit to our economy. But ...Since this is the first PGE mine in Minnesota, I think that we should be extra cautious and be extremely aware of the environment around the site of both the mine and the facility. Now, I know that PolyMet Mining, Inc. has already said that they will continually monitor both the water and the surrounding area. I also know that I am probably going to bring up the same points that countless others have already. I also acknowledge that you and your peers have probably already addressed this. But, I'll still bring them up anyway.I am concerned about the possible damages that the facility and the mine could do to the environment. I am also worried about the land that the Native Americans are connected to. I understand that the land is important to them. I know that in the treaties and other documents on your website, the mining company has said certain things concerning all of the concerns mentioned above.So, to finish up, I can see it going either way with the allowing of the mine. I think that both answers to the question of whether or not to allow the mine are okay by me. I will support whatever decision that you make regarding the mine, and I hope that your decision is the right one.Thank you for reading this, and for being so thorough with your investigation.An anonymous commentor

54333

Dear Ms. Lisa Fay, EIS Project Manager,I don't think the PolyMet Mining has a good idea. The mining will just harm the environment not help it. It will take twenty years to mine the area. That is just too long to be doing that to the environment. The area is around a beautiful place of nature. The mining will just ruin it by destroying trees and most likely some wildlife along with many other things.You need a lot of money to clean the water after you are done mining and that will be years and years from now when we are done with that. We won't have the money to continue cleaning the water so we will just stop cleaning the water so then it will get polluted. If the water gets polluted then the environment will have a counter effect. The water is very important and that's what we need to live.There are others ways to have the things we have without fossil fuels. Instead of spending the money on the mining project we can just use the money to research solar power and other environmentally safe fuels.Thank you for taking my opinion in and using it for your decision.

I do not believe that this is a good idea. This is all about money, not jobs. We have to protect our resources, water soil etc.

Anschel Burk 39355

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness, ultimately threatening human lives, the Minnesota tourism industry to natural wonders like the Boundary Waters, and any other industries that depend at all on clean water. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Anschel Burk 300 N College St Northfield, MN 55057-4000

A majority of us believe that building a mine next to the only preserved native area is not a good (or smart) idea. It is the HABITAT of animals. They need the boundary waters they have nowhere to go. It is also the paradise of humans you can build a mine pretty much anywhere. You can't create a natural habitat. There are also people like me, who want to take their children there one day. In this day of age, nature is becoming rare. It is a place where you can see and feel what earth would be like without human interference I am not only talking for myself, but on the behalf of a majority. You can build a mine anywhere, but not true nature.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Anthony Wolf 19998 200th st N Ulen, MN 56585

You would be fools to even consider any further, the detrimental damage polymet and sulfide mining would have on our aquafor. There has never been a sulfide mine proven safe. We the people of Minnesota, want to protect our clean water. This project is too expensive in the long run, for clean up. Why sacrifice our water for a few temporary jobs. It doesn't make sense. Promote recycling for precious metals, quit mining.

April Hughes-Brauner 43726

Concerning the Polymet mining project in NE Minnesota: Given that the mine in question is in one of Minnesota's most scenic and pristine areas, where water is of such abundance and purity I would like to voice opinion to the mine, especially of the threat to native flora and fauna, wild rice in particular. -Sharon Campbell 2101 Island View Drive NE Bemidji, MN 56601

Archie K Benham 47364

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, FACTS: The ENVIRONMENT is ****not**** more important than the ECONOMY. Climate change and global warming are real issues. Pressing issues. The world does not need to farm Copper/Nickel anymore. Recycling can handle the demand. The CONS ****far**** outweigh the pros. I do not want to take away from Minnesota's healthy environment. WE WILL LOSE A PART OF OUR GREAT STATE. I SAY, NO, TO MINING.. Sincerely, Archie K Benham 3928 Abbott Ave S Minneapolis, MN 55410 Sincerely, Mr Archie K Benham 3928 Abbott Ave S Minneapolis, MN 55410-1037

Ariane Norrgard 57465

As a concerned citizen of Duluth and the surrounding area I am commenting on my position against PolyMet Mining. If citizens of this community allow companies to mine copper and nickel at the expense of clean water, we are setting the stage for years to come. Fresh water is a more valuable, precious resource that will provide more wealth to Minnesota in the far future. PolyMet mining hinders Minnesota's ability to use water resources because of the detrimental effects copper nickel mining has on water and wild rice. Please consider protecting the boundary waters area, Lake Superior, and water quality as a whole by not allowing PolyMet (or companies like PolyMet) to operate within our region. Thank you, Ariane Norrgard 1615 E 2nd St Duluth MN, 55812

The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Arly Piri 1027 16th Ave SE Minneapolis, MN 55414 US

March 9, 2013 To: [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us)NorthMetSDEIS.dnr@state.mn.us Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources, Environmental Review Unit, 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Re: Supplemental Draft Environmental Impact Statement for the mining plan for Polymet's NorthMet Mine. I cannot fathom why the State of Minnesota would provide a permit for this mining plan. I lived in Minnesota for many years and directed a children's camp in Ely area and though retired now I return to the area to relive those years. This is an area of unique natural resources and belongs to all of the citizens of the USA for their pleasure. From my viewpoint it is apparent that such mining would: pose human health risks through contamination of drinking water and fish, seriously degrade the St Louis River, destroy wild rice and irreplaceable wetland habitat, and harm Lake Superior that holds 10 percent of the world's fresh water. The precedent set and the ramifications of this project transcend short-term economic concerns. provide a significant risk in the watersheds receiving the drainage from Polymet's waste rock and tailings complexes, given that two million tons of sulfur would be brought to the surface during mining, result in unacceptable and long-term water quality impacts, which exceed water quality standards All of this for a foreign corporation whose stated goal is to provide the first eight years of copper produced to China, without any plan to meet domestic needs in our country. How strange. How unnecessary when the promise of jobs constitutes non-union jobs that carry the possibility of unknown periods of layoffs and a terminal time period. Armand Ball 16502 Cypress Villa Lane Fort Myers Florida 33908

I am writing this letter to recommend not to do the mining. The reason for this are because it's going to destroy the beauty of the land, its going to slowly destroy the wilderness, and our water pH level will decrease. Our planet is damaged enough already and destroying the wilderness or turning the water into sulfuric acid just to mind copper and nickel is [ILLEGIBLE] have heart to think about the animals that are going to affected! Those animals also deserve to live peacefully. We humans have destroyed enough land and token away a lot of land that a lot of animals are forced to leave to find another home and many die! PLEASE DON'T DO THIS!

Art Lind 18131

Good evening. My name is Art Lind. I'm a lifelong Iron Ranger, born and raised in Hibbing. I've been working in the mining industry for over 52 years already. I graduated from Hibbing High School in 1963; graduating class at that time was 325, about. Also in about 1963, happened to be the year that they passed the Taconite Tax Relief Act which spawned massive investments in this region to build six taconite plants. Jobs were everywhere by 1965 and people that had once moved away started to return. People with teaching degrees were taking jobs as laborers in the area of taconite plants because the jobs paid better. Our economy was vibrant and the young people were everywhere. Well, the world has changed. We have to -- we have to compete with many manufacturing and mining jobs that are now being done in third-world countries under some of the worst job conditions imaginable with little regard for human health or the environment. Graduating classes in Hibbing today are about 150. You have to have good-paying jobs to support young families. Tourism? Yeah, we like tourism. Tourism wouldn't make a pimple on a mining job's behind when you compare the economics each of those jobs produces. On the horizon is the next era of mining and the top-paying jobs that will come with the development of one of the world's largest deposits of precious metals. I guess I'm part of the silent majority, most of which have left now. Let's see. I lost my place. I guess I'm getting tired of listening to the anti-mining group whose main focus seems to be to stop any mining development. You keep talking about 200 to 500 years of water treatment. It doesn't say that. It doesn't say the treatment will be 500 years. It says, "Treatment will be determined using measured results," which is the way the law is designed to responsibly handle it. The 200- to 500-year timeframes used in the SDEIS model represents the durations that models were run, not to predict how long treatment would be needed. Read page 39 and then take a good look at your life. If you drive a car, have electricity, buy groceries, have a cell phone, a computer or go to the clinic or hospital; everything we do is touched in some way by these metals. If you can't grow it, you've got to dig it out of the ground. I would venture a guess that those against this project have just as big an environmental footprint as everyone else and they enjoy the quality of the life these metals help to provide. Does that make them hypocritical? In the news yesterday it was reported that 10 percent of the air pollution on the west coast of this country comes from China. We can do this project right. Our mining industries operate under the strictest environmental regulations anywhere in the world, and we have all these agencies to watch over them. We need this project.

Art W 43384

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Art W 830 S. Winthrop St StPaul, MN 55119

ARTHUR 5936

Most people do not realize the value that mining brings to their everyday life and the historical development of this country, especially those that are opposed to the development of this particular project as it is in "their back yard". They take for granted the conveniences as though they are picked from the sky when in fact most are derivatives of mining processes in one way or another. All mining has some risk. Since Polymet's inception 10 years ago, many tens of millions of dollars have been invested, not only by Polymet, but the State of Minnesota and the Federal Agencies to process the best environmental alternatives known in modern technology to be the best that we can be. Not to utilize this vast resource and the economic benefits they will provide and allow the metals to be mined somewhere in the world not as attentive as Minnesota is HYPOCRITICAL. I support Mining and Mining supports me. We need this project. This State needs this project. The Country needs this project. Art Lind 3904 5th Ave E. Hibbing, Mn 55746 Cell: 218-969-6169

Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. With unknown outcomes, it is essential for us to err on the side of caution, requiring total thoroughness in studying the matter, and total transparency in reports. Until that occurs, and unless the results of such study are that there is no danger to water quality, soil integrity, and wildlife populations, there should be not action. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Arthur Dorman 817 Orange Ave W Saint Paul, MN 55117-4028 (651) 487-3793

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Arthur Marble Edina, Minnesota

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, ashley ferguson 12th st duluth, MN 55806

The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, ashley ferguson 12th st duluth, MN 55806

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ashley Williams Minneapolis, Minnesota

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Audrey Burmeister 8708 41st Ave N. New Hope, MN 55427, MN 55427 612 280 5707

Audrey Cullen 18300

Audrey Cullen. My statement is I don't think this is a responsible project. There is too much inherent risk involved with polluting the best watershed in this country. There is a drought in the western part of this country that is going to soon be escalating to the point of a crisis, and if we really want to do a commodity depletion or removal, it should be our clean water. It shouldn't be destroying our environment to get things that we can get by recycling (phonetic). I am also asking the DNR, the Forest Service, and all governing agencies that are involved in this to think about the future generations. Who out of that governmental agency is going to be around in 500 years to make sure everything is good? Not one of us breathing at this moment is going to be here. Who is going to take care of the future generations? Also, I think that it is very arrogant just to think about our own species. There is frogs, birds, deer, fish, moose, lynx, cougars, skunk, raccoons, et cetera, et cetera, that all depend on land. Why are we able to go in and tear it apart for our inability to conserve anything as a people? I'm just asking them to be wise versus short-sighted, myopic. I think I have gone on long enough. Thank you so much.

Feb 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuri

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Audrey Glassman 2120 Aldrich Ave S Apt 202 Minneapolis, MN 55405-3099 (612) 870-7157

Dear Lisa Fay, I am writing to you to inform you that I strongly oppose sulfide mining in Northern MN. I worked in Northern Minnesota for many years. I am very familiar with the area. In addition, I am a graduate student in Environmental Science. I have a lot of experience with the consequences of mining in natural areas and I know the damage that projects, such as this one, can have on natural resources. The Boundary Waters of Minnesota are a state treasure, which draw tourists not only from the Twin Cities but all over the country. I can personally attest to that, as I have travelled from California many times to paddle the Boundary Waters. Throwing away the natural beauty, a large source of income and state pride, in favor of the temporary income from mining is foolish and shortsighted. Moving forward with mining without a comprehensive and realistic Environmental Impact Assessment, and plan for what to do with the mining waste is, again, shortsighted. Sulfide mining could cost the state more in damages and waste removal than it is even worth. Letting the sulfide mining proposal go through is an irreversible decision- and not worth the unknown risks. Again, I urge you to consider this issue. Say no to sulfide mining. Audrey Haynes [HYPERLINK "mailto:audreyhaynes@berkeley-edu"](mailto:audreyhaynes@berkeley-edu)audreyhaynes@berkeley-edu 510-316-1334

Dear Ms Fay, As as a frequent traveler to the Boundary Waters Canoe Area, I have significant concerns about the proposed North Met SDEIS mining and land exchange project. Twice a year, I travel from Utah with my husband and children to Ely, MN to enjoy the unique beauty and wildlife of the area. When one looks at the history of sulfide mining, there is no reason to believe that there won't be serious negative environmental impacts that will last decades if not centuries to come. From an economic standpoint, any short term gain for Polymet and addition of some jobs in the immediate future will be negated by longterm negative environmental and economic impact when the environment including something as precious as water quality is damaged. What is the chance that decades from the mining of the desired material, the company will still be around to take responsibility and continue to try to clean up the surrounding area. History tells us not a chance. Additionally, as a obstetrician/gynecologist, I have even more concerns about the heavy metals and toxic chemicals which will certainly impact the reproductive health of women living in the area as well as the development of embryos/fetuses. More and more evidence is pointing towards significant negative impact of reproductive and developmental health from these toxins. A lack of information regarding the specific pollutants may lead to catastrophic outcomes for individual women in the area. Overall, the project appears to focus on short term gain while ignoring significant negative long term impacts. More time is needed to investigate fully the potential outcomes for Minnesotans and the citizens throughout the world who travel to visit your beautiful state. Thank you for considering all viewpoints. Sincerely, Audrey Jiricko, M.D.

To: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit The North Met SDEIS should be rejected for a number of reasons. The computer model shows that the water seepage will pollute for at least 500 years and must be treated for the entire time. This is totally unrealistic to expect this to happen. PolyMet is asking to be allowed to run a 500 years experiment that has never been tried before. PolyMet is a company with no mining experience and no substantial financial backing. The financial assurances for hundreds of years ate not addressed in the SDEIS. This must be corrected. In addition the computer model is known to have been run with incorrect water flow information. The water flow was greatly underestimated requiring the analysis the be completely redone Dennis J. Peterson 3458 N Rangeline Rd Gheen, MN 55771 218-787-2302 [HYPERLINK "mailto:audrey.dennis@gmail-com"](mailto:audrey.dennis@gmail-com)audrey.dennis@gmail-com

I am concerned that leaching from the sulfides in the pit, waste rock, and tailings from the proposed PolyMet copper-nickel mine cannot be effectively contained after the mine is decommissioned. I request that you not approve the required permits for this project. Furthermore, if permits are approved this could set a precedent for possible approvals of the Twin Metals projects and the leaching from those projects, could be disastrous for the BWCA watershed. August W. Haugan 1161 Oakcrest Ave Roseville, MN 55113

Avery Jorgenson

54343

Dear Ms. Lisa Fay, EIS Project Manager Polymet Mining seems to have a very set plan in place. I think that this plan is a good well thought plan because they are doing the best they can to not change to much of the surroundings. Personally I think the copper-sulfate mining will benefit MN. I think that it will benefit us by helping create a better environment and also finding better ways to get the resources we need. There are many advantages to the mining process. Some of these are getting some of the resources like copper, mixed nickel and copper, and PGE to be more abundant. As there are many advantages that also brings the disadvantages. Some of them being that wildlife will be affected by the mining process. Also, that some of the land open to public is going to turn private. This process will also affect the cultural resources greatly. Ways being, fish, plants, and animal species being affect either positive or negative. This project will also affect the people that are living in this area. I agree with the land exchange. I agree because I think that Polymet is trying their best to make it fair but still get the resources they need to continue with this project. The Net will gain or increase most of the needed land and material from this land exchange. This project will impact or affect a lot of people. However, I do not think that this project will end up being an impact on me. Sincerely, 8th grade student Avery Jorgenson

Dear Ms Fay, Mr Bruner and Mr Dabney: Please accept these comments on the PolyMet Mining Corp. mining project Supplemental Draft Environmental Impact Statement. Please reject the PolyMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River waters "would continue in perpetuity." One peer-reviewed study found that, while all projects that were reviewed predicted they would not pollute, at least 76 percent of the time they still did. The same study found that 89 percent of mines that have polluted said they would not. It is this history that is one of the biggest reasons for worry about proposals to bring the mining to Minnesota. The industry says they won't pollute our prized waters, but they've said that before, and they've been wrong more often than not. The Brohm Mine, mentioned above, is also a useful illustration of this problem. There, the mining company assured the state that the mine would not produce acid mine drainage because the ore was low in sulfides, around one percent average. The mine still created terrible pollution, killing all the fish in that stream turned acidic. This is an important point, because the mining industry in Minnesota frequently states that because the ore here is low sulfide, it won't cause acid mine drainage. Taxpayers left holding the bag Confronted with astronomical clean-up costs and battered by a volatile metals market with frequent boom-and-bust cycles, mining companies often abandon their polluted mines, walking away and leaving taxpayers holding the bag. Although Minnesota requires mining companies to provide financial assurances to fund cleanup if the company goes bankrupt or is otherwise unable to perform the work itself, it is very difficult to predict the extent of the pollution and resultant cleanup costs. Also, assets of bankrupt mining companies are often awarded to other creditors. The industry's track record of not paying to clean up its messes is long and shameful. A few examples include: Zortman-Landusky Mine, Montana – \$33 million and counting Summitville Mine, Colorado – \$185 million and \$1-5 million/year Grouse Creek Mine, Idaho – \$53 million Solution: The Minnesota legislature needs to first pass a bill similar to Wisconsin's "Prove It First" law that, before opening a mine, a company must be able to point to a similar mine to what it is proposing that a) has operated for 10 years without polluting and b) has been closed for 10 years without polluting. Major problems of the SDEIS Evaluation (1) Mercury is a huge concern. The Minnesota Health Department found 10% of infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS

Hello DNR, Let's get to the core of the issue. Who stands to benefit monetarily far greater of all interested parties. It is the Chinese. Do we here in America want to sacrifice our natural resources and jeopardize our future human habitat in order to supply minerals to the Chinese. No. It is time that NE Minnesotans move toward a regional future that doesn't include this kind of eco-unfriendly, shortsighted enterprise. Did you know that: 1) PolyMet would require hundreds of years of expensive treatment of polluted water, 2) PolyMet would destroy thousands of acres of habitat used by threatened moose and lynx, 3) PolyMet's mine plan lacks analysis of human health impacts from mercury and asbestos-like fibers, and 4) PolyMet's studies contain inaccurate water data that need to be corrected. It's too risky and does not pass a Minnesota smell test Bert Flora ===== B H Flora 5336 26th Av S Minneapolis, MN 55417 612-210-1614 bert.flora@outlook-com

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, b mayler po box 1012 yelm, WA 98597 US

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. One idea if the mine does open: any and all profit from the mine goes into a trust fund to pay for any damages and clean up that is caused by the mine. Once the water and any other environmental damage(s) is fixed, then PolyMet can have what's left in the trust. B Wagner Sincerely, Ms b wagner 1471 Hague Ave Saint Paul, MN 55104-6727

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement.- TOO DANGEROUS FOR THE GREAT LAKES. West Virginia, North Carolina, how many others have been damaged for years to come due to some form of mining or chemicals for mining. That should provide more than enough evidence to prevent any mining on or near the Great Lakes. Including but not limited to, they couldn't even figure out how to shut down the spill in North Carolina-it was shut down by pure accident when the platform they were to use to figure out how to shut down the pipe spilling chemicals collapsed by accident thereby collapsing the pipe and shutting down the flow. WE DO NOT WANT AND CANNOT AFFORD THESE KIND OF SPILLS ON THE GREAT LAKES. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, B. J. Alexis

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." I appreciate the opportunity to voice my opinion on the SDEIS, as it has major flaws that must be addressed. Most importantly, the pollution of water sources is unacceptable. Drainage and toxic run-off into the St Louis River and ultimately Lake Superior is both a hazard to local inhabitants and a dangerous long-term decision. Water has become one of the most precious resources in the world and we must recognize both its crucial importance and its finite nature. We cannot afford, figuratively or financially, to pollute our healthy waters. The lack of financial assurances provided by Poly Met is also extremely concerning to me. After 20 years of mining, the taxpaying citizens of Minnesota deserve a detailed financial plan for how Poly Met will ensure 500+ years of water treatment. The fact that these assurances have not made it into the SDEIS scares me as a Minnesota resident and tells me that this company is not looking out for our best interest This issue is not a matter of the environment versus jobs in terms of economic interests, and I want to stress the overall financial stupidity of this project. Lastly, this mine would set a horrific precedent for both the health of Minnesota's wildlife and wilderness areas across the country. Please do not allow Minnesota to be part of this short-term economic project that will create pollution for hundreds of years to areas of beautiful and precious wilderness. Thank you for considering these changes that must be made to the SDEIS. These components of the Poly Met proposal, as well as countless others, should ultimately reveal the extreme negative effects that this mining would have on our waterways, our wilderness areas, and our pocketbooks. Sincerely, Ms Bailey Rehnberg 1600 Grand Ave Saint Paul, MN 55105-1801

To whom it may concern, In my opinion, you should NOT approve the permit to start sulfide mining. Many factors need to be addressed. *The money for any potential cleanup after mining needs to be in a secure financial institution BEFORE the mining starts. *It wont hurt anything to wait until all the questions are answered *The "what ifs" on toxic effects to water are still unknown and cant be fixed quickly once it starts to happen Thanks for your time, Barb Cooper 10125 Bandana Lake Rd Isabella, MN 55607

To:NorthMetSDEIS.dnr@state.mn.us I would like to respectfully register my opposition to the proposed Copper mining project. While my rationale stems from a sincere appreciation for the natural beauty of the area and a strong desire to see it protected, I also have substantive rationale for my objection to the project. 1- The Environmental Impact study has not adequately addressed the elevated levels of sulfate and metals such as copper, cobalt, and nickel. The potential presence of mercury is also a threat to water based organisms 2- The amount of wetlands at risk (913 acres) is too great to warrant the minimal benefits of the project. 3- The minimal number of jobs promised by this project is not worth the permanent damage likely to be done to the natural resources of this area. 4- The minimal compensation promised for the workers to be hired is not worth the damage likely to be done to the natural resources of this area. Thank you for your attention to this matter. Barb Landes landesbj@frontier-com 14398 Embassy Way Apple Valley, MN 55124

Barb LaVigne 39319

Dear Federal and State Agency Leaders. I co-own the Angry Trout Cafe on the harbor in Grand Marais, MN. We employ over 60 people and cater primarily to tourists interested in wilderness and the pristine beauty of our area. I am very concerned about the PolyMet Mine Plan. We can not gamble our future for the promises of questionable environmental protection and short term jobs. This is just crazy. The reason many support PolyMet is that they were left jobless after iron mining's boom and bust Please reject PolyMet's SDEIS and deny them permits. Clean water is the basis of our economy in NE Minnesota. PolyMet's plan puts my business at risk. There is no room for error here. Sincerely, Barb LaVigne Owner, Angry Trout Cafe P.O. Box 973 Grand Marais, Mn 55604

Barb Manns 38950

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Barb Manns 15941 Ebony St NW Ramsey, MN 55303-6901

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

As a person who was born in Virginia, MN and whose family owns lake property in Britt and a tree farm in Angora I urge you to approve the Polymet mining project. I am an avid outdoors person who enjoys fishing, hunting and other activities outside and appreciate the beauty of our area. However I also believe that we, who choose to live up north, also need industry. I believe that the SEIS had been thoroughly prepared and reviewed and demonstrates that industry and environment can co-exist and thrive. Please consider this a vote for Polymet for both of us. Respectfully submitted, Jeffrey and Barb Wiklund 6705 McQuade Rd Duluth, MN. 55804

Barbara A. Haack 21171

Dear DNR: It is with great concern that I am sending this email regarding Poly Met's proposed mining in northern Minnesota. After reading about the project the following information supported my decision that a email must be sent: 1) It appears foreign countries are the promoters (Canada and Swiss) and not the United States. 2) The main jobs are to be given not to Minnesotans but to imported professionals therefore providing only minimum income for the people of our state. 3) Poly Met mining experience of this type is limited therefore Poly Met could end up losing money and filing bankruptcy leaving the tax payers of Minnesota to pay the bill for all clean-ups (especially water pollution). 4) Permitting this type of mining operation opens the door to other companies who can use this permission to say, "You granted permission before, how can you refuse us." The treasure we have in our northern water, soil, and air should never be taken for granted. Once gone it cannot be restored. Please consider my sincere concerns for the future of Minnesota having been born and raised here. I am 78 years old. Thank you. Barbara A. Haack 36815 Country Road 15 St Peter, MN 56082

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Barbara Bower 8053 40th Ave Brainerd, MN 56401-1740

Barbara Burkhart

48123

Dear Ms Fay, Dear Federal and State Agency Leaders: "PolyMet's water pollution from the permanent mines site waste rock pile would need treatment for at least 200 years and pollution from the tailings piles would require treatment for at least 500 years. Pollution seeping out of the mine pits would "continue in perpetuity." Forever." ~Water Legacy. So, in other words, for a couple decades of a small number of people having a job, we're willing to let this company saddle generations centuries into the future with the consequences. Classy. I can't even imagine what the people 500 years from now will think of us and our greedy, shortsighted generation. Will they starve because they can't eat the fish or the wild rice. Will they have birth defects due to the chemicals and toxins in the water. What about the people who are alive today, who depend on the fish, land, water, and wild rice as part of their livelihood. Are we saying that big business is more important than our rights as citizens to clean water, clean air, and sensible land-management. The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Barbara Burkhart Barbara Burkhart 3501 - 15th Ave S Minneapolis, MN 55407

Hello. I am a Wisconsin resident with summer recreational lake property on Cadotte Lake in Minnesota. I have many questions and concerns regarding the current EIS surrounding this project. Attending the forum at the DECC, some of my questions were answered most not. I am very concerned about the lack of knowledge of this type of mining. What kind of clean up will be needed. The amount of sulfuric acid into the ground water. The 500 year plan for clean up That is just too bizarre to comment on. I was born and raised in MN. The land and water is like no other. I pay taxes in MN, I work in MN. I have boats registered there. We have discontinued all further development of our property until this is figured out. Please reconsider the continuation of this EIS and the project until we can comfortably say this mining will not now or ever damage our beautiful land and water. Thank you, Barbara Curphy 4989 S. Rockmont Rd Poplar, WI. 54864 Sent from my iPad

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Barbara Downham 4141 Arbor Ln Eagan, MN 55122-2893 (651) 454-2818

To Whom it Concerns at the MN DNR and State of MN: I am opposed to copper/nickel mining in MN. I am opposed to a foreign company mining on our soil China has a poor history of protecting its environment and people. Water is a huge natural resource, and in shortage worldwide. It is only going to get worse as time goes by. We should protect a very important resource for the planet as well as humans. In the short run this allows us to continue tourism to a very pristine place. In the long run it protects generations. The decisions we have made in the last 100 years have decimated the planet. 20 years of jobs for what this will do to the land, air and water, is shortsighted. It will not provide a man or family with a lifetime of work and wages. Please do the right thing, not the shortsighted money decision. Thank you for opening this to the Citizens. Barbara Erickson 104 West 36th St Minneapolis, MN. 55408

Feb 15, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Barbara Fleishman 5522 Century Ave Apt 4 Middleton, WI 53562-2029

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please, please think long and hard about the consequences of the PolyMet Mining Corp. NorthMet mining project. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. This type of contamination can have drastic effects on future generations of humans and animals, even to the point of extinction of species. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest It MUST be prevented. It is incomprehensible for a project of this nature to be planned for PROTECTED NATIONAL FOREST LAND. Sincerely, Barbara Garett 13384 Ravine View Dr Grand Haven, MI 49417-9165 (616) 847-3576

---Original Message--- From: dlhuskins@hotmail-com [mailto:dlhuskins@hotmail-com] Sent: Tuesday, March 11, 2014 8:37 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, barbara hughes 2624 Windsor Ln Saint Paul, MN 55125-2792

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Barbara Janssen 7356 Quantico Ln. N. Maple Grove, MN 55311

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Barbara Johns 693 Yorktown Road Lewisberry, PA 17339 US

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms barbara monks 420 Minnie St Trlr 5 Paynesville, MN 56362-1800

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the TIME. ine should not be built as described. NO PROJECTS OF ANY SIZE SHOULD BE APPROVED TO GO FORWARD UNLESS CLEAN ENERGY IS USED. IT IS CRAZY WHAT HAS BEEN ALLOWED IN THE PAST 50 YEARS. IT DOE NOT TAKE A COLLEGE EDUCATION TO KNOW AND SEE ALL THE DAMAGE DONE IN THIS SPAN OF TIME. THESE GREEDY PERSONS MUST NOT HAVE GRANDCHILDREN THEY CARE ABOUT. .. PLEASE CONSIDER WHAT IS HAPPENING TO ALL HUMANITY BY MANY BAD DECISIONS. THANK YOU. Sincerely, Ms Barbara Naber 723 Evergreen Ct Burnsville, MN 55337-4672 (952) 210-8021

I believe PolyMet has done their due diligence and has provided a detailed and thorough SDEIS. I feel they are responsible and capable of managing this project. This study proves they are committed to the environment. The number of jobs PolyMet would create would be a huge benefit to the Iron Range and increase the tax base which in turn benefits our local economy. Including families, schools, and merchants. This is a project that the Range hasn't seen the likes of in decades. It's time to put Iron Rangers to work and prove to the rest of the country that we can do this right. Barbara Peterson 401 Douglas Ave Eveleth, Minnesota 55734 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

Barbara Raye

42034

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Barbara Raye Mpls, Minnesota

I am concerned about the impact the proposed mine will have on the state's water. The plan for treating polluted water does not have enough detail. How will this be paid for in the future? Is having polluted water for hundreds of years a reasonable by product of this mine? Please don't sacrifice our water resource for the mine. Barbara Ritter 2117 Sioux Blvd New Brighton, MN 55112

Barbara Ronningen 44833

I am totally opposed to the Polymet project in northern Minnesota. To me, the risks are too great in a pristine environment. I am more concerned about the rush job the DNR has taken on comments. I agree with the Minnesota 2020 piece on the very short comment period. See http://www.mn2020hindsight-org/view/trust-me-the-polymet-comment-period-was-too-short.utm_source=emailandutm_medium=emailandutm_campaign=polymet Makes one wonder who's pushing this - citizens, environmentalists or more likely Polymet. BJR Afton, MN Laughter is the sun that drives winter from the human face. Barbara Sellers 45687

Dear Ms Fay: 1- Polymet's mine plan fails to address mitigating the environmental impact of the mine by using underground mining, rather than open-pit mining. If the financial cost is currently too great to justify underground mining, the metals should be left in the ground until the demand for them justifies the cost of underground mining. 2- The precious metals that Polymet proposes to mine would currently be available in sufficient quantities if previously-mined metals were reclaimed and recycled. Polymet's mine plan fails to address mitigating its environmental impact by reclaiming and recycling previously-mined metals instead of digging any mine, whether underground or open pit. Thank you. Barbara S. Sellers 1875 Juliet Avenue St Paul, MN 55105 [HYPERLINK "mailto:BarbaraSellers1947@msn-com"](mailto:BarbaraSellers1947@msn-com) BarbaraSellers1947@msn-com

Barbara Snyder 58063

This type of project is just nonsense - big money destroying our state! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Barbara Stamp 40006

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Barbara Stamp 6901 W 84th St Apt 216 Bloomington, MN 55438-1188

Barbara Walker 14210

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I despair at how often, with regard to safeguarding our environment and wildlife, our country engages in repeated forgetfulness, denial, rationalization, negligence, spite. Mining results in toxins that almost always eventually leak or leach or belch into our waterways, soils, air. Enough.. As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Barbara Walker 5450 Windsong Ct Morrison, CO 80465-2177

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Barbara Wirth 4834 33rd Ave s. minneapolis, MN 55417

Barry Babcock 39440

The Polymet non-ferrous sulfide mining proposal should not be allowed. The lakes and rivers in N MN are a national asset. Few if any states have the abundance of relatively clean waters we do. The historical evidence of contamination from sulfide mining is too risky to place our waters in jeopardy. The MN DNR should be more protective of our clean water assets than catering to the wishes of industry. According to "Earth Works" a 2008 study shows that the American taxpayer is stuck with a 70 billion dollar cleanup cost for sulfide mine AMD in our waters. We would be foolish to risk our waters to a 20 or 30 year mining project. Barry W. Babcock 38998 315th Ave Laporte, MN 56461 solaris@paulbunyan-net

Barry Bissonett 43007

KAHN HAS CONCERNS ABOUT POLYMET PROPOSED NORTHERN MINNESOTA MINE St PAUL – Rep Phyllis Kahn (DFL-Minneapolis) said in a statement on Tuesday that she has serious concerns about PolyMet's proposed open-pit mine and ore processing facility near Hoyt Lakes and Babbitt. While she believes the environmental impact will be significant, her statement stuck to the issue of financial assurance. Her statement will be part of the public record of review and comment called for by the Department of Natural Resources regarding the controversial proposed copper-nickel mine. The Canadian mining company has proposed building the first of what could be a series of many copper-nickel mines in the state. The area for the possible mines is just east of the Iron Range north to the edge of the Boundary Waters Canoe Area Wilderness. Kahn's statement is: The scope of the PolyMet NorthMet SDEIS [Supplemental Draft Environmental Impact Statement] is seriously lacking. This is especially the case when the issue of financial assurance is concerned. I have three points:

I. In chapter 3, pages 136 to 138, you list information that includes the preliminary cost estimate of closure. The source cited is "Foth 2013." I've looked at the Foth memo cited in the SDEIS. The Minnesota DNR has simply copied information from PolyMet's hired consultant without confirming or fact-checking their work. If the Minnesota DNR and its co-lead agencies are unable to fact-check the work they presented on financial assurance, how are we to expect that they are capable of the adequately protecting the citizens of Minnesota.

II. This project should not go forward unless a third-party insurer, such as Lloyd's of London, can be found. The simple fact is, if a third-party private entity will not take on PolyMet, the state shouldn't. Private insurers have expertise in managing risk that the State of Minnesota can't match. Additionally, policymakers could tap the assurance funds for other purposes. Private insurance is clearly superior to a state managed approach in this case.

III. In the SDEIS you say that financial assurance will be done in the Permit to Mine stage. Looking at the most recent MinnTac Permit to Mine document, there is one short paragraph on financial assurance. This project shouldn't go forward without robust public debate, and the opportunity for legislative hearings, if what we can expect is a paragraph from the DNR in the Permit to Mine phase. You must ensure that the public, including financial experts and those elected to represent the citizens of Minnesota, have a chance to weigh in on financial assurance. It has not been your practice to do so in the past; will it be in this case. The

Barry W. Tungseth 10161

To the Minnesota DNR, in regards to the Polymet mining situation in Northern Minnesota . Rebecca Otto has it correct when it comes to Polymet putting it`s money where it`s mouth is. The claim they have made, is that they will be around to monitor the mine site and it`s holding and run-off ponds for 250-500 years. That is longer than Minnesota has been a state. Facts are, all ANY company has to do in this state, is to go bankrupt, and the taxpayers are held up to paying the cost Minnesota knows it, the public knows it, and the companies know it. Also, for a 20 year life span of a mine that will not even complete the working lifetime of one single long term employee, the risks out weigh the bennies. In 20 years or so, the entire area here in Northern Minnesota will be right back to ground zero, and will be going through exactly the same set of long term employment problems, and economic depression all over again. Those who tout the saying, "Mining supports us", must be talking about someplace else in Minnesota, because it hasn`t done it here in northern Minnesota at all. In the last 10 years, while our economy was turning into depression, the steel and mining companies made RECORD PROFITS, while those who were the labor force, went into record unemployment. Most sought everything from state and federal help, after their unemployment bennies ran out. THAT made them fall out of the "count of those unemployed". Mining has a proven track record of "NOT supporting us" should be the slogan. An example of the public held at bay via a mining company would be the status of state HWY 53 through Virginia .WE THE PEOPLE of Minnesota will be paying to move an entire highway because of the companies mining "rights". Taking THAT into effect, just how can this state look at the Polymet statement of , "we`ll be here for over 250 years to monitor at no cost to you the taxpayer, as truth. Let alone believe their propaganda that says they have figured out how to mine it correctly, when they have no there mine using the Tec. they claim they perfected. They can`t show one ounce of proof to that at all. Clean water is FOREVER. Mining is not. Period. I`m against the Polymet mine, and agree with Rebecca Otto put your money where your mouth is first, and prove the things that are claimed as fact before even looking at opening any new mine in Northern Minnesota. Thank you, Barry W. Tungseth 13898 Romberg Shores / P.O. Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Bea Shemberg 13228 Central Ave, Unit #101 Hawthorne, CA 90250 US

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. We have had a family cabin up north for over 50 yrs. The changes we have seen have been very concerning, we used to have tons of green frogs, cray fish and yes even leeches. I don't know how long it has been since we've seen them but it has been long while. Though you may think you may not see any changes but believe me they do happen faster than you think. We are suppose to be good stewards of the land. This is not about jobs etc It is about taking care of what we have been entrusted with. Please think long term. Don't be short sighted. Like they say "pay back is a Bi .". And the pay back would be polluted water, soil and air. Look what has happened to W VA and the oil from the gulf spill has been making it way down the coasts and they have found it is make the sea life sick.. Leaks and spills can never be cleaned up, really they can't. Please don't allow this to happen Please. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Beck Austin 3145 44th Ave S Minneapolis, MN 55406-2313

Becky and Jack Hustedt 58000

I agree that we can't continue to destroy our environment - especially for supposed "energy" mining. We need to find alternate energy sources, & projects for jobs. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Becky Ault 44084

To Whom It May Concern: I feel strongly that sulfide mining should not be allowed in NE Minnesota until it has been thoroughly explored. Citizens like myself (I am an 83 year old farmer) must be heard before letting it be done. This is a democracy and my point must be heard. Dwight Ault 51564 262 St Austin, MN 55912

Becky Erickson and Dan Sullivan 40122

I would like to express my strong opposition to granting the permit to pursue this copper mine project. While the SDEIS indicates few cumulative effects, there are many unknowns and a significant number of assumptions contained in that report. We know for certain that other similar mines have had measureable adverse environmental impacts. We also know that mining companies have poor track records for safety and environmental concerns. Given the fragility of the environment in the vicinity and the potential for long term adverse impacts, I would encourage the DNR to decline this permit. It would be unfortunate to allow a short term economic interest endanger long term environmental balance. I will watch the proceedings with great concern. Sincerely, Daniel Sullivan 857 Lincoln Avenue St Paul, MN 55105

I'm writing to submit a comment on the Supplemental Draft Environmental Impact Statement (SDEIS) for PolyMet Mining's proposed NorthMet project. For almost a decade, PolyMet has been going through a permitting process with several, highly rigid and regulatory agencies to develop a plan that addresses issues concerning safe copper mining in Northeastern MN. Having participated in the public comment events, reading the SDEIS, visiting with PolyMet officials at their site as well as reviewing information provided by the three governmental co-lead agencies (MNDNR, USACE and USFS), I am very confident that each entity has done thorough and extensive work to address the environmental concerns of this project and it should be permitted to move forward with its construction and production of the mining facility at the former LTV site in Aurora, MN. PolyMet's SDEIS, in partnership with the three co-lead agencies, overwhelmingly addresses many facets of the environmental impact of this project. However, initially I did have some concerns regarding the 200-500 year ground water flow model and after further review of all the pertinent information, I believe there is a bit of misinformation regarding the model from those who oppose this project. The argument I'm hearing in the community states that it's next to impossible to expect a mining company to mitigate any environmental hazards for 200-500 years. My understanding is that this model was created to show that, due to the water flowing ever so slowly through the stream system from the site to its end point being Lake Superior, that the model is based on that movement of water taking somewhere between 200-500 years to make it to its endpoint. By the time, such water from site empties into Lake Superior, the acidic level is well below the co-lead agencies requirements. The argument that it will take 200-500 year to treat the water from the site is factually incorrect. What the model does show is that PolyMet can comply with Minnesota's laws, some of the strictest in the nation, regarding environmental protection of its lands and water. I also learned, after visiting PolyMet, that even at the site, should any water inadvertently escape the "lined" tailings basins, its acidic level (after being treated at the site) is well below the agencies requirement as well, about the same acidity as milk for that matter. Additionally, PolyMet has already committed somewhere between \$100 – 200 million for water treatment, clean-up and mitigation once the plant is closed. Along with already investing millions of dollars in the permitting process over the last decade, PolyMet is also committed to investing millions more in leaving its home, once the mining is complete, in the best condition as it received it. Under the ground near Aurora, MN lies the second richest resource of precious metals in the world. And here in this region, with PolyMet, it can be mined safely and within the rigid regulations of our governmental agencies. I support this project wholeheartedly rather than remaining dependent on these resources coming from other countries with less environmental regulation and more harm to their environments. Aside from the environmental impact of this project which I believe has been thoroughly addressed by the company and the governmental co-lead agencies, this project has a huge economic impact on our region creating hundreds of great paying jobs for families – 360 full-time jobs, 600 more related jobs, 2 million construction hours, and increased tax revenue that benefits our communities and education system. It's time to support our region's families and communities by putting folks to work. It's irresponsible to import these metals from other countries and export our jobs when we can mine safely here in Minnesota. I look forward to an exciting and promising future for the Iron Range and our region with companies like PolyMet at the helm providing safe opportuni

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Becky toner PO Box 325 Grand Marais, MN 55604

Hello, I am opposed to nickel/copper sulfite mining in Northeastern MN because my understanding is that it has never been done before without polluting the water where these mines are located. I live outside Ely, just 3 miles from where Twin Metals has one of their proposed sites and I am extremely concerned about how it will affect my well water and general quality of life from traffic, noise, mine construction, etc I know this is not about the Twin Metals sites, but if Polymet gets their's approved, it would seem that Twin Metals would be allowed in as well. I am all for good paying jobs, but it is just too risky and not worth the harm I believe these mines will very likely cause. Time and again you read about environmental disasters and the companies that cause them who fight tooth and nail not to pay what they should for a proper cleanup or declare bankruptcy and leave taxpayers with a large cleanup bill along with the wrecked environment. Clean air and water are priceless resources that belong to millions of Minnesotans and should not be risked for a hundred or even thousand jobs. The short term benefits just do not add up to outweigh the very real likelihood of the long term negative effects. Thank you, Becky Zientek 1587 Saari Rd Ely MN 55731 Beckyzientek@gmail-com 218-365-3447 Sent from my iPad

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. An impact study would be the very least you could do for the public. We Minnesotans take pride in our pristine land. Consider the public's well being as much as you consider the opportunity for profit. Please make a balanced decision and don't let the motivation of greed after your decision. Sincerely, Ben Christiansen 6425 W Franklin Ave St Louis Park, MN 55426-2107

From: benjamin@greencorps-org [benjamin@greencorps-org] Sent: Monday, March 10, 2014 4:43 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Ben Cushing 2232 Vermilion Rd Duluth, MN 55803

Dear Ms Fay, 9 March 2014 Marquette, MI 49855 Dear Ms Fay, Mr Bruner and Mr Dabney: My addition to the following information relates to forty-five years of living in Marquette County Michigan. Mining has been part of life here for over 100 years. The cumulative effects of mining can be seen everywhere. Two groups of people have benefited from mining; those who own the corporations, companies and businesses who supply the particular mine, and the group of people who are their employees-those whose who do the heavy lifting. Efforts here to forbid or restrict mining have always failed. It is primarily about the power of money, pure and simple. All of Earth has been degraded for profit. I look at a Google map of areas I explored as a child-now I can only see the orange tailing pools, where once was nearly virgin forest towering high above, and plant life on the forest floor seemingly gone forever. Doing no harm at all may be a dream, but mitigation of harm should not be in the category of wishful thinking. The mining companies of the present and future should be forced to jump through as many hoops as scientists and environmentalists can design. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, f

Ben Wagner 45344

Benjamin Wagner 329 West Arrowhead Road Duluth, MN 55803 To Whom It May Concern: As a concerned citizen and resident, I feel compelled to draw your attention to certain portions of the industrial copper mining plan which fall short of providing a clear picture of a safe future for Northern Minnesota. As I understand, the plan allows for the industrial mining interest ('PolyMet') to simply state that it plans to contain any contaminated waste water from this operation, additionally planning to 'treat' any contaminated waters for up to and beyond -five-hundred- (500) years. All this, in the midst of a vast, complex system of inter-connected waterways which serve as habitat for many of our state's treasured residents, including Common Loons, Moose, Lynx, as well as many precious plant species including Wild Rice, Labrador Tea, orchids, and many other incredible residents of this state. How can a responsible plan, which supposedly(.) aims to protect and preserve the future interests of the state, as well as the common citizen and local resident, allow for a plan with abstractions such as "500 years" of ongoing water treatment. In considering such a mine project, I think to myself, as one regulating the issue must think too; 'What was going on 500 years ago around this region of North America.' And, more important in this discussion, 'What will be taking place on this continent in another 500 years.' THINK about the spans of time you are considering. THINK about the habitat and animals whose futures you are sending towards doom if this mine becomes reality. Can we really say, in an -HONEST- assessment of human civilization at this point in history, that we are in some golden age, at some point of collective stasis that will continue and reign dominant over the course of 500 years.. HAH. Has anyone considered where we will be in even 100 years. Any plan that talks about ongoing water-quality issues that will require intensive treatment at timescales of 500+ years is obviously extremely risky and requires extremely careful examination, creative and open foresight regarding all possible futures, and probably should involve lots of effort towards gathering public input (for many different reasons). As a citizen of this state I demand that you be honest about water quality issues surrounding this mine, and provide us with a REAL plan to treat contaminated water. If the plan calls for water to be contaminated, perhaps it is a bad idea in the first place, since it clearly is a plan that threatens the well-being of human and non-human residents and future residents of this state. What happens when(not if) the mine pollutes surrounding waters, and let's say anecdotally, the mining company is dissolved and/or goes bankrupt. Who will pay for further maintenance of the polluted waste site. Who will oversee water issues. Will I, as a taxpayer, be charged to maintain what was destroyed to create profits for others. This subject of water quality and future maintenance of the site is clearly worth discussing for hours, perhaps days or week on end, and is only one of many issues surrounding this mine project which did not receive adequate public discussion. This is only one of quite a few grievances I have with the plan being offered. You also need to HONESTLY address issues of habitat destruction and impacts of stress on local inhabitants (MOOSE anyone.), regional human health impacts of mining, effects on local infrastructure, noise pollution in surrounding wilderness areas, HONEST information on local job creation associated with mining, and most importantly, HONORING THE EARTH. I happen to have a deep connection with Loons, and am very concerned about your plan to seriously impact a favored area of one of the most enchanted, magical creatures of this landscape. Please provide me with details of how you will meet the requirements of guiding us into a safe and livable future in this part of Northern Minnesota. Sincerely, Benjamin W

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I am writing to state my strong opposition to the PolyMet mine. Our lake and waterways are what help make Minnesota a great place to live. And Lake Superior is not only a state or national treasure but a ONE OF A KIND treasure that is vital to our state. Please don't risk polluting it for a few jobs and a few dollars. We have to much to lose. Please don't go down that slippery slope of allowing non-enviromently friendly industries to destroy our states future beauty. Thank you for your time , Sincerely, Mr Benjamin B. Eide 519 Heinel Dr Roseville, MN 55113-2108 (651) 245-8538

Dec 24, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have witnessed sulfide mining firsthand in South America. The waste-water from sulfide mining damages the ecosystem around the mine, as well as everything downstream from the runoff. Studies show there is not a possibility long term pollution, but a certainty. It doesn't belong in Minnesota. The companies that own the mines will reap the profits and then leave, forcing the citizens of Minnesota to deal with the damage to the health of humans as well as wildlife. There is no guarantee that any company will be around long enough to sufficiently correct all of the damage done, no matter what these companies promise in the beginning. However, there is a guarantee that damage will be done to the natural environment, especially the irreplaceable Boundary Waters Canoe Area Wilderness. Destroying the beauty and health of the state of Minnesota is not worth creating a few hundred temporary jobs. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Benjamin Cook 6805 Athena Way Inver Grove Heights, MN 55077-2413 (651) 492-1640

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Benjamin Johnson 11 Daniels Farm Rd Saint Paul, MN 55110-5211

Benjamin Krohling 52291

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Benjamin Krohling 1819 5th Street South, 104 Minneapolis, MN 55454

I regularly go to the Boundary Waters and surrounding areas for camping and fishing opportunities. I want to voice my opposition to the PolyMet mine plan because I do not want us to endanger these beautiful areas with long-term mining pollution. In 2010, the U.S. Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surface waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever.

