- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, John Wensman 15740 Upper 34th St S Afton, MN 55001

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. Not only is the science bad, but the provisions for long term clean up are financially inadequate as well. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, John Wensman 15740 Upper 34th St S Afton, MN 55001

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr John Wheeler 651 Huntington Ct S Saint Paul, MN 55119-6765 (651) 735-1805

Discovery is always the rape of the natural world...always! Science is now our modern day belief system. And, like the medieval system before it, science is starting not to fit into the world anymore. Science has attained so much power that its practical limits begin to be apparent. Largely through science, billions of us live in one small world. But science cannot help us decide what to do with that world, or how to live. Science can make a nuclear reactor, but it cannot tell us not to build it. Science can make pesticide, but cannot tell us not to use it. (Science can make a copper-nickel mine, but cannot tell us not to dig it) And our world starts to seem polluted in fundamental ways....air and water, and land...because of ungovernable science. Scientists used to believe that prediction was just a function of keeping track of things. If you knew enough you could predict anything. That's been cherished scientific belief since the time of Newton...until chaos theory came long and threw it right out the window.(These words are taken directly from a character in the novel "Jurassic Park;" They accurately reflect my suspicions regarding the viability of the Northmet proposal)The EIS conclusions are based on predictions, on calculations with upwards of 90% confidence. Pretty good odds were not the stakes so high. What we stand to lose can never be regained. For ourselves and for future generations, we must beware that our actions may well have unintended, unpredictable, and potentially disastrous and irreparable consequences.(These words are mine. In my view, the proposal smacks of "ready-Fire_Air"! Can we be completely sure of the project's plan detail? Think Jurassic Park.)

John Wild

I think it is an exceedingly bad idea to place permanent toxic waste dumps in a sensitive area. The creation of a few temporary jobs does not justify doing so. While the area is already been mined and industrialized, there is no guarantee that toxic runoff will not affect other areas that are not now polluted. Iron mining, unlike sulfide mining, does not pose big a threat to surrounding areas. Nice neat environmental reports and all the regulations in the world mean little when in actuality you know things can and will go wrong. Technology simply cannot be relied upon to solve all of the problems To sacrifice a part of our state for the benefit of international mining interests is crazy. This is a Pandora's Box we do not need to open. There is no compelling reason, other than political nonsense, to allow sulfide mining in Minnesota. John O. Wild 1123 15th AVE SE Minneapolis, MN 55414-

Johnathan Eisenberg

18138

My name is John Eisenberg. And I'm speaking on behalf of myself, my wife, and our two children. We have made extensive use of the north woods, which we love, including the resources in that area, including the Boundary Waters, the Lake Vermilion area, the area around Grand Marias, the Gunflint Trail, and other areas, state parks, natural forests, and so forth in that area. In fact, we took our honeymoon in Mike, Minnesota, which is -- it's way the heck down the Echo Trail. We bring business to Northern Minnesota. We bring paying business and we bring sustainable business to Northern Minnesota. So I just want to make that point. We're a bit appalled that the Draft Environmental Impact Statement on this project got an F from the Environmental Protection Agency. I don't keep score of these kinds of things, but I don't think that happens very often. Now we have a Supplemental Draft Environmental Impact Statement only to find out that the water quality model is inherently flawed. It's going to have to be redone again. So the water quality model was a base for a lot of the other aspects of the Draft Environmental Impact Statement. If that has to be redone, then a lot of other (inaudible) has to be redone. So we say: Send it back and get it right. And don't advance this project until all of those flaws have been fixed and we have an environmental impact statement that actually accurately assesses the impact of this project. We're looking here at the potential for 500 years of water quality treatment, which in my mind, and I think in the mind of the law, is essentially permanent pollution to Minnesota that would require to be treated permanently. That's not lawful in Minnesota. It shouldn't be allowed. And you shouldn't advance the project unless there is some way that that can be done without that happening. As far as we know, there is no way that that can be done. If that can be done, we would like to see it in the Draft Environmental Impact Statement. We don't see it yet with a realistic water quality model. But we're not aware that that's been done anywhere on the planet. So we don't think it can necessarily be done in the state of Minnesota. Again, if there is a way to do it, bring it on. Let's see it. But let's get it right. Let's do it accurately, scientifically, truthfully so that we can assess it to determine the impacts and get this right. But let's not approve a project that has essentially permanent pollution impacts in the beautiful area of Northern Minnesota that we all love. Thank you.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I live in the heart of the experimental drilling area and the new SDEIS is important to me, but to date I have only made it through about 150 pages. I support the Water Legacy request as follows. Please give us more time.. I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Johnna Hyde PO BOX 188 10538 Bandana Lake Rd, Isabella (No Mail) Ely, MN 55731 218 365-3375