Thank you for this opportunity to comment. We vacation in northeastern Minnesota every year and we are concerned about the long-term environmental impacts of mining sulfide-bearing rocks. We have read the DEIS and our concerns about the adequacy of the DEIS are included below. Please forward the land exchange comments to the Forest Service. · Land Exchange: The DEIS does not adequately address all the biological and land use issues with the land exchange. Additional information on the natural heritage and timber resources of the exchange lands need to be gathered. In the long run, the public is best served if the public gains much more public land than it gives up. The exchange ratio should be at least 2 to 1. · Storage of Tailings: To prevent the oxidation of sulfide tailings a tailings basin must be designed to secure those tailings forever. Forever is a very long time. No made-made structure can be designed to last forever so at some point in the future the tailings storage facility will be compromised. At some time in the future the people of Minnesota will have to pay for and clean up the failing tailings storage facility. Large amounts of money put aside today for future remediation will fall short of what is really needed. Millions of dollars today will equate to pennies in the distant future. The DEIS should make very clear that the tailings storage facility will not last forever and at some time in the future the people of Minnesota will either pay huge amounts for a cleanup of endure sulfide pollution. Thanks again for this chance to comment. Ron and Jan Eckstein 5059 Sunset Dr Rhinelander, WI 54501

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

After working for both Reserve Mining Co and Northshore Mining Co I was able to retire with healthy lungs in 2010- I saw how environmentally sound their practices are and know how the air and water is tested for contaminants. Any water (even rain water) leaves the property cleaner than when it came in. I would expect that the State and Federal government would be just as strict with the non-ferrous as they are with the taconite mines. The mines offer a quality way of life with a great respect for the environment. I believe that it is better to have the mines in Minnesota with its tough laws than in third world countries where they don't care how they pollute the air and water and they have no regard for the safety of their employees. We would not have children working for little of nothing so that big corporations can get even bigger profits. We have to care about those far off countries, because their polluted air and water does make it to North America. Not only are the mines scientifically safe, but they add tax dollars to the local, state and federal coffers. Those of us who have lived here all or most of our lives are proud of how we have maintained our beautiful Arrowhead Region, we won't turn our "back yard" into a sewer. We will demand responsible mining practices. We can have both mining and clean air and water. Bernice Norregaard

39844

I believe that the environmental impact studies will show that Polymet's plan to operate a mine on the Iron Range are very sound and will not adversely affect the air or water of NE Minnesota. In Minnesota we have strong environmental laws and the mines are monitored regularly to insure that they don't pollute. It is much better to have the mines here, where they will add to our productivity, rather than in third world countries that exploit not only the land, but the people as well. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Bernie Schlafke 1029 Spaight St C6 Madison, WI 53703

bernita flynn 38523

The Polymet project is a bad plan for Minnesota. Minnesota should be putting its efforts and funds into alternative forms of energy such as solar and even nuclear. Both would create more skilled jobs that pay higher wages that could employ our graduating college students who are now unable to find jobs. We must stop destroying our land and atmosphere and it is time to take other forms of energy seriously. The company says it will restore the land for 500 years following the sulfide mining. Really. They won't be around and our future generations will be the ones to suffer. I beg you please do not allow the destruction of our water supply and wildlife. Sincerely, Bernita Flynn
1310 32nd St NW Rochester MN 55901

Bert and Cynthia Weberg 57171

Have other sulfide mines been near a big body of fresh water? If so, what are/were the results? We would hate to be part of the generation that would allow Lake Superior and other great lakes to be poisoned. Bert & Cynthia Weberg 1067 6th Street SE Forest Lake, MN 55025

This is my fifth letter. The others were sent by US Mail, and I'm emailing this one to get it in before the deadline. There is so much more to comment on. I've been reading carefully for months and have only reached section 5- I hope these letters will convince you that this SDEIS is so inadequate that at least it should be redone. Pg.3-136 Section 3-2-2-4 Financial Assurance Paragraph 2 - The wetland mitigation that would be constructed should require financial assurances. These wetlands would be in place before the mining process begins. They will be monitored throughout the "life" of the mining project. Hopefully information gathered throughout the monitoring process will aid in creating the best possible wetland outcomes - "best possible" means matching exactly the wetland in form and function with complex and interrelated species. Why are the financial assurances not spelled out in the SDEIS. These should stand to answer many of the "what if." questions raised in these SDEIS reviews. With all the pages of "infrastructure" that PolyMet has generated, it seems suspicious that they did not have the time, resources, or expertise to put together a complete and accurate financial assurance plan. Please have PolyMet submit a true financial assurance detailed statement. Please include financial assurances that include information that extends 500 years into the future. Please include information that would make clear how the state of Minnesota would not be financially liable for environmental clean-up if PolyMet goes bankrupt, dies, disappears, or otherwise "skips town." Pg. 3-158 Section 3-3-1-1 Priority 2, 2b through 2e The reasons that the land exchange should NOT take place: I ask that the USFS reconsider and then refuse the USFS land exchange. 2a and c Land that enhances recreational opportunities, public access, and aesthetic values. The area of the proposed land exchange includes much of the High Value Biodiversity, 100-mile Swamp wetlands. This area supports many varieties of life forms that are not common to other areas in Minnesota. *Caltha natans* and *Felm Canadensis* are but two. 2e. The Partridge River, among others, would be severely negatively impacted by this PolyMet project. The Partridge River flows into the St Louis River, then Lake Superior. Heavy metals and other toxic and carcinogenic pollutants would definitely be washed to the lake Superior waters. Please read pg. 4-157, paragraph 2, and Table 4-2-3-4- Wetlands 92% high quality. I ask that the USFS land exchange NOT go forward. Pg 3-158, Priority 2-2c Environmentally sensitive and/or ecologically rare lands and habitats. 2d Wetlands 2b Land needed to enhance or promote watershed restoration or improvements riparian areas. Pg 4-192 - 4-2-3-3 Threatened and Endangered Plan Species There are three state-listed ETSC plant species. Even though they are not federally listed, that does not weaken the argument that they are rare and unique individuals and deserve full protection. The land exchange would doom these plants and their community. The No Action alternative is the only fair and reasonable path. Pg 4-1732 Mn Biological Survey, paragraph 2 Two native plant communities: Black Spruce-Jackpine woodland (FDn32c) is 34% of the mine site and Rich Black Spruce Swamp are characterized by the MBS as "imperiled/vulnerable" and "vulnerable" - another reason for the No Action alternative. Pg 5-4, 5-2-1-2-2 paragraph 1, last sentence: "The USFS also requires preparation of associated reclamation plans to insure the long term protection and restoration of the natural resources." The SDEIS has not documented the "protection and restoration" of the natural resources. See pg 3-124, 3-2-2-3-1-2 PolyMet says they have developed a Reclamation Plan, but they WILL submit it to the MDNR (not USFS) as part of the permit process. These plans should have been included in the SDEIS for examination and evaluation by the public. I ask that these plans be included in the next dr

Some years ago, the acid rain resulting from emissions from coal fired power plants south of us was a problem for the northern Minnesota ecosystem. Would the acid resulting from the extraction and processing of the sulfide ores present the same problem?

54573

In other sulfide mine sites, as in So. Africa, have there been problems with dust from the mining process? We worry about the workers and flora/fauna in nearby forests.

I am writing to voice my deep concern about PolyMet's proposal for copper and nickel mining in the Masabi Iron Range. I am deeply concerned that pollution to this pristine area of our state will be potentially devastating. Can we realistically accept a plan that demands remediation for the next 500 years. Do we expect PolyMet to exist in 500 years. In 50 years. If the best case scenario that PolyMet puts forward does not happen, what then. The consequences for any misstep, any glitch in PolyMet's plan could be devastating. The Natural Resource we should be protecting are our waterways, the Boundary Waters and Lake Superior. Can PolyMet or the DNR give ANY example of copper or nickel mining that has not caused pollution. And if the pollution proves too costly for PolyMet to clean up, they will most likely file for bankruptcy and leave Minnesota with both the spoiled and polluted environment and the bill for the cleanup. PolyMet's proposal does not make long term economic sense for Minnesota. PolyMet's proposal is not without grave environmental costs. Please reject PolyMet's proposal. Recently I have heard about the water shortage problem in western United States. We have water in Minnesota so why should we take any chance of polluting it with a material that wrecks it for people and wildlife. No one can drink money. The water shortage throughout the world does not appear to be getting any better. Who in that area thinks they will make a lot of money from this mining project. Do cities and the state think they will collect high amounts of taxes. Do people think there will be a hugh number of high paying jobs connected with it. The only people making large amounts of money are the owners of the companies, and it is my understanding that no one has on record just who these companies are. It would be best for the whole state to deny this mining project forever. Beth and Leland Blackledge 2430 Heimele Street South St Paul, MN 55075

In addition to the risks outlined below, I remain very concerned that the long term effects of keeping the water clean are not being acknowledged. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dniinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, beth knudtsen spears 807 N Main Cambridge, MN 55008

Dear DNR,, Assuming the above is a true equation, I find it shocking that anyone is still considering approving this mining operation. Water is essential for all life, and in MN we are especially known for our water Land of 10,000 Lakes To consider jeopardizing our water flabbergasts, confuses and disappoints me. The environment and natural splendor of the Arrowhead region of MN is it's greatest asset (not to mention one of our state's greatest assets) and the reason folks visit and want to live there. DO NOT even consider jeopardizing such a jewel. Thank you, Beth Yokom 806 Linwood Ave St Paul, MN 55105

Bethany Ebert 9599

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: When the information given regarding pollutants in the atmosphere is inaccurate, it is impossible to have an open and honest dialogue regarding pollution. Therefore it is my opinion that the SDEIS should be redone to reflect the new information. I also think that, considering what I already know about the topic, PolyMet's sulfide mining plan should be rejected. PolyMet gave inaccurate information about the amount of waterflow. Therefore it's possible they also gave inaccurate information about air pollution. Speaking as a person with lungs that are annoying at best and life-threatening at worst, I prefer to not sit in my apartment all day because there's too much pollution in the air to enjoy the weather. Sitting inside all day gets boring, and I like walking outside. People need to breathe fresh air and get out there and get exercise. If the sulfide mining plan messes with my lungs too much, I could die. I know I'm just one person, but there are other people in the Midwest who have to use inhalers. A lot of us would be affected. Please also keep in mind there are some people in the world who are predisposed to cancer, and too many carcinogens in the air could aggravate their conditions, causing more illness and death. This would change the city drastically as well. While death is a natural part of life, it's also true the quality of life while living should be a good one. PolyMet is not going to do much to improve the quality of life. It will just make the environment more polluted. A lot of people here like to fish and hunt, a lot of people like walking their dogs, a lot of people like just hanging out by the lake, and if the mining happens, who's to say any of that would continue. And then there's the part about pregnancy. What sort of risks would the pollutants in the atmosphere bring to a fetus in the first trimester, or a newborn. The first trimester is one of the most important times regarding health. If a woman is exposed to too much at that time, with regards to pollutants, she is more likely to miscarry, which is a terrifying thing to go through as a young woman. And if the baby is carried to term, there is still the risk of its future health, as well as the hobbies it can be part of once it's old enough to get outside and have fun. Kids should be able to get outside and play. If there's a lot of pollutants in the environment, this kind of ruins that. I know a lot of people are big on sitting a kid in front of the television set or a cell phone or an iPad, but we should be allowing our children the ability to play outside. Technology should not be running everything. We don't need a ton of iPads and televisions to be happy. These are luxury items I understand video games are fun, I love them too, but there is nothing wrong with going outside. And I think we don't need too much that we don't already have There are jobs in the area. People just aren't looking for them because they've given up. If it ain't broke, don't fix it. That's all I've got to say on the matter for now. Thank you for considering my opinion. With respect, Bethany A. Ebert Bethany Ebert 230 West 3rd St #306 Duluth, MN, MN 55802

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Betheny Ebert 230 West 3rd St #306 Duluth, MN, MN 55802 218-269-3883

Betsy Blume 44364

To whom it may concern, My name is Betsy Blume and my address is 5157 Upton Avenue South, Minneapolis, MN, 55410- I am grateful for the DNR's effort in taking on the huge undertaking of providing the public with information and the ability to comment on this project. It is truly all of our responsibilities to understand the long term consequences of allowing this and other similar projects to go forward After reviewing some of the executive summary report information and other information that is part of your website I believe the risks for allowing this project to move forward are too great. My greatest concerns are: Review of other EIS from Hard Rock mining projects in other parts of the US show that of the 20 mines reviewed, 80% or more had a violation of water quality standards. A recent statement by the EPA says that Hard Rock mining is the most toxic polluter in the US today. The problems with this type of mining have not been solved. It is an experiment that Polymet proposes in dealing with the issues of polluting our watersheds. New technology is Not evidence that the projects will not have severe long term damage to our water resources. Hard Rock mines in Colorado and Montana have permanently caused the death of rivers. Noise pollution near wilderness areas like the BWCAW will effect users (like me.) and the economic interests of the community that supports these recreation geMs There are many untested laws in this proposal that could cause years of litigation that lie in wait for the citizens of the state of Minnesota. Is the environment (water, air, wildlife, wetlands, Lakes) worth less than these precious minerals. Thank you for the opportunity to comment. Sincerely, Betsy Blume

From: Betsy Daub [mailto:betsy@friends-bwca-org] Sent: Friday, March 07, 2014 11:52 AM To: Periman, Richard -FS Subject: Fwd: PolyMet water data issues -----
Forwarded message ----- From: Betsy Daub <HYPERLINK "mailto:betsy@friends-bwca-org"betsy@friends-bwca-org> Date: Fri, Mar 7, 2014 at 11:48 AM Subject:
PolyMet water data issues To: "Rye, Marty E -FS" <HYPERLINK "mailto:mrye@fs.fed.us"mrye@fs.fed.us>, Mary Shedd <HYPERLINK
"mailto:mshedd@fs.fed.us"mshedd@fs.fed.us> Cc: "Radosevich-Craig, Lisa -FS" <HYPERLINK "mailto:lradosevichcraig@fs.fed.us"lradosevichcraig@fs.fed.us>, Nancy
Schuldt <HYPERLINK "mailto:nancyschuldt@fdlrez-com"nancyschuldt@fdlrez-com>, Margaret Watkins <HYPERLINK "mailto:watkins@boreal-org"watkins@boreal-
org>, John Coleman <HYPERLINK "mailto:jcolema1@wisc-edu"jcolema1@wisc-edu> Dear Marty and Mary, I am emailing you with a big concern about our attempts
to get geochemistry leachate data and other relevant water data from the MN DNR regarding PolyMet. I am hoping you might work with Brenda to urge the MN DNR to
grant a 30-day extension to the comment period, and that the DNR would be encouraged to fully share the data that has been requested repeatedly. Here is a quick summary
of the key issues: MCEA and the Friends have retained 6 technical experts to help us evaluate the SDEIS for PolyMet. These are hydrologists, geochemists, geophysicists,
wetlands ecologists, etc They have been hard at work on the SDEIS and its thousands of background documents for months. But their analyses have been hampered for a
number of reasons: 1- Several technical documents that MCEA requested of the DNR were not sent in a timely fashion. The first document: "Wetland Impact Assessment
Technical Memorandum - Appendix B" was requested from the DNR on January 23, 2014- MCEA did not receive a copy of it until February 24, 2014- This technical
memo was the sole basis for the sensitivity analysis that determined the extent of the potential indirect wetland impacts that could occur as a result of groundwater
drawdown. The second document, PolyMet 2013k, was cited 14 times in Chapter 5 of the SDEIS and should have been included on the SDEIS reference disk but was not.
This document provided data on potential indirect impacts that may occur as a result of the augmentation of Second Creek. MCEA requested the data from the DNR on
February 20, 2104, and received it on February 24, 2014- The delay in receiving these documents resulted in delays to our technical expert's review of the information.
2- We have had recent issues in obtaining geochemistry leachate data. These are data that should have been attached to the original SDEIS or in the reference documents,
but were not. We are still trying to obtain them. MCEA made several requests for documents that were cited in reference documents, only to find more citations to earlier
documents. The path has finally led to documents from 2007, which MCEA requested. The database MCEA received this week is incomplete and has many empty cells in
the Excel spreadsheet. Many of the missing cells appear that they would have contained leachate concentrations above water quality standards. For example, a plot of nickel
concentrations in one document shows a great many samples of test pile leachate to be above the 10 mg/L for Ni. But in the database that accompanied it, only six samples
with concentrations above that limit are shown. Most of the entries in the database are filled with "#N/A." It seems odd that the higher values for Nickel are missing. This
occurs for many constituents - not just Nickel. We still need a database with all the entries included. 3- Our geochemists have found the documentation to be extremely
complicated. We are working with two geochemists, both of whom have worked on hundreds of mining proposals. They have found the SDEIS materials to be extremely
difficult to understand and to work with. Part of the problem is t

Please see the following. Elizabeth LePlatt 7012 Cheyenne Trail Chanhassen, MN 55317 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 I do not believe PolyMet's NorthMet project would be good for the State of Minnesota. I am very concerned about trading our long term environmental health for short term and not clearly spelled out financial gain. One of the things which concerns me most is permanent water pollution. I do not think it is good enough to base such important decisions on "probabilistic simulations," or computer models, of the effects of PolyMet's mining activities on water quality. After all, I read the other day that the flow rates on the Partridge River entered on the SDEIS were wrong. How would we know the models were correct. Are there any real world examples of similar mines run in equivalent environments which have not resulted in major environmental problems. Seems to be a pretty big gamble to me. "Direct and indirect effects to wetlands would result from mining operations. The NorthMet Project Proposed Action would directly affect 912-5 acres of wetlands located within the NorthMet Project area, mostly within the Mine Site, as a result of activities such as filling, excavation, and installation of a containment system within the wetland boundary, and, therefore, these wetlands would be permanently lost" "Due to both on- and off-site limitations and technical infeasibility, it is not practicable to replace all affected wetland types with an equivalent area of in-kind wetlands." The SDEIS states there will be water pollution and loss of wetlands. I do not understand why this would be okay for Minnesotans. I have narrowed my comments in this letter to focus on water quality and wetlands, however, I am very concerned about other effects of the mining project on the environmental balance of northern Minnesota. The long term economic impact of this project is also a big concern of mine. Would the clean up cost the State more than the economic gains of the project. It seems to me it would be wise to have a more concrete answer to this question before approving this sulfide mining project. My family and I have loved Northern Minnesota – the beautiful boreal forest, the pristine lakes for years. We own a cabin near Ely, where we spend our summers. I do not look forward to the industrialization as well as air pollution this mine and others proposed near our cabin would bring. Thank you for your time and extreme consideration of this matter. Sincerely, Elizabeth LePlatt

cid:image001-jpg@01CEFBFF.AF2AC0D0 February 2014 "What's Happening in Better Government for a Better Minnesota" is the source for the latest news and info on government reform as seen from the perspective of state employees. We want to hear from you. Have something from your agency to share. Tips, best practices, success stories or other news of note. Send them to us at [HYPERLINK "mailto:better@state.mn.us"better@state.mn.us](mailto:HYPERLINK \). A Message from Chief of Staff Jaime Tincher cid:image010-jpg@01CF2E33-8F05DE50Dear Colleagues, After a year and a half as Governor Dayton's deputy chief of staff, I am excited to take on a new role as the Governor's chief of staff. I look forward to working with you and continuing our work together to build a Better Government for a Better Minnesota. The upcoming Unsession truly gets to the heart of our better government efforts. The Unsession legislative recommendations we are developing will incorporate many of the great ideas that state employees across the administration recommended this past summer and fall. Paired with suggestions from people around the state, the Governor's Unsession agenda and additional Unsession efforts from legislators will help state government better serve the needs of all Minnesotans. In the upcoming session, Governor Dayton also has proposed providing additional tax relief for middle class Minnesotans, eliminating business to business taxes, and passing a comprehensive bonding bill that will create an estimated 27,000 jobs. These initiatives along with your valuable service for the people of Minnesota will help us support continued economic growth, while making critical investments in the state's future. Thank you for the work you do every day to build an even brighter future for all Minnesotans. Sincerely, Jaime Tincher Chief of Staff, Governor Mark Dayton and Lt. Governor Yvonne Prettner Solon cid:image012-png@01CF2E3C.A7B2EBB0 "Transition Briefs" Aid Disaster Response and Recovery

To whom it may concern: I am writing in strong opposition to the Polymet copper mining proposal. There are so many concerns and unanswered questions that it is unbelievable to me that we would risk our future by moving ahead with this project. These are just a few of my concerns: - Health risks such as exposure to mercury, asbestos and arsenic. Mercury is already a problem with 10% of newborns in the Lake Superior basin. Polymet admits that mineral dust released could harm workers and nearby residents. Doctors have recently requested a study of the potential health impact of this project. Let's study the potential impact and not the problem after it has sickened or killed many people. - Hundreds of years of polluted water seeping into our streams I am not convinced that Polymet would be able to contain all polluted water. It will inevitably seep into our clean waters. Boundary Waters rivers have been named at risk for pollution as a result of this proposal. The Boundary Waters is a most precious resource that we simply must preserve for future generations. - Destruction of 6,000 acres of wetland which are currently habitat for our endangered moose and lynx populations and many other species. - Questions about whether Polymet would cover the costs of cleanup and whether they would be paying fair taxes. To me, I don't think it would be possible for them to pay enough for damage and taxes because they would be destroying a treasure that is priceless and irreplaceable. Please stop this proposal from moving forward. Elizabeth Preus 40 E. Faribault St Duluth, MN 55803

Betty Tisel

38391

Dear reader at the MN-DNR, My name is Betty Tisel. I live in South Minneapolis and am a lifelong Minnesotan. My Slovenian-American grandfather spent his working life in the open pit mines in Virginia, Minnesota, as an employee of Oliver Mining, and then US Steel. He was also a union member. I am writing to convey just one of my many concerns about the mine plan and PolyMet's Supplemental Environmental Impact Statement. I am concerned that the SDEIS does not include any analysis of the health effects for on-site workers at the mine. The only "health-risk assessment" in the SDEIS was done for people who are off-site. Mining industry workers are at a higher risk of fatal mesothelioma. PolyMet ore will include asbestos-like fibers. According to the PolyMet SDEIS, exhaust from the rock crushing plant will be vented back into the plant, in order to reduce heating costs. In a recent University of Minnesota study, workers involved in the crushing process had toxic particle exposure over the safe exposure limit. The PolyMet site is a "lean" deposit of copper and nickel - 99% of what is dug out of the ground will be considered waste. Blasting and grinding the dug-up rock will unleash huge amounts of particles and fibers that workers will breathe. Other Minnesota environmental impact statements and documents have looked at cancer risks for workers. Why not PolyMet. The SDEIS must let the public know the health risks to on-site workers. The SDEIS must analyze particles and fibers in crushing plant air, not just air outside the property boundary. Sincerely, Betty Tisel 4155 Garfield Ave Minneapolis, MN 55409 612-824-5820 Betty Tisel HYPERLINK "mailto:betty@tiselfarley-com"betty@tiselfarley-com

58075

Others will speak more specifically about this specific mine's potential negative impacts. My concern is also that 1) we need to stop all projects that will worsen the environment anywhere and 2) if we want more jobs in MN let's create jobs that people can really take pride in. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Bev Gillen

40727

DNR, I am highly against the proposal to allow PolyMet to operate mines in Minnesota. I have lived in the Twin Cities for 50 years. My husband and I chose to raise our family here because of the beautiful lakes, trees, wildlife, and clean air. My family has camped in the Boundary Waters and experienced its beauty and peacefulness. We cannot afford to have this resource polluted by mining companies who lamely promote job growth but are really counting profits. Counting on you to represent the best interests of Minnesota families in the face pressure from these big companies and their slick staff. Please say NO to Polymet and preserve Minnesota's beauty for generations to come. Regards, Bev Gillen Bev Gillen | Sr Electronics Commodity Manager | Rosemount Flow Emerson Process Management | 12001 Technology Dr | M/S AE07 Eden Prairie | MN | 55344 | USA T +1 952 828 3019 beverly.gillen@emerson-com

Please enter these comments into the public comment process: The SDEIS doesn't account for the replacement capital costs of the mine proposal, eg. water treatment plant, holding pond liners, etc The SDEIS is silent regarding emergency measures in case of failures in construction and treatment. The SDEIS doesn't analyze the relationship between Polymet and Glencore Xtrata. If the Glencore firm is a silent partner, or at least a financier, that information should be included in the SDEIS because a partner or assign should be part of the application for the permit. The partner or assign (or any other term) should be noted so that all parties are included in the permit and are responsible for cleanup if Polymet (or NorthMet) goes bankrupt. The draft SDEIS doesn't include a long-term analysis of present or failed sulfide mines anywhere in the world. The draft SDEIS doesn't include capital costs of the life of the liners of the pits or stockpiles, nor does it include methods to monitor the liners and the replacement of those liners and the surrounding possibly-contaminated soils and aquifers. The aquifers surrounding the proposed sites haven't been monitored for the existing conditions of the waters. The draft SDEIS doesn't include maps and analyses of surrounding streams and rivers as to their existing conditions and a process for monitoring in the future. No accounting for monitoring of conditions in he 200 and 500 year models as included by Polymet. The Polymet document labeled Figure H-16-24-2 shows Mixed Influent Cncentration (ug/L) at year 200 that is six times higher than the present water quality standaRd These and other concerns should trigger an additional document that addresses the items that are missing from the draft SDEIS. Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. The risk to our children, grandchildren, and the environment for many generations to come is too great - and not worth the benefits of a few jobs for a few years. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the precious Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Beverly Blinde 5620 Bloomington Ae. So. Minneapolis, MN 55417 Sincerely, Mrs Beverly Blinde 5620 Bloomington Ave Minneapolis, MN 55417-2641

Beverly Finke 16154

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

The employment is good for the workers in that area.

Bianca Geisdorf 18104

My name is Bianca Geisdorf and I'm from Aurora. I am the vice-president of the 7th Grade Student Council for Mesabi East High School. I know numerous students who live at or beneath the poverty line due to the loss of jobs or lack of opportunity for good-paying jobs. Jobs are important for the future of the students of Mesabi East and the Iron Range. Presently good-paying jobs are secured and many of us will have to move away in order to be able to earn a living capable of supporting a family. The reason our towns are here today in the first place was because of money. It provided our families with jobs capable of supporting them. We need these jobs that PolyMet will bring to our towns for strong communities and thriving families; not ones that just get by living in poverty. We truly care about our land, air and water and believe that the SDEIS is sufficient to address this. The co-lead agencies have done the job needed to show that PolyMet will not pollute our land, air and water. I support the work of the DNR, the Army Corps of Engineers and U.S. Forest Service. I also believe that the Minnesota Pollution Control Agency is the best in the world and will make sure that PolyMet does not pollute. Thank you.

Bill 6595

Let them build the copper mine so we can have jobs in Minnesota. Bill_Thiffault@yahoo-com Da Bill

BILL: Hello. I am Bill (inaudible) from Ely. I am a lifelong resident and third-generation business owner and former school board member. I look at the opportunity to bring PolyMet to our area and look at the needs, the jobs, the benefits, and (inaudible) and also look at the challenges that face a project like this in water quality, wetlands, wildlife. Growing up in Ely, the population was near 6,000. The K-12 enrollment was 1,775 students. Today there are 540 kids in Ely's K-12. That's a drop of 70 percent resulting in the loss of dozens of teaching jobs. Ely's population today is about 3,460. A drop of 264 from 2000 to 2010. Sure there is more people living in the townships, but that doesn't tell the whole story. Drive into town and look at the shuttered storefronts. The additional people in the townships haven't kept those businesses open. Drive to the post office. Eight empty house in two blocks. (Inaudible) shingles coming off the roofs. Our median age is now 45.3 and climbing. A jump more than 6 percent since the 2000 census. The median household income has dropped from 27,602 to an average of 24,000 as of the 2010 census. 200 families on food-shelf assistance this year compared to 110 last year. Tourism by itself is not providing sustainability. Obviously there is a tremendous need for jobs here in our area, not China. We need the metals. We also care if mining is done environmentally responsibly to maintain our clean water and air. I-Pads, computers, electronic places use the metals that come from this project. Hybrid cars, (inaudible) wind turbines. When you turn on the appliance or lights in your house, you are using copper. When you go to the dentist or doctor, the stainless steel surgical tools are nickel alloyed steel. Therefore, after reading the SDEIS summary and reviewing other documents of the document, I can conclude that the scientific integrity, the research, (inaudible), including the mitigation and mtreatment procedures have done an in-depth job to accurately address the issues. And I support the findings for this project to move forward.

Bill 45634

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. NAME. Bill Culbert ADDRESS 601 5th Av. So. Virginia, Mn. 55792 Sent from my iPhone

Bill & Nancy Henke 4783

Hello. It is my belief that this project should not proceed without full due diligence environmentally (ie. conservation over mitigation/ repair of damage) and full and complete financial assurance by Polymet. Full financial assurance by my definition means that it is provided for by the company inflicting the damage, for the duration, whether this is for decades or for hundreds of years. The monetary amount backing this full financial assurance should take into account not only industry projections of clean up needs but also worst case scenarios including catastrophic accidents and acts of nature that overcome technology. Minnesota's water and land resources are an undeniable treasure and absolutely cannot be compromised. We are already so hard on our environment and can ill afford to further punish it with impunity. A legacy of a well cared for and sustainable Minnesota natural environment holds far more value to me than the convenience of my cell phone and the limited entertainment emanating from my big screen TV. Thank you. William C. Henke MD 962 South Shore Drive Detroit Lakes, MN 56501 HYPERLINK "mailto:wchenke1@gmail-com" wchenke1@gmail-com

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, bill braskey Mankato, Minnesota

Bill Collins

To Whom it May Concern- I am writing to express my support for the issuance of permits for PolyMet Mining. I have been actively following Polymet's efforts and after reviewing SDEIS, news articles and opinion pieces I am confident PolyMet's project will have no discernable impact on the natural environment while at the same time greatly benefitting the economic environment. I have personally invested in the project not only because of my confidence in PolyMet but also because I want to see my state benefit from the great jobs, economic synergy and expanded tax base and my country from the increase in the domestic supply of critical metals needed in many vital manufacturing industries. I urge you to approve PolyMet's mining permits. Bill Collins, Managing Director N 44 Productions 275 East 4th Street, Suite 730 Saint Paul, MN 55101 Phone: 651-290-2290 Cell: 612-961-7311 Fax: 651-224-6902

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: While I am not against mining in general, this type of mine in this location seems like a recipe for disaster. Please consider the quality of life, the value of wild and natural places, and the health of our citizens and environment and reject the PolyMet plan. It is difficult to place a dollar amount on the above items. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Bill Conger

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Attn. Lisa Fay - EIS Project Manager, MDNR Division Of Ecological and Water Resources Please green light the permitting and approval process required for the proposed PolyMet mining operation in your jurisdiction. I have followed this approval process for several years and strongly believe that the PolyMet Mining Company has operated in the best interests of the public and the enviroment. Both in the past and fully intends to meet all expectations in the future of the EPA and the Minnestota Department of Natural Resources. Also Minnesota really needs the jobs. Thank you for your consideration and this opportunity to weigh in. Sincerely, William Fredrickson 5428 Overlook Drive NE Albuquerque, NM 87111

My February National Geographic Magazine came yesterday and the article, "Gold Fever in the Yukon", documents the exact issues we debate today. That is; long term environmental and economic stability versus short term extractive wealth and its threats to a regional community. Yes, twenty to thirty years is very short term for the issues we must decide today a wealthy owner of a current Yukon prospecting company is quoted in the article; "I tell people not to get too attached to all this beauty. We just might want to mine it." I have seen firsthand the yellow orange acidified streams flowing near western state copper mines. I have seen firsthand the moonscape desolation around Sudbury, Ontario caused by the copper nickel mines and smelters. Treeless granite hills where the rocks crumble in your hand and the lakes sparkle blue and fishless. Granted, companies who extract and process ores have been forced to meet much more stringent environmental guidelines in the past few decades, but significant air and water pollution will occur in any mining project. PolyMet has done a lot of advance work on this DEIS. It is an impressive document. It is also imperative to always remember that a corporation is required by United States law to reap maximum monetary rewards for its stockholders. This fact mandates that business operations externalize costs whenever feasible. The DEIS states on page 5-7 that the mine and plant site might need hundreds of years of monitoring and maintenance. What American companies can you name that are still viable after only one hundred years? How will future inhabitants of northeastern Minnesota pay for this task? St. Louis, Lake, and Cook counties have a combined population of approximately 220,000 people. The PolyMet plan estimates about 360 permanent jobs over the twenty year life of the mine. This means that the equivalent of .16% of the 3 county regions will have jobs through the mine. If those 360 jobs each pay \$100,000 per year then they will bring thirty six million dollars a year into the community, for the 20 years of operation. In 1996 David T. Schaller from the Department of Geography at the University of Minnesota did a research study of the economic impact of tourism in the region. He found that the major group of visitors are from Minnesota and visit for the fishing. He estimated the regional monetary impact of tourism at around fifty million dollars a year. Tourism and diversified small businesses will bring in that fifty million dollars a year for the next twenty years and on into our great grand kids' futures. The issues are simple but deep. Short term extractive wealth and its threats to the established community or long term environmental and economic stability. The people of PolyMet and Glencore Xstrata must PROVE IT FIRST at another copper nickel mine and then return in twenty years to talk about sulfide mining in the St. Louis and Rainy River watersheds of Minnesota.

I am writing to you today to thank you for the excellent job done putting together the NorthMet Mining Project and Land Exchange SDEIS for the PolyMet Project. It is a thorough analysis of all aspects of the proposed mining effort with specific solutions defined to address all areas where the environment could be impacted. Thank you for a job well done. I fully support the PolyMet project and ask that you complete the SDEIS review phase and move to the permitting phase as soon as possible. In addition, I want to convey my strong support to maximize the protection of the environment while the project is underway. I believe we must do both, safely mining for critically necessary metals and protecting the environment are both necessary. I do not think these are mutually exclusive goals and I believe the PolyMet project has developed a comprehensive, practical plan for safely developing, executing, and closing the mining project. So, please, endorse the PolyMet project. Remember, We Must Do Both. Sincerely yours, William H. Horsch 2292 Timberlea Dr Woodbury, MN 55125

You cannot build this mine because the company and its owners will not fund the two hundred plus years of compliance to protect their mine waste from our fresh water. It is simple if they can insure for the two hundred plus years a fund to observe and protect our fresh water, then the market forces can be used to protect the water, however, I know of no insurance company that will underwrite such a risk at a premium that Poly Met can afford, thus there is not way to mitigate the risk of the mining wastes thus no mine should be build. Given the track record of the mining industry in managing mine wastes, we can not trust our fresh water to these business people. There is not enough money to be made to risk our fresh water future. With a barrel of water put in plastic bottles more expensive than a barrel of oil, we should protect our water. Finally, there is not enough jobs to make this work either. Bill McKechnie Wolf Hill Management 1394 Blackburn Dr Cotton, MN. 55724 952-237-2962 612-208-7753 wemwolf@gmail-com USBC Agent

Bill Polchow 19524

My name is Bill Polchow, P-O-L-C-H-O-W. I reside at 49623 County Road 191 in Deer River, Minnesota. My comment is the International Brotherhood of Boilermakers, Iron Shipbuilders, Blacksmith Forgers and Helpers, Local 647, would like to comment on the implementation of PolyMet. Boilermakers Local 647 covers all of Minnesota, North Dakota and South Dakota. Although we are considered one of the least-known construction unions, we feel we play a big part in the industry. In a nutshell, we construct and repair power and steam-generating boilers, construct and repair pressurized vessels, construct and repair stacks, and more importantly, construct and repair pollution control devices, such as baghouses and scrubbers. Our trade has been around a long time with many generations of proud boilermakers who have seen the streets and yards black with soot and the air hazy from the emissions from smoke stacks of factories. We are proud of the fact that we are partly responsible for the cleanup, clean air we now have, and the fact that most of the emissions we now see from the stacks are mostly steam. In fact, most of our work today is the construction of pollution control systems. Boilermakers do not look at the construction of PolyMet as a full-time employment opportunity. As a matter of fact, most boilermakers work short-term jobs and then move to the next. They do, however, believe in protecting the environment in which they live and investing in the economy. The fact is, a third of the Local lives in the area affected by the plant, another third lives in Minnesota outside range, the rest live in North and South Dakota, but we all respect the environment and a strong economy. We also believe in not passing the buck. We look at the environment globally. If these resources are not produced in an area where they are monitored by the finest governing agents in the world, they are still needed and will be produced or shipped out to be produced in an area that is not controlled. As boilermakers, we believe the construction of PolyMet is a win-win situation. Not only does this put back to use the mine, but can create jobs and much needed resources in an environmentally-friendly fashion. Thank you.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Bill Sorem Minnetonka, Minnesota

21 February 2014 Dear Sir or Madam: I am writing to express my views concerning the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS). My wife and I moved to northern Minnesota 17 years ago because of its relatively pristine environment with many lakes and forests. As a 71-year old retired geologist, I have seen more than my share of both active and abandoned sulfide mines. I have never seen either an abandoned or a working sulfide mine that was not causing water pollution. Tailings dams leak, pipes leak, waste water seeps through liners, etc According to the SDEIS, At the Mine Site, about 10 gallons per minute of untreated water would be released during closure (all related to groundwater seepage), which represents less than 5 percent of total Mine Site water releases. At the Tailings Basin, about 21 gallons per minute of untreated water would be released during closure (all related to Tailings Basin seepage that bypasses the groundwater containment system), In other words, 5-2 million gallons of polluted, untreated water from the mine site and 11 million gallons of untreated seepage from the tailings pond will enter groundwater every year with no treatment whatsoever, and ultimately much of this water will end up in the Embarrass and Partridge Rivers. That in itself should be unacceptable. Moreover, the groundwater model used to obtain these numbers may be flawed so as to skew them to be unrealistically low. Even more problematical is that the SDEIS indicates that the NorthMet Project is to operate for only 20 years but water from the site may need to be treated for 500 years. If we consider a human generation to be 25 years, is one generation of mining employment worth condemning 20 generations to pollution. I think not. In my opinion, to do so is both illogical and immoral. I am adamantly opposed to ruining part of northern Minnesota with this project. If, however, the project is approved, somehow Minnesotans must be protected from the expense of treating waste water for 500 years and other environmental problems that turn up. Our country is not even 500 years old. How can 500 years of waste water treatment be financed over such a period. In my experience the old adage about mining that "Wealth strays and pollution stays," always applies. I doubt that Polymet will exist 500 years from now. I suspect that even 10 years after closure of the mine, when some pollution control agency tries to find Poly Met Mining, Inc. to send a bill for environmental remediation, the result will be something like, "Oh, Poly Met was sold to Acme Mining Company, which is now defunct." If mining does occur, provision must be made to protect Minnesota taxpayers from the expense of dealing with the abandoned mine and plant sites. How do you finance waste water treatment for 500 years. Regulators must obtain funds for long term waste water treatment and cleaning up failures of tailings management facilities up front. The SDEIS itself gives no indication about how centuries of waste water treatment and remediation of probable failures of tailings containment infrastructure will be financed. Clearly, the state of Minnesota must mandate establishment of a large fund for future environmental maintenance at the NorthMet site. The huge Glencore Corporation owns 25% of Polymet. Glencore has extremely deep pockets, and consequently Polymet should be able to provide a very large trust fund for future cleanup actions. Government regulators have an obligation to secure funding to protect Minnesota taxpayers. Large ownership of Polymet by Glencore should itself be a red flag. Glencore and its many subsidiaries are notorious for a wide variety of egregious behavior including tax avoidance, violating UN embargoes of despotic regimes, rampant pollution by its mines, and even major human rights violations. A quick reading of the Wikipedia entry for Glencore gives an overview of some of its wrongdoing as does the site <http://pu>

DNR, I am submitting my feedback regarding the Polymet proposal. It seems to me that the solution to this issue can be had pretty easily. We all want more jobs and everyone benefits from the materials that will be mined through products used in everyday life. The company says they have a plan to deal long-term with the water pollution and will be putting away money into a fund to address it. The easy solution is to triple or quadruple the amount of funding that the company "claims" needs to be set aside. It is certainly in the company's best interest to lowball the number needed so let's have them put in a much higher number that would cover all possible worst case scenarios. What we don't want to happen is for us to run out of money 40 years from now and be stuck with a company that may not even exist. If putting triple the amount of money into the fund forces the project to be uneconomical then maybe it shouldn't be built. I certainly think we can negotiate in good faith and say that milestones can be met for the company to get the money back if it isn't needed at long-term intervals in the future. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Billy Southwell 425 13th Ave SE Apt 804 Minneapolis, MN 55414-2060

Birgit Walch

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Birgit Walch Stone Church Rd E Hamilton, ON L8W 0B1

Bjorn K Monson

43043

March 8, 2014 Tim Dabney, Deputy Forest Supervisor U.S. Forest Service, Superior National Forest 8901 Grand Avenue Place Duluth, MN 55808 Dear Mr. Dabney, I am writing in opposition to the PolyMet copper-nickel mining proposal. In 1948 Aldo Leopold wrote in his A Sand County Almanac that, East of the Rocky Mountains, the only remaining parcel of true wilderness was the boundary waters area of Minnesota and Ontario. So far we have been able to preserve this as the BWCA. Permitting the PolyMet project would be the opening of a Pandora's Box releasing multiple evils: Sulfuric acid, the result of disruption of the sulfide containing rock and exposing it to water and air (oxygen.) This will poison the watershed. It is unlikely that this can be neutralized or contained in the short term, let alone for half a millennium. Poisonous heavy metals, especially mercury which is already a problem in northeastern Minnesota. Asbestos causing malignant mesothelioma, which is a horrible disease. It causes a slow painful death. Asbestos also increases the incidence of lung cancer. As a retired heart and lung surgeon I am particularly concerned this problem. Although drainage from the PolyMet mine would flow to the St. Louis River, which already has adverse effects from acid drainage, allowing a permit for the PolyMet Mine would set a precedent, and likely accelerate permits for mines closer to the BWCA. Acid drainage from these mines would then drain into the boundary waters with disastrous effects. Like with Humpty Dumpty, once we break it, all the king's horses and all the king's men, all of the money and all of good intentions cannot put it back together again. I urgently implore you to decide in favor of preservation, and not allow this process to proceed any further. Sincerely, Bjorn K Monson

Blakely Fraasch 44379

Hi my name is Blakely Fraasch, It has come to my attention that Polynet will build their first mine on the edge of the Boundary Waters. In my science class here at Prior Lake High School, we learn the pros and cons of mining. I realize that this mine could cause severe environmental damage with little pros to individuals (little jobs created, with the boom hitting only the corporation). As well as a little economic impact for the state of Minnesota with a huge environmental impact to our land. I believe the right thing to do is to save the beautiful and preserved environment from severe damage. It's time we stop "looking away" from the damage we are causing this planet in order to make some bank. Do the right thing for the true Minnesotans that love our state. Sent from my iPhone

blayne johnson 57479

I would hope people agree that Minnesota's Natural Resources and water quality is more important than pillaging a beautiful natural forest area for a few dollars and a lifetime of potential contamination. I would express my opinion to not allow the mine to proceed.

Bo Benya 39352

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bo Benya 3325 High Way 55 Eagan, MN 55121 (651) 621-3109

Bob Amis

15289

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay, Please consider this my comment on the SDEIS for the NorthMet mining project. My name is Bob Amis. I live in Minneapolis, and own a cabin near the Boundary Waters in Cook County, MN. I have a number of serious concerns with the current Supplemental Draft Environmental Impact Statement. Even though it has been improved from the original Draft Environmental Impact Statement, there appear to be a number of deficiencies remaining in the document, including numerous unsupported assumptions and unsubstantiated, overly optimistic projections which, if uncorrected, will not adequately protect the region from an unacceptably high risk of air and water pollution. I will give two specific examples, although there are many others: First, The SDEIS estimates that the project will increase seepage at the LTV tailings dump from 2,020 to 3,380 gallons per minute. The SDEIS then claims that all but 21 gallons per minute will be contained. That's a collection rate of over 99%. The SDEIS does not support this estimate by naming one tailings pile in Minnesota, or anywhere else, that has experienced such a high collection rate from pumps at the edge of an unlined tailings pile. It is my understanding that comparable real world experience is between 50% and 75% collection rates. The SDEIS does not consider the impact to water quality if the collection rate is lower than this extremely optimistic estimate. I ask you to require the SDEIS to be revised to include real world data on collection rates for tailings piles of this type, and an analysis of water quality outcomes if the tailings pile collection rate is not what PolyMet claims. Second, The SDEIS acknowledges that the bedrock at the mine site contains numerous fractures, but states that these fractures won't transport pollution into the nearby 100-Mile Swamp and Partridge River. In order to come to this conclusion, the SDEIS assumes low average, or "bulk" rates of rock conductivity, claiming that any pollution will take dozens, or even hundreds of years to travel even a short distance. This defies common sense. We all know that water will flow along the bedrock, find the fractures, and then flow through those fractures at a rapid rate, much faster than the SDEIS assumes. Furthermore, in addition to the existing fractures, mine site blasting will occur every 2-3 days, breaking up 200,000 to 300,000 tons of rock with each blast, creating more fracturing in the bedrock. The impact of this increased bedrock fracturing is not contemplated in the SDEIS. Therefore, I ask you to require the SDEIS to be revised to clearly analyze and explain the impact on surface and ground water if contaminated water from the mine site is transported through fractures in the bedrock. Ms Fay, I am not opposed to this mining project per se, but I am opposed to any project that will pollute the air or water of this beautiful state. I implore you to hold this project to a high enough standard to ensure that our air and water quality are not compromised. Sincerely, Robert W. Amis Jr. 1911 Kenwood Parkway Minneapolis, MN 55405

What will we have left for our grandchildren? Everything in our country is not for sale. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Bob Bartlett

9394

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Bob Bartlett 5080 Silver Lake Rd 5080 Silver Lake Rd Mounds View, MN 55112

I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Bob Bartlett 5080 Silver Lake Rd 5080 Silver Lake Rd Mounds View, MN 55112

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Bob Bartlett 5080 Silver Lake Rd 5080 Silver Lake Rd Mounds View, MN 55112

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, The BWCA is unique to the world. There is no other place like it, except for a smaller area in Canada. This treasure has to be given the best protection possible. PolyMet must be able to prove, guarantee that their mine will not affect the quality of wetlands and water in this area. They cannot do this as of yet. Human error happens. that is how we got Asian carp and oil spills. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Bob Bartlett 5080 Silver Lake Rd NW Mounds View, MN 55112-4817 (763) 780-1110

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Bob Bartlett 5080 Silver Lake Rd 5080 Silver Lake Rd Mounds View, MN 55112

Dear Director, I cannot find on the DNR website the public comment section on the Polymet application, so please forward this to the appropriate office/file/folder: Polymet has no record at all of mineral mining, much less a record of environmentally safe mining. All the promises and assurances it gives are of no value. The cost of failure is cataclysmic: All of the Boundary Waters and Quetico from Basswood to Crane Lake, and Voyageurs National Park, Rainy River, and Lake of the Woods would be rendered sterile – no fish, no vegetation, no clear water, no safe swimming, nothing. That kind of risk is inconceivable and unimaginable. Those waters are not ours to ruin – we hold them in trust for many succeeding generations. 20 years of profit and a handful of jobs are not justification for ruination of our natural jewels. Bob Carlson 18089

My name is Bob Carlson. I'm from Ely. I'd like to address wild rice. I started picking wild rice in 1963. I think I'm familiar with all of the major rice beds in Northern Minnesota, and many, many, many of the small, little rice beds. I went through the draft statement. I read everything that I could read on wild rice, and I think that the DNR and the other people involved did a really thorough job in their research on wild rice. Several comments I got about that. The areas downstream of the PolyMet Project have such a tiny bit of wild rice that I don't think it's really an issue. There's not a bed of rice down there that's large enough to harvest any rice out of, and -- and another thing to add in that tiny bit of rice down is something that really went haywire with the wild rice, we've got a lot of lakes in this area that historically didn't have rice. Some examples are Stone Lake near Hoyt Lakes, Seven Beaver. Stone Lake's got more than 100 acres of rice. Seven Beavers has got 4 or 500 acres. Those were seeded by the forest service in the 1970s, and they've got good crops of wild rice right now. There's a whole bunch more and I know a bunch of them that were seeded, some by the DNR, which they're in the process right now of trying to seed some, so that would mitigate any damage, should something happen. A couple other comments on this. They've got Hay Lake listed as a control site, you know, for comparison to the PolyMet Project. I think that's a poor, poor lake for a number of reasons. I picked rice in that lake for a number of years starting in the '60s. Sulfate levels. They check the sulfate downstream of this PolyMet site at a number of places. Two of the places where they checked sulfate layers, levels were much higher than the 10 parts per million. One was 17.something, another one was in the 30s. So it makes me wonder if the DNR and maybe our legislators shouldn't look at raising that 10-part-per-million sulfate level because rice is growing pretty darn good right now where that -- where the levels are higher. I guess the last thing I'd like to say is that the band members in the 1854 Treaty area have concerns about wild rice, but I think their concerns are really unfounded due to all these other lakes that have been planted that historically didn't have rice. Thank you.

19523

My name is Bob Carlson. I live at 324 East White Street, Ely, Minnesota. I'd like to address the wildlife -- or the wild rice issues. I think that concerns about wild rice with this PolyMet Project are really overblown. I've been picking wild rice since 1963, and I've picked most of St. Louis County and adjoining counties, and downstream of PolyMet, I'm completely unaware of any significant wild rice stands. So even if they did release sulfites that were damaging to wild rice, there isn't any wild rice there to hurt, so I think it's an insignificant thing to think about. And another thing, if wild rice was harmed by some sulfides released from the PolyMet Project, they could quite easily mitigate that by purchasing some ponds and planting wild rice. The United States Forest Service and the State of Minnesota have planted wild rice in the area with very good success. Stone Lake near Hoyt Lakes is one example, it has at least 150 acres, or maybe 200 when the crops are good. Seven Beavers, which is at the headwaters of the St. Louis River, has much more than that, maybe 4- to 500 acres of wild rice. That was planted by the United States Forest Service in the '70s. Plus, there are some lakes near Ely that were planted and wild rice grows well, and the State of Minnesota, at this time, the Minnesota DNR is attempting to get rice growing in a lake called Garfield Lake. It's between Soudan and Ely off the Mud Crick Road. So I think the wild rice concerns are really insignificant and should not be a factor in this draft EIS. Thank you.

Bob Hale 44617

My concern with granting permits to the mining companies pertains to the water quality of the mines after the metals have been exhausted. I do not see adequate funds being required to execute a plan B in case all the currently mentioned mitigation fails. The main issue is: you can't take it back once it has been released into the environment. According to my analysis of past industry cases, there is a larger than prudent risk of contamination. I don't see specified, who will monitor these so called bedrock walls that would contain pollutants. Overall, it doesn't seem like a good idea to risk our wonderful resources. Why don't we just give the mine workers a salary, it would be cheaper than trying to fix things afterwards. Bob Hale St Paul, MN

Subject: SDEIS Date: March 12, 2014 To: HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us Minnesota DNR, Please do not let SDEIS do any mining in the Superior National Forest Please save our wetlands, bogs, and swamps from being destroyed by pollution due to open-pit mines. We do not want contamination of ground water or our lakes and rivers. Once the water is polluted it will never be the same. Clean water is precious to every form of life. Minnesota's valued resource today and the future for its economy. SDEIS is inadequate and should not be mining in a fragile ecosystem. Robert Ilg 57 Bunn Trail Grand Marais, MN 55604

Bob Kaiser

16234

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Bob Lenzmeier 44829

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. Twenty years of jobs with the result being hundreds of years of polluted water. Any project that harms the water supply should be turned down without question. Sincerely, Mr Bob Lenzmeier 5041 Wood Ave Saint Paul, MN 55110-6625

Bob Ray 42027

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Bob Ray St Paul, Minnesota

Bob Shannon 47660

Please find attached my comments on the Supplemental Draft EIS. Sincerely, Robert Shannon Grand Marais, Minnesota

Bob St. Dizier 21252

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. The United States needs and the jobs it can get. Complete the process. Bob St Dizier 316 Montrose Ave Lafayette, LA 70503 bstdzier@cox-net

Bob Tammen

18090

I'm Bob Tammen from Soudan, Minnesota. I worked in several of the mines, and in the '70s, I had the privilege of working on the PolyMet site, back then it was Erie Mining Company, and it's an interesting history, and in my golden years, my wife and I spent a lot of time working with environmental organizations and I worked the Blueberry Festival in Ely, and perhaps some people here have stopped by and talked with me, reasoned with me, and there are a few that agree with me and one, especially, stuck in my mind. He was a water plant operator that worked on the Dunka site. They had a water treatment plant on that site to clean up the water before it ran into Birch Lake and they eliminated his job. They shut down that water treatment plant, which was meeting Minnesota's discharge standards, and they went to a constructive wetland, which was cheaper to operate but did not consistently meet Minnesota's discharge standard. As a matter of fact, there's a variance request in right now for the Dunka site. And just recently, we've had other request for a variance. We've heard so much about Minnesota's stringent environmental regulations. There's a request for a variance in right now on PolyMet's leaking tailings pond over here. It's leaking 2.9 million gallons a day. Now, that plant shut down in 2001. They've had a very good opportunity to clean it up. I think it's time they started cleaning up their mine sites and quit granting variances. We've also heard mention of socioeconomic effects and I think, once again, the environmental impact statement should do the science. We've heard people talk about 2,000 pages of science in that EIS and we've heard talk about socioeconomic effects. The studies are out there. If you build your economy on a mining industry, on the average, in the United States of America, you have you lousier economy than people that built their economies on nothing but the intellectual horsepower of their residents. We're going to be trapped in this boom-and-bust economy until we finally accept that we are a talented people up here and we're going to have to build our economy on the talents of our people instead of on stripping our assets, which are going to be shipped overseas, they aren't going to be building windmills in our backyard. We've already got a contract outstanding with Glencore. There's only half a dozen places on earth that can process these plant minerals. They're headed out of our country. So with that, I'd say, we should start working now on the future of our children. Give them something besides mining. Thank you.

18205

My name is Jacquelyn Halberg, and I respectfully defer my time to Mr. Bob Tammen. I'm Bob Tammen from Soudan, Minnesota, T-A-M-M-E-N. My wife and I live in Soudan, a little mining town, and I worked in several of the mines when I was younger, so I'm familiar with the process, with the economy, and so a lot of people have spoken on environmental issues. I want to focus a little bit on socioeconomic issues. First, I would respond to the mayor of Hoyt Lakes who said the IRRRB is working tirelessly to diversify the economy of Northern Minnesota. I go to IRRRB meetings, and I can assure they work tirelessly to rebate tax dollars right back to the mining industry; In the last 20 years, over \$200 million. They did it again last year, and they'll do it again this year unless we embarrass them enough to quit rebating tax dollars to taconite companies, and it takes a lot to embarrass a mining company. I would also comment on the Chamber of Commerce spokesperson that said the industry does not seek to weaken Minnesota's environmental regulations. The industry regularly requests variances to Minnesota's discharge standards, and the State of Minnesota regularly grants those variances. I checked the list at the end of 2013. There is a variance request for PolyMet's tailings pond which is leaking approximately 2.9 million gallons a day as we speak. If we have stringent environmental regulations in Minnesota, why are these tailings ponds constantly leaking. And in closing, I would speak as a union member who believes in collective bargaining, and I would point out to our friends in the labor movement that have been promoting this project that it's been a long battle. I lived through Reaganomics. It's even worse now, and I sympathize with people trying to maintain a decent standard of life, but we've seen what happened in Wisconsin, we couldn't get the vote on the recall. We've seen what happened in Michigan, right to work. Why does that happen? You union people should realize that environmentalists tend to be progressive people that support your collective bargaining agreements and tax (inaudible.) Why are you bashing the last friends you have in the State of Minnesota? Thank you.

Please accept the following comments. They will also be submitted as hardcopy for your convenience.-Bob Tammen Lisa Fey, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Re: Comments on Northmet SDEIS Dear Ms Fey: Please accept the following comments on behalf of myself and my wife Pat. I have worked in the mining industry as both a direct and contract employee in Montana, North Dakota, Minnesota, Wisconsin, and Michigan. Pat was employed as a teacher for over 30 years and we have seen the negative economic and environmental consequences of mining in the communities where we were employed. As retirees in northern Minnesota, we oppose opening up a sulfide ore body while the State of Minnesota has demonstrably failed to properly regulate the taconite mining industry. Sincerely, Robert Tammen PO Box 398 Soudan, MN 55782

***** GLOSSARY It has been my experience in the industry that acid draining from a mine is referred to as Acid Mine Drainage. Industry efforts to euphemize the term to Acid Rock Drainage is sadly unprofessional and should be corrected in the glossary and in the SDEIS. ES-10 "uninterrupted operation" There is no history or probability of uninterrupted mining operations in Minnesota. ES-24 Adaptive Management. As a Vietnam veteran, I personally participated in one of the larger adaptive management exercises in American history. When my unit, the 173rd Airborne, was transferred from Okinawa to Vietnam in the spring of 1965, we were told we'd be returning in a few months. Of course, we never returned to Okinawa. The war drug on for 10 years but the magic of adaptive management allowed the military industrial complex to keep the profits rolling in regardless of costs or casualties. Just as the military industrial complex dominated US policy, the mining-political complex dominates Minnesota to the detriment of its environment and economy. As a firewall against excessive meddling by agency personnel, the mining industry hires retiring State employees to make sure that any "adapting" they must do is favorable to their bottom line. Our environment should not be exposed to the vagaries of adaptive management. ES-31 PolyMet. Several documents refer to PolyMet and Poly Met (Two words). There must be a reason for having two different legal entities. The SDEIS should explain the difference and perhaps declare which will get dividends and which will have environmental clean up liability. ES-40 Federal, state, and local taxes. The SDEIS does not quantify rebates traditionally given to the mining industry. Our history of rebates to the taconite industry should be documented and the probability of rebates to the sulfide mining industry should be acknowledged. ES-40 IMPLAN. The November 2012 UMD Economic Impact Report and it's IMPLAN references are not credible. Page 4 declares that mining totals approximately 5-3% of Minnesota's Gross Regional Product but the same page lists Minnesota GRP as \$281-1 billion and mining GRP as \$4-5 billion. Mining is obviously less than 2% of Minnesota's economy. ES-41 "There is no legal access to the federal lands via land, The SDEIS should acknowledge that the mining industry has the power to prevent American citizens from accessing Superior National Forest land and should resist efforts to give the industry even more power by facilitating a sulfide mining operation in Minnesota. ES-41 Cumulative Effects. Respected geologists have estimated that the Duluth Complex is a 10 billion ton ore body and have predicted with great certainty that it will be developed. Being the State of Minnesota has been able to estimate the cumulative benefits for school trust funds, the State should also be able to give a

Bob Tanner

18377

I'm Bob Tanner from Soudan, Minnesota. An old mining town. I worked in several of the mines in my younger years. And there are a few issues with the supplement to the EIS that I believe need improvement. Of course, being we live in that economy I don't think the EIS treats the economic issues thoroughly. Now there's some sections in there that talk about the benefits of mining, but we know that there are significant costs to living in a mining economy. I will start with the rebates we're giving to the mining company. We read that EIS and see that we're getting millions in taxes. But that EIS doesn't disclose that we're giving \$220 million back to the mining companies. Over the last 20 years they clawed back \$220 million of our tax dollars. Now that's important to my wife Pat and I because our high school in Tower closed a couple of years ago. Just a little bit of that 220 million could have healed us up for quite a while. But the mining company has the political clout. They get that money back. And those of us that came down here from The Range drove down Highway 53. What is it going to cost us to move that highway? The mining company wants the highway moved. We're going to pay. They have enough political clout to get an agreement that we're going to move that highway. Well, Pat and I go to the informational meetings to try to figure out how much it's going to cost us to move that highway. A year or so go they said, "Well, between 60 and \$150 million." A couple weeks ago we went back for another informational meeting. "Well, we have a lot of alternatives. Between 80 and 300 million." Now any time you got blacktop involved, I would say you're going to end up the higher end of the range. But that's the cost of having a mining economy and not being diversified. Another thing I bring up is that we've heard lot of people say that we have clean water in Northern Minnesota. We're responsible stewards. That we can trust our mining organizations up there to do the right thing. I live within a mile of Lake Vermilion. Sulfates in Lake Vermilion are now over 10 milligrams per liter on our end of the lake. We know there's over 100 miles of headwaters in the St. Louis River. My wife and I love Birch Lake. The Dunka site is still leaking toxic crap into Bob Bay of Birch Lake. We've heard speakers say, "Well, we've got reverse osmosis. We got wonderful technology now." If this technology is appropriate for mining, why aren't we using it to clean up our existing messes? Minnesota has a history of being unable to regulate the mining industry. Thank you.

Bob Wirtanen

46536

My name is Robert A. Wirtanen currently residing at 5805 English Drive Farmington, NM 87402 I was raised in northern Minnesota for 24 years and I currently own property in Minnesota. I am opposed to the SDEIS NorthMet Project for the following reasons. Waters Resources are portrayed as capturing greater than 90% of the water for treatment. This should be reset to 100%. Mercury loading levels to a receiving water resource should NEVER be allowed to increase.(example Table 1 Page 53 the Embarrass River) Aluminum and lead evaluation criteria should NEVER be allowed to exceed applicable water quality evaluation standards Robert A. Wirtanen, CSP Retired - Environmental Specialist (35 years) Oil and Gas Industry.

Bobbi Galush

4

I have been following this saga for over 8 years now. Northern MN needs this. Let's go. The EIS addresses all of my concerns. I am embarrassed that the government has delayed this project for this long. No wonder why northern MN has been suffering for so long. Reverse osmosis is the best technology to keep the water supplies clean. I deal with it daily at my place of work. It is extremely effective. Quit catering to all the tree huggers in this state. We need mining for northern MN. Sent from my iPad

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, bodin sabrina 3 allée anatole france séné, ot 56860 FR

57873

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please consider the significant environmental impact that this mine would have to the treasure that is our Northern Minnesota- the wilderness, the pristine waters of the BWCA, to the Great Lake of Superior. Please think of the generations of the First People's who lived lightly on this land. Consider how the unintended consequences of what is projected but not known about how this mine's construction and operations could lead to impacts that would affect this area for generations to come. Sincerely, Ms Bonnie Morris 3129 James Ave S Minneapolis, MN 55408-2519

Bonnie Nelson. For the Land Exchange, I am concerned that we are taking land that is currently in a natural state and turning it into or exchanging it into land that's going to be mining. It would make more sense to take mining land and turn it into a natural state in exchange, so that the two would have an equal use exchange. Does that make sense?

Bonnie Peterson

Dear Ms Fay, Dear Federal and State Agency Leaders: Who really believes that polluted leach water would be monitored and treated for hundreds of years after the mining ends. We have no mechanism for long term treatment on that scale. It's more likely that a polluter-friendly government will reduce treatment requirements - or forget them entirely. The land swap should be denied, and mining company should not be allowed to strip mine and expose sulfide waste. Mining company should instead mine underground, replacing waste materials in mined out tunnels. If the strip mine is to be allowed, regulators must keep in mind that are no materials that will hold up for hundreds of years. Waste pit liners will degrade over time, and leak. The project must include at least one, and probably more liner replacements. Look around the country and notice neglected pipelines that leak and burst because once they are installed we neglect them. 20 years of jobs is a bad trade for hundreds of years of problems I am counting on you, as regulators, to protect Minnesota's long term interests. Thank you for your work. Sincerely, Bonnie Peterson Bonnie Peterson 155 Sherwood Road Shoreview, MN 55126

45618

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: Please reject the land swap that would enable sulfide mining in the arrowhead region of Minnesota. Sulfide mining and resultant fragmentation of our wild areas would be a permanent loss for Americans. With so few wild areas left in the world, it is more important than ever to preserve them where we can. Sincerely Bonnie Peterson Bonnie Peterson 155 Sherwood Road Shoreview, MN 55126

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Bonnie Shallbetter

45677

Hello, I am a resident of Hackensack, Minnesota. I have lived in Minnesota all of my 60 years and have been very proud of that fact. Minnesotans treasure the out of doors and the myriad of outdoor activities the state has to offer. I have been going to the Boundary Waters since I have been 13 years old and it has been a significant factor in shaping me as an adult and my relationship with the outside world. It is truly rare to have a place like the Boundary Waters where one can experience quiet and a sense of self. I, therefore, am very much against any mining by PolyMet or any other company with that goal. I strongly believe that it will change the Boundary Waters forever. The shortsighted 20 years of jobs verses 500 years of pollution (and why would it stop there.) is not the legacy we should be leaving for our children and the generations to come. I fear that if the mining proceeds we will hugely compromise our natural resources and our beautiful state of Minnesota. Thank you for your time, Sincerely, Bonnie Shallbetter 934 32nd Street NW Hackensack, Minnesota 56452

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Bonnie Shenski 2606 Chapel Lake Dr apt105 Gambrills, MD 21054 US

To Whom It May Concern; I am against copper-nickel mining by PolyMet, or any similar operation in NE Minnesota. I have seen the damage done by other mining projects and do not want to jeopardize the clean water, fishing, forests, and tourism industry we currently have in place. When you make an informed decision, you balance the risks vs rewards, and the risks are far too great. We have something special in NE Minnesota. Do not take the chance of ruining it for our generation, my children's generation, grandchildren's generation, and all generations to come. Please do what is right and deny this permit. Thank you. Brad Borrman 111 Westmaher Drive Marine on St Croix, MN. 55047 612-850-4152(cell) bradbwca@aol-com Sent from my iPad

My name is Brad Clifford. I'm with -- I live at 1006 West Sixth Street in Duluth, Minnesota, 55806. My comments are in agreement with the Water Legacy in addressing the cumulative effects and the request for an EPA study. Last month, 59 groups in Minnesota, Wisconsin and Michigan asked the United States Environmental Protection Agency to do a cumulative analysis of the effects of mining on the Lake Superior Basin. These 59 groups included Duluth businesses, non-profits and faith groups like Whole Food Co-Op in Duluth; the Institute for a Sustainable Future; Idle No More Duluth; Peace United Church of Christ; Food, Energy and Environmental Team. On January 6, Congresswoman Betty McCollum sent a letter urging the EPA to use the funds provided by Congress to conduct an assessment and inform citizens of the generational consequences of sulfide mining to impact ecosystems, human health and the basis of tremendous water resource. The PolyMet SDEIS doesn't study impacts that could affect mercury contamination of fish in the St. Louis River Estuary, let alone impacts to habitat and tribal resources in the region. A cumulative effect analysis of mining should be done before the PolyMet SDEIS gets finalized. That would permit us to know the consequences before opening up Minnesota's northeast to a sulfide mining district.

57354

My name is Brad Clifford. It is C-L-I-F-F-O-R-D. I live at 1005 W.6th Street, Duluth, Minnesota 55806. My telephone number is (218) 260-3208. And my comments are reflective of that information that I've heard in many community conversations, as well as conversations that we have looked at at Northstar Community Development Corporation, which for 35 years we, as a nonprofit organization, look at economic development, small business development, job creation, cost per job, and sustainability of risking capital to create economic opportunity. Over our 35 years we have invested eight million to nine million dollars with 350 ventures, and 125 are still in business today, with about 600 jobs. So, with that, I look at the history of '72, 1972, when US Steel closed down out in Morgan Park 320 acres that are still on the Remedial Action Plan with the Superfund site, and there is no money to clean up an estimated 28 to 38 million dollar cost to reclaim and restore the land. And some say the land will heal itself. And others say, "If we ever lived out there, we would create a Love Canal incident all over again." We did manage, I believe, a sizable amount of money, somewhere between I think 15 to 20 million, I'm not sure of the exact amount, with the Equestria (phonetic) cleanup. And there was some dumpings that were in Lake Superior that the Red Lake Tribe is investigating, which many dismissed it, not wanting to look at the impact to fish migratory patterns and other issues to the habitat when contaminants were put into the lake. And when we see drought and when we see lack of water, like in Colorado or other places in the country, and we can buy water at \$10 a gallon, our greatest resource, above and beyond what we cut down of the trees or what we can dig up out of the earth, really is our water. So, as citizens of Duluth, the question we are scratching our head and saying is, "Well, wait a minute. Nobody has cleaned up the US Steel site." So, if we are going to exploit and take one percent of the earth and crush the other 99 percent and leave tailings, what would Judge Myles Lord say? What would we do to clean up after the fact? And if we simply say, "Well, we will shove it down the road to the next generation," and here we are, 40 years later, and the US Steel site is still a mess. How do we trust this economic opportunity? And how do we assure ourselves that we can see sustainability, we can see an economic balance, sort of the idea of an "economic equilibrium," and Dr. Gram Nash's theory, who was a Nobel Prize winner on economics, where values were assigned to each component, the land exchanged, the reclamation, the actual value of the minerals in the ground and the cost to get them up, and the tax revenue that the agencies and state can levy to keep it balanced. And as long as those answers come up to a balanced equation, then we should -- we should go forward as quickly as possible. However, if the questions aren't answered and mitigation and rationalization and the science isn't proven, that's the problem that we have. Who can say honestly and clearly that this science has been proven? When Mesabi Nugget tried to prove their technology, they did a very, very small equation, and it took several years for that to be proven, before they went forward to the next step. And if we skip any step and try to argue that our concerns are dismissive, then the deliberative democratic process gets thwarted. And so suddenly somebody's assertion isn't as important as the individual that has more money and can buy it, does it? So, when we look at our mineral rights in our forest, they may not be worth what some people believe them to be worth. And if they are, then show us what the math is. And if they can do that, then people will buy into it. But if they can't, and they can't deliver, then remediation, for example, in the river, if it gets to certain levels -- and how do we determine those levels? At .2 on the map, and down at the rice patties

Brad Davidson

44755

269 Anemone Dr Boulder, CO 80302 TO: Lisa Fay, EIS Project Manager, My name is Bradley R. Davidson, I have a Masters in Environmental Geochemistry and have lived in the Southern and Central Rocky Mountains for most of 40+ years. I have seen first hand the results of the hard rock mining of massive sulfides underground though out the WeSt Efforts to control AMD in many area of the West have met with limited success and long, long term care and oversight has been the prognosis. The only bright spot is that some sites have become living laboratories for the study of AMD. Requests for samples come from around the world. Not an export to be proud of. The NorthMet Mining Project and Land Exchange and its Supplemental DEIS represents a significant improvement in identifying impacts and solutions. This is due to the expanding embrace of interrelated parties and their interests to the realization that other resources will be impacted and their availability to future generations imperiled. It is encouraging to see that the rice waters as well as other 1854 treaty concerns are priority iteMs The potential impacts to the watersheds and the other renewable resources which support sustainable economies cannot be taken lightly and trusted to the normal economies of mining. We owe it to the future to take it slow and do it right the first time. I feel that the process of Impact Assessment continue but not progress with the following points addressed. 1) Why Sulfides will always present a hazard and to consider a sulfate potential standard related to surface area. 2) What kind of extreme weather events are considered. 3) Who would maintain containment in perpetuity. 4) What value do we place on the complete loss of a renewable resource in the immediate area. 5) What value do you place on the potential loss of a much greater area and its resources. 6) What if we made a Return To Initial State a requirement for tailings. I can comfortably discuss just the first point but it is to the heart of the issue. It is a matter of chemistry and physics. Rock turned to coarse flour. In order to separate the low grade disseminated metal sulfides from the waste rock, the ore must be milled to the point where the target minerals are liberated. Liberated: that the grain size is small enough so that one material (mineral) dictates the grain's response to various processes and treatments. Sulfide ores had been sequestered within solid rock for millions of years. What had been solid rock will run through you fingers easily, the texture of fine sand with grains . 074 to .42 mm in diameter. The separation process will evolve as conditions change but the goal is to efficiently remove the valuable from the waste. Trial and error is a common method of refinement in recovery rates. Most likely much regrinding occurs and as a result of the milling the surface areas of metal sulfide minerals such as pyrite and chalcopyrite could be on the order of a fraction of a square meter per gram. The now liberated sulfide minerals are very reactive with respect to oxygen and immediately begins to oxidize or at least will if given the opportunity. The urge to oxidize begins during the milling process and the oxygen is quickly depleted in the early stages of the milling process. Sulfate formation is usually anticipated in flotation processes. The specific hydro-metallurgical process employed will probably strictly control oxidation. The dramatic increase in material surface area contributes to this extraction process but it leaves the discarded sulfide ripe for oxidation. The rate of pyrite oxidation by O2 is first order with respect to the surface area. First order: as you increase a concentration of a particular reactant the reaction increases by a like amount. Double the exposed surface of metal sulfides the rate of oxidation doubles. We are in fact faced with a tremendous increase in the concentration of sulfide surface area by many orders of magnitude. If No

Brad K

Lisa, I am 100% IN FAVOR of the PolyMet Met Mining project and the firm's plans to extract minerals and metals on the Iron Range and northern Minnesota lands managed by the firm. I will also state that I am an avid BWCA/Quetico canoe camper and also water sports enthusiast who frequents numerous northern Minnesota lakes and rivers. I am also involved as a volunteer and camper parent of a YMCA youth camp near Eveleth, MN . I also use the area's bike trails/paths and state and national forests and campgrounds on the Iron Range. This project will be good for the region and state. Again, I am in favor of issuing PolyMet the necessary permits and regulatory paperwork necessary to proceed with the firm's mining plans. I believe it will be very positive for Minnesota economic development and provide much needed natural resources for our region and nation and others around the globe. It will provide needed jobs so more people can pursue the American dream. I am confident in PolyMet's ability to manage its operation(s) and comply with Federal and State regulations - and not have a negative impact on outdoor recreation activities or the natural environment beyond the boundaries of the mining operation and related land/soil and watershed. Thank you, Brad Brad Konkler 23 Wildwood Ave St Paul, MN 55110 952-491-1470 - cell

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Brad Little 2729 E 6th St Duluth, MN 55812-1507 (218) 269-0904

38873

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. A health impact assessment should be standard for projects like this that have the potential to affect both human and environmental health across the Arrowhead. Sincerely, Mr Brad Little 2729 E 6th St Duluth, MN 55812-1507 (218) 269-0904

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. If this mine is to be developed safely and responsibly, we must take the time to ensure that PolyMet is willing to make sure no human lives or ecosystems are put at risk by this project. 20 years of copper reserves is not worth jeopardizing ten percent of the world's fresh water in the Lake Superior watershed. I suspect that in my lifetime we will see fresh water become even more valuable than copper. Sincerely, Mr Brad Little 2729 E 6th St Duluth, MN 55812-1507 (218) 269-0904

38942

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Brad Little 2729 E. 6th St Duluth, MN 55812

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Brad Little 2729 E. 6th St Duluth, MN 55812

Brad Oachs 18088

Good evening. I'm Brad Oachs; Oachs is spelled O-A-C-H-S. I'm chief operating officer of Minnesota Power. I've lived in Northeastern Minnesota for over 24 years. In my various us roles at Minnesota Power and through its utility operations, I have worked with several Iron Range mining businesses; US Steel Minntac, Hibbing Taconite, Arcelor Metal and North Shore Mining. The metals mined at PolyMet will be used for electrical components, cell phones, computers and catalytic converters; products critical to our lives. Mining has a long history this our region. Because of this history, significant support exists; the regulatory framework, the people and technical expertise, the physical community infrastructure, all there to safely mine copper-nickel. For these reasons, there is no better place in the world to be mining copper-nickel than right here, and I support the PolyMet Project. So often the response to opportunities and projects like this is not in my backyard. I find it very refreshing to hear many of you speak to, "Yes, in my backyard," and why we can do that is because we know we can do it well. Thanks.

Brad Sagen 42928

Brad Snyder 40701

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, As a current Science Teacher and Outdoor/Environmental Education instructor, and former Engineer I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Brad Snyder 8887 Dallas Ln N Maple Grove, MN 55369-9270

My name is brad carlson. My wife and I own a cabin outside of ely - 840 kawishiwi trail. We have had the place for over ten years. Our six acres is a precious place to us as is the entire wilderness, surrounding national forest and community of ely. We are in strong opposition to allowing copper mining in Minnesota. For a few jobs created during the brief period such mining would be around it will leave in its wake hundreds of years of toxic waste and destruction. We do not consider this a fair trade off - not even close. This type of mining has a proven track record of being destructive to the environment and communities - without exception. This fact alone should dictate a flat denial of permitting for such mining in Minnesota. The US e.p.a. has shown this industry to be the largest polluter in our nation. There is no doubt this type of mining if allowed in the area proposed would have devastating negative effects on the wilderness, the local communities, water supplies, wetlands and property values (ours included). We urge you to deny the permit for polymet to mine for copper in this area and in the state. Shame on Minnesota for even considering it. Signed, Brad carlson and barbara garza, residents of the affected area in question. 840 kawishiwi trail Ely, mn 55731 This is a second version of this comment because I forgot to put our full address on the firSt

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Bradley Schmidt 17 13th St NE Faribault, MN 55021-3813

Bradley Thompson 41666

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bradley Thompson 5400 46th Ave S Minneapolis, MN 55417-2310

Brandenburg Gallery 46103

To whom it may concern: M.I.T. researchers, when asked their opinion on whether or not copper-nickel sulfide mining should be permitted in northeastern Minnesota replied: "In a water table as fragile and valuable as the one in northeastern Minnesota, you just don't do it." The PolyMet Environmental Impact Study is hypothetical. Even proven first methods can result in environmental disaster given the event of natural earth movement, equipment failure, or human error. Should companies be allowed to put at great risk the health and welfare of ecosystems, people, and wildlife. No, because individual citizens are not permitted to. If a terrorist were to come and poison our water supply we would go to war over it. Minnesota is defined by its lakes and quality of clean water. The shortage of clean water in the world is becoming increasingly severe and large scale. Unlike other resources, there is no substitute for clean water. The world's water crisis is closely related to the flaws of modern economics and politics. Greater than a crisis in jobs, is a crisis in our own values. We need jobs. Well, some jobs will kill you. I am saddened to think that Minnesota even considers permitting copper-nickel sulfide mining. Minnesota ought to first make mandatory the recycling of all metals. Just say NO to permitting sulfide mining in Minnesota. Sincerely, Milli Salmela Bissonett P.O. Box 31 Ely, Minnesota 55731

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Brandi Balmer 1422 E 3rd St Apt A Duluth, MN 55805-3936 (608) 201-9519

Brandon

44581

Hello, I am a current student at prior lake high school and I would like to let you know that the mining idea next to the boundary waters will be a bad decision for not only the company but also the environment. The clean up costs will far outweigh the costs of running this mine for only 20 years. It is absurd to think that you will be able to clean up and pay for the clean up many years after. I believe that this is a bad decision for the fate of the precious boundary waters and the environment around it. Please make your decision wisely. I normally don't get involved with environmental impact statements, but this one stands out to me. Thanks, Brandon

Breawwna Wunder

19513

My name is Breawwna Wunder, B-R-E-A-W-N-N-A, W-U-N-D-E-R. My address is 3515 Columbus Avenue South, Minneapolis, Minnesota 55407. And here is my statement. The SDEIS is insufficient and should not be approved. It does not provide adequate information about the water treatment. How will up to five centuries of water treatment be paid for? No details are provided as to how the centuries of operation, maintenance, monitoring and reconstruction of water treatment facilities will be paid for. What financial institution has ever lasted even one century, much less five? The mining industry as a whole is responsible for the largest and most costly environmental cleanups in our nation. Across the country, environmental damage from sulfur mines is well documented and well known. In Minnesota, we value our waterways, and it is unacceptable to not be protecting our ecosystems for our current citizens, as well as our future citizens. Claims in the SDEIS that mercury and sulfate pollution will decrease in nearby waterways as a result of mining are dependent in large part on operation of water treatment systems that are not detailed. To ensure protection for future generations, we need a detailed report that guarantees the protection of our waterways. Thank you.

Dear Sir or Madam: If it is the mission of the Minnesota DNR is to “work with citizens to conserve and manage the state’s natural resources, to provide outdoor recreation opportunities, and to provide for commercial uses of natural resources in a way that creates a sustainable quality of life”, I don't understand how we can even be having a conversation about the possibility of allowing this mining. Even if the PolyMet mine were going to provide for thousands of good paying jobs, it would not be worth a minimum of 500 years of cleanup. The cost to the taxpayers of this state will be unthinkable, and the costs will be on the taxpayers because corporations always externalize such costs. No reasonable person can think that any corporation will live up to the responsibility of paying for that kind of cleanup, and that is just the financial coSt The cost to the environment would be a sustainable quality of life. No one would be able to live in that area. A minimum of five hundred years of cleanup basically means there is no way to clean it up. As a taxpayer and a citizen that loves this state, I say this mining project should not be approved. Regards, Brenda Beebe

22192

Beebe, Brenda (DLI) would like to recall the message, "PolyMet Mining".