Johnnie Forrest

18072

I'm Johnnie Forrest and I support the PolyMet project, because according to the water legacy thing, the propaganda in 2009 they said that 84 percent of all mines were done environmentally unsafe. So that means 16 percent can be done environmentally safe. And we're Minnesota, we can make them do it right. And I'm looking for jobs for the future for my daughter. Okay.

Johnny Jones Jr

39794

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Johnny Jones Jr 3523 24th Ave S Minneapolis, MN 55406-2529

From the bit of research I've done and talking to others in "the know" this company that plans to do copper-nickel mining in MN has a poor reputation for cleaning up sites where they have done mining before I.E. Sudbury Canada (a total moon scape). In conferring with an environmentalist in Finland (Europe) I was told copper nickel mining uses large volumes of H2O and brings up toxic waste from in the earth. She claims if sales of copper go down and the plant has to shut down temporarily the toxic runoff can continue to pollute the waterway – ground water, streams and lakes. Also, she said it smells terrible – she visits sites around Russia where this type of mining has been a disaster to the environment. She is a top environmentalist for the government. I feel we just have too great a risk here being the beginning of the clean water source for the nation and the quality of life we have come to enjoy here in MN. Much more research is needed it will be too late.Jolane Sundstrom1314 East 8th StreetDuluth, MN 55805

Jon 45619

Dear Lisa Fay and Members of the MDNR Division of Ecological and Water Resources Environmental Review Unit, I am writing to voice my strong opposition to the proposed PolyMet, NorthMet Project open pit copper, nickel, cobalt and metals mine in Northern Minnesota. Despoiling our priceless ground and surface water, destroying wetlands and other wildlife habitat, and ruining natural beauty in return for mere metals is almost more than I can comprehend. Our most valuable natural resources, including clean air, clean water, wildlife, and unspoiled habitat are being sacrificed and squandered at an alarming rate. They are being squeezed by increasing populations and demand from extractive industries, industries which have a long history of exploiting people and the environment, making themselves and their investors wealthy, then moving on and leaving residents and taxpayers across the country to clean up and pay for their messes. I am originally from Missoula, Montana, and I have seen first-hand the destructiveness of open-pit copper mining. The Milltown Dam (Bonner and Milltown Montana are just outside of Missoula), was over 100 miles from an open-pit copper mine in Butte and a smelting operation in Anaconda, but the pollution from those operations caused dangerous levels of arsenic to appear in drinking water wells around the communities of Bonner and Milltown. Water from the Clark Fork River had also deposited MILLIONS OF TONS of toxic waste behind the Milltown dam that required expensive (Superfund) removal and extensive remediation efforts to clean up. The clean-up was largely paid for by taxpayers. Please see: http://en.wikipedia-org/wiki/Berkeley_Pit http://en.wikipedia-org/wiki/Milltown_Reservoir_Superfund_Site I hope that one day the DNR will become a protector of our natural world instead of a facilitator for its destruction. Sincerely, Jon Read Jon Read 1603 Berkeley Ave Saint Paul, MN 55105 (651) 698-9349 mnjonread@msn-com

Jon and Kia Blumenthal 21375

I am writing to oppose the Polymet mine in Northern Minnesota. I wish there was an environmentally responsible and assured way to provide jobs to the region, but the risks to water-which may wind up being the more precious resource in the earth in the future-outweigh the potential short-term economic benefit. Until a virtually guaranteed method arises to protect water, this proven-damaging mining method is not appropriate given its proximity to vital water resources, such as the Boundary Waters and Lake Superior. The unique water resources in the proximity of the mine are worth protecting for the coming centuries. Once the mine proposal is defeated, I hope effort will be directed to developing the economic vitality of the region, which deserves access to employment opportunities. Thank you. Sincerely, Jon Blumenthal 5941 Grimes Ave S. Minneapolis, MN 55424