I know I am a small voice, however, please do not let Polymet or any other mining company destroy our natural resources. There is no amount of jobs worth putting MN resources at risk. Our freshwater lakes already have contaminates. Stop the purposed copper-nickel mine (and make the other mining companies more responsible for what is already happening. Sometimes in life we all must sacrifice something to insure the future population can live in a clean, safe environment. There is no amount of money that will ever bring back what the mines are taking. Polymet and others will continue to throw money at this and pay off Politicians to get their way. Please do everything you can to secure our great resources in our state. Health all around us is a beautiful thing. Thank You, - Brenda Doup 4556 Miller Rd Duluth, MN 55803 Work: Program/Project Specialist University of Minnesota Duluth 1035 University Drive, 109 Med Duluth, MN 55812 218-726-7581

Five reasons why I'm against allowing PolyMet to open a Copper Nickel Mine in Northern Minnesota. Not in order of importance. 1- Have these facts been checked into. PolyMet is a Canadian Company and their largest investor is a Swiss commodities trading firm (Glencore) with a poor environmental and human rights record 2- This Swiss commodities trading firm (Glencore) has an agreement to sell copper concentrate to China. What about the US. 3- Open-pit mining and the entrails leave behind a devastating landscape. 4- Pollution and toxic waste. 5- 100 jobs (short term) in exchange for millions of dollars lost in tourism and clean up (long term). I beg you, please do not allow Open-pit mining in Northern Minnesota. Sincerely, Brenda Jerich bsjjoy@aol-com

Brenda Johnson

I have lived here most of my life and think our state has the potential to be the cleanest state in this country. People like the idea of waking up and being able to take a shower, get a cup of coffee, or whatever it may be, they count on the water to be clean. This mining operation is filthy. It will have long lasting effects on the environment and our children. No amount of jobs or money could possibly be worth the trade off. Have you not seen the effects of previous endeavors by mining companies. The media has painted a care nothing attitude about the people or the environment by mining companies. Please, prove me wrong. Name one mining company, fracking company that has put the people first Please explain why the continued pollution of our land is in the best long term interest of anyone. Put PolyMets history on the table for review by the people in this state. What is their history in previous places. I'd like to hear interviews by the people who live near a PolyMet mining operation, both current and past Include environmental photos of the areas affected by PolyMet. Brenda Johnson

I made the attempt to retrieve this message and then thought “really Bren.” So I am resending it as I really do believe we need to consider the impact. Sorry for the confusion and thank you again for your time. _____ From: Sweet, Brenda L Sent: Thursday, March 13, 2014 10:36 AM To: 'NorthMetSDEIS.dnr@state.mn.us' Subject: Mining concern/comments Good morning, I grew up in the small town of Babbitt during its prime, and enjoyed the spoils afforded us by the mining industry. I understand everyone’s concern for employment. It is unfortunate to go back home and see houses in disrepair, schools closed. I also enjoyed the lake and the woods. My father loved being out in nature and he passed that love and appreciation down to me, although as a child I thought everyone had a lake in their backyard, a forest in the front. After leaving the area to live elsewhere to work, I soon discovered that is far from the truth. How blessed I was without even being aware of what was right before me.. As an adult, I have a whole new appreciation of the area, nature and how fragile it really is. The gratitude for what I had as a child was so deep, that when the opportunity to purchase the home I grew up in presented itself, we jumped. Currently we only get to enjoy the area on weekends but plan is to retire there. So as a child of mining: The history of copper mining/pollution/clean up is very disheartening. What makes us think this will be any different. I have been told “well, it is all underground.” Honestly, that just doesn’t satisfy my concern for such a beautiful area and the potential seepage and damage we are asking them to merely put a deposit on. Think about that. We are saying “We are so certain you are going to mess up this area, we would like a damage deposit. It won’t be enough money to get the job done after you destroy where we live but gosh, go ahead make your mess and leave, we have your deposit.” We will not only lose jobs people are fighting for at that point but we will lose the whole BWCA Wilderness and all this area is appreciated for. All of it gone so much for leaving the world a better place. President Roosevelt had the foresight to reserve some of our lands as national parks. How many of us go enjoy them. Maybe the people there don’t appreciate us all visiting their area like I have heard people on The Range don’t appreciate the BWCA. Yet those parks are there, we go visit them and we are grateful his legacy. Please be certain of your actions and decision. This will be your legacy to our children and grandchildren. HYPERLINK "<http://www.brainyquote-com/quotes/quotes/a/anseladams161651.html>" It is horrifying that we have to fight our own government to save the environment. HYPERLINK "http://www.brainyquote-com/quotes/authors/a/ansel_adaMshtml" Ansel Adams Thank you for your time, Brenda Sweet

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Brenda Scott 409 7th Ave NE Minneapolis, MN 55413-2028

20207

Dear Ms Fay, My husband and I have had the privilege and opportunity to experience the unique beauty of the Boundary Waters Canoe Area for the past 35 + years. We first visited the BWCA as Sr. High Church Youth Group members, canoeing and camping in this pristine area of MN. Our family thoroughly enjoyed vacations at various campgrounds/resorts every summer in the Ely area. We had a dream of one day owning our own cabin in this paradise, and finally in December 2013 our dream came true. We purchased a cabin in the Isabella area. We, our family and friends, are looking forward to enjoying the breathtaking beauty and tranquility this area offers for many years to come. Until recently, we were unaware of the exact location and potential devastation the PolyMet mining project poses to this sacred area. We are VERY CONCERNED about the negative impact the mining will have on the land, water, wildlife and tourism in NE MN. We understand mining may create jobs/revenue for the next 20 years, but the destruction/pollution it will create will last for centuries. We feel protecting the environment far outweighs any benefits PolyMet claims We are asking you to please protect Minnesota's future. Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank-you for your concern and assistance in protecting the land, water, wildlife, and tourism industry from the devastation this mining project will cause if it is allowed to proceed. Sincerely, Brenda and Jeff Solomon Cabin: 2307 N McDougal Ln Isabella, MN 55607 Brenda Solomon brenda@erahome-com Phone: 507-213-9496

Brenden Obryan

42081

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Brenden O'bryan Woodbury, Minnesota

DNR, Please, do not let PolyMet go through with their project in Northern Minnesota. People have been saying that it is too much of a risk for us to allow PolyMet to exploit our environment, but the truth is, it's more than that. The term "risk" implies uncertainty, but as your Environmental Impact Statement shows, there is no uncertainty that PolyMet will negatively impact our environment. Without doubt, PolyMet will foul our air, dirty our waters, rob habitat from our endangered animals, kill our endangered plants, and alter our landscape and its ecosystems. Indeed, PolyMet will lose an opportunity to make a profit and some of us will miss out on a short-term economic boon. But in allowing PolyMet's project to be realized, you are breaking not only the hearts of thousands of Minnesotans, but those of everyone who has ever fought in the name of our environment. When it comes down to it, this question isn't just about politics and economics— it's about morals. Many people see a dichotomy between nature and culture, but in actuality, we are part of nature. Not only do we depend on it, but it depends on us. And because my words are not as eloquent as his, I will end this letter in the voice of John Muir: "God has cared for these trees, saved them from drought, disease, avalanches, and a thousand tempests and floods. But he cannot save them from fools." Brennen Byrnes Stenke 636 Grand Avenue #202 St Paul, Minnesota 55105

Lisa Fay, I'm writing to submit a comment on the Supplemental Draft Environmental Impact Statement (SDEIS) for PolyMet Mining's proposed NorthMet project. First, I want to express my confidence in your agency to thoroughly evaluate the project and its ability to mitigate potential environmental impacts. I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. Additionally, I'd like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out – all the more reason to support it. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country. Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. We cannot afford to miss this job opportunity. This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Based on my review and the level of detail included in the draft EIS it appears that a thorough evaluation of the project and potential impacts has been completed. Sincerely, Brent Chezick 7534 Trapper Trail Eveleth, MN 55734

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Brent Gurtek 1873 Korkki Road Duluth Twp. Duluth Twp., MN 55804 218-525-7573

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. As a tax paying citizen of the great state of Minnesota who loves the beauty of the Lake Superior basin and the Boundary Waters Canoe Area Wilderness, I am extremely concerned about this project's potentially hazardous environmental impact on the region where I live. Not only have I made my home in this region so that I can easily access its beauty, but I spend literally thousands of dollars each year fishing, camping and canoeing in Northern Minnesota. The fact that something as destructive as sulfide mining is even being considered baffles me beyond expression. As I'm sure you know, Sulfide mining has never been done in Minnesota and its track record has been sketchy at best in terms of environmental consequences. This project is not being proposed in some remote corner of the world where nobody visits, but in the heart of one of the most spectacular and most visited natural areas in the continental United States. I beg of you to seriously consider the consequences heavy metal contamination could have on our precious region, and the wildlife and water quality that people travel from around the world to enjoy. Even one slip of environmental protections could have a dramatic impact on the lives and lifestyles of the people who live here, like myself. Please consider the public's best interest and protect our Superior National Forest by rejecting PolyMet's destructive and polluting open pit sulfide mine proposal. The risk is not worth the reward for the people who love and live here. Thank you. Sincerely, Brent Notbohm 5001 Peabody St Duluth, MN 55804-2441

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to

Brett R. Ewald

41331

Mar. 9, 2014 Dear MDNR Division of Ecological and Water Resources Environmental Review Unit, I think that we must weigh the possible outcomes of the NorthMet Mine proposal, and other projects likely to follow, against the plausible benefits and detriments. PolyMet offers at least 20 years of jobs for between 300-360 personnel. There are varying estimates of temporary construction and indirect jobs. The state will reap the benefits of taxes per pound or ton with additional taxes from purchased goods in the local communities. Their modeling, as evidenced in the SDEIS, eludes to 200 years of water treatment costing between 3-6 and 6 million dollars per year. This assumes there is minimal exposure, run off, or other means of untreated water leaving the compounds. It is great if their modeling is too farsighted and treatment is not needed for that long. What occurs if treatment is needed after the 200 or 500 years. Can we rely on future technologies to better mitigate the untreated water. I see this issue as short term profits for very few and jobs for some versus potential contamination of water that has existed for millennia. As seen in the news, water is constantly and quickly becoming a scarce commodity. Copper and nickel are not. We need not mine the copper and nickel in NE Minn. using unproven methods for mostly profits of foreign owned and backed corporations. Please take these considerations into account when weighing the benefits and detriments. Thank you for your time. Brett R. Ewald 4790 Centerville Rd, Apt. 215 White Bear Lake, MN 55127 ----- This message was sent using the University of Minnesota Duluth Webmail

From: Brett Reiersen [mailto:mr**brett64@gmail-com**] Sent: Wednesday, December 11, 2013 12:37 PM To: Fay, Lisa (DNR) Subject: copper mine While i love the Boundary Waters and the wilds of northern Minnesota, i believe we also have to use our natural resources for our modern needs. But USE, not ABUSE our resources. I think a properly planned and managed project could be positive, but i don't think this project, at this point, is properly planned or managed. Please make the mining company provide better answers and solutions.. Thank you for all you do. -Brett Reiersen

Bria Schurke

18212

Hi, I'm Toni Watt. I live in Minneapolis, and I met tonight Bria Schurke who is the daughter of a person who introduced me to the Boundary Waters 30 years ago. My name is Bria Schurke, S-C-H-U-R-K-E, and I am born and raised in Ely Minnesota, White Iron Lake. Kawishiwi River is my literal backyard playground, and I'm a proud customer and friend from of Zup's Grocery Store, but I'm not going to give you my car keys. You don't want my car anyway. I have high expectations of my policymakers and community members to make decisions for my community that will keep Ely and Northern Minnesota sustainable, clean, healthy and inviting for the next generation. I do not want to raise my children in a community that has fallen at the mercy of a money-mongering mining -- international mining company that has yet to prove that they are truly vested in the sustainability of the future generations and for our quality of life. There is more to life than money. I am happy to live cutting wood and living in Ely but live with minimal means. Mining is not the only answer for a middle-income job in Northern Minnesota. Also, sulfide mining is not the same as iron-ore mining. We were not founded on sulfide mining. We were founded on iron-ore mining. That is completely different. 100 percent of sulfide mines around the world have proven to cause pollution. I will not accept any pollution in the community that I want to raise my children, if there's risk that my children will be raised on polluted water. Why? Why would I want to do that. I feel like I am against a wall with these major corporations. It's just another classic story from another small community in the world being pushed up against major corporations. Where are our politicians? Where are our local leaders? Why are we having this conversation right now? There's more to life than corporations taking over small towns. I'm disappointed, and I'm frustrated. We have a huge problem with PolyMet SDEIS, but this is not rocket science. This problem is so alarmingly simple that everyone in this room should be pushing the panic button right now. For five years, PolyMet and various government agencies have studied the potential impact of the (inaudible) polluting it. Thank you. Please protect Ely and Northern Minnesota. We are beyond -- we are above -- we are above this.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Brian and Ruth Lavelle 19206 Redtail Drve Spring Grove, MN 55974 507 498 3695

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. SDEIS Comments 13 March 2014 As a Wetland Health Evaluation Project volunteer for the last 13 years, and as a wild ricer during my college years as a biology major, I have seen the limits of mitigation, reclamation, remediation, and restoration. Nothing beats not messing things up in the first instance. Even with significant money, the efforts rarely achieve more than partial success. Section 3-3-3-4 Financial Assurance starts with the grammatical fiction that costs can be better estimated later in the permitting process as outlined in para.4-1- The 200 year and 500 year timeframes, numbers that exceed the lives of nations and certainly that of commercial enterprises, are beyond both planning and funding. The effects of dewatering, sediment movement, chemical leaks and seeps, and ground disturbances on a large scale in such a sensitive area are not possible to estimate. One event like the Duluth deluge will overcome all prior planning. Worse is the statement that “compensatory wetland mitigation” not be approved and constructed in advance – outside of financial assurance requirements. Comments The Watershed Restoration goals described on page 3-71 seem overly optimistic. Water events, sediment and toxic waste or process water migration, have a way of defeating barriers and will only minimize watershed contamination. With the number of sites identified as problems (Table 4-2-1-2) and the sensitivity of wild rice to sulfates (4-2-2-1-3 and Table 4-2-2-3), the state should reduce or eliminate problem sites prior to permitting. Mining may be inevitable someday, but placing processing facilities and tailing sites at the head of an important watershed, and adjacent to the BWCA and Rainy River Watershed should never be allowed. We cannot leave a legacy of NURPs (National Urban Runoff Ponds) for a principal watershed of Lake Superior. Thank you, Brian Berggren 11 High Road Inver Grove Heights, MN 55077

Brian Bluhm

43729

Hello - I am contacting you with two of my concerns about the proposed PolyMet Mining Project. I am concerned with humanity's ability to continually monitor and manage, as would be the case with the proposed project. Despite the use of new technology, there is always risk involved when disturbing natural processes. If some aspect of the proposed management system were to fail, for example from a sustained power outage, are there other measures in place to prevent contamination. I am also concerned about the potential effects on human health, and the related monetary costs to those impacted and their communities. If contaminated water were to enter the watershed, are there assurances in place to prevent the cost of these impacts on human and community health from being imposed on the municipalities, tax payers and individuals of northeast Minnesota. Thank you for all the good work the DNR has done and will continue to do in our state, Brian Bluhm 630 N 10 Ave E Duluth, MN 55805

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Brian Duren 3732 Garfield Ave Minneapolis, MN 55409-1115 (651) 408-5390

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Brian Guadagno 101 E 26th St Bayonne, NJ 07002-4904

Brian Hanson

18378

Good evening. My name is Brian Hanson, H-A-N-S-O-N. I'm here tonight because I care. I care about a lot of things in this region. I care about our environment. I care about our economy. And I care about our world's environment. And that's an important part of the component of this whole conversation tonight, because we live in a global environment. We need to make sure that there's protection across that globally. We know that can happen here. So like just about everyone else who is here I consider myself an environmentalist. And with that in mind I took a look through the SDEIS. Now I will be the first one to admit it, I don't have a lot of experience with reviewing these kinds of documents. I'm not a scientist. I work in economic development. But I learned a lot from looking through that. First of all, I learned that it's truly a process that is followed on an independent basis by people who have been trained and do understand environmental impacts. I picked up a lot of information. And I appreciate that. Thank you very much. I think the organizations have done a great job of circling around the most important issues and covering them and talking about them, and talking about how those issues are the things that need to be addressed at a permitting stage. Ultimately what I found as I read through the SDEIS was that it does cover the key issues. That it does create a basis. That it is a document that we can use to safely permit this mine and be able to proceed with (inaudible) mining in Northeast Minnesota. Now, here is what I know about the PolyMet team. These folks are our friends and neighbors. These are people who grew up in the communities that we grew up and the people in this room. We know these folks. They're going to produce metals that we all need, that we all use. No matter who are you are, unless someone came here either walked here in moccasins, clothes that they made themselves, they probably got here aided by the metals we're talking about and that we need. It's irresponsible to use products that are generated elsewhere when we have no idea of the impacts of those areas when we have people who live and work here, who have studied the impacts, can tell us how to control them, and can help make this happen in a responsible manner. So I support PolyMet. I'm proud of the Supplemental Draft EIS that has been put together here in our state. And I look forward to this project moving on to the permitting stage. Thank you.

Minnesota has turned the corner with the state's job market's recent return to pre-recession levels. Forbes recently ranked Minnesota the eighth best state to do business — a 12-spot jump in the rankings. Helping to fuel this economic success is Minnesota's mining industry, which contributed more than \$2-9 billion to the state's economy and supported nearly 10,000 jobs in 2012- As business continues to play the primary role in job creation, it is critical that policy-makers continue to support this industry in order to continue an upward trend in growth, specifically in this region. PolyMet Mining's proposed copper-nickel project on the Iron Range is an example of how Minnesota companies continue to lead the way balancing technological advancement with the State's environmental standards. I support PolyMet Mining and believe they will build and operate a mine that complies with all regulations and protects the environment. Multiple State and Federal Agencies have been involved in preparing the SDEIS document; I place trust in and respect the integrity and the responsibility of these organizations to manage the impact of mining efforts. The SDEIS was a sound process — a detailed and independent review. Federal, state and tribal agencies shaped the development of the draft EIS, which was written by an independent, third party. The draft EIS offers regulators the information they need to issue permits so that PolyMet can operate in a way that protects natural resources. The SDEIS demonstrates that PolyMet can develop resources in a sustainable manner and there are logical, engineered solutions proposed for potential impacts. PolyMet's project is a case study for business and economic development. The Company will put a brownfield site back in operation and reuse existing infrastructure at the former LTV site in Hoyt Lakes — a \$350 million facility that would cost nearly \$1 billion to reconstruct today. PolyMet's project will create 360 direct jobs and over 600 indirect jobs, at a time when family-sustaining jobs are needed in Northeast Minnesota. The project has been designed to minimize environmental impacts and the disturbance of wetlands, utilizing multiple safeguards to protect the environment. PolyMet will be a domestic supplier of critical metals consumed every day. Minnesota's \$5-3 billion electronics industry depends on the metals supply chain to produce the technology that we as consumers depend on for use in medical applications, electricity, catalytic converters, cell phones, computers and other essential products. A decade ago computer chips were made with 16 minerals. Today as many as 60 different minerals and constituent elements are used to produce similar computer chips. Mineral needs will only swell with technological advancement. If we are to maintain our modern way of living, depending on these types of technology, we need to continue to find and extract these metals. Minnesota has the ability to demonstrate leadership in innovation with sound regulations and standards — there is no better location in the Country to access these resources in a responsible manner. As a person who lives, works and plays in the area, I understand the importance of proper use of resources like minerals and preservation of resources such as water and air. I trust and support that the SDEIS lays the proper groundwork for developing an environmentally and economically sustainable project. PolyMet can produce these metals in an environmentally sound manner and create hundreds of jobs that can support families, sustain communities and ensure a thriving Minnesota for future generations. Thank You. Brian W. Hanson President and CEO APEX_Final_New Logo_6 1 10-jpg 306 W Superior St Duluth, MN 55802 P 218-740-3667 C 218-730-7330 HYPERLINK "http://www.apexgetsbusiness-com/"www.APEXgetsbusiness-com Notice: This email contains confidential, legally privileged information which belongs to the se

The SDEIS does not include an option or discussion for a closed water system for not only Polymet but also for other Iron Range industries. Instead of making an open system where water can flow in and out of the mining system and impact the environment, it may make more sense to create a closed system where water can be piped between industries as supply and demand dictates. Polymet excess water could be used for cooling at proposed powerplants and steel making operations. In other words, think beyond just the needs of Polymet but to also the needs of other industries as well as the needs of the environment. Given this proposed mine has been in the works for over a decade, Polymet should have in good faith already restored the wetlands needed to compensate for the proposed impacts on the existing wetlands. In good faith, this action would show a more proactive approach which would help mend the long term and permanent impacts any mining operation produces.

I have concerns with this mine (Polymet), and it is not simply because I love the BWCA and all that the northern areas of our state have to offer. My concern lies primarily with the money available for cleanup when the containment fails because it will fail the rock in the area fractures with frost, settling, etc so the containment isn't going to stop it all. I reviewed their stock/invester information and as far as I can tell, they don't have any money they are completely funded by others as a startup which as soon as the well runs dry and income stops, they are going to sell their shares as fast as possible. This will leave MN taxpayers with the cleanup costs and while we are an easy target and can offer little to stop the state from taking the money needed for cleanup I don't imagine this will go over well with the masses. Thankyou for considering my comments regarding this issue. I am not opposed to mining in general, but as far as I can tell, this company cannot prove they can do it safely, and cannot prove they have the finances to keep our waters clean. I have a 5 month old daughter and I don't want to raise her knowing I didn't say anything on the topic hopefully I can raise he knowing I did something to make sure our land and waters are kept as clean in the future, as they are today. Brian Maki 18094

Hello. My name is Brian Maki and I'm president and CEO of Lakehead Constructors which is located nearby Virginia, Minnesota in the Twin Ports of Duluth-Superior. We employ over 700 full-time union employees in the construction business across Northern Minnesota. I was born the grandson of Finish immigrants, like so many others, at the White Community Hospital here in Aurora. My parents raised six children in Hoyt Lakes on a draftsman wage from Erie Mining Company. The town was prosperous and bustling with the schools and churches bursting at the seams. There were 100 kids on every block of town. We had a storybook childhood filled with our great memories and all the neighboring towns were the same for generations. This was our way of life. Our immigrant parents and grandparents worked at the mine, at the power plant, on the railroad, construction, grocery stores, coffee shops, restaurants, drugs stores, movie theaters, auto dealerships, logging, trucking, all sorts of other businesses. This was our way of life. We all spent time hunting, fishing, trapping, skiing, shooting, biking, hiking, snowmobiling, camping, swimming, water-skiing and boating. And the list goes on. We were good stewards of the environment. Our communities established campgrounds and parks, preservation areas, ski hills and trails, sanctuaries and other scenic places. We were and are good stewards of the environment. In 2001, Erie Mining Company closed its doors and the east end of the Range began to suffer almost immediately. The darkness days were upon us. It was not a good time for families and the human suffering began. Unemployment, bankruptcies, business closures and all sort of personal tragedies associated with unemployment befell our residents. It's time to turn this around. We have the opportunity to revitalize Northern Minnesota with the promise of good-paying jobs. We have done our homework and science is on the side of progress, and on the side of responsible environmental stewardship. We have the opportunity with non-ferrous mining and PolyMet to demonstrate to the world the type of people we are in Northern Minnesota. Hard working, thoughtful and caring folks who would never harm the land we love so dearly. Every job is a family. Every job is a family, and don't forget it. I would like to thank all the agencies here, working on this project who clearly understand the science behind the project and who deal in fact and not fiction. I'd like to thank all of the elected officials who wholeheartedly back this project. I'd like to thank all of those who came out in support of this great project in Duluth last week and tonight, and finally, I would like to thank PolyMet for their hard work and determination on behalf of the folks the Iron Range and we pray for your success. Thank you.

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Brian Mulally 8090 Upper 129th Ct Apple Valley, MN 55124-9759

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Brian Murn 5421 Twin Lake Blvd E Minneapolis, MN 55429-3356

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Brian Nordlund 2537 Providence Rd Duluth, MN 55811-2947

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Brian Nordlund 2537 Providence Rd Duluth, MN 55811-2947

Brian Peterson

I am submitting this comment in order to reflect the position the sulfide mining and mining near culturally and environmentally valued areas is not in the overall, long-term interest of Minnesota and Minnesotans North Eastern MN is one of our state's greatest assets, it has many formally recognized forests parks, as well as an abundance of hills, forests, lakes, rivers that are not on public property but are equally valued for what they contribute to the Minnesota experience. We should be working to expand the borders or protected areas, strengthen the protections and see to it that we save and preserve what we have not yet ruined. In many parts of the state it is too late or not feasible to take such actions. Why should we do this. Because it is the right thing to do for future generations, current Minnesotans, and our long term fiscal health and physical health. I am fully confident that when all true costs are considered (loss of habitat, noise pollution, water contamination, clean-up, human health costs, infrastructure demands, etc) these proposals will be a net loss for MN both in economic terms and human terms I also see almost no circumstance where some of the clean-up and reclamation does not fall on the taxpayers. The jobs this will likely create, long-term, are Superfund jobs, the kind of jobs Minnesotans don't want. Don't let this mining take place, but if you do, Polymet should put skin in the game. My suggestion: \$500,000,000 in escrow, with an oversight board using the money to immediately address environmental and human concerns. Polymet can always add money, and keep any interest If the fund is depleted to \$250,000,000, all mining stops, the money is used to reclaim the land and any leftovers go into the Legacy Fund. When the mine closes and the area is properly cleaned and restored, Polymet gets any remaining balance back. If Polymet intends to play by the rules there should be little objection to such an arrangement. I appreciate you taking the time to read my letter and please make the decision that is best for Minnesotans in the long-term and considers all associated costs and negative, as well as positive, externalities. Thank you Brian Peterson

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Considering that Lake Superior has a water retention time of almost 200 years, even a small risk of pollution should be taken seriously. It could create a problem for our continent's largest freshwater lake that's unsolvable for two centuries. Sincerely, Brian Slaby 16218 Edgewood Ct Maple Heights, OH 44137-3921 (216) 475-7767

Feb 27, 2014 Ms Lisa Fay MN Dear Ms Fay, I now live in California, but am a native of Wisconsin and have traveled from CA to MN to canoe and fish in your pristine Boundary Waters park, as have tens of thousands of others who appreciate clean water and healthy ecosystems I understand the need for mining but there are places it should not be done no matter what the short term gain. The water shed that feeds into Boundary Waters is one of those places. We have mines from the 1800's in the watershed that feeds in to San Francisco Bay, that despite extensive efforts, are still leaching acid and mercury into the rivers flowing into the bay, and make fish from the Bay unsafe to eat. San Francisco Bay was once a great source of good fish. Not now, thanks to mining. So many waters have suffered a similar fate. No one wants to visit polluted waters with contaminated fish. **SAVE THE TOURISM AND GREAT FISHERY WHICH WILL LAST FOREVER**, and forgo short term profits from mining. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Thank you. I hope to visit Boundary Waters again if they are still pristine. Sincerely, Brian and Susan Stompe 110 San Mateo Way Novato, CA 94945 Sincerely, Mr Brian Stompe 110 San Mateo Way Novato, CA 94945-1201 (415) 897-1610

Brian Thorbjornsen

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Sirs and Madams, Allowing the Northmet sulfide mining operation would violate a binding treaty with the Chippewa to protect their hunting and fishing rights in that region, by contaminating their food sources. Please protect our most important natural resource: fresh water. Surrounding water would be contaminated by the NorthMet Mine, and though it creates a few jobs and a some tax revenue, the bulk of the profits go to foreign countries. The risks for environmental degradation are too high. The risk that taxpayers will end up footing the bill for long term clean up is too high. The increased risk of chronic illness is too high. When it comes to acid mine drainage, a little goes a very very long way. Please protect our state. Thanks, Brian Tighe

Brian Wicklund

7083

Dear Ms Fay, Dear Federal and State Agency Leaders: I am deeply concerned about the potential for PolyMet and other mining corporations to be allowed to mine public land that contains Minnesota's most pristine and fragile water system. It is foolish to allow a type of mining with a 100% failure rate of toxic leakage into ground and surface water to be allowed at the source of three watersheds. A decision to allow sulfide mining would also be an economic disaster. Any short term gain of jobs and revenue would be trumped by the estimated 500 years of maintenance of the waste. In spite of assurances by PolyMet, what companies can you name that have been continuously viable for 500 years. You can bet our tax paying children will be footing the bill for clean up for generations to come. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Brian Wicklund Brian Wicklund 800 Broadway St Marine, MN 55047 651-402-5435

Brian_Walvatne

37830

My name is Brian Walvatne and I am a MN resident that is opposed to the opening of the Polymer mine in Northern Minnesota. Water is the essence of life and this mine will increase risk of severe environmental damage that could last for 500 years or more. This mine is not right for Minnesota. Thank you, Brian Walvatne 227 Paisley Lane Golden Valley, MN. 55422

Bridget Carns 41990

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Bridget Carns Rochester, Minnesota

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Water is a finite resource. The Great Lakes holds some 80% of North America's fresh surface water and about 20% of the entire world's(<http://www.epa.gov/greatlakes/basicinfo.html>). This is about more than us and our region(even though the damage to be done here is to me enough on its own), putting resources needed not just by us here but by the entire WORLD in such jeopardy for mere profit is ridiculous. We are already wasting such resources by not engaging in recycling what's already out there as much as available, something which could both reduce pollution(and the damage done to humans exposed to it wasteful atrocities such as this - <http://www.theguardian-com/environment/gallery/2014/feb/27/agbogbloshe-worlds-largest-e-waste-dump-in-pictures>) and create the much-needed jobs, probably more and longer lasting employment than the mine will create, at a benefit to our environment rather than more harm. It astounds me how willing some are to let an outside corporation come in and muck up our environment so drastically for resources that seem most likely destined to be shipped overseas at a great profit for them, and just a few jobs and decades of likely irreversible pollution to our drinking water and environment for us. Thank you for your time and thoughtfulness in reviewing my, and the rest of the community's, comments. Sincerely, Bridget Peterson 222 N. 2nd Ave E. Apt. #223 Duluth, MN 55805 Sincerely, Ms Bridget Peterson 222 N 2nd Ave E Apt 223 Duluth, MN 55805-1752

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Brigitte James 1482 Wakefield Ct. Upland, CA 91784 US

Britt K Johnson

57263

The impact of winter release of sulfates should be further studied. The sulfides will accumulate in the organic sediments and not flush down river during the winter. Then in the spring when the H2O warms up the microbiome will be high on verifying the stored sulfates into sulfite at the same time as the wild rice begins to germinate. John Patter's research has shown that sulfite is toxic to wild rice seedlings at very low concentrations. Thus the predictor would be that the sulfite concentration would be the highest in the spring after continuous winter loading due to water discharging of sulfate from the Polymet site. This would put the wild rice seedlings at even greater risk. The EIS should assess to the fact of what winter water releases from the Polymet site on spring sulfite levels in the seedlings of wild rice beds downstream. Britt K. Johnson 9007 East Superior St Duluth, MN 55804

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Britta Dornfeld Owatonna, Minnesota

Dear Minnesota DNR, Hello. I would just like to say I am against the proposed PolyMet Mine for a variety of reasons. This sulfide mine has said that it has a plan for dealing with acid mine drainage; however, this plan has never been tested before. Minnesota's North Shore and the Lake Superior watershed should not be the guinea pig for this new idea. As no mine has ever successfully mined without creating acid mine drainage, I think this proposed mine is a bad idea. Also, since acid mine drainage can last for hundreds of years, it is highly likely that the mitigation of the drainage will fall upon the government- an expensive, long-term task that we, as citizens and tax-payers who would help foot the bill, can ill afford. Also, I would just like to say that this is not an issue of the environment vs. employment; it is an issue of the environment vs. resources. The jobs that this mine would provide are based off of cycles of boom and bust- while they would provide jobs for a thirty to forty years, areas that benefited from these jobs would be in the same, or worse place than they were before the mine. In starting this mine, more long-term jobs in tourism and public land management would be harmed, since this area would not doubt be damaged by acid mine drainage. Please seriously consider all of the drawbacks to this mine- while it has a significant economic impact, its cons outweighs its pros. Thank you for your consideration. Sincerely, Britta Dornfeld

My name is Brittany Wilson and My address is 1030 Como Place, St Paul, Mn 55103 I am very concerned about the proposed Polymet mining that would be taking place in Northern Minnesota. As someone who spent over 20 years living in Northern Minnesota I am greatly disappointed that our state would even consider putting our states natural assets at risk. I grew up being surrounded by clean fresh water lakes, beautiful coniferous trees, and seeing natural wildlife almost every day. It would be unwise of Minnesota to destroy its streams and lakes, poison its animals, and ultimately lower the living standards of its citizens, because it will more than likely pollute lake superior. A short gain of profit is not worth the hundreds of years this project could take to clean up. I do not support Polymet Mining in our state. Thank you for your time, Brittany Wilson

Bromley Griffin

I've lived for 77 years. I was a natural resources professional for 38 years. I have been a serious supporter of environmental causes for 70 years. I am fortunate to own and live on 1/4 mile of land on the beautiful St Louis River. I am sick of the get-rich-quick schemes of the mega-wealthy here and abroad who promise everything and have historically lived up to virtually no promises to 'keep it clean forever'. Short-term jobs for a few native and non-native Minnesotans is no where near worth the risk of the permanent damage to the resource that almost always follows the flash of profits and then polluted silence following the fading of almost all major mining projects, especially copper mines. I stand in total opposition to the granting of permits to allow the despoliation of the land, streams and rivers of northern Minnesota via copper mining.

Brooke Shepherd 9185 182nd St N Forest Lake MN Brooke Shepherd Avd. Science, Hour: 4 Ms Olson 30, January 2014 Digging Ourselves a Copper Grave There is much controversy about the new copper mine that Polymet is thinking of building. First of all, copper is a chemical element used in conducting electricity. The mining process is rather complicated and consists of concentrating ore, a type of rock containing minerals. In order to concentrate it, they must crush the ore up and roast it to convert the interior minerals, sulfides to oxides, which they then mine and produce hot metal. They then refine it and finally use a process called electrolysis to obtain the copper. The average American uses twelve pounds of copper per year. Minnesota is considering building this mine because not only is copper a highly useful element, but the mining process will also create hundreds of jobs and a flow of revenue. Northeastern Minnesota, where the mine would be built, has one of the largest untouched copper deposits, as well as other minerals, just beneath the lakes and forests. In my opinion however, building this mine would be a huge mistake. We simply do not have enough information of the damage it could cause to our environment at this time. The Polymet mine will also affect our air quality by releasing sulfur dioxide, greenhouse gases and nitrogen oxide into the environment. They estimate that even with this pollution, the air quality will still be up to standards. However, an estimation alone doesn't seem safe enough to go ahead with the project. The water useage from Colby Lake is another large concern in building this mine. Polymet says it could vary in using between twenty and 810 gallons per minute. There is a very large difference between twenty and 810, so we really won't know what affect it will have on the lake if we aren't sure how much water they'll be using. They say that they will build a waste water treatment plant and let it run off into two nearby rivers, but what does that mean for the lake. There is also a chance of mercury being released into our air and water. Though it would be a minimal amount, it is still dangerous to be releasing any amount of it into our air or water systems. Lastly, we should be thinking of the animals in the area. The construction of the mine, the noise from the workers, the clearing of forests and the changes in air and water quality could greatly affect the several different species of animals who call the area home. Two of which are endangered species, the gray wolf and the Canadian lynx. Polymet claims that once they finish with the land, they will attempt to restore it; however, this could take decades to have it return to normal and the animals who lost their forest homes may not come back. I understand that some would think the jobs and revenue would outweigh the potential pollution but they also need to think of the future of Minnesota. I strongly feel we know too little of the environmental effects that the Polymet Copper Mine will have on our animals, water and air. My opinion should be considered because some of the things we are risking with this mine take decades to correct themselves once the damage is done. My hope for the future is that we find a safer way to extract copper so the flora and fauna and the mining can live peacefully together. At this time however, the Polymet mine is not ready for this and it would be wise to wait until we know more. Websites Used

DNR, we should not use the sulfide mining act because it pollutes the water with sulfuric acid the PH levels will go down. People like to fish up there and eat the fish, if the people of Minnesota and tourists eat the poisoned fish it's not going to be good. Also it will put a huge amount of business up there. We as the people should have at least one place of natural wilderness where we could count on our generations to come and be a part of this beautiful wilderness center we have been protecting for 30 years. My name is Brooklyn Blackman and I am Against it. The mine up north is a horrible idea.

The Boundary Waters and surrounding area is one the jewels of Minnesota and the nation. Any risky endeavors such as this mining project will negatively affect the environment, the wildlife, and water quality. Please don't let this mining project move forward. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

From: bruce berggren [mailto:brski67@gmail-com] Sent: Wednesday, March 12, 2014 7:04 PM To: Fay, Lisa (DNR); Brian Berggren Subject: SDEIS I've worked as a forester for the DNR in northern Minnesota for over 31 years. Caring for the resources on both State and private forest lands was my job and as and as a retiree maintain a Stewardship ethic. Reviewing the SDEIS, I've found certain areas of concern. Minnesota law is in conflict with the SDEIS, as in order to advance the SDEIS an arbitrary term of 500 years is used as the last year that monitoring is needed. The State law I am talking about is the law prohibiting issuing a "Permit to Mine" to any mine requiring Perpetual maintenance after closure. Chapter 5-2-2-8 Mine Site Surficial Flow paths states that both the East and West pits "Solute Source End Time" is listed as continuous. Continuous and perpetual sound pretty similar to this reader. The USFS requires the preparation of a reclamation plan to ensure the long term protection and restoration of the natural resources. If a reclamation plan has, or is being developed, the project may meet their goals. The Weeks Law of 1911 is designed to protect the headwater watersheds of navigable rivers. Both the Partridge and Embarrass river watersheds fall under protection from this law but I could not find it addressed in any of the chapters I read. One more item. In all the tables of contents, I could not find anywhere how an emergency shutdown or closure will take place if or when needed. An emergency Shutdown chapter would let others know what management or mine owners plan to do in an emergency. Or at least think about a course of action to take. This project is for the 300 to 600 jobs that will last for about 20 years or so. The USFS and State are sacrificing portions of the 100 Mile Swamp for this mine. The USFS, in their forest plan, has considered this an ecologically sensitive area. Thank you, Bruce Berggren 5105 Rice Lake Rd Duluth, MN. 55803

I have worked as a forester on the North Shore. This comment is in regards to the land exchange process. The land exchange should consider lands within a reasonable distance from the mine site. The site in Cook county is beyond a fair distance from the mine site and should be removed from the exchange process. All sites in Cook county should not be attached to this project. Thank you, Bruce Berggren 5105 Rice Lake Rd Duluth, MN 55803 On Mar 12, 2014 6:05 PM, "*NorthMetSDEIS (DNR)" <HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us"> wrote: Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. A very small gain for a very few with long term pain . The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Bruce Brummitt 24747 Guyles Rd Ponsford, MN 56575-9276

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Giving a go ahead to POLYMET mining in northern MN would be probably the dumbest thing I have ever heard of. The ore isn't going anywhere. SO WAIT until the future brings a better way to do it. DON'T DO THIS . Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Bruce Downing 510 North 7 Avenue #2 St Cloud, MN 56303 Sincerely, Mr bruce downing 510 7th Ave N # 2 Saint Cloud, MN 56303-3522

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bruce Droogsma 203 1st St Delano, MN 55328-9775 (763) 442-2229

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bruce Droogsma 203 1st St Delano, MN 55328-9775 (763) 442-2229

39130

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bruce Droogsma 203 1st St Delano, MN 55328-9775 (763) 442-2229

39134

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bruce Droogsma 203 1st St Delano, MN 55328-9775 (763) 442-2229

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bruce Droogsma 203 1st St Delano, MN 55328-9775 (763) 442-2229

From: asajuce5@hotmail-com To: opinion@startribune-com Subject: Open Pandoras Box . Date: Tue, 17 Dec 2013 12:15:25 -0600 Ive been reading the EIS on the Polymet process. The footprint they want to establish overlays a very messy footprint left by "Bygone Mining interests" that continually pollutes my Brown trout stream (St Louis River @watershed) who's pollution study was recently abandoned by the PCA for reasons not given. PCA is one of the Major Permitters for Polymets application. In putting the polymet footprint into the existing polymet wants to use the same berms, tailing pools, ect ect, which in turn gives Polymet the liability phrase "It was polluting before we began" were not responsible. Eight miles of railroad from defunct upgraded plant to the open pit (42,240 feet of asbestos like dust rout, subject to runoff and derail.) This is Minnesota with the Biggest fortune 500 co.s the best Schools and universities, the absolutely finest engineers and the most accomplished, productive, licenced, organized labor force on the planet : So I propose an underground mine , that does not infringe on the existing mess that has an "adjacent" New Closed Loop Crushing, milling, extraction, smelting, sulphide processing and capture, water filtered and reused, dry tailings/site return with NO EXTERNAL PONDING OR BERMS every process INTERNAL . When the power go's off everthing stops . This Is Minnesota where WE CAN INSIST ON IT . .And We Can Do IT . The EIS also has quite the "Socio-economic" article which is intended to obfuscate anti-pollution criteria in favor of "jobs". Army Corps of Engs, MPCA, MDNR .are charged with decisions on natural "Environmental Impact Only" .and leave Socio-economic to our inept legislature where it belongs. Thank you bruce harten 5640-138 st west apple valley mn 55124 952 431 1123 retired IBEW wireman USAF

It would be wonderful to be able to live in a beautiful area and have good union job for 20 years. It would be wonderful if the PolyMet and GlencoreXstrata companies could guarantee that the NorthMet mine would be safe for the environment during its operation and centuries after its closure. However, the risks of sulfide mining are very high and there are no guarantees. There are only promises. Mining companies don't always keep promises. Mining executives sometimes exaggerate their commitment to environmental safety and their concern for the well being of union families. Do you trust them. You may believe that PolyMet would never allow sulfuric acid runoff from their mining/refining operations to destroy surrounding wetlands and that any liability for future cleanup costs would fall to the company and not to the tax payers of Minnesota. You may also believe that corporations put people and natural resources ahead of profit. If so, enjoy your hopeful and wonderful fantasies, but please, also consider the track record of sulfide mining because the stakes are very high for Minnesota and this industry does not deserve your faith. Sincerely, Bruce Hurtley 122 Demont Ave E, #159 Little Canada, MN 55117 612-270-7638

Dear Ms Fay, Dear Federal and State Agency Leaders: I am writing as a concerned citizen of Northern Minnesota to ask that you reject Polymet's SDEIS as inadequate. There are many reasons why this proposed project would be damaging to the quality of life in this region. A few of the most important problems are: The long-term pollution of our precious water resources is unacceptable. Clean water is our area's most valuable resource. This is not the deserts of Arizona, Chile, or the Australian outback. The wetlands of northern Minnesota are simply not the place for a copper mine of this kind. The financial assurances are inadequate. What is said is vague and completely unacceptable. Glencore, Polymet's 'strategic partner,' has a very poor track record with respect to environmental pollution and human rights abuses. The proposed operation would require massive amounts of carbon-intensive energy. We need to be transitioning to sustainable energy systems. The habitat of already vulnerable species, such as moose and lynx, are threatened by this project. Wild rice would be further damaged by the inevitable pollution from this misplaced mine. We are responsible for the stewardship of this unique and life-sustaining environment. The risks involved are simply too great. Sincerely, Bruce Johnson 835 West College Street Duluth, MN 55811 (218) 724-6084

Bruce Kuehl

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Due to the problems with the draft mine plan outlined above, I believe the mine should not be built. I am a long term, out of state frequent visitor to MN for tourism reasons. Should MN allow this mine project I think my friends, family and I will look for a different state/province to visit. Sincerely, Dr Bruce Kuehl 8004 Eagle Rd Lake Tomahawk, WI 54539-9468

The following are my comments regarding the Polymet NorthMet SDEIS: Regarding the land swap: While the proposed swap would involve roughly equal acreages, it seems like the Superior National Forest would be diminished as a result, since the land to be traded to Polymet is on the perimeter of the SNF boundary, thus reducing the "effective size" of the forest, while the lands traded to the USFS are within the forest boundary and are effectively already part of it. It seems that there would be a net loss of forest and wetland as a result of this trade and the subsequent Polymet operations. I'm also concerned that in the proposed trade the USFS is not getting a good "price" for the lands that would be traded to PolyMet. Since the owner of the surface estate effectively controls access to the minerals below, the value of those minerals should be factored into the value of the surface estate. The lands proposed to be traded to the USFS have little mineral value, so are effectively worth much less. Regarding water quality: Due to the long time span (100s of years) over which treatment will be needed, I think it is a leap of faith to conclude that containment and treatment systems will be effective and can be maintained for as long as necessary. Can we really expect these engineered liners and collection systems to last for hundreds of years. It seems that they would at the least require ongoing maintenance, and possibly require complete rebuilding at some point. I don't trust the engineering over such a long time span. Is there enough financial assurance to cover rebuilding the containment systems 100 years from now. What will the political and economic situation be even 20 years from now. I am not confident that the proper monitoring, maintenance and response to unforeseen issues will occur into the future as assumed in the SDEIS. According to the SDEIS, the water discharged from the mine and plant sites is expected to contain levels of sulfate that are less than or equal to current levels in the watershed, and less than the current standard for wild rice waters. Even assuming that that situation is maintained for the long term, are we certain that we aren't replacing a natural water flow that would have had lower sulfate levels in the absence of the NorthMet project, and thus increasing the flow of sulfate into the watershed. Is sub-aqueous storage really a safe way to dispose of the category 4 waste rock. Regarding the cumulative effects: If the model results show at a 90% certainty level that water quality won't be impaired with this project, isn't it reasonable to expect that one out of 10 similar projects might result in unacceptable contamination. Given that there are several other similar projects likely to be proposed in the region in the near future, I think the 90% certainty level is far too low. For what it's worth, I think the comment period should have been extended; the SDEIS is a very large and complex document. Given the high level of public interest in this issue, 90 days wasn't enough time for an average citizen with a full time job to properly review the document. Thank you. Bruce Ludewig 6 Chester Pkwy Duluth, MN 55805

Bruce Magnuson

12077

Dear Persons, I realize that the NorthMet project is a very emotional issue and I am not an expert on the subject. However, my gut feeling is that in the long run, the proposed NorthMet mining project will be bad for the state. The mining company is looking at it with profit in mind and profit motives can cloud good judgment. As I understand it, there will have to be long-term containment of acid formation, and that means 200 years at the mine site and 500 years at the processing site. I think this is too long. I think the risk is too high. I know there are jobs that would be created by the mining of copper and nickel, but I feel that the area's current economic base of tourism and agriculture can continue to be a good source of income for that area. Sincerely, Bruce Stephen Magnuson 2434 11th Ave South Minneapolis MN 55404

Bruce McBeath

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. This issue is too important and has consequences too extreme to pass human health and safety concerns. Sincerely Bruce McBeath 1687 siewert Red Wing, MN 55066

---Original Message--- From: bmckay.aces@gmail-com [mailto:bmckay.aces@gmail-com] Sent: Monday, March 10, 2014 8:55 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Bruce McKay 29976 290th St Henderson, MN 56044-4415

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. In short, the time for accepting the PolyMet mine has not come yet. Current mining technology and methods are not environmentally safe enough to operate in Minnesota. Certainly this is not something of honest dispute, otherwise why are we looking at monitoring for 500 years. Is the 20 years of mining really worth 500 years of pollution concern. Seems it would be best to err on the side of protecting the environment certainly at least until safer mining techniques with less risk for pollution have been developed and proven to be effective. Minnesota should not be the testing ground. The precious metals have been there for centuries and are not going anywhere on their own. They will wait until they can be mined in a safe and environmentally responsible manner. I realize the projected economic impact to both the local area as well as the state of Minnesota are large numbers especially to an average citizen, but the reality is the numbers are not that big when compared to the potential costs and risks being pushed upon the citizens. Certainly a 1,000 temporary construction jobs and something less than 400 so called permanent jobs, if 20 years is permanent, all are appealing but at what costs. In light of the recent announcement by one company, Wells Fargo Mortgage, cutting 2,000 good permanent jobs and there being little outcry it does not seem the potential PolyMet jobs are really that big of a deal. Certainly not such a great boon given the potential long term damage to the local environment that is surely to arise from mining in such a delicate environment as that proposed for the PolyMet. History is a great teacher for those who are willing to learn from it. One of the lessons it offers is that mining companies are poor citizens and certainly have not been friends of the environment and all too often not to their employees either. All too often the mining concerns have been interested only in their bottom line and take action to protect, (actually clean up after the fact) the environmental and health concerns only when forced to. The common method of operation is for the mining concerns to get while the getting is good and leave behind a path of environmental destruction. All too often escaping the economic responsibility for cleaning up their mess thru bankruptcy and leaving the public holding the bag. Examples of abandoned polluted mines are ever abundant in the western states. One only need look at the Minnesota's own fight over the taconite tailings pollution at Silver Bay and numerous superfund sites that remain. In short, mining concerns have not been good environmental citizens on their own in the past and should not be expected to have changed overnight. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,34

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. There are no safe guards to protect the environment and the tourism industry after the mining has been approved and started. What happens to the businesses and jobs that will be eliminated after the problems arise from this mining practice as has happened every where this type of mining has occurred. I personally have seen the effects of the damage that has come about and once it happens there is no fixing it. The people of this state cannot afford to fix the problems resulting from the mining process and the lack of oversight that always occurs due to greed and mismanagement that is pervasive in the mining industry as a whole. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Bruce Reno 2851 Tuxedo Blvd Mound, MN 55364-9158 (612) 801-7138

This type of project has no place in the watershed of the Great Lakes. Do we still offer short term riches in exchange for our long term best interests? I hope not. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Bruce Snyder

18184

Good evening. I'm Bruce Snyder. I noticed all the Snyders that have been here tonight were a proud clan, but actually I'm not related to any of the other Snyders. I've been a neurologist in Minnesota for about 40 years, which means I'm old. And it also means I know a fair amount about technology and scientific literature. And I do know a couple of things. I know that economic interest does affect the perspective of the scientist. I know that in science -- although we count on science to be intellectually honest, we count on science to be technically proficient, and we believe some of it still that science is actually objective. And it's not. It's not. I've seen this in my own line of work. I've seen it with various devices that haven't worked as they should. I've seen it with medications that have turned out to be toxic. I've gotten to be -- because I'm old -- skeptical. Now when it comes to environmental concerns, I'm even more skeptical. I mean I went to college when Rachel Carson wrote her book. DDT was actually a very useful chemical coming out of World War II. It killed fleas and lice. And unfortunately unexpectedly it had a major environmental impact. I was in Minnesota the first years when Three Mile Island melted down. That was a nuclear plant that was designed carefully with a great deal of engineering expertise and responsibility. And God knows, I'm sure well-intentioned and well-informed labor. And we know what happened there. Maybe you don't. You don't remember that it melted down. It was a containment breach. And we just avoided major environmental nuclear pollution in that way. Our energy industry has -- it supports us. I burn oil. I use electricity. We all do. Our energy industry, however, needs to perhaps be held in check. Putting a nuclear plant on a seismically active fault is not the best idea. And putting a polluting mine in our freshwater is not a good idea either. The surface water and streams and groundwater that this plant will be affecting are in the watershed of the Great Lakes. The Great Lakes is 20 percent of the world's freshwater. We are in the middle of an impending, increasing, actualizing drought. Two years ago the Mississippi was too low for barges. Groundwater supplies dropped -- and I'll stop there. I'm against it.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Sulfide ore based mineral extraction is also occurring in the Upper Peninsula of Michigan where I live, and has similar potential to pollute Lake Superior. Sulfide based ore extraction took place in northern Wisconsin in the late 1990s, with disastrous results for the rivers in that area. NO sulfide based ore mining or extraction of coal that is high in sulfur has ever been done without major contamination of water resources. No technology has ever been developed to prevent the damage and destruction of watersheds in any region in the world where sulfide based mining has occurred. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Bruce Ventura 140 Timber Ln Marquette, MI 49855-8801 (906) 225-0139

Bruce Vukelich 44066

I am writing to submit my opposition to the new proposed PolyMet mining operation. History has shown that despite men's best efforts to prevent accidents, they continue to happen and once they happen it is too late to reverse the damages. The plans which provide for 200 and 500 year spans of cleaning pollutants and waste from water and the land in the area and surrounding areas is testament enough for me of the potential damages we could sustain to our already endangered eco-system. 500 years. In viewing the FonDuLac watershed district maps produced to show current levels of pollution, many with areas that are already over the limit specified by the EPA as being safe is a big concern. Adding this new mining operation to this area will only add to these already troubled areas. Jobs and opportunities are very important to the vitality of the Iron Range of northeast Minnesota but not at the cost of our water and soil. We are one of the few states in the country with the water resources we have and we should be highly protective of those resources. Thank you, Bruce Vukelich 5481 245th Street Forest Lake, MN 55025 651-464-2573

Bruner Bullivant 52290

Mar 13, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I'm a student at the University of Minnesota Duluth. The natural beauty of the Great Lakes is what drew me to going to school here. I love Minnesota because it is a state that values and protects these natural spaces. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Bruner Bullivant 7518 130th Ave Milaca, MN 56353-4437 (763) 898-0268

Bruno Prata 42437

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Bruno Prata Rua Dr Jorge De Seabra 10 - 1º Esquerdo Castelo Branco (Portugal), None 6000-216

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Hydrologists and futurists agree that one of the most precious commodities of the future is clean, potable water. Northeast Minnesota has some of the most pristine surface waters in the world. It makes no sense to trade it for ten pieces of gold. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Bryan Emmel 322 9th St S Virginia, MN 55792-2836

Bryan Hainey

41817

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Bryan Hainey Fridley, Minnesota

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Bryan Hansel PO Box 149 728 Devil Track Road Grand Marais, MN 55604

42226

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Bryan Hansel PO Box 149 Grand Marais, MN 55604-0149 (218) 370-8351

Dear Ms. Lisa Fay, Do you know what you're doing? You are allowing Polymet to mine a very conservative place. Do you know what that would do to the Boundary Waters? It would basically poison the water with sulfuric acid! But that's not all of it. The water would be contaminated for over 500 years! And the cost to decontaminate it would cost a lot, even higher than one billion dollars. Polymet's plan to mine is also wrong too. They plan to mine in a huge area, but they are telling everybody that they're only mining in a small area. Which is a lie! How can you trust and allow a company to go through with this plan, when it is so obvious that they are lying! That is all I have to say. Goodbye and have a good day. And think hard if what you are going to do. Sincerely, Bryan Thao Zao Chay P.S. I am a Humboldt High School student of Saint Paul, MN. Address: 1245 7th Street East 55106 St. Paul, MN

I would like express my gratitude to be able to provide my opinion regarding Polymet's current proposal for a precious metal mine in Minnesota. As a lifelong resident of St Louis County, I too enjoy the natural resources and outdoor activities of the State, but I also understand the importance of economic growth. While the proposal has drawn opponents, alarmed about run off, mining in general, the company's ability to effectively maintain or clean their waste, and preservation of our current environment, a multitude of concerns have been raised that are simply too advanced to truly have an effective answer. One could theorize different circumstances and still remain unprepared for all eventualities. If Polymet has developed a reverse osmosis process that extracts minerals from waste well below the EPA standards as they claim, one would believe their ability to be environmentally viable. Furthermore, waste water can be treated before being reinstated into the surrounding area. Companies throughout the country have practiced this with great success for years. Recent concern regarding water flow data along the Partridge River have been brought forth. Opponents tout further reason to avoid implementing the mine; however, according to the Duluth News Tribune, a sensor was not placed into the river until mid-2011- I question the true impact of this revelation. First, two years is not a sufficient period of time to conclude consistent water flow data. Second, Northern Minnesota went through one of the worst floods in history in June of 2011, which would obviously elevate data. Finally, data can be skewed by both opponents and proponents alike to meet their own agendas. Northern Minnesota is not truly new to precious metal mining. For decades, copper and silver mines were abundant along the shores of Lake Superior. They remain abandoned today along one of the largest watersheds of the country. Such mines, along both Knife and Sucker rivers are well known to locals. Silver mines were present further up the shore. Vegetative growth, habitat, and wildlife remain viable in these avenues. Certainly EPA standards were less aggressive then today and yet run off persist from these mines with little influence to the surrounding area. I have faith that the project will be environmentally wholesome and beneficial for the region and the state. The proposed minerals that will be mined play a vital role in our society. Little do most people understand that day to day devices carry such metals in their structure. These metals already help advance our Country's goal of being energy efficient and will ultimately reduce the carbon foot print of society. There are many ways to protect the environment on an individual basis. Our current laws are sufficient enough to protect these standards. Assuredly, Government agencies will see that it will. Thank you. Sincerely, Bryan Cox This St Lukes communication is intended for the use of the person or entity to whom it is addressed and may contain information that is privileged and confidential, the disclosure of which is governed by applicable law. Bryce Makela 19522

My name is Bryce Makela, B-R-Y-C-E, M-A-K-E-L-A, 2504 West 11th Street in Duluth, Minnesota. I don't particularly hold any pro or anti-mining view. I think you can mine and have clean water. They're not mutually exclusive, but what I'm concerned about, I can't find any information in the EIS that has looked at the existing copper mine that was closed in Ladysmith, Wisconsin. I would think that, rather than modeling, computer modeling, you know, sulfite concentrations in water, that there should be a comparison study of a few existing copper mines that use modern technology, such as the Eagle Mine in Upper Michigan, and the closed Ladysmith Copper Mine. I mean, just simply going down there and sampling the water flowing from the waste rock pile will generate a mountain more data than computer monitoring -- or computer modeling situation. That's all I have to say. I mean, it's a mistake if the EIS has not taken real-life measurements from an existing closed copper mine, such -- I think it was in Ladysmith -- I'm not sure of the name of the mine. I'm not pro or against. I think that if -- if they haven't looked at that, they're missing something. That's all I have to say.

Bryn M Shank 57198

Ruining the environment for up to 500 years is selfish! The CEOs of these mining companies won't be around. They won't have to pay for the health concerns. People's lives don't have a price. Let's do the right thing and say NO to PolyMet! Bryn M. Shank 1696 James Ave St. Paul, MN 55105

Bryn M. Shank 16486

Minnesota is well known for its beautiful wilderness. Lets not wreck it. 500 years of clean up is way too long. Do the smart thing for the future of Minnesota. -Bryn Shank 1696 James Ave StPaul MN 55105

BSMAJEWski@aol.com 47161

It is imperative that any water discharges from this operation off site meets all standards that protect all users of the resource (plants, animals, insects, etc that are part of the food chain at all levels) within the watershed it will be placed in. Dilution is not an acceptable solution. Treatment level and time is critical. The SDEIS is not clear on how much time will be necessary to treat the water used in the process. It is assumed that rather large quantities of water will be affected by the process and whether this amount can be adequately stored onsite and treated before release to the adjacent watershed for travel eventually to the St Louis River and Lake Superior where it will be drawn into the intake for drinking water by the residents of the urban area of Duluth and Superior. The 12,000 acre estuary could be adversely affected by the water if it is not adequately treated before release. Contamination of the ground water resource is also a critical concern and needs to be examined more closely. Once groundwater pools are contaminated there is no remediation. This contamination could travel considerable distances to affect areas unknown to us today. If treatment time is in the range of 200-500 years as has been mentioned, it is not acceptable. The adjusted cost for such treatment after the mining activity ceases over that kind of time period doesn't make any sense whatsoever. When put in the perspective of the time between the time when Christopher Columbus discovered America and today, I don't think anyone is going to have the resources to set aside to support the long term cost of the treatment process and replaced equipment for that long.

Bud Fontana

18116

Good evening. My name is Bud Fontana. I'm a manager at Hoyt Lakes Global Mining project. And I'm here speaking in favor of PolyMet. And the DNR's extensive testing has shown we can have industry mining jobs and clean water. According to the document, the average mining job paid \$62,000 per year on average. The jobs PolyMet will create are good, high-paying jobs people on the Iron Range are trained for and are good at. Spin-off jobs created because of PolyMet, like those at (inaudible) also very important to our community. The socioeconomic studies included in the primary geographic area impacted by the PolyMet project include the areas of Duluth, Hibbing, Virginia, Ely, Biwabik, some portions of Cook County (inaudible) population trend in our area you will see 10 percent decrease since 1980. Our young people, my daughter, has had to move away from our community to the Cities to find work. These jobs have to be well paying to sustain a family to be able to purchase products and drive an economy. The PolyMet project can bring hundreds of these direct paying jobs back to our region and bring some of us back to the family that they left. Mining these deposits in a reasonable way represents the largest economic opportunity for the Northeast Minnesota region and the state of Minnesota since the Iron Range ore was (inaudible) bringing construction and jobs to support families, provide high-quality health care, and retirement security for the future. If you use, like I do, all the devices in our life these days, which are coming at us faster and faster, you support the mining industry, whether it's here locally or it's a foreign country. I'm glad they have state policies that call for responsible extraction of our mineral resources and sound laws and processes in place to ensure we protect the people and the environment when we mine. I support the Draft Environmental Impact Statement. And I believe it provides sound foundation for the company to seek and obtain the needed permits to operate. The metals used every day, copper and nickel, exceeds the recycle supply. We are net importers of these metals. Given that there are no supports and increases in demand, if we are responsible stewards of our global planet, we should be for locally sourced metal rather than foreign and thereby sending good jobs overseas.

Bud Stone

18096

Good evening. My name is buzz stone. I am the president of the Grand Rapids Area Chamber of Commerce. Our chambers had a formal resolution in place supporting the PolyMet Project since August of 2007. The reasons that we passed that resolution were varied but include the things that you've already heard about, like positive economic impacts, jobs, tax money for the State of Minnesota and funding for schools. Now, some of those opposed to the project talked about the long-term effects of the project in a negative tone, but we don't see it that way. They also talked about unproven processes that might not be perfect and how they don't trust the agencies that are critiquing the project. During the creating of the EIS and SDEIS, hundreds of smart people from these agencies gave their input based on what we call best available technology. Tomorrow's best available technology will be entirely different than today's. Just as Smart Phones evolved from two tin cans with a piece of string between them, mining as we know it today will change as we get smarter. Just as high-tech transportation evolved from the model T, we'll develop advanced ways to protect our environment from things we don't know about today. Just as we have develop ways to scrub mercury and carbon from power plant emissions, we'll also find new ways to prevent new pollution and clean up old pollution. You know, questioning the way we do things is beneficial as this leads to new and better ways to do them. It's always done that way. Today, the world need to the precious metals that we have under our feet. Tomorrow, the world may need something else. But for now, we have the resources to advance civilization down the path that we know best using our best available technology, which is far superior to anywhere else in the world. Fifty years ago, we would not have even been talking about the PolyMet Project as it is proposed today. That's because we weren't smart enough. Fifty years from now, the things that people are concerned about today will no longer be relevant as we will have new tools, new knowledge to deal with. We believe that this project can be done environmentally responsibly and that in the future, it will get even easier. In closing, I'd like to point out that, you know, you can't be anti-mining and pro metals. If you use electricity are indoor plumbing, if you use a computer, cell phone or drive a car, bicycle, if you use this microphone and the amplifiers and the speakers in the room to have your voice heard, you're supporting the mining industry and, specifically, copper and nickel mining. Personally, I'm glad that we have state policy that calls for responsible extraction of our mineral resources and strong laws and processes in place to ensure that we protect the people and the environment when we mine. We support the draft EIS and the supplemental draft EIS and believe they provide a solid foundation for the company to week and obtain the needed permits to operate. Thank you.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I hope you have read very carefully the SDEIS with the very limited time given to the citizens of Minnesota. There are so many environmental, economic, and social costs not answered in this over 2,000 page document. If water pollution will last for a MINIMUM of 500 years this document gives generalities when it comes to COSTS ..repairs, monitoring, treatment of the water. etc Are we really going to pass all this on to future generations. PLEASE google the Berkeley Pit in Butte Montana, a super fund site and this is what we will create in NE MN. Why would anyone want to do this. Also the SDEIS document NEEDS a cost/benefit analysis of the Polymet mine. This document is inadequate and the risks are too unknown to have this type of mining in Minnesota. I do not feel PolyMet's SEIDS is complete enough for this project to go forward. Please consider the following that should be answered. 1) PolyMet's SEIDS needs to be more specific about the expected amounts of mercury that will be released into the surrounding watersheds. 2) PolyMet's SEIDS needs to include the effects of mercury emissions and the exposure to asbestos and arsenic on the health of humans living in the area or visiting the area, as well as the animals and vegetation. 3) PolyMet's SEIDS needs a cost analysis on the indirect harming of wetlands, air pollution, and redirecting of water in the Partridge River headwaters. Water is our most precious resource. We have worldwide water wars and the US will possibly see more of this type of war inside this country with the effects of climate change. Fresh, clean water is more precious to human beings in this state and this nation than any copper so why is this state so eager to poison this natural resource. Once the water is contaminated there is no way to purify the water to make it safe for human consumption or it would cost billions and decades. Why would any state want to EXPERIMENT with a copper sulfide mine such as the PolyMet proposal. I hope the public will see in writing all their questions answered. We cannot vote on this issue so please understand the concerns. You must weigh what is best for Mn. and future generations and this may mean looking at the entire picture and not segments of the PolyMet proposal. And this takes courage to speak out. Let's not EXPERIMENT with NE MINNESOTA's resources. Mrs Barry Wolfe 1612 Jefferson St Duluth, MN. 55812 218-728-2465

Byron Kuster

16074

Dear Ms Fay, Dear Federal and State Agency Leaders: I am writing in regards to the Polymet SDEIS. I believe it has overlooked one important matter, the possibility of a terroristic action directed towards the mercury that is planned to be stored on-site. This mercury is a byproduct of the reverse osmosis and other mining related processes. Most people would agree that there are people who will create havoc and chaos as a way to get attention or as a way to express anger. Examples of this would be the Boston Marathon bomber brothers, the shooter at Sandy Hook Elementary School, or Chris Christie's staff who ordered the blockage of traffic on the Geo. Washington Bridge. My concern is that a terrorist, foreign or domestic, could create an improvised explosive device (IED) and direct it to the Polymet's on-site stockpile of mercury. If accomplished, the explosion could disperse mercury in all directions in a manner that would be extremely difficult to clean up quickly and thoroughly. The un-recovered, toxic mercury could then cause serious pollution to the watershed and underground aquifers. Preventing such a terrorist act would be nearly impossible because an IED could be dropped from a small aircraft or helicopter. An attempt at prevention would likely include a double row fence with razor wire between such as found surrounding a prison, 24/7 armed guards, and a no-fly zone above the Polymet site for as long as mercury is stored in the area. If the mercury were to get moved, similar mobile safety precautions would be needed from point to point. If I can think of this act of terrorism, others more sinister than me can also. A plan of prevention needs to be included in the SDEIS. Currently, it isn't. I am asking you to reject the SDEIS until this threat has been evaluated and a viable plan of prevention has been established. This plan should include an estimate of its cost, its duration, and its likelihood of success. Thank you. Sincerely, Byron Kuster 4761 Coffee Lake Road Moose Lake, MN 55767 218 485-8511

I wish to make one brief comment regarding the EIS for the proposed PolyMet mine in northeast Minnesota. There is discussion that any monitoring and possible cleanup of the site may be in the 500 year timeframe. To put this in perspective, 500 years is as long as the elapsed time between when Columbus "discovered" America and the present. Think of all the events and turmoil which have occurred in the past 500 years. Project this into the future, and then ask yourself if it is reasonable to expect that vigilance in monitoring and potential cleanup will really occur centuries from now. Thank you. Byron Paulson 10822 Oxborough Ave Bloomington, MN 55437

---Original Message--- From: quinnb@upstel-net [mailto:quinnb@upstel-net] Sent: Tuesday, March 11, 2014 9:37 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Byron Quinn 709 SE 2nd St Little Falls, MN 56345-3503

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I don't want my grand children having to pay for cleaning up Northern Minnesota because we thought it would be a good idea to get jobs up there for a 20 year stretch. Let's come up with a jobs program to help the people of Northern Minnesota. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Byron Rice 6310 Russell Ave S Richfield, MN 55423-1004 (612) 866-8286

Byron Richard

Representative, I have two responses: 1) The process presented is blind to an informed consideration of impacts that could extend from 200 to 500 years into the future. The process is inadequate and represents either our cupidity or cowardice, or both. 2) Geological asset extraction yields short-term financial benefits while expending social, health and other economic resources a score of generations or more into the future. Does that sound like a good exchange to you. I look forward to the day when this kind of proposal is immediately recognized as criminal activity too shameful for anyone to voice in public. Erin Thompson Byron Richard 4609 Lyndale Avenue South Minneapolis, MN 55419

Byron Richard 45463

I'm registering my profound opposition to the Polymet mine proposal and to any sulfide mining in Minnesota. Your assurance, though possibly legal, do not adequately equip the state and future residents to maintain the mitigation of water pollution. I'm looking at Mine Site Version 5-0 Model, Annual Average of Concentration Statistics, CU in the long-term WWTF Influent. This chart ends at year 200 with almost no change in concentration. 1) what kind of fraudulent representation is this. At that slope how long does it take to achieve acceptable mitigation, 2000 years. 2) the parent company of Polymet can cash out and leave Minnesota high and dry. Your assumptions call for best case scenarios for rainfall and assume no leakage in the containment facility. Both of these assumptions are on the wrong side of caution. There is no sulfide mining mitigation that has been successful. The Polymet reserve osmosis plan doesn't have the capacity, never mind the funding for 2000 years. I wouldn't wish this on your children, so don't compel it on mine. What kind of cost are you willing to incur for 3 years of 200 jobs from this low-employment density project and open season on further mining proposals. It makes no sense. NO to Polymet. Byron Richard 4609 Lydnale Avenue South Minneapolis, MN 55419

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, c carlson boulder creek drive 16025 boulder creek drive mtka mn minnetonka, MN 55345 952 934 5357

Dear Ms Lisa Fay, Five hundred years. At least The United States is not yet 250 years old. Who will be here to treat the wastewater in five or six hundred years. Do you think PolyMet will be there. What is the average life of a polluting corporation in our modern era. Even if reverse osmosis is the miracle that the mining companies claim, who will be here to do it. In fact, we know it won't happen. This is permanent destruction of our home planet for short-term corporate gains. The pressure is on you to sell the citizens out to a dirty, greedy corporation. Do the right thing. Say no. Thank you, C Goustin 6029 Dupont Ave So Minneapolis, MN 55419 US

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs C Peterson 7 Bainbridge Ct Laguna Niguel, CA 92677-6067

10829

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs C Peterson 7 Bainbridge Ct Laguna Niguel, CA 92677-6067

11437

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs C Peterson 7 Bainbridge Ct Laguna Niguel, CA 92677-6067

The SDEIS is inadequate. It does not and cannot provide reassurance that this mining will not result in irreparable harm to the watery environment in Minnesota's Arrowhead. PolyMet's proposed mine threatens the state's clean water, wild lands, and public health. These valuable resources must be protected and not sacrificed for short term employment and profits. Charlotte Stephens, 23 Pandolfo Place, St Cloud MN 56303

c. dino pappas 4006

Dear Sirs, The state of Minnesota needs more jobs and must increase its tax base. The environmental issues will be answered with a cleaner state that which exists now (remember this is an old iron ore mine). The community is desperate for jobs, this area has some of the highest unemployment in the state, with this project there will be thousands of new jobs. The fact is that PolyMet is going to be using reverse osmosis as its topping of its water treatment. Good enough to drink, and yes I would drink it. Minnesota is very rich in natural resources lets use these gifts, and we have a very well educated population. I think that we have a chance to keep more of these people in the state by creating these new jobs. I have been an investor and a frequent visitor to Minnesota all of my life. I use to go to Lake Vermillion as a youngster and think highly of keep Minnesota clean and I know that is just what PolyMet will be doing. Oh and just one more thing to think about is that these are strategic materials which we currently get from other countries which are not all that friendly. Please approve the PolyMet application. Thank you. C. Dino Pappas C. DINO PAPPAS Vice President for Development @ PyroPhase, Inc. The Future of US Energy .. and President of P.S. Consultants, Ltd. Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Re: PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. To: Douglas Bruner, US Army Corps of Engineers, Tim Dabney, US Forest Service, Lisa Fay, Minnesota Department of Natural Resources Susan Hedman, Environmental Protection Agency PolyMet doesn't have a history to consider. Glencore does. The company founded by Marc Rich, a financier, who if pardoned for his involvement by President Bill Clinton, has nevertheless been implicated in environmental disasters, as well as labor violations and human rights abuses around the world. To date there has been no Sulfide mining in Minnesota. Sulphide mining now threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Renal tubular malfunction and pulmonary emphysema from Cadmium, Arsenic, Mercury are on offer to local residents. A corresponding threat to the health of wildlife will result in species decline. Virtually every environmentally responsible person who knows about PolyMet Mining says no to this project. We, they, do not want acid mine drain water. Those who do, live elsewhere and profit. Nor do those people who will be affected want to lose local wetlands or wildlife to this mining scheme. Specifically, lynx and declining moose populations are threatened by the cumulative impact to an even greater degree than are local residents. The animals are defenseless. Residents can, and do however, say no. The Federal land exchange of protected Superior National Forest decision to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest while those who will profit will in any exigency hide behind corporate law and not be held responsible for the harm they knowingly cause to wetlands, residents and wildlife. C. Morgan McNeil 9876 Wilshire Boulevard Beverly Hills, CA 90210 Sincerely, C. Morgan McNeil 9876 Wilshire Blvd Beverly Hills, CA 90210-3115

Cahrene Dimick

57968

I understand the need for employment, however I am completely opposed to jobs that will place at risk and harm our natural resources. The area on the PolyMet Mining Corp NorthMet is pristine and vulnerable. Please do not let this project occur. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnninage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Caitie Ryan-Norton

45112

Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. As a Minnesota native who is spending a year living in southern Colorado I have a new perspective on our water sources as vital components to our livelihood. Listening to the struggles of southwestern water rights and priorities I know that it is essential for us to protect our water. Participating in a mine that has even the most remote chance of polluting our waterways is not worth it. Our water is an incredibly valuable resource that should not be taken for granted. Sincerely, Ms Caitie Ryan-Norton 307 Laurel Ave Saint Paul, MN 55102-2105

Caitlin Bellis 42444

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, The proposed PolyMet mine is a dangerous beginning to the degradation of lands and waterways we have fought hard to protect for decades. There is a precious amount of off-limits land in this country, and something we as Minnesotans are proud of maintaining. generation after generation. Understandably, there is profit to be made by mining. However, money has a finite existence, whereas the natural beauty and resources of the BWCA are infinite, so long as we protect them. Just because something is profitable, does not mean it is acceptable. For example, the sale of illegal drugs and prostitution. Also, we have the responsibility of protecting the headwaters of the Mississippi River, a water source that cuts through our country and supplies water to millions of Americans. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Caitlin Bellis 325 Runge Ln Saint Paul, MN 55118-2913 (612) 816-3671

Caitlin Kelley 54864

57189

The PolyMet proposal represents unjust risks to our natural resources and the public health. Do not allow this to go through and threaten Minnesota's water quality and native and state resources. Mines like the mine proposed have never been operated without contamination of the environment. Please, oppose PolyMet's proposal. Caitlin Kelley 10155 150th Street East Nerstrand, MN 55053

58117

The Polymet/Northmet proposal should be rejected. The environmental costs of the mining project being proposed are not worth temporary jobs supporting a temporary industry. I believe Minnesota's natural woodlands and wetlands need to be protected and respected. A proposal that suggests cleanup of hazardous materials produced by the planned mine could take 500 years is not an acceptable proposal. Reject this proposal to protect our natural resources.

Caitlin Pedracine 41930

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Caitlin Pedracine Coon Rapids, Minnesota

Caleb DeGolier 47695

My name is Caleb DeGolier. I oppose the PolyMet mine. The possibility of an accident that could drastically affect Minnesota's wilderness and habitats of our wildlife is definitely not worth the relatively few number of jobs the mine will provide. Furthermore, there is no company that can be trusted to provide clean-up for contamination for hundreds of years. What if they file bankruptcy for instance. The tax payer and the environment will end up paying the price. Sincerely, Caleb

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, It would like to believe that there are still some good people out there who are willing to do what is right and in the best interest of all that inhabit this planet. We need to find a balance between use of resources and raping the land. In a time when fresh water is becoming ever more scare we should be protecting the valuable resource we have in the Great Lakes Basin. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Calee Malvasio 414 McMillan St Marquette, MI 49855-4809

Cali Mellin 57192

The mining project would damage Minnesota's Boundary Waters, a very important part of the environment; due to this I do not support the mining effort. Calin Mellin 405 N Ray Street

Calista Small 42416

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I do not even think there is a choice: the PolyMet mine must be rejected. Thank you Sincerely, Ms Calista Small PO Box 200625 New Haven, CT 06520-0625

Calvin Cloutier 41901

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Calvin Cloutier Saint Paul, Minnesota

Camilla Illegible 58001

Keep the Boundary waters clean! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Candace Keskitalo 4341 Channel Rd Spring Park, MN 55384-9734

Candace Smolich 44677

As a small business owner in Aurora, Minnesota I am in full support of the PolyMet project moving forward. The dramatic impact this mining operation will have on my business will be the difference in just existing and trying to keep my doors open to making updates and creating jobs. I look forward to creating a part time job(s) which will help our area economically overall. There are always students and others looking for part time employment and at this time I am unable to support a paying position. I believe once the PolyMet mining project begins this is something I will be able to offer. I see PolyMet as keeping our mining jobs alive on the Iron Range. And jobs with decent living wages which will keep our future families stay in our area and grow our population overall. Mining today is not the same mining created a hundred years ago. I have no doubt that the SDEIS gives regulators the information they need to issue PolyMet Mining permits to operate while protecting natural resources. I am ready to see PolyMet Mining be issued their mining permits. Candace Smolich 216 W 2nd Ave N Aurora MN 55705 218-229-3317

Dear Ms Fay, 3/1/2014 Dear Regulatory Agency: I reside in Duluth, MN and am very passionate about the pristine wilderness and quality of clean water/air we are so fortunate to enjoy in Northern Minnesota. I am deeply concerned about the possibility of PolyMet's copper-nickle sulfide mining project. One of the reasons so many people vacation in MN is to enjoy the Boundary Waters Canoe Area Wilderness and the beautiful lakes in Northern MN. If PolyMet wants us to believe their mining won't pollute the rivers, lakes and water shelf, then they need to take inspectors to past mining sites they have constructed and actually demonstrate that the waters have not been polluted. I doubt very much if they can demonstrate this, as mining has always resulted in pollution. I have heard that before an inspection, the EPA trucks in water to put in the rivers/lakes to dilute the pollution level. Of course as an average citizen, I can neither confirm, nor prove this happens. It's really quite distressing to me to think that our lakes and rivers could become as polluted as others have become in the Southern US Many well established businesses in Northern MN that depend on clean water for fishing, as well as the survival of our wilderness and wildlife will be in jeopardy if PolyMet's mining initiative is allowed to begin destroying the land in Northern MN to extract minerals. People from all over the world visit the Boundary Waters Canoe Area, as it's one of the last wilderness areas on the planet. People right now so rely and need places like the Superior National Forest to get away, rest and recharge themselves. I hope people of MN are paying attention, because the Superior National Forest borders are in jeopardy of being changed. If a border is changed it is geographically a small change; however, the polluted and/or fresh water that runs underground cannot observe a man-made boundary. If our great lakes, rivers and drinking water are polluted, aware people will stop visiting MN for their summer vacations. I realize more jobs will be created by PolyMet, but at what coSt In 15-20 years when PolyMet has extracted all the copper and minerals from the Earth, they will pull out and leave a wasteland that will take 100s of yrs to rehab. This will create jobs too, but not the kind anyone wants. I don't even need to mention the health risks people will face when the water is polluted from the carcinogens that are used in the chemical buffers added to the waste before being dumped into the rivers (that eventually run off and enter Lake Superior (ie water shelf). It's too late for Northern WI, but not for MN. Perhaps we, our water and wilderness still have a chance to protect our natural resources. Please represent me and all of the other people who love the wilderness, clean lakes and rivers MN has to offer. I am absolutely sick at heart to think our precious watershed and land could become a receptacle for toxic waste due to sulfide mining. Glencore-Xstrata, you need to know we totally care about our environment, land and water in the beautiful State of Minnesota, and are prepared to defend it against the likes of corporate sulfide mining. Caree Gordon Caree Gordon 1201 Mississippi Ave Duluth, MN 55811

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Carey Hartman 3666 Roundtree Ct. Boulder, CO 80304

We are property owners on White Iron Lake. This is our comment. Mining should be allowed only if the mining companies are held to the current Minnesota environmental laws and standards without giving them variances. Mining isn't a problem as long as the mining companies aren't given variances which weaken the laws and standards already in place. Carl and Jean Stueland ; 3081 Elm St; Lindstrom, Mn 55045 Sent from my iPhone

Carl Anderson

Mar 2, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. With many states now wondering where are we going to get water for our daily use I just think it would be wise to not allow a risky business adventure like this to come in and produce another Sudbury, Canada, mining area. I remember seeing pictures of that mined area and it was devastating to the country side with it's sulfuric acid waste. If it were up to me I would like keeping that area clean and pristine along with preserving the water that we do have in our state. We need to preserve it. I would take clean water over digging up a whole bunch of rock to gain a few tons of copper nickel ore that they might get, and then leave that area in mess of mining taillings. Don't let them destroy our beautiful state and its water supply. Sincerely, Carl Grandstrand 2411 Island View Dr Albert Lea, MN. 56007 Sincerely, Mr Carl Grandstrand 2411 Islandview Dr Albert Lea, MN 56007-1302 (507) 373-3340

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

This is the comment (letter attached below) that I was going to read at the PolyMet SDEIS hearing at the RiverCentre in St Paul, but my name was not called. If you have kept the cards filled out by those wishing to speak, you will have the one that I filled out. I am sending my remarks as a comment now. Sincerely, Carla Arneson P.O. My name is Carla Arneson, C-A-R-L-A, A-R-N-E-S-O-N, and it's PO Box 336 in Ely, Minnesota 55731. The Minnesota Department of Natural Resources is lying to the public. PolyMet's NorthMet Project will require perpetual water treatment for its solution. This project, by law, must not be permitted.

42512

Perpetual PolyMet By Carla Arneson Minnesota cannot legally permit a mine that requires perpetual water treatment. In the Preliminary SDEIS, the consulting firm Environmental Resources Management (ERM) -picked by the Minnesota Department of Natural Resources (MDNR) and paid for by PolyMet- succinctly stated, "For purposes of this SDEIS, the WWTF (wastewater treatment facility) is considered a permanent facility and would be discharging treated effluent for perpetuity." (Duluth News Tribune) Perpetuity is perpetual. Released to the public on December 6, the final version of PolyMet's SDEIS is a fabrication, morphing from ERM's determination of water treatment for "perpetuity" to a watered-down version, "Modeling predicts that treatment activities will be a minimum of 200 years at the Mine Site and a minimum of 500 years at the Plant Site. While long term, the time frames for water treatment are not necessarily perpetual;" then that weaker version morphed too, essentially disappeared. By the time the general public saw PolyMet's SDEIS there was no mention of perpetual. Vanished. A redacting magic act! And by then the public's right to know had been emasculated even further. "Minimum" had been cut, no longer delineating water treatment of "200 years at the mine site and 500 years at the plant site." Water treatment "for the very long term" became "long term." But one telling word survived, it concerned closure, and "transitioning from mechanical to non-mechanical/passive water treatment if or when proven effective." (SDEIS 3.1.1) IF. If, or when, proven effective! Sophistry. During the April 9, 2013 panel discussion on nonferrous mining at the University of Minnesota-Duluth, MDNR Commissioner Tom Landwehr was asked whether the MDNR could issue a permit if it received a plan that called for long-term treatment. "Landwehr replied that treatment would need to be passive (such as water being filtered through a wetland) or not active at closure." (Cook County News Herald) Minnesota Administrative Rules concerning closure and postclosure maintenance (Minnesota Rule 6132.3200) states: "The mining area shall be closed so that it is stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." Perpetual water treatment is not maintenance free. The permitting process for sulfide mining needs to stop in Minnesota. It is not only delusional in Minnesota's water rich environment, by law it is over. Carla Arneson P.O. Box 336 Ely, MN 55731

I apologize for any inconvenience. I realized that I did not have my full address on the comment I just sent. This one is corrected. Carla Arneson P.O. Box 336 Ely, MN 55731 POLYMET NORTHMET SDEIS COMMENT These were some of my Hardrock Comments (concerning exploratory drilling) to the US Forest Service; With a few alterations I am adding them to my PolyMet SDEIS Comments. I believe they are vital when considering proposed sulfide mining. An intensive, cumulative impact assessment needs to be done for both the Lake Superior and Kawishiwi Watersheds as part of PolyMet's SDEIS. Its NorthMet mine would be in the Duluth Complex; all very "foreseeable" sulfide mines to follow would also be in the Duluth Complex. I am respectfully requesting that the public be informed, as part of a cumulative impact study for PolyMet's NorthMet Project, of the total number of exploratory borings that exist in the Duluth Complex – including the approximate number of undocumented borings and the number of borings that will be added by further proposed exploration. I also ask that a thorough inspection be done of all borings, that all borings be sealed properly, and that all borings be sealed the full length not just 250 feet (change the law if necessary). And, that exploratory borings no longer be allowed to remain merely capped, not sealed, for ten years. Drilling is not only exploration for mining - it is turning our National Forest into a mining pincushion. No one knows what is happening within our aquifers. If the inherent belief is that it doesn't matter because it will be mined anyway that rationale needs to stop. There has been inadequate oversight of just what happens in our water rich environment at these drilling sites. If Minnesota does not properly supervise exploration, it will certainly not be able to control massive sulfide mining operations. Minnesota does not hold taconite operations to standards, instead issuing variances. The issue with the first photo below is not how it happened, but that it was left that way for weeks/months without anyone finding it or doing anything about it. I dropped a line with a weight to see if it was an open hole – I stopped at a hundred feet – when I pulled it up it was covered in stinking, oily slime. I have a collection of similar photos that show lack of oversight. The photos below give you the idea – uncapped boring hole, loose pipe that is oozing substance into the middle of a wetland, a broken off pipe that has a beer can stuck down it. I have found other borings that are loose and oozing, broken off, or just holes in the ground and I didn't get a chance to look at that many. There was also debris left at sites. Orange fencing was left around an open pool at one boring. There were borings too close to the lake (under the Shipstead-Newton-Nolan Act). One wetland drill pit was going to be buried the next day. It was covered with slime and smelled like something dead - the DNR said it should not have been that way and it would get soaked up and then buried. I can only assume that it was. If I hadn't said something it would have been buried, as is. It was interesting to note that right after I reported the detached pipe (above) the borings nearest to roads were all cemented around the base of each boring pipe – I question why they were not done that way in the first place - or if it is just for show and ineffectual. The pipes off the road - that you had to hike to - were not cemented. I have attached photos of some of the cemented borings and some of the borings that were not cemented. Oozing fluids from boring Beer can inside broken off boring pipe Newly cemented drill site . Newly cemented Cemented Not cemented Not cemented Not cemented These borings are conduits to our aquifers. The following is info from research on Picher, Oklahoma: "Beneath approximately 2,500 acres of this site lie around 300 miles of underground tunnels, and mo

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes unsubstantiated claims. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells, nor explore alternatives that could reduce PolyMet’s destruction of wetlands, nor examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of positive predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely Carla Jentoft

Feb 13, 2014 Ms Lisa Fay MN Dear Ms Fay, As a proud Minnesotan, I carry on the tradition passed down from my ancestors to enjoy the outdoors, always leaving the environment in better condition than I found it. If I see garbage while kayaking, I pick it up. Polymets plans run counter to my values, and to the values of most Minnesotans. They want to strip away all the resources of our state, then leave stinking, polluted, lifeless pits in place of a vibrant, sustainable ecosystem. An animal will not defecate in their lair, so it makes sense that Vancouver based PolyMet; infamous "I want my life back: Tony Hayward, and Swiss Glencore are the financial backers. They will not drink the water, hike the scarred, barren of life land, or raise their children in a toxic waste dump, They are fine with doing it here in Minnesota, because they don't live here, and it is about profit and cutting corners, Why do I have concerns. For one, Tony Hayward is involved. He promised, he glossed over and mostly he lied day in and day out for each excruciating day of the Deep Water Horizon catastrophe, one of the worst man made disasters to hit this planet, Secondly PolyMet is going to pollute the water for 500 years. Enough said. Of course, PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. They will directly destruct the habitat and sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. This is what they do. They pollute the environment. Birds that depend on fish and other aquatic organisms for food will be SOL, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl can pack their meager bags and head nowhere, as this is their suitable home. They will be part of the "overburden" that is culled, carted away and dumped. I urge decision-makers, and those with common sense, morality and humanity to reject this disastrous proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Carla Johnson 3175 Cuneen Trl Inver Grove Heights, MN 55076-4539 (651) 554-0807

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, carlie volbrecht quodbury, Minnesota

Please do not build a mine in the boundary waters. I feel that there is a high chance that the water will become polluted and that the poor innocent fish will die. I feel that if a mine is built by the boundary waters, by people with big names and lots of money and power will feel like it's okay to destroy beautiful places such as the boundary waters just for a quick buck. Please leave the Mother Nature and her home alone, thank you.

Carlsons 42936

Daniel L and Ann M Carlson 902 Timberline Lane Duluth, Minnesota 55811 Phone: 218-726-0325 Dear Department of Natural Resources: We are property owners on Clear Lake, along Highway 169 between Tower and Ely (GENE GAZELKA PLAT T OF EAGLES NEST LOT 11 BLOCK 1). We would like to express our strong support for the PolyMet project. We have lived in Minnesota all of our lives, being born on the Iron Range and currently living in Duluth. We chose to live and raise a family in northern Minnesota because we enjoy the environment of forests and lakes and felt that northern Minnesota was a great place to raise a family. The mining industry has provided a good living for our parents and generations of other northern Minnesotans. PolyMet will provide an opportunity for satisfying and productive careers for many young people who wish to be able to remain on the Iron Range and raise their families in northern Minnesota. Thank you for your consideration, Dan and Ann Carlson

Carly Coulson 11332

To the Minnesota Department of Natural Resources, I oppose the planned PolyMet Mining Inc Project because the location is within the Lake Superior watershed and puts our clean water resources at risk. Our clean water resources are more valuable in the long-term than the short-term economic benefits of the mine. A 500 year commitment to mine waste water treatment is far too great. No matter what regulations imposed and funds received from the mine company to meet this 500 year commitment, it is foolish to think we can plan for anything that far out. The 300 or so jobs created by the mine is such a small number in comparison to the high environmental and regulation risks that will go on for 500 years. 300 jobs can be created in so many other ways that are easier to create and have no environmental risks. We should be turning this conversation into one about jobs and other ways to create 300 jobs in the northland. The State of Minnesota should not trust that the PolyMet Mining Inc company will take its environmental responsibilities seriously. The project has in its planning, investors, and management team individuals with very poor records regarding environmental damage. Bill Williams is being charged with Crimes Against the Environment in Spain. Tony Hayward was responsible for the BP disaster in the gulf. These leaders should not be trusted to operate such a high risk mine in Minnesota. I am not opposed to mining in general. I have an iPhone and use many products with metals which I fully understand must be mined from somewhere. I would likely support a mine if it were in a safer location in Minnesota, did not impact Lake Superior, did not require 500 years of water treatment, and had mining leaders involved that had a clean record regarding environmental damage. Kind regards, Carly Coulson 10 west first street apt 105 Duluth, MN 55802

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Carmen Oprea 4106 Brooklyn Ave Cleveland, OH 44109 US

Quit destroying our water and our wetlands. By removing our minerals you are also causing all these sink holes. I don't want the pipeline from Canada coming down here. Let them keep their crap up there. Why in the Hell are we allowing B/P in our country. We kicked the Fricken British out of our country. Don't let them back in!! We don't want them.