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Jon Hayenga 421 2nd St NW Stewartville, MN 55976

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Dr Jon Jensen 9586 Polaris Ln N Maple Grove, MN 55369-4414 (763) 420-9814

Jon Lee

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

In this day and age we all know that it is possible to mine without ruining the environment around the mine. This country needs its own precious metals If we ceded to those who say do not mine think where we would be today . I would be writing this in either Japanese of German because we would not have won WWII. This will be a showplace mine for the world, with hundreds of jobs just for protecting the environment. Jon Read 44886

Message From: Jon Read Email: mjonread@msn-com Response requested: No Message: I am writing to voice my strong opposition to the proposed PolyMet, NorthMet Project open pit copper, nickel, cobalt and metals mine in Northern Minnesota. Despoiling our priceless ground and surface water, destroying wetlands and other wildlife habitat, and ruining natural beauty in return for mere metals is almost more than I can comprehend. Our most valuable natural resources, including clean air, clean water, wildlife, and unspoiled habitat are being sacrificed and squandered at an alarming rate. They are being squeezed by increasing populations and demand from extractive industries, industries which have a long history of exploiting people and the environment, making themselves and their investors wealthy, then moving on and leaving residents and taxpayers across the country to clean up and pay for their messes. I am originally from Missoula, Montana, and I have seen first-hand the destructiveness of open-pit copper mining. The Milltown Dam (Bonner and Milltown Montana are just outside of Missoula), was over 100 miles from an open-pit copper mine in Butte and a smelting operation in Anaconda, but the pollution from those operations caused dangerous levels of arsenic to appear in drinking water wells around the communities of Bonner and Milltown. Water from the Clark Fork River had also deposited MILLIONS OF TONS of toxic waste behind the Milltown dam that required expensive (Superfund) removal and extensive remediation efforts to clean up. The clean-up was largely paid for by taxpayers. Please see: http://en.wikipedia-org/wiki/Berkeley_Pit http://en.wikipedia-org/wiki/Milltown_Reservoir_Superfund_Site Sincerely, Jon Read 1603 Berkeley Ave Saint Paul, MN 55105 Classification: UNCLASSIFIED Caveats: NONE

1- I would like to see a job breakdown for the PolyMet mine to understand what jobs will be in state vs. out of state, and what pay range each job would hAve 2- I would like to see more thorough evaluation of the Sulfuric Acid Polution. What is value of our water resource vs. benefits of the PolyMet mine. a. Example: What if you sold that amount of unpolluted water to drought stricken California. What would come out ahead. 3- The computer model seems to make various assumptions around current conditions. 4- What happens when failure occurs. a. Is there a plan Thanks Jon Shern Software Development Lead – Max Team Cargill Animal Nutrition Office: (952)984-5690 HYPERLINK "mailto:jon_shern@cargill-com"jon_shern@cargill-com

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Jon Stanley Minneapolis, Minnesota

I write to ask your consideration of the my concerns with regard to the Polymet mine proposal. Length of Hazard There is simply no precedent for maintenance of toxins for any time span remotely close to the one proposed here - 200-500 years. To make projections that far out can simply not be justified scientifically without enormous error bars. To give one example, you have a difficult time even justifying the proposition that the state of Minnesota will exist in 500 years - what percentage of political bodies are still functioning continually since the year 1514, 500 years ago. What is your contingency for the dissolution of the state of Minnesota. Apply the same awareness of the limits of our knowledge to unknowns about climate, about economics, about social stability, let alone the performance of the retaining membrane, and it seems reasonable that whatever your calculations arrive at as possible risks and costs should be increased by many multiples - truly unknown many multiples. In short, there is simply far too little knowledge to make an informed decision about the risks and costs for the time span that this mine would remain a danger. Consequences of Failure Any time one considers a proposal, one must always ask "what if I am wrong." Despite the best efforts of the DNR, it is entirely possible that time will reveal errors in thinking. This is all the more likely because of the timespan involved. In this instance, the consequence of failure is pollution of the Lake Superior watershed - too high a price for such little gain for anybody except a few Polymet stockholders. Precedent and Context As you are undoubtedly aware, this proposal is almost certainly to be the first of many more, should it be approved. Because of that, it cannot be accurately considered in isolation. The consequences of approval include enabling mining across northern Minnesota, including into the BWCA drainage. The EIS should properly consider the environmental costs of that larger condition of mining across the north of Minnesota. Because of these and numerous other reasons why this mine represents a negative trade-off for this state and its future, an irresponsible mortgaging of the future for a small payoff to the many citizens of the state. I urgently ask you to deny this permit. Jonathan E Fribley 423 16th Ave N St Cloud, MN 56303