Carol and Doug Damberg 43020

P.O. Box 121 Cold Bay, Alaska 99571 HYPERLINK "mailto:cd_damberg@hotmail-com"cd_damberg@hotmail-com (907) 947-8088 March 12, 2014 To: Lisa Fay, EIS Project Manager DNR Ecological and Water Resources Division Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay I've been watching the debate about the PolyMet mining proposal in northern Minnesota for a long time. You'll see from my address that I can't vote for folks who are either for or against the proposals. My career choice in conservation and resource management has afforded me the opportunity to move around and live in many communities over the years, some of these that bear the scars of significant past or ongoing resource extraction efforts. Despite my wanderings, Minnesota will always be home for me. My family roots are in the iron range, I graduated from high school near St Paul, and I visit the family cabin near Ely for extended periods every year. In ten years or so I will be thinking of retiring from my current job. I've often thought of Ely as a place that I would settle. I strongly oppose the proposed mine based on two primary factors: first, and most importantly, the significant long-term environmental impacts that would undoubtedly result, and second, the associated social impacts that could significantly alter the fabric of significant parts of northern Minnesota, and not for the better. These impacts would be at the expense of our most treasured public resources, including surface and groundwater and the Boundary Waters Canoe Area Wilderness. The trade-off for a limited number of jobs and short-term economic boom is simply not worth it and a disservice to not just to the State of Minnesota, and all those that love and treasure these resources around the country. The technology that mining interests claim will protect water quality is untested and unproven. It's just not possible that the proposed mine, particularly with the anticipated sulfide impacts, can be put in place without significant long-term environmental damage, particularly to surface and ground water quality. To say that a mine won't impact the areas water quality is like the smoking industry claiming that secondhand smoke doesn't have health impacts on folks sharing the same airspace. Both arguments have been made and both are equally irresponsible. The Boundary Waters Canoe Area Wilderness is a national treasure. It is one of the most pristine and unique locations not just in the lower 48 states but anywhere in the world. There's nothing else like it and once it is trashed, it can't be repaired, fixed, or mitigated for. We're already seeing changes of unknown cause to the Kawishiwi drainage, where our family cabin is located, even without additional runoff and contaminants from a new mine. Over just the past few years alone wild rice stands in the North Kawishiwi have declined by over 50%. I lived for 7 years in the Rock Springs/Green River, Wyoming area and during that time experienced the take off of the latest natural gas boom. Anyone who has driven through western Wyoming can see first hand the impacts and scars of this crush of gas wells on the landscape. If you've lived there, like I have, you've seen the significant social impacts of transient workers – folks who work hard but play hard too and don't have a vested interest in the long term viability of the area. In Wyoming this is a boom and bust cycle, and it's not hard to see the complex social issues of both the boom, and the bust, on the local economy and lifestyle. On the sidelines, the predicted significant impacts to wintering mule deer, migrating antelope, soon-to-be-listed sage grouse, and other species is quietly occurring much to the chagrin of sportsman and wildlife viewers alike. The vast sea of sage plains surrounded by glorious mountains has become a tangle of roads, weeds, gas wells, drilling towers, and dust trails l

Carol Bogart 27021

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please do not issue permits that will allow this threat to one of the world's largest freshwater resources. Please also initiate testing of feeder rivers to Lake Erie such as the Sandusky River so as to ascertain the impacts of upriver discharges to the river. Example: the unremediated Tiffin, Ohio-owned landfill in Seneca County on CR 90- The landfill, active in the '50s and '60s, has never been issued an NPDES permit, yet extensive industrial toxic waste has been documented in leachate and aquifers that discharge into the Sandusky River. (See Ohio EPA file) Sincerely, Carol Bogart 760 Dorothy Adamo Ln Apt 921 West Sacramento, CA 95605-2167

Dear Ms Fay, Dear Federal and State Agency Leaders: Get your priorities straight. We we cannot live without clean water-Just ask the people in West Virginia who are now left holding the bag of externalities of the company "Freedom (to pollute) Industries, which has now declared bankruptcy. CLEAN WATER, NOT COPPER, IS WHAT IS GOLD. We need clean water to survive. But corporations don't care, because they profit most when they create scarcity - and there is movement underway in Washington to encourage state and local municipalities to privatize water resources. CONNECT THE DOTS. How dare we pollute such a precious resource that is necessary for crop production. California, in the midst of a drought of historical proportions is stupidly proceeding with fracking, even though it requires millions of gallons of water and pollutes water at the same time. THIS IS SHEER AND UTTER MADNESS. WHEN WILL WE STOP BOWING TO CORPORATE INTERESTS AND INVEST IN THE SURVIVAL OF THE HUMAN RACE. WE CANNOT UNDO THE DESTRUCTION ONCE IT STARTS - NO COPPER / SULFIDE MINE HAS OPERATED THAT HAS NOT POLLUTED WATER. In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." PolyMet has stated that it may not have insurance available to cover liabilities for environmental pollution; (and the pollution would be for OVER AT LEAST A 500 YEAR PERIOD). PolyMet has received significant financial backing from Glencore, a multi-billion dollar privately-held foreign company founded by pardoned US tax exile, Marc Rich, has been named by European NGOs as the "Worst Corporation of the Year" – globally; Glencore has cut jobs at the Mopani copper mine in Zambia, Africa when copper prices fluctuated, creating a boom and bust for the local economy. Observers report that infrastructure in the host community has been left derelict; Environmental problems at Glencore's Mopani mine have resulted in fish kills and drinking water contamination resulting in hospitalizations of 800 people; Glencore's Prodeco coal operation in Columbia was fined \$700,000 in 2009 for numerous environmental violations; its Cerrejon plant is notorious for displacing indigenous peoples and razing their villages; Glencore's South American operations have also been criticized for systematic firings of union workers and intimidation through the use of armed guards; Glencore's Metaleurop copper processing subsidiary removed corporate resources, leaving workers uncompensated and imposing on France a \$411 million unfunded pollution liability. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely, Carol Bolin-Abrahamson Carol Bolin-Abrahamson 5009 Quail Avenue North Crystal, MN 55429

Carol Brandenburg

47177

To the People of the DNR, As a teenager and young adult I canoed our beautiful Boundary Waters many times, and still have precious memories of that unique area – the crown jewel of our state. My brother Rick Brandenburg - a former US Forest Service Ranger in the BWCA - still lives with his family in the Superior National Forest. We are all committed to seeing the BWCA protected, in perpetuity. But as we know, the BWCA's future is now in grave jeopardy. Here is the short list associated with copper-sulfide mining operations - the ecological, social, and economic legacy that would impact our state for hundreds of years, if proposed mining operations go forward. That is a truly terrifying prospect, when Polymet, Northmet and their cohorts will be long gone by the year 2040 or so. I implore you to consider their existing track records: Water pollution Fresh water, the world's most precious natural resource, is now threatened in many places. · Loss of pristine wetlands and forest · Negative impact on three separate watersheds, and all wildlife in the area · Climate change due to carbon emissions · Serious health threats, including cancers and respiratory ailments · Mercury poisoning People who live in the Superior Basin are already exhibiting dangerous levels. · Loss of public lands · Devastating aesthetic impact · Loss of northeastern economy based on eco-tourism · Loss of wilderness jobs Thousands of people depend on ecology and wilderness for their wages (compared to an estimated 300 mining jobs that may last a couple of decades—and then where will the miners go when the last traces of mineral are gone.) · Superfund cleanup to the tune of billions of dollars for hundreds of years Once our priceless Boundary Waters area has been destroyed, it can never be restored. Please, PLEASE stop the mining companies before any more damage is done. Thank you for your consideration of this most urgent issue. Sincerely, Carol Brandenburg 2950 Dean Parkway #705 Minneapolis, MN 55416 612 353-4847 Executive Producer/Project Manager Conrad Productions [HYPERLINK "mailto:carolb@conradprod-com"](mailto:carolb@conradprod-com) carolb@conradprod-com

Carol Buelow

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Carol Buelow 4206 Doncaster Dr Madison, WI 53711

Carol Dallman

18278

My name is Carol Dallman and I live in St. Paul. I am here to oppose the mining because I do not believe that we have done enough to recycle and conserve resources and now is not the time to mine an area that has such potential for long-term environmental effects. We know where it is. If we choose not to mine now, we know where it is, it will still be there, if there is a way to do it in a more environmentally responsible way in the future. So I guess that will be it.

Carol Frechette

17039

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: The PolyMet NorthMet SDEIS is an open-pit sulfide mine that will ruin ground water quality for hundreds of years, if not forever and must be rejected. I'm also sending a copy of my letter to the US Environmental Protection Agency. Recent DNR documents showing that base flow at the mine site was seriously underestimated and confirms this. The PolyMet SDEIS relies on unsupported assumptions to minimize threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health.

- Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts wetlands and streamMs
- Minnesota should not be an experiment for untested technologies.
- The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no scientific real support, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unproven assumptions, conceals facts, and won't allow the public to understand risks of accidents, failures or routine violations of water quality. Please reject the SDEIS and the experiment in long-term, potentially permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Carol Frechette 1511 W 6t1h Ave Shakopee, MN 55379

Feb 15, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. As someone who values life and the clean water that supports it, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Carol Gisselquist 29 W Governor Rd Hershey, PA 17033-1723

From: carolgreenwood2@gmail-com [carolgreenwood2@gmail-com] Sent: Monday, March 10, 2014 4:58 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Carol Greenwood 2615 38th Ave S. Minneapolis, MN 55406-1751

Greetings, Keith Haasl 215 W. 4th Ave N. Aurora, MN. 55705 1-218-750-2366 I attended the meeting at the DECC last week and would like to add. I heard a lot of talk about responsibility. Responsibility to our water, responsibility to the 9000+ acres of wet land, responsibility to the environment, responsibility to the next generation. No one address out responsibility to provide a way for us to acquire the metals we need in a responsible manner. We live in a world economy and will get the things we want. Is it ok to buy the copper from a source that has no environmental controls or concerns as we do. Are we responsible for the damage that happens in another part of the world. I believe that you cant have it both ways, if we choose to use the things PolyMet will provide we need to find a way to let them produce them, or continue to buy them from questionable sources. I heard more about the study, most opponents stated that it was incomplete or incompetent I don't think either. I believe that it was responsibility prepared by people that have a genuine concern about this matter. Thank You

Carol Hedberg

4185

Minnesota's greatest assets are our natural resources: ground and surface water, soils, and, yes, metal deposits. But water is what we are known for and have the most of, and the need for that will increase the most in the coming decades. There will always be a need for copper and nickel, too. Its value will only increase over time. Minnesota needs to focus on - and invest in - our pristine spaces and relatively unpolluted fresh water as our biggest asset. Watch the value of a protected Minnesota soar. Don't vote to lose it forever for a very-short-term gain that really helps only a very few. There is no rush. Keep our copper, nickel, forests and waters for the future. In even 25 years, they will be ten times as valuable as they are today. Sincerely, Carol Lewis Hedberg 6150 St Croix Ave N, #312 Golden Valley, MN 55422

45040

Dear Ms Fay, Dear Federal and State Agency Leaders: As a citizen of Minnesota who is concerned about environmental safety hazards, I ask that the PolyMet SDEIS be rejected as inadequate and that a permit not be granted to them for mining. These are the reasons for my position: 1- Copper and nickel mining (from sulfide ores) is not like other mining but far more polluting. Sulfide Mining—everywhere it's been done in the world—has caused serious pollution, even in dry environments like the American WeSt Northern Minnesota is wetlands (the Hundred Mile Swamp) where pollution spreads even more easily. 2- Polymet's first Environmental Impact Statement was in 2010; the US Pollution Control Agency gave it the lowest possible failing grade. (Only 0-3% of projects are graded this low.) This revised draft (SDEIS) is still very inadequate and makes optimistic promises based on speculation: no consideration of alternate methods (like underground mine, putting liners under the waste dumps), no guarantees of who pays for even routine monitoring/treatment after mine closes—and no consideration of spills, etc 3-The computer model for treating wastes and handling pollution is based on poor data, not even good science: sparse water data from dry years. (MN has had 4 “100-year” floods in the last 9 years.) 4-Knowledge about this bad data has been available to the DNR for years. Native scientists (from the Great Lakes Indian Fish and Wildlife Commission) have been trying to draw it to their attention, and have very different data. 5-PolyMet says they will guarantee the water treatment for “however long it takes.” But PolyMet is a shell company. Their chief investor, Glencoe Xstrata, is not on the hook for any guarantees. Glencore Xstrata, is a Swiss mega company with a truly terrible environmental record that is international in scope. 6- “However long it takes”: PolyMet's own EIS is working with figures like 200 and 500 years. It is completely unrealistic to expect that PolyMet or their owning company will be around that long with the resources to clean up environmental waste. 7-Taxpayers will end up paying for environmental damage. The single biggest Superfund costs have been cleaning up sulfide mining. 8- The Iron Range needs jobs. But these mining jobs come at too high a coSt There are other jobs that depend on a clean natural environment, such as for tourism, hunting, fishing etc these jobs would be loSt 9-Pollution will affect everyone. Mineworkers. Babies. People who drink water. Lynx and moose and bears. Wild rice. Fish. Therefore—people who rely on the tourism economy. The waters at risk include the Partridge Cree and the Embarrass River. The St Louis River basin, to Duluth and Lake Superior. (Already 1 in 10 babies born in St Louis River mouth and the North Shore has an unacceptable level of mercury.) Next to be affected—perhaps from Polymet, for sure from the next projects—the Boundary Waters. 10- PolyMet is just the first of the companies that will be mining in this environment. If they are granted a permit, there are numerous other copper-nickel projects targeting the BWCA watershed) that are waiting for the outcome of this process. Thank you for your attention. Sincerely, Carol Iwata Carol Iwata PO Box 395 Afton, MN 55001

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: PLEASE reject the PolyMet NorthMet SDEIS. The PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. Recent findings from the Department of Natural Resources' documents show that the base flow at the mine site was seriously underestimated. The SDEIS and the sulfide mine project are based on seriously flawed, unrealistic and inconsistent assumptions, not accurate science. PolyMet is using these improper and unsupported assumptions to minimize the threats and impact of sulfide wastes on drinking water, surface water and, ultimately, the health of all Life that would be touched by this waste. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts and does not allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS. This experiment would violate water quality standards for generations to come, bringing unwanted and unnecessary harm to Minnesota. Sincerely yours, Carol L Weber 5223 Silver Maple Circle Minnetonka, MN 55343

Our natural resources are the most important aspect of our lives - NOT money - not politics - not business run in this manner - We can live w/o money, politics, water - we CANNOT live w/o our water, creatures, air, land - STOP THIS MINE! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Carol Michealson 42869

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Carol Mockovak 4300 W. River Parkway #407 Minneapolis, MN 55406

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. No pollution, by water or air, should be permitted to infiltrate Minnesota wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. As a Minnesota resident I demand ZERO pollution, zero water runoff and zero air pollution be proven beyond doubt and if not proven this mining activity must be rejected by the State and Federal agencies. No pollution of any kind is acceptable in this sensitive region of the State. As a State resident I value our natural resources above corporate profits. If they can not provide PROOF of Zero pollution, both now and future, from their project it must be rejected. The requirement of providing proof and reimbursement of all governmental cost to verify their proof is valid must be 100% their responsibility. Minnesotan's can not afford to damage our waters or absorb the risk of any future costs for loss of resource or cleanup of pollution, no mater how insignificant it may appear now. Burden of proof for zero pollution and zero future risk to Minnesota must be provided. Failure of either zero threshold requires project rejection. Businesses come and go. States can not afford to participate in corporate risks. ALL COST and Elimination of ALL RISK must be paid for by the business. Additionally, the Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Carol Reamer 4159 Primrose Path Saint Paul, MN 55127-6141 (612) 720-2922

comments from: Carol Reschke 869 Shoreview Heights Road Two Harbors, MN 55616 HYPERLINK "mailto:cr3@frontiernet-net"cr3@frontiernet-net 13 March 2014 to: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay: I have reviewed portions of the SDEIS for the NorthMet Project proposed by PolyMet Mining, Inc. I have three major concerns about the adequacy of the SDEIS: 1) inadequate discussion of cumulative effects of all proposed sulfide mining projects located in northern Minnesota; 2) inadequate resolution of major differences of opinion (MDOs) expressed by cooperating tribal agencies; and 3) inadequate models and data for addressing the effects of sulfates on growth of wild rice in light of recent MPCA findings. I previously mentioned my first two concerns in comments on the DEIS that I sent on February 3, 2010 to Stuart Arkley, EIS project manager at MNDNR, and to Jon K. Ahlness at USACE. I will reiterate those comments here in hopes that they will be taken more seriously by the co-lead agencies (MNDNR, USACE, and USFS). I am a resident of Lake County, Minnesota and I live on property I own near the city of Two Harbors. These comments reflect my professional opinion. I have 30 years experience as a professional plant community ecologist; and my current research is related to restoration of fish and wildlife habitats within the St Louis River Area of Concern (AOC) in Duluth, Minnesota and Superior, Wisconsin. 1) My first concern is that I have found no suggestion or discussion that a Generic Environmental Impact Statement (GEIS) may be needed for sulfide mining projects in northern Minnesota. PolyMet's NorthMet Project is anticipated to be the first of several proposals for sulfide mining of precious metals in northern Minnesota. The SDEIS lists eleven projects they consider "Speculative Actions" in section 6-2-2-1-21 that "have not been mapped or considered in the cumulative analysis". I understand that there are numerous mining exploration permits to search for precious metals in the Duluth Complex rocks. I understand that if ore containing small percentages of precious metals is found, mines would be proposed which would presumably utilize similar sulfide mining processes to extract precious metals from the rocks. I suggest that a GEIS for sulfide mining on the Iron Range would be an appropriate document for addressing cumulative impacts of multiple mining projects currently being planned. A Generic Environmental Impact Statement (GEIS) is a specific form of environmental review that can be used to study certain types of projects not adequately reviewed on a case-by-case basis. The authorization for conducting alternative forms of environmental review, such as a GEIS, is found in Minnesota's Environmental Policy Act, MS 116D.04, Subd. 4a. Specific criteria for determining the need for a GEIS and the unit of government most appropriate to oversee its preparation, and the general process and content of a GEIS are identified in Minnesota Rules, part 4410-3800-Although only the Minnesota Environmental Quality Board (EQB) is authorized to order a GEIS, any person or government body may request the EQB to consider the preparation of a GEIS. I suggest that MNDNR, USACE, and USFS ought to be requesting the EQB to order a GEIS for sulfide mining in northern Minnesota. According to Minnesota Rules, part 4410-3800, a GEIS may be ordered by the EQB to study types of projects that are not adequately reviewed on a case-by-case basis. Subpart 5 lists twelve criteria to be considered in determination of the need for a GEIS. I think at least nine of the twelve criteria are relevant to sulfide mining projects in northern Minnesota. Those criteria are listed below: A. if the review of a type of action can be better accomplished by a generic EIS than by project specific review;

Until they can prove otherwise, sulfide mining is a destructive process. The permanent rape of our environment is not worth the profit of a few (Big Business). We all need jobs, but not at such a price. Let them prove they can mine safely, until then sulfide mining has no business in Minnesota. Carol Selmason 924 South 72nd Ave West Duluth, MN 55807

Carol Smith 52228

Hello, This is a request for the powers that be to deny Polymet Mining and all companies like the opportunity to mine nickel and other various metals from the Mesabi Iron Range. The location of the anticipated mining is too close to the BWCA, Superior National Forest, and other natural wilderness. The inevitable water pollution, the loss of the natural land, the mitigation of wildlife and fauna is too high a price to pay for any benefit from mining - including jobs the opposition argues for. Once the land is compromised, it is lost forever. As stewards of nature, please protect this region from this invasive action as devastating as any war may be. Please do not allow the exchange of land for Polymet, do not allow the reopening of the shuttered processing plants. Thank you. Carol Anne Smith 11093 Branching Horn Eden Prairie, MN 55347

Carol Vopatek 41865

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Carol Vopatek Minneapolis, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, carole blaska 589 rice creek terrace fridley, MN 55432

---Original Message--- From: Larry-Carole-Rust@msn-com [mailto:Larry-Carole-Rust@msn-com] Sent: Tuesday, March 11, 2014 1:13 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Carole Rust 1826 Alameda St Saint Paul, MN 55113-6532

I am not a chemist, however could there be a positive use for the sulfide acid that might be created. Could it some how be harvested and used in industry or in consumer products so that it would be reclaimed from the start instead of being wasted. Kind of like motor oil is a waste product of making gasoline. Just a thought. Carole Zanardi 1916 W. Kent Road Duluth, MN 55812

Members of my church's Caring for Creation Committee at Macalester-Plymouth United Church have discussed the proposal for a large scale copper-nickel sulfide mine near the BWCA, to be conducted by PolyMet. We have shared our concerns about the long-term and destructive impacts on this special area of Minnesota. We are concerned about: 1. The major loss of wetlands, primarily bogs, that cannot be replaced. The SEIS already makes it clear that wetland "restorations" will not take place in the Lake Superior watershed and are highly unlikely to replace bogs. The wetlands at the site have been rated as "having high wetland quality." How can they possibly be "replaced?" 2. Predictions of chemical pollution, not just from sulfate and its acceleration of toxic mercury conversions, but also heavy metals like nickel and aluminum, that kills fish. 3. The long term need to clean up water from pollutants, possibly for 200 years. How can that be assured, especially with more mines ready to ask for permits in that area? 4. The questionable suggestion that a company, that plans to mine the proposed site for 20 years, could possibly provide "financial assurance" to cover the expensive costs of water treatment for 200 years or more into the future. And can such treatment truly control all the sorts of pollutants that will come from the mine site? The SEIS predicts the company will excavate 307 million tons of bedrock in 20 years, at 70,000 tons per day. 5. We are concerned that a lot of the proposed PolyMet site area has been designated by MN DNR as "Sites of High Biodiversity Significance" and support eleven state-listed species of plants. Destruction of such an area cannot be rectified, nor justified. We urge our government officials to take courage and SAY NO to this mine and to others waiting in the cue for permits. There are other ways to secure jobs in this fragile and unique area of Minnesota than this. One suggestion is to create metal recycling facilities and hire people to work on recovering the metals we need. Please reject the PolyMet mine. It's a short term venture with long term harm to MN.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Carolyn Blaso 3301 Sardis Bend Drive Buford, GA 30519 US

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have grave concerns about this project's potential permanent destructive impacts on Minnesota's natural resources and public health. I also have grave concerns about the project's delivery on the economic benefits it promises. I have grave concerns about relying on DNR to monitor. DNR monitoring resources are not guaranteed and its independence from the companies' influence not assured. DNR has squandered resources fighting an Ely researcher who has collared a dozen bears-but seems to have no problem saying "yes, yes, yes.." to mining permits. The permit should require the companies to pay for independent experts to do monitoring if DNR's resources and independence fail the test I have grave concerns about relying on the slow judicial process to remedy pollution when it is discovered. There needs to be agreement on an expedited process so that pollution is stopped immediately. Carolyn Chalmers 4148 Edmund Blvd Mpls, MN 55406 The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Carolyn Chalmers 4148 Edmund Blvd Minneapolis, MN 55406-3646 (612) 722-9116

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Carolyn C Carolyn Clements 601 Sunset Dr Sunset Dr Minnetonka, MN 55305

6067

Dear Ms Lisa Fay, As a Minnesota resident, I am HORRIFIED by Polymet's proposed NorthMet mining project. And really mad. We're seriously going to let them dig massive holes in the ground, destroy wide swaths of wetland, and count on them to treat the water for hundreds of years after. Let them create another Superfund site. This is insane. I get that we need jobs but not at the cost of unacceptable, irreversible environmental impacts. We've lost enough wetlands to iron ore and taconite mining. Can we not sacrifice our environment to line people's pockets. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. And the mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. Everybody knows the land exchange is just a sham and won't be in the public interest. The SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Carolyn Crooke 3657 Grand Avenue South Minneapolis, MN 55409 US

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I am opposed to copper mining in Minnesota. It is nearly impossible to obtain guarantees sufficient to protect future generations from the damage and expense of the resulting pollution. Requiring deposits sufficient to forestall future environmental damage will probably scare investors away. Either way we win. If they want to dance they must pay the fiddler. Scare them away, or make them pay the exorbitant sums necessary to protect our land and non-mining livelihoods. The metals to be mined by Polymet are an integral part of modern living. There is no denying that the demand for these metals will require finding and extracting them for years to come. I believe that Polymet has shown that they will mine the metals in a way that is the most environmentally safe for air, water and land. Foreign production of these metals will not meet the strict environmental codes and practices that are required by Polymet. If we do not allow Polymet to mine the metals it will be done by foreign suppliers in which case there will be a greater chance of global environmental impact. By allowing Polmet to extract the metals, that are critical in so many key areas of our everyday life, I feel that not only will the environment be protected to a greater extent but it will also benefit the state of MN economically. We again must realize the demand for the metals worldwide. Wouldn't it be beneficial to MN to have the creation of jobs and income at the same time as demanding strict environmental safeguards. If we do not allow Polymet to mine in MN we lose economically and environmentally. Carrie Evans 19996 Rendova St Ne Cedar, MN 55011

I am opposed to this project- when I moved to Minnesota 9 years ago, one of the factors that drew me in was the beautiful unspoiled areas within the area, particularly up north. It's a treasure we should protect. 500 years to clean up the toxic mess this would leave behind. Too much risk. I don't trust these people to clean up ANY mess they make. Please protect our natural resources and the people of Minnesota, as it was my understanding was your job. Thank you, Carrie Shanahan

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Carstens Smiht Minneapolis, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Cary Anderson 3848 45th ave s Minneapolis, MN 55406

Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Cary Anderson 3848 45th ave s Minneapolis, MN 55406

46079

Cary Anderson 3848 45th Ave S Minneapolis, MN 55406 We have an amazingly beautiful state and very unique area in all the world that is the Boundary Waters Canoe Area Wilderness. It is the most visited wilderness in the United States. It is a vast network of watersheds - ground water and lakes, ultimately, Lake Superior and beyond. All Minnesotans benefit from it. A multinational resource extractor with no allegiance to the United States, much less Minnesota, wants to dig gigantic pits there, to take out copper and other metals from rock, ship it out of the country, and leave sulfuric acid in it's place, fully expecting and admitting pollution cleanup will be necessary for 200 years in the surrounding area, and 500 years on the site. WHAT What in hell's name are you considering here. Are you being paid off. I really believe you must be. Polymet is basically owned by Glencore Xtrata. They are famous for private profit and public pollution. They buy mining rights in the first years of production, then sell to Chinese companies. They also have a terrible record of labor rights violations. These jobs they promise do not take that into account, nor account for how long they would even be there, or who takes care of workers when they get illnesses from the mine. There has never been a sulfide mine anywhere that has not polluted. I don't want large chunks of watershed in northern MN to be their quick profit and my sulfuric acid waste dump. Minnesotans will be paying for the clean up in so many more ways than just \$\$ for as long as we are living and our descendents. How much fresh water is pumped up from the ground to be used in the mining process. Lots. We don't have any to spare. We don't get the product from the mine. It is shipped overseas. Copper mining is so much different than the traditional iron mining that has been happening in MN. The difference is sulfuric acid. Fewer than 20% of computers are recycled in the US Why mine when we can recycle. Because Glencore Xtrata wants gobs of \$\$\$. Recycle computers by choosing e-Steward certified recyclers

Cary Gilbert

Feb 17, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. Dear Lisa Fay, I sincerely urge you to reject the proposed PolyMet mine. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. The water will take hundreds of years to clean itself if we mine sulfur. Lake Superior is the prominent feature of Minnesota and almost every Minnesotan goes up to visit it. It's one of the only places that has been untouched by humans for years and the beauty which has grown as a result of that is marvellous. Please don't take away something we value and can never get back. I want to be able to take my children to her glistening lakes and it's completely unfair of you to take that opportunity away from everyone so that there can be a profit for some billion dollar company. Support our state by not putting out all the local boundary waters camps and business' as well as the beauty where we can't find anywhere else in our state. Don't destroy what is not yours. Sincerely Casandra Ladas Roseville Minnesota 55113 Sincerely, Ms Casandra Ladas 1766 Alta Vista Dr Roseville, MN 55113-6553

Casey Deschampe 41981

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Casey Deschampe Grand Marais, Minnesota

Casey Jo Remy 38889

Mar 11, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Mrs Casey Jo Remy 1472 Days Creek Rd Days Creek, OR 97429

DNR, These facts have been brought to my attention recently: Glencore Xstrata, the primary owner of PolyMet, which [reportedly] will buy the rest of PolyMet once all the permits are in place for the copper mine in northern MN. So, who is Glencore Xstrata. Glencore Xstrata is a Swiss-based firm known for its ruthlessness. It is the fourth-largest mining company in the world. It controls 50 percent of the world's copper through its ownership of more than 100 mines around the world, and its commodities trading operations. Glencore Xstrata has run up a long list of labor and environmental abuses, including 58 mining fatalities between 2008 and 2010, over twice the number reported by any other mining company over that period. Just in 2012, their environmental and labor record includes dumping raw acid in waterways in the Congo, failure to provide a vapor barrier to keep an acid mist from descending on 3,000 people in Zambia, utilizing child labor as young as 10 years old in mines in Congo, and causing environmental damage at its McArthur River mine in Australia. These facts are alarming and scary. I would like to know what I can do in order to convince the public to not support this mine. I am scared the boundary waters will be an unsafe place to bring my children when they grow up. Thank you for your time, Casey Lebens

Casey Stepien 18355

I would like to give my time.

cass kane 6716

I read a lot about sulfide surface water contamination. What is Polymets plan 2 keep sulfide pollution from the groundwater table. I live in the country and get potable water from a drilled well and am concerned about the possibility of this event. Pat Kane 1337 Shoreview Rd Two Harbors, Mn. 55616

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Cat Thompson PO Box 7851, St Paul, MN St Paul, MN 55107 612 616-6298

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Hi, I have been reading the pros and cons regarding the proposed copper/nickel mining operation being considered. I am opposed to this mining proposal, as I believe that environmental consequences outweigh the benefits. I firmly believe that we need to be good stewards of our natural resources, and one of the most precious of these resources is clean water. The stakes are just too high to gamble with our water supply, even if the chances are small of it being contaminated for possibly hundreds of years into the future. Our children, grandchildren, great grandchildren, etc, will thank us for having the wisdom to do what is right rather than bow to the pressure of the almighty dollar. I realize the economy is suffering, but why risk an already fragile economy with the added burden of environmental disaster. Thank you for allowing me to express my opinion. Sincerely, Cathy Anderson 949 Oakcrest Dr Sauk Rapids, MN 56379

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Catherine Apostle 6808 Gleason Rd Edina, MN 55439-1601 (952) 941-0642

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. And, as time slips by, as we all know, the challenges will become even greater. With our worldwide population on the rise and the shrinking of habitable land resulting from global warming, we must fight to maintain not only our own health but the increasing threat to the wonderful wild animals that increasingly must struggle simply to stay alive. Just because we humans have the big brains and prehensile thumbs that have enabled us to take charge of the world, we have done so to the disadvantage of our fellow beings, be they four-legged, six-legged, or leg-less, like the whales and snails and snakes, and on and on. Thank you. Sincerely, Catherine Coult 4300 W River Pkwy Apt 602 Minneapolis, MN 55406-3682 (612) 721-1829

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Catherine Harrison 27242 Crooked River Rd Pine City, MN 55063-4947

I understand the economic considerations in wanting to approve this project, but I think past history should teach us that once pollution occurs, it is extremely difficult and costly to clean it up - and the pollution could become an issue long after PolyMet ceases to exist as a company. Of course, then you and I would not be here either, so we can leave the mess to a new generation. we are still dealing with other mining pollution and significant pollution by 3M that no one even thought about. There are also known and unknown health issues to consider. Do I have an answer. - No. But I cannot help but think the costs to the environment outweigh the gains to the current economy.

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Catherine Johnson-Thomson 676 Arcadia Dr Mendota Heights, MN 55118-1802 (651) 552-0234

Catherine Nicholl 39330

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Nothing is more precious than our water resources. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Catherine Nicholson 58132

We do need more jobs, but we need clean jobs that don't create a long term cost. Soon we could have jobs mining the pure clean fresh Lake Superior water/ but not if we have contaminated it by allowing acid based mining in an upstream watershed. What irks me is that this company is not even an American company. They'll make their money and the few jobs they'll provide Minnesotans and then leave and go bankrupt, leaving us with the mess. We are being mined like we are on the frontier, Canada's frontier. We aren't a third world country welcoming resource harvesting mining jobs as our only income. But that's what we are doing in this case. Thank you. I do not support the proposal.

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. My family spent some time in this region in October and we were told that they have some of the purest water in the country. As a Minnesota resident, I want to retain my RIGHT to experience this pristine environment. I also want my children and grandchildren to do this. This is our treasure, and I fear development will destroy it. Let's follow Wisconsin. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Cathy Botha 13 Hilary Street, Gillview Johannesburg, 1450 ZA

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Hello. I urge everyone to please look into "Flambeau Mine Exposed"(FMC) that was in operation back in the 90's (Rusk Co., Wisconsin), before making a final decision on PolyMet Mining here in MN. PolyMet's website boasts about FMC's successful mining project although years after the mining was completed and the plant shut down, not only did high levels of toxins (most notably manganese) show up in groundwater, but also a tributary/stream of the Flambeau River was polluted with copper and zinc toxicity. As of 2012, the WI DNR has recommended to the Environmental Protection Agency(EPA) that the stream be listed as "impaired". I've included the boastful comment from PolyMet Mining's website below after talking with a representative from PolyMet at the meeting last night about this success slogan, I'm guessing this will be disappearing soon. By meeting Minnesota's strict environmental standards, we have the opportunity to mine metals we use every day without harming our air and water quality. In fact, it's been done before at HYPERLINK "<http://www.flambeaumine.com/>"Flambeau Mine. In its four-year life, the mine, located in Rusk County, Wis., successfully produced essential metals while creating local jobs, benefiting the economy and most importantly, protecting the surrounding environment. Flambeau Mining Company now operates under the tagline "Promises Kept." "Promises Kept" is far from the truth - and even after lawsuits were filed back in 2011, FMC appealed the decision and the US Court of Appeals for the 7th Circuit proceeded to let the mining company "off the hook" in Oct. 2013- The appellate court did not dispute the district court's finding that FMC had violated the Clean Water Act on at least 11 counts. But, what's truly disturbing is that groundwater pollution at mine sites in WI has been legalized by the WI DNR and State Legislature (see NR 182-075 - WI administration code), so even the Clean Water Act did not protect the streams around the Flambeau River, nor the people and wildlife near the Ladysmith community. While it is now known, that Wisconsin actually "shields" mining company's from ever being prosecuted proves that this loop-hole also allows the mining industry to avoid cleanup and absolutely nothing has been done to clean up the toxins surrounding the Flambeau Mine. If cleanup ever does happen now, it will most likely be at the WI tax payer's expense. I urge the powers-that-be in Minnesota to take a long, hard look at what toxins could possibly be in our Lake Superior someday. Especially since the safe long-term storage of metallic sulfide waste depends entirely on complete isolation from air and water. What if their containment fails. Is this PolyMet Mine really worth it, with probable long-term affects. Thank you for allowing me to share my concerns, Cathy Gagliardi 1735 Sheridan Ave St Paul, MN 55116

16340

The man who heads a Hedgefund project to open an alleged open pit mine in the Penokee Range south of the Bad River Ojibwe Reservation in Northern Wisconsin, and over the objections of all eleven WI tribes has been indicted. <http://wcmcoop.com/2014/02/19/gtacs-bill-williams-indicted-in-spain/> I hope MN looks into this too with the proposed Polymet Mine. Cathy Gagliardi St Paul, MN

Hello, I am writing to express my strong concern about, and opposition to, the NorthMet mining proposal. I attended the February meeting in St Paul and also read much of the Executive Summary of the SDEIS. As a conservation biologist and environmental science instructor, I am extremely concerned about the long-term ecological impacts of this project and also the serious ecological "unknowns". In addition to the likelihood of long-term pollution, I am particularly concerned about the probability of not being able to successfully restore the impacted wetland areas. In my graduate study of ecological restoration, I learned that successful wetland restoration (both restoration of species diversity and ecological processes) is tentative at best. The required restoration in the proposed area seems more like an experiment than a known process. This is simply not OK to do in our precious northland areas. I am certain that many people have written about their concerns for the long-term effects on the waters of the area (including groundwater) and the effects on endangered species (eg lynx) and their habitats. I echo these concerns. I request that this mining project be cancelled. Thank you for considering my concerns, Cathy Geist 3428 34th Ave S. Minneapolis, MN 55406 Cathy Geist Biology Instructor Minneapolis Community and Technical College HYPERLINK "<mailto:Cathy.Geist@minneapolis-edu>"Cathy.Geist@minneapolis-edu Phone: 612-200-5239 "Come forth into the light of things . . . To Whom It May Concern: I support PolyMet Mining and believe they will build and operate a mine that complies with all regulations and protects the environment. Based on my review and the level of detail included in the draft EIS, it appears that a thorough evaluation of the project and potential impacts have been completed. As a person who lives, works and plays in the area, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this SDEIS lays the proper groundwork for developing an environmentally and economically sustainable project and I wholeheartedly support it. Polymet can produce these metals in an environmentally sound manner and create hundreds of jobs that can support families and sustain communities. PolyMet and its vendors will provide our young people with multiple opportunities for challenging and exciting careers. Enough is enough. Let's get on with permitting this mine. Mining is our bread and butter. Cathy Klegstad Cathy Klegstad Clerk-Treasurer City of Babbitt 71 South Drive Babbitt, MN 55706 (218)-827-3647 cathy@babbitt-mn-com

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. We cannot afford short-term jobs at the expense of long-term environmental degradation. Our precious few natural resources must be preserved, unpolluted, for all future generations. Once having destroyed our water, it cannot be restored. Look what is happening in West Virginia, for heaven's sake And that chemically poisoned sludge is flowing toward major metropolitan centers, impacting humans, wildlife, natural environments, all manner of agriculture and beyond. The long term effects are incalculable and won't be known for at least a generation; by then it will be far too late to help those impacted and to clean-up the toxic stew that fouls the water. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. These are major camping and family areas. If you dump on them, they disappear forever, destroy communities, economies and especially, the natural habitat and beauty which can never be reclaimed. Where is the benefit to communities. to wildlife. to our air and water. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is most definitely NOT in the public interest. Sincerely, Cathy Silvern 4618 Washington St Apt 3b Skokie, IL 60076-2591

I am opposed to the NorthMet copper nickel mining plan. Here are some reasons why: 1) Project Does Not Comply with the MN DNR Mission Statement - This project does not reflect the MN DNR's mission statement: The mission of the is to work with citizens to conserve and manage the state's natural resources, to provide outdoor recreation opportunities, and to provide for commercial uses of natural resources in a way that creates a sustainable quality of life. The MN DNR is considering the start up of copper nickel mining in Minnesota. This is a type of mining has never been conducted in Minnesota and the environmental record of sulfide mining in other areas of the United States has shown that releases of sulfuric acid to the surface water and groundwater are prevalent. Based on the fact that sulfide mining has never been conducted without negative environmental impact, the proposed NorthMet mine is not expected to create a sustainable quality of life within the area of Hoyt Lakes and the Lake Superior watershed. 2) PolyMet Lacks Mining Experience - PolyMet does not have a proven track record of successfully operating a copper nickel mine. In fact, PolyMet has absolutely zero experience in operating a copper nickel mine. I believe that the MN DNR should not allow a company to undertake such a huge mining operation without a record showing that they are a qualified company to safely operate the proposed NorthMet mine. 3) Financial Assurances - Glencore will be providing funds to PolyMet for the mining operations. Glencore should be identified as the lead company in this effort. PolyMet does not have the resources to provide financial assurance for environmental clean-up. 4) Establishing a Precedent for Copper Nickel Mining in Northern Minnesota – I am concerned that if the PolyMet mining EIS is approved by the MN DNR and mining permits are issued that it will allow copper nickel mining to proceed in other areas of the state, such as near the Boundary Waters Wilderness Canoe Area. The MN DNR should be very aware of how their decision on the NorthMet mining project will affect other proposed mining plans in the state. 5) High Likelihood of Environmental Contamination – Even with the best intentions and plans, accidents can occur. This is also the case with the proposed NorthMet mine. If there are any releases of sulfuric acid to the soil, surface water and/or groundwater, then long-term significant environmental clean-up will be needed. I do not feel that the MN DNR should use the proposed NorthMet mine as a pilot project for copper nickel mining. Until PolyMet can provide evidence that they have successfully operated a similar-type mine for at least 15 years, I don't think that the MN DNR should grant approval for this project. Thank you for taking the time to read my comments. I feel very passionately that the MN DNR should not move forward with the NorthMet mining plan at this time. My contact information is as follows: Cathy von Euw 4740 Wentworth Avenue Minneapolis, MN 55419 cathy_voneuw@yahoo-com

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Catlin Spargo 1290 Hall Ave Lakewood, OH 44107 US

Hello, I am a concerned Minnesota citizen. I oppose the sulfide mining project submitted by PolyMet Mining Co. because these ventures have damaged water supplies in other areas of the country and I do not think it is worth it to do it here. I have read some of the comments by those who are going to profit from the mining and am not convinced that they are telling the whole truth. I think they want to make the money and then pull out and let the state pay for the clean up. Thank you. Cecelia R. Hartleib 2034 Selby Ave St Paul, MN 55104 Call Send SMS Add to Skype You'll need Skype CreditFree via Skype

Dear Ms Fay, Dear Federal and State Agency Leaders: I testified at the hearing in St Paul but run out of time and am not sure if this got in the minutes. Climate change caused by rising greenhouse emissions will be affecting Minnesota's natural habits, agriculture and our health. The Polymet project should not be permitted without substantial change to reduce emissions. The SDEIS should be redone to compare alternatives that reduce Carbon Dioxide emissions, starting with changes in vehicle fuel and reduced reliance on coal power. Cecelia Newton 5516 Irving Ave S. Minneapolis, MN 55419 (612) 929-0372

My name is Cecelia Newton and it's spelled differently than a lot of people spell it. C-E-C-E-L-I-A, and then Newton, N-E-W-T-O-N. I am from Minneapolis, Minnesota. I also was a girl scout. I'm a Minnesota citizen. I'm concerned about climate change and the effects it is having on Minnesota. I know this sounds weird, but Minnesota is the third fastest warming state in the USA. We are being affected. I know you want to laugh, but you go talk to a metrologist. The CO2 emissions from the PolyMet sulfide mine and/or processing facilities would greatly increase Minnesota CO2 emissions. The greenhouse gas emissions from the PolyMet Mine, the processing facility, including the fossil fuels burned to run the vehicles on site and the plant on both places would be potentially -- now I know this is 107,342 metric tons per year. The statistic I'm giving is stated in this Supplement Draft EIS, Chapter 5, 405. That's why I'm giving the specific numbers. For perspective, in the city of Duluth in 2011, that includes commercial, industrial, transport, and waste, they emitted 2.7 million tons of CO2 equivalent gas, greenhouse gases. So in one year PolyMet alone would emit one-fourth of the CO2 equivalent pollution of the whole city of Duluth. That's one plant. Over a 20-year mine plan PolyMet will emit 15,790,750 tons of CO2 equivalent pollution from burning coal to run its processing. That also is from the draft statement, Chapter 5, 406. Climate change caused by rising greenhouse gases will be affecting our natural habitats, our agriculture, and our health. Our natural habitat would include fewer lakes -- not the land -- it wouldn't be "The Land of 10,000" anymore. More dried up lakes. Less or no moose. No pine forest. Less good fishing and walleyes. More ticks. So I propose the PolyMet project should not be permitted without substantial change to reduce emissions. The SDEIS should be --

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- Sincerely yours, Cece;ia Newton 5516 Irving Ave S. Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Cecilia Lieder 318 N 14th Av E Duluth, MN 55805

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Celeste Birkeland 4036 Zenith Avenue North Robbinsdale, MN 55422

Celia Hallan 42445

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Celia Hallan 1901 W 49th St Minneapolis, MN 55419-5225

celia poehls 15867

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I urge you to reject the PolyMet NorthMet SDEIS as inadequate. I also urge you to acknowledge the PolyMet open-pit sulfide mine plan has unacceptable environmental impacts on surface and ground water quality. These impacts will persist for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan deserve a less than a failing grade and both should be rejected. Recent news of internal DNR documents show that base flow at the mine site was seriously underestimated. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats the sulfide mine plan and wastes will have on drinking water, surface water, wild rice, mercury contamination of fish. All of these present extreme risks to human health at a time we can no longer ignore them. The SDEIS must be redone. It "methodology" is faulty and conceals, rather than analyzes environmental impacts. Here are a few critical failures: •No use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. NOTE: Both tribal hydrologists and MDNR staff have determined the real base flow is at least two to three times higher than the number used in the SDEIS. Base flow affects pollution seepage and impacts on wetlands and streams •No use a reasonable range of probabilities polluted seepage from the Category 1 waste rock pile and the tailings piles collection. NOTE: The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no "real-world" support. •No use of accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. NOTE: Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •No inclusion of a specific and reasonable plan for financial assurance toxic mitigation treatment for hundreds (or more) of years (ie, how we can be assure this will not become yet another SuperFund site). The PolyMet SDEIS is not a scientific analysis of water pollution threats. It is a biased document relying on unjustified assumptions. It conceals important facts and does not allow the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. It should be noted that we only need to look to West Virginia and North Carolina to see immediate and real threats to our earth from bad management strategies for treating the byproducts of these methods. Sincerely yours, celia poehls

I fully support the PolyMet project. The agencies have done an excellent job preparing the SDEIS. I fully trust the agencies expertise in making sure that this will be done in a safe and responsible way. I was able to attend all 3 public comment sessions. To me this is cut and dry . We can have both clean water and jobs in northern MN. PolyMet has demonstrated it and will prove it when they get their permits. Sarah Sahr 204 S 6th St E Aurora, MN 55705

57490

I fully support PolyMet, the DNR, and all of the other agencies on mining safely in northern MN. I have lived here my whole life and mining is critical to our area. I trust that all of the agencies will ensure that PolyMets mining will be safe for the environment. I also know the huge economic impact that this could provide for the whole state of MN. I also know that all of these metals that they will be mining, will still be mined elsewhere. So why not have it done here .. Where we already have the strictest standards. PolyMet has proven that they will meet all of the standards and I hope that the regulators won't let the environmentalists delay this any longer. I feel that the groups that are against this are not pro-environment, they are anti-mining. If these groups were pro-environment then they would want this kind of mining here where we know it will be regulated and watched closely. Not in another country where standards are lower. Sincerely, Chad Sahr

Chad Trebilcock

21879

I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations. It's time to move forward as people want and need jobs in the area. Chad Trebilcock 7805 South Jackson Road Lake Nebagamon, Wisconsin 54849 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Miss Chanda Welch 670 Ockley Dr Shreveport, LA 71106-1249

char

I'm very supportive of Polymet's efforts to start a mine in Northeastern Minnesota. The SDEIS outlines what has to be done to ensure that the mining process is done in an environmentally responsible manner. It has taken 10 years of study to get where we are today. It is time to move forward with the Polymet project. We desperately need the good paying jobs and to be independent from foreign suppliers of these minerals. Thank You, Charlotte Colarich 1011 east white street Ely, MN. 55731 Sent from my iPad

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, char colo jamieson St louis, MO 63109 US

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mrs Charlene Blake 40 Elizabeth Street Corner Brook, NL A2H 5Z6 (709) 388-0425

Charlene Maertens

57244

All of your mining is destroying our water, the wetlands for animals, and causing more pollution. To top off your handi-work with your mining. You are also partial to blame for formations of sink holes. You take away the ground, but you don't replace it. Shame on you - this planet is dying. Charlene Maertens 1641 - 20th Ave, #314 International Falls, MN 56649

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Charles And Mary Weaver 1245 Karth Lake Dr Saint Paul, MN 55112-5714 (651) 631-3021

Charles Baribeau

18127

Thank you, Dave, and members of the Committee and the groups here. The first thing I'm going to do, I'm going to be putting on two different hats here. I'm putting on my hat -- I'm a Virginia City Councilor from the City of Virginia. My name is Charles R. Baribeau, last name is B-A-R-I-B-E-A U. With that, I'm going to introduce for the record, two resolutions we passed on PolyMet. One for the original draft EIS and we'll be putting together another resolution in next Tuesday's council meeting for this current supplemental EIS draft that's out at the present time. I've been a pharmacist for 40 years throughout the community of Virginia, and we support the PolyMet from a City Council perspective, and we support it 100 percent. These resolutions were a 7-nothing vote and a 7-nothing vote with two members absent. The PolyMet Project will increase, and as already mentioned, jobs in this area by about 400, from 1,000 1,000 to more. The Iron Range unemployment rate right now is higher than the state average, so This will help to increase the employment in this area. There will be high-paying jobs. There will be an increase of younger families due to subsistence of everything on the Iron Range. There will be an increase in school enrollment, an increase in real estate values of homes and businesses if this project goes through. There will be an increase in all types of sales. Now, I'm going to put on my hat as a pharmacist. The water process with reverse osmosis has been in the business as long as I've been a pharmacist, for 40 years. The quality of water coming out of this system will be better than the water that they're drawing from whatever streams, and et cetera, that they draw the water from. The process will be pure; all the minerals, all the chemicals, the mercury, everything you've heard, them talk about will not be available to go back into the downstream system of the Lake Superior watershed. We in Virginia are held to a standard of mercury that will be identical to what the environmental system requires of the mining industry. That standard is based on a brand-new sewage treatment plant we just put into operation here in Virginia this past year. So it's a brand new standard that the mining company will be held to. Just a couple other things. Reverse osmosis is used in drinking water purification. Food industry, food and juices. Your household water industries. Your sewage treatment plants. Your desalination of fresh -- for fresh water from the ocean. The pharmaceutical industry has used reverse osmosis with purity of water for many years. One last thing. It also extracts bacteria and pathogens- from the system, depending on the membranes you use, so the water will be more pure than what went in.

Dear Ms Fay, Dear DNR Friends: I'm a lifelong friend of the boundary waters and I am writing to tell you that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality now and long into the future. This mine would work fine in Nevada or other states with the minerals where the water table is not rich and pristine. But to do this mine at the top of the Laurentine divide where its effects would not just damage local water tables but run off into Lake Superior, the Mississippi River and hundreds of other smaller rivers and lakes is simply foolhardy. Please reject the PolyMet NorthMet SDEIS as inadequate. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Charles Borden Charles Borden 9 Delos Street W, # 3 St Paul, MN 55107

Comments of Charles K. Dayton. January 28, 2014 1666 Coffman St St Paul, MN 55108 651 341 2049 HYPERLINK "mailto:chuckdayton@gmail-com"chuckdayton@gmail-com Regarding the Draft Supplemental EIS for the Polymet mining operation at Hoyt Lakes Minnesota. My experience as a retired environmental attorney with over 40 years of practice includes some lessons relevant to this issue. We can't predict the future very well. Pro-mining interests keep urging us to trust the agencies to do their job. I don't doubt that the agencies will act in good faith, but as a lawyer for environmental groups on the Reserve Mining case I learned that State Permitting agencies are not adept at predicting what will happen in nature in the future, even using the best available scientific information. The then Commissioner of DNR, in issuing the original permit allowing Reserve to dump taconite tailings into Lake Superior, found that there would be no harm to water supplies and that the tailings would stay within a mile of plant. But, the tailings turned out to be carcinogenic, they polluted Duluth's water, and were found across the lake in Wisconsin; 20 years later the discharge stopped. The lesson for this EIS is that potential changes in climate, particularly rainfall, should be evaluated. Economic analysis of future treatment costs is required by law. As a lobbyist for the Sierra Club in the 1973 session, I worked on the Minnesota Environmental Policy Act requiring impact statements. That law clearly requires that the potential economic cost of treating the water that will be affected by the waste rock must be evaluated in the EIS: 116D.4, Subd. 2a. provides: "The environmental impact statement shall also analyze those economic, employment, and sociological effects that cannot be avoided should the action be implemented." This failing is an obvious flaw in the Supplemental EIS. The EIS must evaluate scenarios that include an increasing incidence of heavy rainfall events. Three years ago, I co-authored a chapter of "Water Policy in Minnesota" published by Resources for the Future, together with Don Pereria, the head of fisheries research for the DNR. In working on our chapter, entitled, "The Impact of Climate Change on the Distribution and Use of Water" I learned that the severity of heavy thunderstorms has increased and will continue to increase in northern Minnesota as the climate warMs The research cited shows that the incidence of heavy rainfall events is now double the rate of a century ago, and that climate change forecasts show that current increasing trends will continue into the future. Id. at 206- This research is confirmed by the report of an inter-agency task force in Minnesota, Adapting To Climate, 2013, Report of the Interagency Climate Adaptation Team, which included representatives of the PCA and DNR, November 2013- <http://www.pca.state.mn.us/index.php/view-document.html.gid=15414>- The report shows a 45 percent increase in "very heavy precipitation events," from 1958 to 2011 in the upper Midwest, including Minnesota. P. 8, figure 6- The report forecasts more frequent extreme weather events as well and notes, significantly for our purposes: "Higher peak intensity rainfall events may result in bypass of wastewater treatment facilities or sanitary sewer overflows, leading to the release of minimally treated or untreated wastewater." My understanding is that the waste basins and treatment facilities for the water polluted by contact with waste rock will be designed for a hundred year rain event of 5-2 inches of rain in 24 hours. This is insufficient. The flood that plagued Duluth and Northeastern Minnesota in June of 2012 with 8 to 10 inches of rain was the worst in history, so far. Mark Seeley, climatologist with the University of Minnesota, observed, "This type of storm reminds us that climate is changing in Minnesota. Not only in terms of quantity of precipitation, but in the character of precipitation

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Maybe you don't seem to understand that the Lake Superior waters are pretty much a closed system and, as I have heard, have 300 year turnover. The lake may look big, but, it really isn't and this type of mining, shows the potential of killing the entire lake and its surroundings. You are playing with fire here and it is time the fire was put out. Do not allow this mining to take place and pollute the entire Great Lakes. We take so much care in not letting lead from the Mackinaw Bridge get into our lakes, when the sulfide mining contamination is going to be far greater and far worse. Make sure your priorities are in the right place as you drink your filtered city water. You are playing with 1/5 of the world's fresh water here. Don't take a chance like this that could be fatal for our lakes and our children. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Please stop this greed and insanity before you kill the greatest of the Great Lakes and maybe all of them down the road. Thank you. Sincerely, Charles Derry 8660 Merkel Rd Dexter, MI 48130-9655

Charles Lahti 18061

My name is Charles Lahti. The question that I have relating to this particular permitting system is what happens to permitting after the product leaves the property? In other words, when it's in transportation we have hazardous materials that's in a liquid solvent state or a dried state going across all the water aquifers between here and the location. I'm afraid a train accident or something like that will put it into our water system, the Great Lakes, the Red River, going up the Hudson Valley or the Mississippi. And we are talking thousands of tons of hazardous material. How do we handle that? And why isn't the Department of Transportation involved in this permitting? And the other thing is on these routes we have to look at the hazardous characteristics for the emergency people and the fire responders. Those first responders are they going to be aware and properly equipped to handle the hazards that this brings forth to their towns.

Charles Lehn 36610

Please consider the attached letter regarding Polymet Mining. cl Sincerely, Charlie Lehn Morningstar Exteriors, Inc. 4991 165th Ave NW. Andover, MN. 55304 763-286-9792

Charles Madsen 39765

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Charles Madsen 90 13th Ave SW New Brighton, MN 55112-3438 (651) 724-8593

41840

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Charles Madsen New Brighton, Minnesota

Charles Marsden 20173

I sent an email on this subject moments ago, but was unable to determine if it went through, so I am sending in a different manner. My apologies if this turns out to be a duplicate message. Please make this a part of your file of comments on the NorthMet SDEIS. Charles Marsden

36906

Attached is an analysis of the size of a Trust Fund required to provide adequate Financial Assurance as well as some suggestions on dealing with the issue. Charles Marsden

42819

See attachment

43029

Your task is complex. The attached letter includes some suggestions about how not to lose sight of the big picture. Charles Marsden

54574

I am writing to you regarding the application for mining permits for the NorthMet Project and the SDEIS currently under review by the DNR. I am a retired chief financial officer of a chemical company listed on the NYSE and have had many years experience buying and selling properties that involve complex environmental issues, and, as a result, believe I can offer some informed opinions about the issue of Financial Assurance which is a major consideration in the PolyMet proposal. The main points of this letter can be summarized as follows: •Copper-nickel mining in Minnesota involves a significant risk of groundwater contamination. •Taxpayers need to be protected from the potentially very large cost to clean up environmental damage resulting from this type of mining. •The time to get the necessary financial guarantees to protect taxpayers is now, before permits are issued. •The best protection would be a large initial cash deposit supplemented during mine production by a tonnage charge. As you know, hard rock sulfide mining, unlike iron mining, has potential severe environmental impacts on ground water, and the challenges of dealing with toxic runoff from tailings impoundments are substantial. This is evidenced by the fact that no sulfide mining operation anywhere in the world has yet succeeded in containing the toxic runoff and avoiding pollution of groundwater (drinking water) in surrounding areas. PolyMet claims in its SDEIS that it knows how to solve this seemingly intractable problem. However, the most optimistic way of looking at this issue is to view it as a bold experiment to be conducted in Minnesota. The state needs to protect itself and the taxpayers if it allows this experiment to take place and serious environmental damage does occur, as it has in every other sulfide mine. The PolyMet SDEIS acknowledges that treatment of runoff from tailings impoundments will need to continue for hundreds of years. The net present value cost of that alone is huge, and not really addressed in the SDEIS. Scientists, engineers, and other technical experts can argue about the relative merits and likelihood of success in containing toxic runoff and treating whatever escapes impoundments. But there are other important evaluations to be made that are of a business and financial nature. How can we be assured that Minnesota taxpayers will not be stuck with an enormous bill for cleanup of the mining sites and ongoing treatment costs? Minnesota Rules, part 6132.1200 is supposed to provide for that, but the rule is only effective if (1) the future financial liability is forecasted realistically and (2) PolyMet is capable of providing financial assurances to the extent required to meet their potential obligations for both mine closure and reclamation and environmental damage. Section 3.2.2.4 Financial Assurances of the SDEIS for the NorthMet Mining Project and Land Exchange is the only place where this issue is addressed. Having reviewed that short section (3 pages), I can say with confidence that no businessman would consider the statements made and assurances suggested to be anywhere near adequate for entering into an agreement with PolyMet. The section consists solely of generalities and future intentions to address the issue in a more comprehensive way during the permitting process. Given the extensive time and work that went into preparing the voluminous SDEIS, it is surprising that no more definitive estimates of future costs to reclaim the sites and deal with long term monitoring of ground water are available. Further, there is no indication that the possibility of substantial contamination of ground water due to failure of impoundments or other issues has even been considered. Costs to deal with this kind of issue could far exceed the general estimates of closure costs (\$120-\$170 million after 20 years of mining) and post-closure monitoring and maintenance costs (\$3.5-6 million annually) that ar

57343

My name is Charles Moore. I live at 4320 London Road, Duluth. I am opposed to the proposed mining for the following reasons. One, I think that the proposed or postulated cleanup has not been adequately tested on a large enough scale at other such mines. Secondly, I am opposed because I think underground mining hasn't been given a – I don't know how much that has been looked into. And thirdly, the cost of the cleanup for hundreds of years seems to be -- how is that going to be guaranteed? Okay. That's it.

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

DNR, I am writing you with my concerns about the proposed Polymet sulfide mining to be done very close to the BWCA. After reviewing the information from the recent environmental impact analysis, I have no confidence that the Polymet company can keep the surrounding watershed safe from pollution caused by the mine. As an avid user of the BWCA and resident of the state of Minnesota, I am urging you to reject Polymet's proposals for sulfide mining in our state. Sincerely, Charles Plumadore 5965 195th Ave Foley, MN 56357

Charles Renner

18263

Charles Renner, Ely, Minnesota. I just wanted to say I have lived on the Iron Range for 50 years. The mining industry is what brought us to the Range during the mining business in Hoyt Lakes, Minnesota during the sixties and seventies. The town was full of miners, full of kids, full of schools. Now we have no miners to speak of, a handful of miners. The schools are all closed up and boarded up. And I am for the mining industry and I am looking forward to it starting. They have studied it for years, eight years I believe, possibly ten. They have spent millions of dollars studying this. I believe they are capable of doing it safely and I am looking forward to them getting it started as soon as possible.

58141

Lived on range for 50 years supported by mining. We've studied this for years, spent millions of dollars. Lets start mining!

The fact that this company will provide so many good jobs for Minnesotans, is by far the most important thing to remember. I also believe that conservationists have too much say in what happens in our state. We all want to keep our planet livable, but we have to remember that our population is constantly growing. We have to do something to create jobs for the expanding job force.. The fact that this can be done with no appreciable effect on the environment, is all the more reason to promote this project..
Charles F Schaedler

Charles Skaudis 41915

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Charles Skaudis Woodbury, Minnesota

Charles Sugnet 48670

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I am a property owner in Cook County and an outdoor sports/environmental writer. The news media keep framing the mining question as a question of jobs and the economy versus the environment, completely forgetting that a clean wilderness will produce jobs over a much longer haul. From a strictly economic point of view, it is a question of a large number of jobs that last for a short time and destroy the resource (the capital) versus a smaller number of jobs that are sustainable over the very long haul because they do not destroy. I've seen what the area around Sudbury looks like after copper-nickel smelting. Nothing in PolyMet's approach (leaky test wells, misleading public communication) leads me to believe that northern Minnesota will be spared serious and long-lasting damage if PolyMet is allowed to mine. Charles J Sugnet 2312 30th Ave S Minneapolis, MN 55406 The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Charles Sugnet 2312 30th Ave S Minneapolis, MN 55406-1444 (612) 655-9700

Charles Wick 54568

Cu-Ni mining is too risky so close to priceless watersheds. Minerals are too toxic in parts per billion to ensure safety. Monitoring of water quality has to be done way past the life of the mine and the corporate owners. Its too close to the BWCAW to risk such a major intrusion.

Charlie Elowson 38947

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Charlie Elowson 2515 Burnham Rd Minneapolis, MN 55416-4333 612 729

To the Minnesota DNR: I am strongly opposed to the sulfide mining proposal in northern Minnesota. From the reading I have done in the media and portions of the prepared environmental statement, it is inconceivable that sulfide mining can be anything but disastrous for our northern water and land environment. Our natural resources in Minnesota have always been a defining part of our state's economic health and culture, and they MUST be protected. I do not believe that human progress and economic need should be held to be more valuable than our beautiful lakes, trees, land and wildlife. We need these places of quiet, clean air and water, these places of refuge. I have visited the BWCA the past 5 years and will continue to visit as long as I am physically able. The history of previous sulfide mining projects elsewhere in the country tells the story of ongoing pollution, bankruptcy of the mining companies, and cleanup burdens left to taxpayers. Why would we expect it to be different in Minnesota. Minnesota has been a leader in protecting the environment-do not stop now, do not change this now. Please say no to this mining project.. Sincerely, Charlotte Anderson 2909 40th Avenue South Minneapolis, MN 55406 Sent from my iPad

The boundary waters is a beautiful place with many aquatic and non-aquatic animals. There is a lot of people who frequently visit the boundary waters. People also own businesses on and around the waters. If you start to mine for precious metals you will destroy so many great things. Sulfide ore mining will kill thousands of innocent animals. It will also turn the water yellow and pollute the little wilderness we have with acid and lower the pH so fish will die. The mining will bring jobs but it will also destroy many family businesses. Tourists won't come to visit because the wilderness won't be there. You think you will get profit from precious metals but it's not worth destroying so many great things. If you mine their I guarantee you will regret it.

Dear Federal and State Agency Leaders: Firstly, I want to express disappointment that the ninety day comment period has not been extended. Ninety days is insufficient for proper public analysis of this SDEIS given its length and complexity. I concur with the Tribal Comments and Supporting materials related to hydrological monitoring and models conducted on the Partridge River. I concur with MDO #1 that "the natural variability in precipitation would be more adverse than reported in the SDEIS." It appears that these models to again quote "characterize the groundwater hydrologic system as moving an unrealistically small quantity of water." Predications of future water quality cannot be based on flawed statistical data related to current water quality. The agencies response states that if "actual NorthMet Project Proposed Action effects were found to be higher than predictions that steps could be taken to reduce those effects." What these steps would be needs to be specified. I request that the SDEIS needs to be redone to accurately reflect quantities of water in this hydrological system. Polymet's proposal would destroy 913 acres of high-value wetlands in the St Louis River watershed according to the SDEIS. The proposal would indirectly affect up to another 7,351 acres. There is NO PLAN to compensate for these thousands of affected wetlands. Additionally any compensatory mitigation, an undefined term, does not affect the St Louis River watershed or Lake Superior resident. As a citizen of the Lake Superior Basin, I believe that the Section 404 permit must require "compensation" for loss and injury to wetlands in the Lake Superior Basin. Additionally the SDEIS reveals that PolyMet would not build a reverse osmosis plant for water treatment at the mine site for approximately 40 years. Contaminants in the permanent waste rock and tailings will require treatment for hundreds of years, and admittedly mine pit pollution would continue in perpetuity. The mine itself will only be in operation for 20 years. It is extremely unlikely that the PolyMet Corporation would survive the years that are needed to mitigate this pollution. Costs and a plan necessary for funding this treatment must be sufficiently developed and provided to the public. The SDEIS should explain exactly what would ensure how the treatment of mine pit pollution will be funded for hundreds of years. Sincerely, Chelsea J. Helmer 302 Hawkins St Duluth, MN 55811 (218) 341-4407

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Chely Tverbeg 4294 Munger Shaw Rd Cloquet, MN 55720-9252 (218) 591-4750

Dear Ms Fay, Dear Federal and State Agency Leaders: In the SDEIS from PolyMet, it is claimed that the tailings piles resulting from the mine project won't cause pollution(p5-159- However, this unlined tailings site will be on top of the existing LTV tailings piles, an area exceeding two square miles. The tailing site already leaks pollution. Now there will be even more toxic tailings added, and they will be there forever. Polymet claims that all but 21 gallons of seepage per minute (out of 3,380 gal. per minute) will be contained via pumps. That is a 99% collection rate. Nowhere is there an example of this almost perfect result at the edge of an unlined tailings pile. Simply saying it will happen does not mean that it will. As with many other points in the SDEIS, PolyMet makes claims that are not backed up with hard evidence or scientific review. Nor do they explain what will happen when PolyMet is no longer there to keep the mechanical form of reclamation going - some 50, 200, or 500 yrs. down the line. The SDEIS needs to be redone to analyze water quality outcomes/risks IF the tailings pile collection rate is not what PolyMet projects. It also needs to detail Polymet's financial guarantee to back up its claims Sincerely, Cheryl Dannenbring Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803 218-730-9973

Dear Ms Fay, Dear Federal and State Agency Leaders: Dear Lisa Fay, EIS Project Manager: I am writing regarding the US Forest Service's willingness to accept Land Exchange on behalf of PolyMet. The Forest Service claimed that the purpose of a land exchange was to unify ownership of federal lands so federal forests would not be on top of mineral leasing. But the proposed land swaps do not fill that purpose. Almost all of the land proposed for the swap have split ownership and severed mineral rights. (SDEIS, p. 3-163) In other words, the land swap will allow PolyMet to take lands from the Superior National Forest—lands currently available for multiple-faceted public use—wildlife habitat, forestry, and recreation—and turn them into a single use (mining) parcel. It is not the Forest Service's job to make land available for a foreign corporation's economic benefit. I ask that the proposed Land Exchange be rejected since it does not serve a public interest PolyMet should have to find lands where the public would have unified ownership with no split mineral leases to sell off. Sincerely, Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803 Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803 218-730-9973

7548

Dear Ms Fay, Dear Federal and State Agency Leaders: In 1997 the MNDNR and the MNPCA, along with several other agencies developed a Minnesota Wetlands Conservation Plan. To quote from this project: "The goal for wetland conservation in Minnesota is to maintain and restore the quality and diversity and increase the overall quantity of wetlands in the state . . ." According to the DNR's own document, the benefits of wetlands are many. They include: erosion control, fisheries habitat, flood control, ground water recharge and discharge, natural filter for pollution, rare species habitat (almost 50% of threatened or endangered species in the US live in wetlands), general wildlife habitat, recreation, sources of income and food, and educational opportunities. Being aware of these critical roles that wetlands play in the ecology and culture of Northern Minnesota, I am extremely concerned about PolyMet's proposed impact on such lands. By its own admission, PolyMet will destroy 913 acres of wetlands directly and another 7,351 acres will likely be destroyed due to fragmentation, pollution and changes in hydrology. However, the Polymet's EIS details no plan to mitigate this huge loss within the Lake Superior Basin. Furthermore, the Army Corp of Engineers has no record of requiring wetland compensation or mitigation after a project is built. Polymet's SDEIS shows a disregard for the ecological and public value of wetlands. I ask that the EIS be deemed unacceptable and that the DNR does not permit the mine on the basis of its own stated goals for preservation and improvement of wetlands in Minnesota. Sincerely, Cheryl Dannenbring Duluth, MN Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803 218-730-9973

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: There appear to be many inadequacies in Polymet's new EIS, with limited plans for protecting ground and surface water topping the liSt The mine will open a pit reaching below the presently used aquifer, thereby making a permanent connection between all geologic zones that are mined through. There is no plan to create a permanent barrier from the toxic mining byproduct to the water, either during mining or after by-product disposal. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: Sincerely yours, Cheryl Dannenbring Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803

10931

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: Polymet's SDEIS, section 3-40 paragraph 2 states "There is no mine plan for any material that lies outside of the proposed open pit; as such, mining material located beyond the proposed pit outline would be evaluated as appropriate if proposed in the future." As in many sections of the EIS, this vague language opens the door to future environmental assaults without having a plan 'on the books' to deal with those eventualities. This EIS should cover all possible known variants of the mining plan, not just the one proposed at the time being. I am concerned that the mining company could start with a small operation and thus be grandfathered into a larger operation without needing to go through all review processes. This is only one of many shortcomings that has become clear on the public's scrutiny of this document. The SDEIS needs to be redone to address all such concerns, without the 'smoke and screen' language it currently employs. Sincerely, Cheryl Dannenbring Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803 218-730-9973

15263

Dear Ms Fay, Dear Federal and State Agency Leaders: The amount of water that the proposed PolyMet mine would require for operations is of great concern to me. On pg.3-102, paragraph one states that 'make-up water' drawn from Colby Lake would average 275 gallons per minute. (and we, as good citizens, worry when our taps are leaky.). After twenty years of use, this would mean removing a significant portion of the lake's total volume. No study was done to measure the effects of this lake drainage. For instance, the Whitewater Reservoir could become tainted from the City of Hoyt Lakes' sewage discharge. Any number of unintended consequences could arise from using such large volume of water, and polluting much of it to the point that it cannot be discharged from the plant. Furthermore, as with the issue of pollution, the effects will be greatly multiplied with each additional mining operation permitted for the Arrowhead region. I believe the people of Minnesota should have priority use of our waters, not foreign mining companies. I reject the 'we'll deal with that if it arises' solution which seems to be an integral part of this SDEIS. Plans for such eventualities must be in place before the operation is permitted. Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803 218-730-9973

57152

ES-24, paragraph 3 states that the Hydrometallurgical Residue Facility will be capped and double-lined for the duration of the estimated 500 years of toxicity. No know man-made structure can retain its original and viable properties for such a length of time, especially concrete or geomembrane, which are known to degrade. Thus any claims which count on this system to contain polluted material must be discounted. Until this very crucial point is addressed in a scientific, valid manner, the project should not proceed. Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803

57153

I am wondering how the MN EPA can approve and permit the Polymet copper-nickel mine (or Twin Metals, or any other perspective operation) when many MN water ways are already polluted by old iron mining operations. The Clean Water Act clearly states that no new source of pollution can be added to already polluted water. PolyMet's permit must be denied until old pollution problems are dealt with. Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803

57154

Mining proponents keep claiming that sulfide pollution will not be a problem due to the low percentage of sulfide in the rocks (less than 1%). The Brohn Mine (SD) produced acid mine drainage, although the same claims had been made. The company declared bankruptcy (after done extracting) and the site was declared a Superfund Site in 2000, to be treated perpetuity at taxpayers expense. The same thing at the Zortman-Landusky Mine in Montana. Thus all "estimations" for pollution assumed by the SDEIS must not be accepted. Simply saying Polymet won't produce water pollution does not make it so. Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803

57155

I am concerned about pollution from the open pit Polymet mine. There has been no study that proves or disapproves that water pollution will migrate via natural permeability or existing fractures. Any pollution could dangerously seep into the local fresh water system. (ES-5 and 4-43 through 4-44) Until independent studies are conducted (not connected to the agencies authorizing the SDEIS) regarding water seepage (sub-terrain water migration) to give a clean understanding of where pollution may travel, the SDEIS should not be approved. Cheryl Dannenbring 1850 Vermillion Rd Duluth, MN 55803

Dear MN DNR: What I would like to see in Polymet's EIS draft, is: 1- a clear explanation of how they are going to prevent pollution from leaking out of holding ponds that are designed to leak. 2- how they plan to keep the leaking pollution from seeping into surface and groundwater. 3- whether accurate water samples are being taken now to determine the pre-mining sulfate levels in surrounding ground and surface water. 4- whether Polymet is making financial commitments to be responsible for 'clean up' of pollution that appears 20, 50, and 100 years from now. (as it is known that this type of pollution often takes that 20 years to manifest itself-hence the need for accurate pre-mining samples-and that it can be expected to linger indefinitely. 5- whether they will be held responsible for restoring deforested areas with the biodiversity that presently exists, and continue to finance that restoration until the forests regain their former health. 6- whether the economic impact of the loss of tourism-related jobs, jobs related to our present resources of clean water, forests, and wilderness, have ben figured into the scenario. I am sure there are many other areas I would like to see addressed in the EIS, but these seem pretty basic. Since I don't believe heavy-metal mining has any justification in comparison with maintaining our clean water, questions regarding water should be the priority. Sincerely, Cheryl Dannenbring 1850 Vermilion Rd Duluth, MN 55803 218-730-9973

Mar 12, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. AS A FORMER STOCKHOLDER in Polymet, I felt great pangs of conscience when I learned of the potential for disastrous natural consequences to sulfide mining. I have several friends who still have a financial stake in Polymet's future, but their small economic loss is nothing compared to the threat to the clean air and water which is Minnesota's best legacy. For them it is a small economic game; for everyone else, it spells foreboding and the future loss of a healthy environment is NO one's gain. I sold my stock, not wishing to participate any longer in this dangerous risk. PLEASE DO NOT APPROVE THIS. It is time for the world to learn to live on less. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Cheryl Gerth 10122 Uplander St NW Coon Rapids, MN 55433-4655 (763) 862-8050

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

During this public comment period I would like to support the issuing of permits necessary to allow Polymet to begin mining in Minnesota. Northern Minnesota has been dependent on mining for over a century and another employer would be a great benefit to the area. Our young people need another employer in the area to help them be able to make this area their home for life. This area has seen far too many layoffs and the mass exodus of young people and now we need a reason for them to say or come back. As a small business owner, the higher paying jobs would bring customers to my business. With more business comes the possibility of having to hire more employees and hopefully lower the unemployment rate in northern MN. I am proud to be an investor in Polymet and I have confidence in the company that they will do whatever it takes to run a clean operation now and in the years to come. Sincerely, Cheryl J. Olivanti 727 15th St N. Virginia, MN 55792

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Cheryl Storm 6068 Murphy Lake Road Brimson, MN 55602

March 11, 2014 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Re: Protect Water from PolyMet Dear Ms Fay, I study Environmental Science at the University of Missouri, which is where I first heard of the plan to mine sulfide ore in northeastern Minnesota. Naturally, the consensus of the class was one of concern. Though I cannot speak for my peers, I would like to express to you why I think sulfide mining in this delicate area should not be approved. The Superior National Forest is home to many plants and animals, including two endangered species and 11 rare species. It's also the largest designated Important Bird Area. The mine would dig up roughly 1000 acres of peat and bog but its effect would be felt for more than 4000 acres. These areas will be difficult to restore and monitoring plans in these areas is decidedly insufficient. Downstream from the PolyMet site are wild rice beds, which are sensitive to sulfates and will die at even low levels. Much of my concern stems from insufficient or inaccurate information provided by PolyMet. There was very little information about the water treatment systems that would be used. How will it be paid for in the years after the mine is profitable. Will taxpayers be held responsible for the treatment costs. The SDEIS also mentioned that the cut off wall would extend down to the bedrock, but what will they do if there are cracks in the bedrock. The SDEIS also does not include information about potential influence on the endangered species in the area. Those in favor of the mine claim it will boost the local economy and create jobs, but is there no middle ground between jobs and environmental protection. PolyMet boasts the creation of 360 jobs and others that wouldn't be local, so I fail to see how that will help a great deal. I feel certain that transitioning to wind, water, and solar energy could produce more jobs than that while protecting the future of the environment. Do we want to leave a legacy of pollution and expenses for future generations. Or could we give them a beautiful, healthy national forest that provides numerous ecosystem services. Approving this proposal by PolyMet is an unnecessary risk that will surely result in damaging ecosystem, polluting water, and further endangering fragile species in the area. Sincerely, Cherylyn Kelley 2500 Old Highway 63 South (816) 510-7780 [HYPERLINK "mailto:KelleyCh@Missouri-edu"](mailto:KelleyCh@Missouri-edu) "KelleyCh@Missouri-edu"

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Cheyenne Kopp Saint Cloud, Minnesota

Chiara Race

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Chiara Race Eagle Bend, Minnesota

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, chiara testi via nazionale 980 s. gemignano di moriano lucca, ot 55100 IT

Chipper Johnson 19892

I have reviewed the draft EIS and believe PolyMet has done a great job addressing the issues. I support this project. Peter G. "Chipper" Johnson, PE President Hoover Construction Co.

Please don't let Polymet take our state's true legacy away from the people who live here. What a dreadful shame it would be for corporations from other countries to damage our beautiful state for short term gains. Short term gains with disastrous long term consequences Nature that is timeless and rewards each generation with its lessons as well as guides us towards a healthier earth and more enlightened future: this is what we stand to lose. No amount of money can possibly be worth what would be lost. Please close the door to the Polymet future and we can proudly share in this beautiful state that we are lucky to live in Very Sincerely, Christian Langheinrich 5032 Bloomington Ave Minneapolis, MN 55417 (612)867-6903 Choochkarton@gmail-com

Lisa Fay, We are writing to submit a comment on the Supplemental Draft Environmental Impact Statement (SDEIS) for PolyMet Mining's proposed NorthMet project. First, we want to express our confidence in your agency to thoroughly evaluate the project and its ability to mitigate potential environmental impacts. We trust the multiple State and Federal Agencies involved in preparing the document. Minnesotans trust the DNR to study copper-nickel mining and keep our communities safe. We believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. The environmental review process has been lengthy and thorough; the supplemental draft EIS addresses potential environmental impacts and how to mitigate them. Additionally, we'd like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out – all the more reason to support it. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country. Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium, and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. We cannot afford to miss this job opportunity. This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs. Copper-nickel mining will contribute to the local and state economy at a time when we really need the jobs and economic benefit. Copper-nickel mining will provide millions of dollars in local and state taxes to support our communities and education system. Enough is enough; let's get on with permitting this mine. We want jobs and it's time to put people to work. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Based on my review and the level of detail included in the draft EIS it appears that a thorough evaluation of the project and potential impacts has been completed. We live and work in the area that will be affected by allowing PolyMet to get the needed permits to begin operating. We feel that PolyMet has done their due diligence in providing a safe environment for our family and other families in the area to live in. We would like to see the permits needed to begin production provided to Polymet. Sincerely, Ronald and Christine Adams Makinen, MN 55763

I was born and raised on the Mesabi Iron Range in Chisholm, MN. It was a fine town to grow up in and has been through the highs and the lows that come with any mining operation. I've owned businesses across northern MN for the past 40 years and I have owned recreational land on the Littlefork River north of my hometown since the 70's. I am pro-business and I understand the need for jobs. But I also have a great love and appreciation for the land and waters of our famous "Up North". The costs for these copper mining jobs will come at far too high a price for all of the people of MN. The industry's track record of environmental damage is long and damning. Too many abandoned mines have been left for other state's residents to clean up at obscene cost levels. Furthermore, this mine is located much too close to the jewel of northern MN- the BWCA, which is a treasure we cannot risk to lose. On its eastern flank lays Lake Superior, the continent's largest source of clean water-which in time may prove to be far more valuable than all the copper below our state's surface. From a business economics viewpoint I'm surprised by how little study has been done on this project. With only 350 jobs being proposed over 20 years and with environmental reparations costs projected to be in the hundreds of millions-why are we even considering this one-sided fiasco of a proposal. I, and many other businessmen, would be happy to propose far less damaging options for 350 jobs at a fraction of the cost to the state that these will become. Please deny PolyMet's permit until a far safer and less intrusive methodology is found and verified to work. Chris Bangs 8846 Pheasant Run Rd Woodbury, MN 55125 Sent from my Verizon Wireless 4G LTE smartphone

DNR I urge you NOT to accept the SDEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model In conclusion it is my opinion that the few hundred jobs and monetary gain for a corporation is not worth the perpetual damage a

Dear DNR staff, Having reviewed the NorthMet proposal and followed much of the reporting on this issue, I would like to offer the following comments: The EIS states: "Mining would be conducted in three open pits. The East Pit and West Pit would be mined simultaneously through the first 11 years of the mine life. Mining would cease at the East Pit at approximately year 11 and continue at the West Pit until year 20. The Central Pit would be mined between years 11 and 16 and would ultimately be combined with the East Pit." This is not a long-term jobs program. It only delays the need for development of good, new jobs in that part of the state. We would not offer to have a nuclear waste storage facility in Minnesota just for the jobs - we would want the strongest assurances of safety and even then we might see the risk as too high. And such jobs would last for centuries, not 11-20 years. This is not a safe plan. The plan does not seem to adequately address the consequences of failures of primary water protection mechanisms. Numerous disasters in the US and elsewhere have shown that these systems cannot be trusted to behave as promised, or even as designed. As someone with a child who lived through the earthquake and unnecessarily disastrous Fukushima consequences in Japan, I don't want other parents to have to worry about their children's safety due to the poor decisions of others. Even now, my son (still temporarily in Japan) has to worry about the food he eats. I urge you to take the long view and turn down this application. In addition, this mine would damage the tourism business, including hunting and fishing, reducing long-term jobs in the region and our sense of being connected as Minnesotans by our commitment to our beautiful land and clean, productive waters. The proposed mine is a bad deal for Minnesota, even economically. As someone who is very concerned about the future of middle-class jobs in this state, I urge you to take a pass on this flash-in-the-pan. The EIS states "The monitoring of water, wetland, vegetation, and other resources would continue. Adaptive management would be implemented, if necessary, to protect the environment for the long term." There are no examples of good environmental outcomes related to copper-nickel mining. The checkered history of environmental care on the part of PolyMet's parent company has been terrible. They have not lived up to their promises and they do not inspire trust. I urge you to be the trustworthy ones, and turn this down. As a parent of three young adults who will have to live with the decisions you make, I strongly urge you to do what is best for the future of our land, water, and people. Do not approve the PolyMet application. Sincerely, Christine D. Bremer, Phd 6001 Ewing Ave S Edina, MN 55410

Chris Chiappari

16972

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Chris Chiappari 1937 Fremont Ave S. #2 Minneapolis, MN 55403

Chris Commers

57229

How do we sustain water treatment for 200 years? 500 years? Who will pay for this? I'm trying to find answers to many questions unanswered in the PolyMet proposal to exploit the resources NE of Hoyt Lakes, MN. At this point the DNR should deny the permit application. Do we Minnesotan's really want Glencore (parent co of PolyMet) to bring their show here? Please reject SDIS! Chris Commers 14380 County Road 51 Norwood, MN 55368

Chris Dahlberg

18175

I'm Jim Hofsommer from Aurora, Minnesota. And I'm ceding my time to Chris Dahlberg, St. Louis County commissioner right where this project is taking place. Good evening, or as we say in Finish (speaks foreign language). My name is Chris Dahlberg. I am St. Louis County commissioner. I'm also the current chair of the natural resource committee. St. Louis County is on record of supporting precious mineral mining. I'm a Finlander-Swede. I'm a fourth-generation Minnesotan. My daughter there is in the back, Mia O'Leene. And one of the things is we have a long tradition of mining up on The Range, and families that are involved in that. And so my great-grandfather Andrew Maki was farming up there 100 years. What I want to say is that it's not only a workplace and play place, but it's our home. And we take care of our backyard, including the environment. And we support mining. We have a process here, it's a solid process, science over emotion. The process needs a resolution. It needs a decision. The reality is that there is some here that just oppose mining. Period. No matter what we say or prove, they're against it. I fear that this process is becoming unreasonably lengthy and burdensome. It has taken longer to get a permit for mining on the Iron Range than it took us to get a man to the moon. And that was 1960's technology. We are allowing nations to hand us our own lunch. We need to unleash America's great workforce, including such people as our building and trades out there and jobless today. In my own district we have a foundry called ME Global. And recently they had an expansion. Great in my district. 50 new jobs. And not only that, how would you like to have an expansion where you had the business ready to go into the future years in? But you know the sad part where that turns, all of those grinders that they're making in that foundry are going off to Mongolia, China. We are letting countries such as China and India take us over. And we need to turn this around. So I'm asking today let's get the permit issued. Let's get jobs going in Minnesota. And let's get precious mineral mining going on the Iron Range for the next 100 years ahead of us. Thank you.

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Chris Davies 7087 Eldorado Ct Cannon Falls, MN 55009-5255

Chris Engel

18294

My name is Chris Engel, E-N-G-E-L. My address is 11615 Northgate Lane, technically Pine River, or Cross Lake, Minnesota. We have owned property in central and northern Minnesota for many, many years. I have traveled extensively in the Iron Range area, and particularly as kids. I spent time in the Babbitt/Ely area, and have studied the nearly 2,000 pages of the SDEIS. And for the greater good of Minnesota, including the propagation of new jobs and a more vital northern Minnesota economy, we are absolutely in favor of proceeding with the PolyMet project. We believe it will be a great benefit to the State of Minnesota. Albeit, maybe not to the level of shale oil in North Dakota, but in fact Minnesota needs to start generating our own jobs and generating our own new economy, and revitalizing that northern part of Minnesota. I think it would be of great benefit for us to do it in-house. I think that the Minnesota DNR, Army Corps of Engineers, along with the US Forest Service, and along with the EPA, have done an extensive study. And I believe from what I've read and what I understand, I believe that the project can be done safely and with a minimum amount of negativity towards the environment. So thank you.

Dec 10, 2013 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I would like to express my opposition to the Polymet and Twin Metals mine development being considered near Ely. The proximity to the federally-protected Boundary Waters Wilderness makes this project clearly and simply too risky. Given the track record for this type of mining and the proximity to the BWCAW it would be unconscionable for the state of MN to allow this development to proceed. Sincerely, Chris Fastner 303 Second Ave NW Aitkin, MN 56431

Chris Fleege

47663

I fully support this project and I ask for the state and federal regulators to approve this and move it to the next level. I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations. As a person who lives, works and plays in the area, I understand the need to balance use of resources like minerals and preservation of resources such as water and air. I feel this SDEIS lays the proper groundwork for developing an environmentally and economically sustainable project and I wholeheartedly support it. Chris Fleege 4031 Regent Street Duluth, Minnesota 55804 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

To Whom It May Concern, I am resident of the state of Minnesota. I oppose the development of the NorthMet Mining Project. The potential impact on waters that flow into the Boundary Waters Canoe Area as well as into Lake Superior, one of the largest bodies of fresh water is too large to risk. No amount of money can guarantee this protection. In fact, every other mine similar to the one being proposed by PolyMet has left pollution in its wake. Other mines of this nature have destroyed the water habitat and left the land worse off than before it was mined. Even in a water rich state like Minnesota, there are already serious problems with our water table depletion. We cannot risk this incredibly valuable fresh water for a mere 360 temporary jobs. The jobs are here until the mining company depletes all the metals and moves on to the next one. The 5-379 million people of our state and the over 250 million people of our nation far outweigh the 360 permanent jobs created by this mine. This mining company will do what many other companies have done. They will take the resources and destroy the land and water in its path and then leave when they have nothing left to take. This company has no allegiance to our state, our resources, the animals that reside in the area or our people. They care about the money and their bottom line and their shareholders. We need to protect the BWCA and Lake Superior as if they are the precious resources that they are and this means keeping PolyMet away. Please deny PolyMet the right to mine. The costs outweigh the benefits. I oppose the North Met Mining Project. Thank you, Chris Gordon 1240 Thomas Ave Saint Paul, MN 55104 651-338-1493

Chris Haenisch

58104

I understand that we need to mine to get resources and it's important to find safe and sustainable ways to do that. This proposed project does not sound safe with the 500 year hitch to contain the pollution. What would have happened is the big flood last year occurred after the mining had started, or what will happen when the next 100 year flood occurs. I think Polymet will declare bankruptcy and walk away from any responsibility like they have in the past. I will not support any of the politicians who are supporting this effort.

Chris Hanson

I don't think the mining project is worth it because it can damage the water. It can also potentially take away camping and canoeing areas. Being an outdoorsy person I would hate for it to damage or take away any of that because those are things I love to do when it's nice. Thanks for taking your time to read this.

Mar 6, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, We are looking at hundreds of years-by PolyMet's own reckoning-of recovery needed in order to re-gain the water quality that we now have This is not something we can risk, not a resource that we can replace in any way. Yes, the lure of jobs is strong, the needs are great. And, the jobs that would be created are not from a long view. Not from a place that is sustainable, even for mining in the long run. Please protect us from that place in all of us that wants a quick fix for our economy. Help us stand for something that looks beyond a few decades and on into preserving a treasured area of wilderness that may not ever recover from this meddling-most certainly not in our lifetime or many generations to come. Be bold. Be wild. Protect what speaks to our greater selves. This is not worth the risk. Thank you. Chris Heeter Sincerely, Chris Heeter 1835 Meadowview Rd Bloomington, MN 55425-2455 (763) 479-3954

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Chris Leier Minneapolis, Minnesota

Chris Lian

To whom it may concern - As a citizen of northeastern minnesota I am vehemently opposed to copper mining. The fact that waste water will need to be treated indefinitely(never) to avoid polluting our waters is a very scary proposition. This project should get rejected due to that fact alone. This is a bad deal for minnesota not only environmentally, but also from a business standpoint. Polymet plans on processing the metals in another state costing jobs in minnesota. This project threatens tourism and property values in the region. I purchased a lake cabin a few years ago and refused to look at property anywhere near this area because of the extreme environmental threats, machinery noise, etc I know I'm not alone. Lake Vermillion has very low calcium levels making it unlikely zebra mussels will have the ability to colonize in its waters. Calcium could leech into this lake via numerous waterways tied to the mine allowing calcium levels to increase to a level that zebra mussels could possibly thrive. This type of mining has never been done safely. There will be contamination. All of this water flows into the St Louis River watershed and into Lake Superior poisoning the water I and tens of thousands of other people drink. Th risk of an environmental catastrophe vs. the creation of a couple hundred jobs is a risk minnesota can't affoRd Please protect this precious area of our state and our basic need of clean drinking water and REJECT this irresponsible mining project. The average Minnesotan is counting on it. Christopher Lian 308 Kenilworth Ave Duluth, Mn 55803 218-724-4763

Thursday, March 13, 2014 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Subject: Send the PolyMet Mine SDEIS Back for Further Analysis as "Incomplete" Dear MDNR Division of Ecological and Water Resources EIS Project Manager Lisa Fay, Regional EPA Administrator Susan Hedman, USACE Regulatory Branch Chief Tamara Cameron, USACE Regulatory Program Manager for Mining Projects Douglas Bruner, and USFS Deputy Forest Supervisor Timothy Dabney, As someone who values clean water and as a former resident of northern Minnesota, I have serious concerns about PolyMet's plans to mine copper-nickel (sulfide) ore in northeastern Minnesota wetlands at the headwaters of streams flowing into Lake Superior as described in the Supplemental Draft Environmental Impact Statement (SDEIS). I have grave concerns about this project's potential impacts on the region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I am also concerned that this risky proposal will set a precedent for how other mines in the Upper Great Lakes will be evaluated, including some within the watershed of the world-renowned Boundary Waters Canoe Area Wilderness. "Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method." - Theodore Roosevelt This mine proposal does not meet the highest and most protective standards for our water and I urge the Environmental Protection Agency (EPA) to send the SDEIS back for further information and analysis. The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for—information that is necessary to evaluate the environmental effects of this proposal. I also urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. "Our government is like a rich and foolish spendthrift who has inherited a magnificent estate in perfect order, and then has left his fields and meadows, forests and parks to be sold and plundered and wasted." - John Muir The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest Not surprisingly, acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. "As we peer into society's future, we—you and I, and our government—must avoid the impulse to live only for today, plundering for our own ease and convenience the precious resources of tomorrow. We cannot mortgage the material assets of our grandchildren without risking the loss also of their political and spiritual heritage. We want democracy to survive for all generations to com

Thank you for the opportunity to provide my comments describing what I think are several substantive deficiencies in the Polymet SDEIS. These are my own comments prepared after reviewing the SDEIS.

1- Land Exchange. The proposed land exchange is key to the overall project. I believe there are several problems with the land exchange that are either not addressed or are addressed inadequately in the report.

a. The map in the study does not seem to accurately reflect the Hundred Mile Swamp. It does not show the full dimensions of the area and the drainage through Langley Creek. This has several implications for the overall SDEIS. The main one of course is that there is a connection from the Polymet project to the Boundary Waters Canoe Area Wilderness as Langley Creek flows through the Dunka River to the Kawishiwi and on to Birch Lake. Water monitoring and remediation at Langley Creek is not mentioned in the study. The fact that this has been missed, intentionally or unintentionally, call in to question quality of the entire SDEIS. The connection to the BWCAW watershed should also mean increased federal scrutiny of the project.

b. The Hundred Mile Swamp which is proposed to be exchanged for is an important wetland supporting wildlife and plant life. The various parcels proposed to be exchanged for the Hundred Mile Swamp are not the same quality of environment or even equivalent wetland. Therefore if the proposed exchange were to go forward, as project runoff flows into the wetland, the result would be an overall degradation of the environment in Minnesota.

2- Air Quality. The portion of the SDEIS that considers air quality impacts considers only direct effects of air quality from the mining project from grinding and tailings pile duSt It does not consider the effect of power generation needed to operate the plant in this area and what effect that would have on the Superior National ForeSt Certainly the amount of power needed to operate this project for Polymet and for expected use of excess processing capacity by Twin Metals would far exceed anything needed for the current population of the area and would have a negative impact on the Superior National Forest and the health of the population.

3- Reclamation. The portion of the study that addresses reclamation states that is “uncertain how long” water treatment would be needed but that modeling shows that at 500 years of treatment, water quality would be within acceptable levels. The section also says that Polymet “would be held accountable”. Later the SDEIS explains, without details, that financial assurance instruments would be created. There are several problems with the lack of specificity in this section.

a. There are currently no financial institutions capable of guarantees extending to 500 years.

b. Polymet could legally declare bankruptcy at any point in time and could no longer be held accountable in any way.

c. Given that the current length of time needed for remediation is unknown, how can any financial assurance be made that could cover any unexpected increase in the amount of time needed for remediation and take into account Polymet’s ability to declare bankruptcy and walk away, leaving the taxpayers of Minnesota to pay for clean up.

4- Unusual Weather Events. The report fails to consider the increasing likelihood of unusual weather events including large volume rainfalls, high winds equivalent to the 1999 blow down, as well as extreme winter temperatures, all of which could cause equipment failures, water runoff surges, and retaining wall failures.

5- Comparative Studies. The SDEIS fails to study the project in the context of other sulfide copper/nickel mines and the overall historical environmental impact as well as the general regulatory compliance history of the companies involved,

I am continually dismayed that our intelligent and technologically savvy society still holds to arcane mineral extraction techniques. This debate is only a replay of the same debate since the inception of environmental impact statement: how much do we need to tweak our outdated mining techniques. Why is there no one in this debate saying we need to develop and implement different mining practices instead of making small changes to outdated techniques. An open pit mine with toxic tailing reservoirs. Really. Is it 1950- If the there is truly the amount of copper and nickel Polymet thinks there is, they should be willing to invest in the research and development necessary to extract the ores in an innovative and environmentally safe manner. Doesn't this also add R and D jobs as well. Chris Mortenson

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. My demand is that a NO VOTE is needed in this issue. How can we continue to trade off our national treasures to allow pollution and to add to a corporation's profit. It is not acceptable to allow this mining for PolyMet Mining Corporation. Just another accident waiting to happen. When our water is polluted we have to then attempt to clean it in order to make it potable. Fish and wildlife die because they have no other access. Our lands have been pillaged and raped by big business. Enough is enough. This is a NO VOTE so Vote NO.. Sincerely, Chris Nelson 1848 Vassar Dr Naperville, IL 60565-9265 (630) 527-0872

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Chris Perry 447 E Sheridan St Ely, MN 55731-1455 (218) 248-1431

Dear Sirs: My name is Chris Rayner in Red Wing, Minn. 55066 (651-388-4447). I am in favor of the Polymet mining operation. I think the State has done a good job in vetting this proposal and now it is time to let the company proceed. People who are against the mining have said someone will have to monitor the water for 500 years. I don't think that is true but let's say it is true. Don't we as a society monitor or test water where- ever people settle I know communities around the world test water on a ongoing basis. Look how towns and cities treat their sewage. I feel that Polymet will operate their mining operation in a prudent manner. Sincerely, Christopher Rayner

Chris Robinson

39220

Dear DNR, The maps are wrong and the environmental impact statement is inadequate until the maps have been corrected. While the true One Hundred Mile Swamp is over 10 miles long and drains out of its east end to the BWCA, PolyMet's environmental impact statement maps draw a much smaller swamp less than 6 miles long that cuts off the eastern portion of the swamp, creating the illusion that the mine and BWCA are not connected. Sincerely, Chris

Chris Spenningsby

18129

Hello. My name is Chris Spenningsby, S-P-E-N-N-I-N-G-S-B-Y, and I'm a resident of Duluth, Minnesota and I support PolyMet Project as outlined in the SDEIS for three primary reasons. The first reason I believe the PolyMet Project should advance to the permitting phase is my faith is in the environmental review process. Our country and in particular our state have among of the highest standards for air quality and water quality in the world, and our regulatory and permitting process works as designed. One example of this improvement is the improvements made in the underground containment in water treatment since the original draft impact statement in 2009. The regulating agencies at PolyMet identified an improvement in the process, tested and implemented this new design and now they're able to reduce the projected sulfate level in the wastewater discharge to less than 10 milligrams per liter, which by the way, is 25 percent -- 25 times less than the standard required for discharging water. The second reason I support the PolyMet Project is that mining minerals in our state under our very strict regulatory control is the ethical thing to do. We have already decided as a society that minerals such as copper-nickel are required for modern conveniences and we've collectively have chosen to produce and use them. These conveniences include indoor plumbing, electricity, as well as the 64 pounds of copper and 32 pounds of nickel in a Toyota Prius. If the PolyMet Project were not to advance, the world-wide demand for copper that fuels our improvement in the quality of life will still be filled but not under the strict and open environmental review process we're seeing here tonight. Finally, I support the PolyMet Project for the economic benefits documented in this study by the University of Minnesota-Duluth referenced in the environmental impact statement. Economic development in this area creates a future where young people can stay in this area and afford to raise a family and it's not only for the workers and mine, but supporting contractors and those who operate businesses in the area. The economic benefits will also trickle outward to areas such as Duluth, where I live, and down of St. Paul in the form of taxes and because of the strong environmental regulations and oversight in our state, these jobs can exist with the existing jobs in our tourism sector. I would like to thank the DNR, Army Corps of Engineers, US Forest Service, as well as everyone who showed up tonight. In the words of Thomas Jefferson, "Wherever the people are well informed, they can be trusted with their own government." Thank you.

Chris Swensen

I am opposed to any new mining in Northern Minnesota. I believe the land should be preserved. Chris Timm-Hughes

Chris Vreeland

5996

I believe the co-agencies have done a very complete job on the EIS. You can't determine all the problems, but I believe they have all the tools in place to take care of any problems that come up. Citizens of Hoyt Lakes have coexisted with mining for 60 years with no problems and with very good working relationships with the companies. I believe the same will be true with Polymet. We need to move forward with precious mining, these are metals we use every day and we need to mine them in a environmentally friendly way. I believe Polymet will do it the right way and this EIS proves that. Sent from my iPad

Chris Waltz

18242

My name is Chris Waltz. That's spelled C-H-R-I-S, W-A-L-T Z. And my question would be specifically on EIS report. I'm wondering, and I'm not fully sure about the process, but I'm wondering why the MPCA is not involved in that process, and specifically were they excluded from that process? And then the other agency that I was surprised wasn't involved in that process was the US Fish & Wildlife Service, so I'm wondering why those two organizations weren't in that draft EIS report.

18260

My name is Chris Waltz. I had a question specific to the DNR. I'm wondering what assurances they could provide where tailings and other pollutants from the copper-nickel mine would not flow into the Boundary Waters Canoe Area? I didn't feel that was fully addressed in the EIS statement or in at least the executive summary that I read. So, some clarification there on, you know, what pollutants, if any. So far it doesn't seem like any, but just assurances that pollutants won't be running into the Boundary Water Canoe Area. And then a follow-up to that is if the potential would exist that pollutants could run into there, could we have assurances through the financial assurances mechanism to properly fund those pollutants, if they do discharge into the Boundary Waters Canoe Area?

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Christeen Stone 2727 Hazelwood St Saint Paul, MN 55109-1158 (651) 777-4864

Christey Sharpshair

41617

Hello, My name is Christey Sharpshair, and I'm taking part in a conference at Gustavus University concerning environmental justice. I have heard about the proposed plan to possibly build and maintain a mine in northeastern Minnesota, and I would like to say that I am against such a proposal. After what I have learned of the effects this project will inevitably have on the environment-and eventually the people-the negative consequences far outweigh any positive benefits on the economy the project might have. Please look further into ecological ramifications and weigh these damages with the benefits carefully. Again, I propose a stop to this mining project. Thank you so much for reading. Christey Sharpshair

Christiaan Petersen

40273

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Christiaan Petersen PO Box 66926 St Petersburg, FL 33736 US

Christian Nelson

37313

To Whom it May Concern, The proposed Polymet mine has unacceptable risks and therefore should not be approved. 1 generation of jobs is not worth 19 generations (500 years) of clean-up efforts. Not only is this just outright wrong, it's likely not feasible that the money will exist to cleanup something whose value was cashed in 480 years ago. A time-span of 500+ years means catastrophe is not a question of 'if', but rather 'when'. Without clean water an area is uninhabitable. Forever. The risks are simply too high and the gains too small and for too few people. Sincerely, Christian Nelson 910 25th Street Cloquet, MN 55720

Christie Jarmey 18339

Hi, my name is Christy Jarmey, C-H-R-I-S-T-Y J-E-A-R-M-E-Y (phonetic). I am a Hibbing native, born and raised in Hibbing and I had to move away from Hibbing to get an education and job. I was gone for about ten years and was able to get back to the Hibbing area, in northern Minnesota. The Supplemental Draft EIS provides a good portrait, a good picture of the potential environmental and economic impact of the project, but it doesn't soften the impact the project will have on the communities and on the families, and especially the educational programs throughout northern Minnesota. It (phonetic) has been working hard to allow educational opportunities and to allow residents to stay where they live and play in northern Minnesota; something that I could not do. Many of our educational opportunities, such as the science and engineering festivals, the after-school programs, the new post-secondary educational opportunities that are being developed in northern Minnesota are being funded by the area's various businesses. The PolyMet project will provide substantial additional funding to our area's educational programs, which will help the whole state. PolyMet has already been engaged in helping set forth various educational programs for the last five years. This has included the area's new engineering program, a new post-secondary program that just started in Virginia, Minnesota that enables or that allows our young people to stay in northern Minnesota. PolyMet is good for the state and I support this project and the Supplemental Draft EIS. On another note, I have a cabin in Forbes, Minnesota, which is just immediately downstream of the tailings basin. Our lake is full of wild rice. The whole area is full of wild rice. Our cabin neighbors go out and harvest wild rice on the lake and I have friends that come to the lake and harvest wild rice on the lake, before they even knew that I was on the lake. The reason I want to point this out to you is that I want to point out that responsible mining and clean water can become hand in hand.

Christie Milczanowski 58020

I support the no action alternative! The mining of copper/nickel sulfide ores is a toxic type of mining that puts our communities environment and local economies at risk... long after the profits' are spent. Please extend the no comment period to 180 days. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

As a resident of Minnesota and owner of cabin and 94 acres of land in Fairbanks Township I can only say: there has not yet been a copper nickle mining operation that has not severely polluted the surrounding area of land and water supply. Why not wait. Wait until the science has proven itself elsewhere. Those minerals will not be worth less for waiting. In fact, they will probably be worth more. Talk is cheap. Mining companies want to mine. The people who run them are unlikely to be affected by negative consequences. Water seeps. My recently drilled cabin water well is 40 miles from Hoyt Lakes. My daughter and son are joint owners of this land. Don't destroy the future relying on untested science. Thank you, Christie Dauphin 2853 40th Avenue South Minneapolis, MN 55458 1185 Gabbro Road Brimson, MN 55602

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Christina Bellert 17064 Saddlewood trail Minnetonka, MN 55345

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this test PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142). The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction. Lastly, the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I do believe it is important to protect all of our natural resources. Why is one cultures lively hood more important then the others. Native Americans rely on wild rice to supplement their lively hood whether they collect the rice and us it at home or sell it to generate income why is their way to make money not as important and miners. Because there are more miners. Wild rice is a delicate plant and will be impacted by the smallest change in its environment. Not only will Native Americans feel the loss of this plant but there are other impacts on our environment that will result in the lose of this plant. I believe everyone who is able and willing to work should. But we do not have the right to destroy our world to make money. Maybe not everyone can working in the mining industry and live in their home town or town they have grown to love. Maybe workers need to reinvent themselves reeducate themselves for a different career and maybe have to leave the town they love. I would love to live in Ely it is BEAUTIFUL up there but I cannot find gainful employment so I do not live there. I go where I can find work. I even had to reinvent myself because that area I would rather work in the jobs are few and far between. There are areas that and more importantly watersheds that make a greater impact on more then just the area up north. This mini

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Christina Klein Place de l'Europe Esch-sur-Alzette, None 4112

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Christina Munko 1000 Ivy Hill Rd Philadelphia, PA 19150-3232 (724) 594-6948

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Christina Rarick 424 Monroe Ave S Hopkins, MN 55343-8456

Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, After attending the St Paul PolyMet hearing, doing research on sulfide mining as PolyMet itself, and reading some of the environmental sections of the EIS, I am deeply concerned with the risks and inevitable damages that would occur from the proposed North Met project. As a college student, I am constantly thinking of the future and the world that I someday hope to bring children into. I want them to know the untarnished BWCA as I do. I understand that we have a desire to continue to obtain the resources that reside at the proposed mine site, but hope instead we can focus Minnesota's time and energy and commitment on sustainable resources that will continue to provide for us into the future. This mine project is a risk and PolyMet's attempted promise for 500 years of tending to the site is seriously beyond their control- that promise extends farther into the future than our nation's history does into the past. I cannot trust PolyMet and neither can MN. We should not be risking the beauty and purity of the BWCA and the water that sustains many people residing there. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. This earth is not ours to destroy, and many generations to come will look to the decision that is made on this project to determine our commitment to preserving the environment and a love towards them. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Miss Christina Sand 28407 County Road 176 Freeport, MN 56331-9730

Christine

Feb 19, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I grew up in Northern Minnesota near the site of this mine. I understand first hand how dependent the people of that region are on mining as a way of life. That dependency sometimes impedes good judgement as there are not many opportunities to positively impact the economy. Environmental laws exist to protect our natural resources, especially when good judgement is impeded by the prospect of short gain. So I as a former resident of the iron range, and as a current resident of Minnesota and as a US citizen, I get to have a voice on this. These mines represent reckless greed and a complete disrespect for future generations living in northern Minnesota as well as throughout Minnesota. I also urge the SDEIS to fully address the long term financial plan to treat water in perpetuity as well as incorporate a cost benefit analysis which takes into account irreversible impacts to the BWCA. Sincerely, Mrs Christine Beckwith 9243 Avalon Path Inver Grove Heights, MN 55077-4431

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The lack of health impacts in the document from exposure to toxic heavy metal contamination, the inhalation of mesothelioma-causing asbestos fibers, the drinking of acidic water, and breathing fugitive dust and other forms of air pollution is inexcusable. All of these are unacceptable risks which no one should have to bear-either mine workers or those living in surrounding communities or on tribal lands. Given that the chemical body burden of the average adult in industrialized society is some 250 chemical compounds, no one can afford further contamination of their mind/body. This is especially true for children, who suffer even higher concentrations. PolyMet needs to go back to the drawing board on this point. For the sake of human health now and in the future, there should be no hard-rock, metallic sulfide mining in Minnesota whatsoever. Sincerely, Ms Christine Frank 115 2nd Ave S Apt 714 Minneapolis, MN 55401-2060

43524

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. With acid mine drainage expected to be virtually in perpetuity (Roman mines in Great Britain have been exuding acid seepage for 2,000 years), the price tag for water treatment will be practically insurmountable. Once a mine is exhausted, the usual behavior of most mining companies is to file bankruptcy, then cut and run without so much as a by your leave, leaving taxpayers to foot the bill. The EPA is now coping with numerous SuperFund Sites, costing billions in clean-up especially in the WeSt I have family in Colorado, which has 30,000 abandoned mines, affecting 1,300 miles of streams and know first hand what this is like. Additionally, the US Forest Service estimates that there are 20,000 to 50,000 mines on Forest Service land that have negatively impacted 8,000 to 16,000 kilometers of streamS The inevitable pollution of Superior National Forest land and the St Louis River Watershed would be adding to these tragic statistics. My folks reside on the Western Slope of the Rockies. When we drive up into the San Juan Mountains, we can see from the highway the yellowboy staining the streambeds bright yellow, orange, and red from the numerous mines along the way. The notorious Summitville Gold Mine is by far the worst disaster in the San Juans. Originally a shaft mine in the 1870s, open-pit mining of gold was initiated by the Canadian firm, Summitville Consolidated Mining, in the 1980s, using cyanide heap-leach techniques for extracting low-grade ores, the high-grade stuff having played out in the 1950s. The irreplaceable alpine tundra ecosystem was blasted and stripped away, now gone forever. Due to a damaged pond liner, which the sloppy, cheap-ass company failed to have properly repaired, there was a massive release of toxic metals and cynaide along with highly acidic waters into the Alamosa River in 1991- As per usual, the mine owner declared bankruptcy and bolted, forfeiting the \$3 million bond it had put up. Clearly, money is no guarantee of preventing such a cataclysm. With the pH level of 3-0 to 4-0, the water was the equivalent of vinegar or battery acid. Either way, nothing can live in that environment. The result

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Clearly, mining of any sort is a highly energy- and carbon intensive industry especially when it is powered by filthy fossil fuels. Jobs from such an enterprise can hardly be called green. To engage in this type of dirty production is suicidal. We have already passed a crucial tipping point with the extreme loss of Arctic Sea Ice, which has upset Earth's heat balance to such a degree that the temperature gradient between the poles and the equator has decreased. This has resulted in an altered Jet Stream and weather fronts that get stuck in place and last for weeks on end be they heat waves, droughts, or deep freezes. A weakened polar vortex due to human influence on Arctic conditions has resulted in prolonged periods of bitter cold in the temperate zone of North America unlike any previously experienced in the second half of the 20th century. That occurred this year while the globe as a whole just experienced its hottest January on recoRd For the sake of the climate and the security of future generations, there should be no hard-rock, metallic sulfide in Minnesota whatsoever. Sincerely, Ms Christine Frank 115 2nd Ave S Apt 714 Minneapolis, MN 55401-2060

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Please protect Lake Superior. You have influence that most of us do not. Please use that influence to help protect the future for our children, and their children. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Christine Huff 1472 Minnehaha Ave W Saint Paul, MN 55104-1911

Christine Oliver

5908

Dear Ms Lisa Fay, This is not the right thing for our state. Our northern lakes and forests are the most invaluable resource we have in this state, this proposal has a high, high risk of contaminating these significantly. How are we considering letting any company, not to mention a brand new company with no formal experience in this type of mining, start a project that we already know, even barring any emergencies, would need 500 years of follow up. Who will pay the price if we cannot miraculously keep this company solvent and in charge of this for the next half millienium. Incidents such as what just occurred on West Virginia's Elk River might be a reminder to us of the potential for things to go array, and again, this situation is even at its onset problematic. Thank you, Christine Oliver 3224 Colfax Ave S Minneapols, MN 55408 US

Christine Pikala

9909

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Christine Pikala 4825 34th Ave So. Minneapolis, MN 55417

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Christine Tendle 2435 Brenner St Saint Paul, MN 55113-1002

Christine Umhoefer

Dear Ms Fay, I realize all of you will most likely be long dead and gone by the time the damage to our environment because of the copper mines will start affecting the residents of Minnesota, and everyone else who loves the beauty of this beautiful place. And no one will remember your name, and that you were part of the problem, and that you abdicated your responsibility to the citizens and the environment. Maybe you do not care about future generations, including your own. Maybe you have been given rewards for caving to large corporations. Maybe you have not read the science reports detailing the damage these mines will do. Maybe you figure it's too hard to stand up to powerful corporations. The list of reasons for your supporting the mine are numerous, and I believe all of them lack credibility. I live on White Bear Lake. The lack of oversight and the DNR's obligation to protect our environment is clearly visible on this lake. It will affect thousands of people economically, recreationally, and in as yet to be determined other areas. There is a lawsuit pending because of the past failure of the people who are the face of the DNR. There are excuses and double talk. It will cost the taxpayers of Minnesota millions by the time it is finished.. This is nothing compared to the mistake the DNR is currently contemplating making regarding mining. The copper mines are an even more serious environmental issue, negatively affecting the entire state, not just one small lake, hundreds of years into the future. Please read the objective science and have the integrity and courage to do the right thing for all of Minnesota. Fight those in the state government who do not have the wisdom to make the intelligent decisions. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Christine Umhoefer Christine Umhoefer 49 peninsula road Dellwood, MN 55110 6514264040

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Christine Underdahl 2205 Dunedin Ave Duluth, MN 55803-2226 (218) 724-6509

I'm interested in learning about existing copper mines, their environmental impact statements and how successfully each has avoided environmental pollution. I believe this background should be included in the PolyMet EIS as it is representative of actual and likely outcomes.

Christopher Boyd 42080

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Christopher Boyd Minneapolis, Minnesota

Comment on the Northmet SDEIS; CO2e and climate concerns While the planet as a whole just experienced the fourth warmest January on record, Minnesotans froze in near-zero temperatures quite possibly the (outwardly ironic) result of imbalanced heating of the Arctic and the more slowly-warming temperate zone, a likely greenhouse-effect-related imbalance that may have impacted the strength and flow of the jet stream, sending unseasonably cold air south from Canada. And yet Minnesota is contemplating the permitting of a mining facility that not only puts both its immediate and regional environment at demonstrated risk - no sulfide-mining operation anywhere having succeeded in demonstrating that it could operate without eventually causing acidic discharge - but which all by itself, as stated in the Polymet SDEIS, is estimated to increase the state's annual combined direct and indirect output of greenhouse gases by nearly half of one percent (0-44 percent; SDEIS 5-2-7, p. 5-430). That is an enormous cumulative quantity of emissions for a single facility. It is also likely an understatement, given - to name just one reason -the potential overall damage to the biota likely to result from such a facility, and the seemingly casual, neatly rounded estimate (10,000 mtpy of CO2e; Table 5-2-7-8) given for terrestrial carbon loss. The potential loss is much higher, and it should be quantified in detail under a worst-case scenario. The industry website [HYPERLINK "http://minecost-com"](http://minecost-com)minecost-com shows values for kg of CO2 directly released onsite per kg of copper produced that run as high as 10 to 1 (<http://www.minecost-com/carbon.htm>). Polymet estimates an output of 36,000 tons (cited at <http://www.northernwilds-com/pages/Explore/perich/understanding-polymets-proposed-copper-mine.shtml>); = ~32,760 tonnes) of copper annually from the proposed mine; a precautionary approach would use the highest demonstrated value for emissions, yielding a figure of up to some 327,000 tonnes of direct onsite CO2 releases per year, compared to the SDEIS value of 196,341 mtpy (Table 5-2-7-8). Why use worst-case scenarios, and why take a precautionary approach. For the well-known reason that ninety-seven percent of credentialed climatologists are now telling us that climate shift - with the potential for medium- and longterm climate shock - is underway, is caused by anthropogenic emissions of greenhouse gases, and may lead to a rise in global average temperatures sufficient to cause the death of millions of people and to disrupt the very basis of human civilization. Most agree, given that most models have thus far proved conservative when compared to real-world events, that temperature rise in this century is more likely to be toward the high end of the range estimated by the IPCC - likely to run to four degrees Celsius or more - than toward the low end. Do we need a continuous output of copper. Of course we do - ironically, on one level, to continue the advance of clean energy technologies which rely on a steady supply of this metal. What we do not need is copper produced in ways that undermine a core intent of clean energy-production, and energy efficiency, methods: vastly reducing our output of GHGs. We need major advances in copper recycling and advances in technologies that allow for the replacement of copper with alternatives, and/or the use of less of a raw material that is becoming increasingly precious - and increasingly risky to produce. Polymet's plans - and the analysis of those plans - are useless in the pursuit of these essential aiMs Future generations of Minnesotans and future generations everywhere on the globe will look back upon us as either those who, in the face of overwhelming evidence that the earth was being put at gross risk by our addiction to out-of-date, carbon-emitting technologies, elected to take out an insurance policy for the planet or as those who failed to do so. We insure our homes against fire not

Greetings, I am a physician from Duluth who just wants to respectfully voice my opposition to the proposed mining plans. Health issues including air born mercury and asbestos fibers were not seriously evaluated with the first draft EIS and not with this supplemental draft either. The first draft EIS was judged inadequate by the US EPA. As a physician I see first hand the increase in the cancerous mesothelioma in the taconite industry. Polymet has never run a mine-they are a fronting corporation for Glencore which has a rich history of environmental damage. Tailings will go on top of existing taconite tailings in one of the mine pits. Discharge from a number of pits on the range already exceed standards for a number of heavy metals including the pit Polymet will use. Polymet is maintaining that a limestone base and synthetic liner will contain discharge for at least two hundred years (the point in their modeling at which time the contaminated water can be expected to get no worse rather than the contamination subsiding to safe levels). Toxic levels of copper in the pit leachate are modeled to persist for 500 years. Any overflow of the pit will dump this into the Embarrass and Partridge rivers and hence into the St Louis. Groundwater flow from the pit into the underlying aquifer are not adequately addressed in terms of both hydrology studies and planned monitoring of local wells in the event the mine proceeds. I am asking you to protect all of us and the future of Minnesota in this regard Thank you Chris Delp

Christopher Lish

Feb 17, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water and as a former resident of northern Minnesota, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. "Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method." - Theodore Roosevelt PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. "As we peer into society's future, we-you and I, and our government-must avoid the impulse to live only for today, plundering for our own ease and convenience the precious resources of tomorrow. We cannot mortgage the material assets of our grandchildren without risking the loss also of their political and spiritual heritage. We want democracy to survive for all generations to come, not to become the insolvent phantom of tomorrow." - Dwight D. Eisenhower Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. "Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish-indeed, all the living creatures of prairie and woodland and seashore-from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement." - Theodore Roosevelt I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. "A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise." - Aldo Leopold Thank you for considering my comments. Sincerely, Mr Christopher Lish PO Box 113 Olema, CA 94950-0113

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Christopher Panayi 4 Devon Lodge Carlton Hill Brighton, None BN2 0HF 447966483031

Mar 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Christopher Ruth 1611 8th St SE Apt 304 Minneapolis, MN 55414-2373 (201) 403-5186

I am deeply concerned and now motivated to express my concerns and frustrations with your organization in how the mining proposal has been handled. I have always been a proud supporter of the DNR believing that the organization really protected our environment and natural resources. I have lived in many different parts of the US, and by far MN is the best when it comes to our outdoor environment. I incorrectly attributed this to the DNR. Until now, I gladly gave to the DNR with supporting the nongame wildlife fund, environmental plates, Conservation Volunteer and supported many of the hunting and fishing initiatives. I will now be shifting my financial support to organizations that actually function to protect our environment as the DNR disgusts me. I live in the twin cities, but I travel often to the Superior National Forest and the Boundary Waters. These locations are truly magical and need to be protected. It is amazing to see lakes covered in wild rice and to see threatened species such as moose, lynx, fishers, etc. After reading your mining environmental statement, I believe that it will be destroyed as you do not go far enough to ensure its protection. How are we going to pay for the 500+ years of clean up needed after the mines have gone in 25 years. You know as well as I know that the mining companies are not going to, which means that the people of MN will be left with the bill. What a terrible thing to leave for the future 4-5 generations of MN. Let's think of them for once and not give into the "me" generation who only care about the here and now. The cleanup costs far out way any financial employment gain that mining will bring. My other concern is about the wild rice and sulfate. It is clear that we do not fully know about the danger of sulfate to the wild rice. I wanted to read the reports from the EPA before commenting here but they have not been released. Despite key information that will impact sulfate mining, the DNR has decided to ram this proposal through instead of waiting for the data. This action tells me that the DNR does not care about the science. We need to know what such mines will do to the wild rice. I do not understand how we can even consider such proposals until after the EPA has determined sulfate and sulfide standards. I am sure that we will get this mine regardless of the cleanup and environmental concerns. I am also sure that the DNR will act surprised when the State is stuck with the bill or when there is a major catastrophe and the BWCA is polluted. I see it all of the time when it comes to the environment, ie BP and the Gulf oil spill. To summarize my letter of concern, I request that the DNR look into identifying methods to ensure that the mining companies will pay for the 500 years of estimated clean up. The DNR should see such funds are put in place before any mining can begin. I also request that the DNR analyze the environmental impacts on wild rice, and threatened species (moose, lynx, fishers and loons). As part of this analysis, the DNR needs to look at what impacts would happen if there is a major spill of contaminated water into the surrounding watershed. What would this spill do the fragile waterfowl population. What measures will be in place to limit the damage of such a spill and what methods and associated costs will be in place to promptly address the contamination. I also request that the DNR analyze what the mining will do to tourism as no one wants to camp or visit a polluted waterway or foreSt The regional income is highly dependent on tourism both from the state and nation. What is the projected loss of tourism income when the mine opens and if there is environmental contamination. Thank you for your time. Christopher D. Stauthammer, DVM Faculty Member of the University of Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Christopher T Loch 6145 15th Avenue South Minneapolis, MN 55423

Chuck Corliss 18284

Chuck Corliss. My concern is that there is a discrepancy between the number of years that we see on the modeling of 200 or 500 years, but I don't understand why they can't do testing of the ground materials to a level where they can tell us more definitively if we are dealing with a pollution containment for 60 years or 80 years, or if in fact it could be for 500 years. And even though we have asked the questions to several people here today, the answer is they don't know. And I have a significant concern with continuing with the project if in fact it has centuries' worth of cleanup associated with it. And we would hope that the state would ask a more definitive timeline on how long the cleanup would take through some sort of testing procedure. That's it.

Chuck Dixon 17334

The Boundary Waters Canoe Area Wilderness is a national treasure, just like the Grand Canyon. The BWCAW is the most pristine wilderness area on the planet. The residue left behind by copper mining seeps into the water, kills plant life, fish and wildlife. In a very short period of time, copper mining will ruin 500 Years Of Echo System. There are several mining companies ready to start mining in this area. As soon as one gets permission to begin mining, the other mining companies will be right behind Poly Met Mining Inc. All of these mining companies are not even US COMPANIES. They are for profit organizations and once they are given the green light, they will destroy this Pristine Wilderness Area. I implore you to take a stand, against allowing the mining companies, anywhere near, any waterway, tributary, stream connected to or running into a Boundary Water Area Lake Or Waterway. Several decades ago, one man stood up against a rich and powerful man, who wanted to dam up this area, to create hydro electric power, for the sole purpose of selling it and making even more money. Something's are worth more than money. The peaceful, pristine, soulful wilderness area, called the BWCA is one of them.. On behalf of my children, their children and your great, great, great grandchildren; PLEASE, SAY NO TO THE MINING COMPANIES SAY NO TO BIG MONEY . Carry on the legacy of the man who originally saved the BWCA. You are in a position to make a decision regarding this matter. On behalf of all of us and future generations, make it a good one. Thank you. P.S. Please forward to Lisa Fay, EIS Project Manager , too. Charlie R Dixon Rochester MN 55901

I am writing to comment on the SDEIS. I am amazed that we would even consider something that will require careful monitoring and oversight for 500 years. I will write about 3 concerns: clean water, sustainable jobs and long-term oversight and accountability. 1- Clean Water. What is the plan for catching and monitoring all water exposed to sulfide tailings for 500 years given fractured bedrock and fluctuating water tables. How does a mine that needs hundreds of years of monitoring comply with Minnesota law that requires mines to be maintenance free at closure. Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Extend the water pollution model and account for changing water tables and fractured bedrock. 2- Sustainable Work. Jobs are so important in our state and especially in Northern Minnesota. I am concerned that the jobs generated will be short lived, largely utilize imported workers and be divisive in the communities we hope to support. Demand that Polymet and Glencore produce documentation about the numbers of local jobs they expect to produce; to describe how they will train and protect Minnesota laborers, how they will protect existing economies (wild rice, winter and summer tourism, fishing) that depend on clean water, silence, low light pollution; to describe methods for enhancing sense of community rather than creating tension and hostility that we see over and over in communities (most recently in our neighbor North Dakota) where new mining industry disrupts and does extensive damage even while providing jobs to a relatively small number of local workers. Demand that Polymet describe and include local jobs produced by the ongoing provision of water safety. Demand that the financial assurance includes funds for those important jobs. 3- Assurance. The financial assurance and contingency plans are inadequate for what we know will be needed let alone what we cannot foresee at this moment. Accidents happen everywhere and in every phase of the mining operation, every mine has had a longer window of reclamation than anticipated. There are way too many ways for Polymet, Glencore and Tony Hayward to reap the benefits, take them out of Minnesota and not assume responsibility for what is left behind for those of us in Minnesota to live with. Demand that the financial assurance is based on realistic predictions based on accurate worst case water table models and fractured bedrock; that Glencore and other large investors are named and held responsible for the financial assurance for 1) mine clean up; 2) water quality maintenance over the projected 500 years of necessary monitoring and treatment; 3) for other environmental disruptions that will occur and for accidents and inevitable problems that were not anticipated in the SDEIS. Minnesota has the opportunity to set a new standard for mining operations. This not only protects the largest body of clean water in the world but also will provide precedence- Chuck LeGros Office: 612-824-2282 Cell: 612-670-3507 EM: LeGrosSci@aol-com

PolyMet Comment We in Minnesota are fortunate to be living in a land of scenic beauty, a land with water resources second to none. For more than a century we acted as though the number 10,000, as in 10,000 lakes, was close to infinity. Only now do we understand our water resources to be both vulnerable and limited. Today we have seen the most optimistic mining and processing proposals put forth by PolyMet. They have put on them the best face that they could conjure up, and it is ugly. Twenty years of jobs for a few, followed by centuries of danger or worse. We would be fools to permit this exploitation. As an alternative to mining sulfide rock we could establish a better jobs program by fostering a metals recovery operation that would mine valuable metals from our electronics trash. Engage the electronics manufacturers in the processing, for they certainly know where the metals are to be found in the devices they have made. Locate this facility away from vulnerable water resources. May our decision makers be wise enough to understand the serious environmental threats. May they be generous enough to forgo short term gains while protecting long term treasures. May they have appreciation for the beautiful. Sincerely, Chuck Nelson 2694 Apache Road North Saint Paul, MN 55109 Sent from my iPad

What was happening 500 years ago? What will the world be like 500 years from now? A little over 500 years ago, Columbus crossed the Atlantic. No one could envision what the world would be like today. No one would be willing to take responsibility for the effects of their actions 500 years in the future. Yet somehow, PolyMet seems willing to take actions that will impact the environment for at least 500 years. Are they willing to guarantee the results at their actions for the next 500 years? Is the state? This project is [ILLEGIBLE] inaccurate, [ILLEGIBLE] beyond belief. And it must be stopped.

Chuck Zeugner 43704

HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us Lisa Fay, EIS Project Manager DNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 RE: PolyMet SDEIS Response To whom it may concern: My wife and I own property near Ely, Minnesota. We spend several weeks each year in the area. We are building a home and plan to reside there year round. We are already employing several local people and our presence there will continue to increase the tax base and economic viability of the area. However, our plans are threatened by the proposed mining activity. I am strongly opposed to the proposed PolyMet project, and I believe that the PolyMet SDEIS is inadequate. I share the concerns of many other people, whether residents of the North Woods, citizens of Minnesota, regular visitors or occasional tourists. There are individuals far more competent than I that have repeatedly addressed the inadequacy of the SDEIS economic impact analysis, the failure to address the consequences of creating a mechanism that will produce a permanent source of pollution in important watersheds, and absence of contingency planning in the event of accidents or unanticipated system failures. Further the SDEIS does not adequately account for opportunity costs for displaced activity, or for the value of intangible, but significant items such as tribal rights to hunt, fish, and gather. I would like to address several other important issues. The first is that the Arrowhead Region is an incredible treasure in its own right. While it is easy to focus on the value of the copper below ground, it is even easier to ignore the value of clean air and water. As easy as it is for the people that live in the North Woods to undervalue these resources, it is even easier for outsiders. The history of colonization is not pretty. Historically, whenever outside entities come into areas to exploit resources, the trade is unequal. This project is no different. Copper is an important resource. However, so too are the other resources in abundance in the North Woods. However, this is not a simple trade. Mining the copper, which provides a short-term benefit will permanently diminish the value of the other resources of Northern Minnesota. Further complicating the economic analysis is that the positive economic impact of the mining will be temporary within the region while the costs will be long term. At the same time, the abundance of wealth derived from the copper extraction will be taken away from Minnesota to benefit companies and individuals elsewhere. The basic calculus of the mining project is arguable. However, assuming that there will be no accidents, system failures, or unintended consequences should be a fatal flaw in any analysis. Any list of these things would be very long, and the economic consequences would be uncountable. A third significant issue is that of financial responsibility. Even the most ardent supporters of the PolyMet project acknowledge that there will be environmental impacts, and the SDEIS purports to describe the remediation efforts that will be made to mitigate the damage from those impacts. Indeed, Generally Accepted Accounting Principles (GAAP) require firms to account for restoration costs in their financial statements. However, there are three important unanswered questions. The first question is what constitutes remediation or restoration. It won't be possible to eliminate the pollution or to put the rock back. The second question is whether the ultimate cost of those mitigation efforts can be estimated, and the third question is whether PolyMet or a successor company will even be around to perform the remediation or restoration. Leaving aside the speculation about business practices in extractive industries, consider whether any major organization, business or government, can make promises about things that will happen at some point in the future. I

Dear sirs/ma'ams, I ask of you, please do not let them mine in Minnesota. I know you are probably getting a lot of contacts from people saying this, but I agree with this and am saying it to. Please, please please do not let anyone mine in Minnesota. We don't need to, it would harm the wildlife(they say it wont but oh...it will. And then it'll be too late.) and it would be extremely expensive, money we could use for other things. Just, please don't let them. We don't need these minerals. We think we do, but to survive, we don't need them. We just need food, water, and shelter. Our wildlife on this planet and in our state is amazing and beautiful, and in order to mine you'd have to destroy pieces of it, unique pieces of it like no other and displace tons of animals homes. If everyone keeps taking pieces of the wilderness away, some sad, horrible day, maybe it won't exist. And then we'll be doomed without oxygen. And what? All for our selfish needs and money? Money creates many unwanted emotions and behaviors that hurt people, other animals and the environment. So, please just don't mine. Not here. (Although, I'd prefer not anywhere on our planet but people obviously won't go for that. Not until we mine asteroids or something..) Also, I do not think there should be a wolf hunting season here currently. The hunting of animals for fun is...not very nice. Plus wolves just got off the endangered species list, they deserve time to repopulate and all that. In the past we over hunted wolves...we don't want to repeat that. Thanks for taking the time to read this. Yours truly, A citizen of Minneapolis

Cindy & Tom Edberg

Sirs, Ladies; This type of mining is much different then ferrous mining of the past for taconite. This nonferrous mining will create no harmful permanent pollution to our waters or land in my opinion. The entire mining process and the end of the mining plan has been carefully planned and written. The more stringent regulations that have been imposed by the DNR and EPA for pollution control for this mining goes well beyond what was done in the paSt I fully support this mining process proposed by Polmet corp. and hope they get the permitting to begin. This also will greatly benefit the peoples of St Louis county financially in many ways in a area that has greatly needed it for a long time. Tom Edberg, Stacy Mn.

21763

I do very much support the new copper mine being proposed by the Polymet corp. They have gone under a relentless 8 year long attack by many groups concerned about the damage it might cause to the environment. I believe Polymet has put together a great plan that far surpasses any previous mining plan to protect the environment ever seen in Minnesota in the paSt. Minnesota really needs this mine for the economic benefits it will bring to the people of the Hoyt lakes area and also to the State as a whole. Not only will good paying full time jobs with livable wages be created but also many more jobs that will pop up to support this new (already existing mine). The economic boost for this part of Minnesota this mine will create has been sorely needed for many years Tom Edberg, 34337 Forest Blvd, Stacy, Mn 55079- .

Feb 16, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

40907

Mar 9, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Cindy Brausen 8301 Virginia Cir N St Louis Park, MN 55426-2447

Cindy Ilg

46880

Minnesota DNR, Please do not let SDEIS do any mining in the Superior National Forest Please save our wetlands, bogs, and swamps from being destroyed by pollution due to open-pit mines. We do not want contamination of ground water or our lakes and rivers. Once the water is polluted it will never be the same. Clean water is precious to every form of life. SDEIS is inadequate and should not be mining in a fragile eco system. Cindy Ilg

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, The long terms dangers of this project far outweigh the short term financial gains. We need to maintain the incredible jewel that is Lake Superior and the Boundary Waters. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Cindy Oberg-Hauser 1206 Charles Ave Saint Paul, MN 55104-2514

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Dear, Mr Bruner, I have spent a significant amount of time in the Boundary Waters Canoe Area and on Lake Superior. Both are precious and must be treated as the such. As a youth I recall my first time seeing the northern lights in the BWCA and discovering what the word awesome actually means. We need these areas and so do our future generations. I ask you to make a decision respectful of what our children deserve from us. Please be a good steward to this beautiful planet. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Cindy Strong 329 Cleveland St Menasha, WI 54952-3402 (920) 209-7883

It is unquestionable that the vast majority of Minnesotans are strongly in favor of protecting our environment from pollution. They have expressed this desire in election and recently even voted to raise their own sales taxes expressly for the protection of clean water. Since it is simply a fact that the mining of this ore will result in sulfuric acid draining into the waters of northeastern Minnesota it is impossible for us to believe that most Minnesotans would support this mine for the short term economic benefit of a relative handful. The waters of northeastern Minnesota, in particular, have a special place in our hearts and to willfully permit their degradation is woeful governance and the abandonment of the expressed interests of the vast majority of Minnesotans. This majority may not understand that this pollution is inevitable if this mine is approved but they will learn and be outraged in time. Do your duty and reject this mine's permit. Sincerely, Cindy Swanson and Dennis Clowes 3904 Washburn AV S Minneapolis, MN. 55410 Sent from my iPad

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I am a girl from an urban city where I get enough of a feel from both the city and the country to know where I stand on this issue. Time and time again, coal miners have been given opportunities to 'clean' up their area years into the future. And for years, these sights have been left untouched because of the companies 'claiming' bankruptcy and so the land is left polluted. The boundary waters have for years been a beautiful and important part of minneosta and its culture. This mine would sit at the prime spot for the pollution to run off into the waters and pollute this 'protected' area. The company claims they'll clean up this mess within 500 years for 20 years of use. If the East Indian Trade Company can't even stick around long enough to last for 200 years, why should we believe that the Nickel mine will last for over twice that amount of time. When will we finally reach a point where we say enough is enough. This mine is creeping in on one of Minnesota's landmark jewels and if we allow it to be followed through, we'll be facing not only a loss of biodiversity and ecosystems but a loss of one of our vital minnesotan organs. The mine is wrong and we should not allow it to be created.

CJ Jacobson 43582

Please - do not let PolyMet pollute so much valuable, fragile land and water. For short-term economic gain and jobs that will not last long and a support infrastructure that will be time-stamped even as it's being built - the cost in the environmental impact and devastation is far too high. Please put life-affirmation ahead of planet devastation. Some things are not renewable and the health of the planet merits protection. Thank you. Sincerely, C.T. Jacobson 617 East Main Street Wabasha, MN 55981

Claire Barnett 14050

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I have heard that PolyMet's Supplemental Draft Environmental Impact Statement (SDEIS), is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. Too often, mining companies use subsidiary corporations that declare bankruptcy after the mining is finished, leaving taxpayers to pay for cleanup. It is vital to have long term planning and delegated responsibilities for cleanup that can not be avoided when mining is finished. And environmental standards should be in force at every stage including planning. Wetland destruction and pollution are not acceptable byproducts of mining. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Claire Barnett 110 W Walnut St Baraboo, WI 53913-1170

Claire Goebel 40133

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Claire Goebel 24th ave south mpls, MN 55406