---Original Message--- From: jongreen@ameritech-net [mailto:jongreen@ameritech-net] Sent: Tuesday, March 11, 2014 12:03 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Jonathan Green 2310 Rose Ln Ely, MN 55731-2216

39285

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (“PolyMet SDEIS”) fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling.

We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests.

Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota’s Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury.

Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates.

The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate.

For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project.

We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of the Minnesota Health Department. This Health Impact Assessment should include at least the following:

- 1- Description of the known human health impacts of all pol

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

To whom it may concern- You probably are have an inbox full of emails concerning the plan for mining by/in the BWCA. These emails are probably lengthy and full of very strong opinions. The BWCA has and always will, hold a special place in my heart. It is a place that cannot be described but is a place one can only experience. This place taught me what I wanted to do with my life, Ecology, as well as showed me who I was as a person. I understand the need for more jobs in the Arrowhead region, but something unsustainable and not permanent should not be put over something that will forever be here if we continue to manage and sustain its virginity. Jobs are temporary, land is forever. Please do not allow mining in the BWCA region. Sincerely, Jordan Johnson 320 469 0960

Hi. I'm Emma Zapchenk. I'm a student at the University of Minnesota-Morris, and I'm going to give my time to Jordan Wente. Hello. My name is Jordan Wente, J-O-R-D-A-N, W-E-N-T-E. Now, I go to school at Morris. I'm a student, much like Natalie -- we actually go to the same school -- and I'm thinking about our future. Now, I don't have a career. Like, I'm a student, I'm going into this new world -- I'll be graduating next year -- into this new economy looking for work, and I'm really glad that the tradesmen are here and the unions are here. I think that's great, and I think this is really great we're talking together and I'm really, really thankful to our agencies for putting this on. But PolyMet is a foreign company. This is not a Minnesota company, and as an economic student and a statistics student, I tend to follow the numbers, and I follow the money, and it is not in the economic self-interest to reinvest this money into our local economy; it is not in their economic self-interest to model accurately; and it's not in their economic self-interest to clean up this mess for 500 years. This project is expected to last 20 years. I'm 20 years old. That's my life-span. I was born in 1993. You might look at me and think, "Oh, this guy is talking -- he's naive, he's young he's this college kid," or whatever, but that's not very long. That is not a time that you could have a job and raise a family with, and I'd like to stay in Minnesota. I'd like to live here. I caught a 26-inch northern in the Boundary Waters last summer. Now, this is my home, and this is our home and we need to protect it, and I just cannot -- I cannot believe that this project -- this project will end well. So I guess I'd urge you all to keep pressuring these agencies, to keep pressuring -- keep talking to your neighbors, talking to people who don't agree with you. I would love to go have a couple beers with you guys, like the guys who work over there, but I got to wait for three months. We all want what's best for our state. We want jobs, we want a healthy environment, and I think we can find compromise. Sometimes there are things that just don't make very much sense, and I think this project is one of them. Thank you.

jose melo

41610

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, jose melo bloomington, Minnesota

Joseph Afrhein

18187

My name is Joe. It is an emotional night here. It's really good. Well, I think I wanted to say is, as Minnesotans, I mean, we are better than this. You know, I used to be a union member myself for 20 years, and it's kind of insulting to have these union people here. It's the blind leading the blind, and that's from my heart. But as far as the jobs that people have been talking about that are being sent overseas, well, you could -- why don't you work on ending the tax benefits for the jobs that are in -- the manufacturing instead of worrying about a couple of hundred jobs. That's really nothing on the large scope. Now, I wanted to say, too, that -- oh, yeah, the NorthMet Mining Project, they said they're going to recreate wetlands and they're going to do all these things, but of course, they don't know what the impact will be until they start. Now, that's a lie. I mean, they know what the impact will be. They're just not telling you because they want approval, and then we'll be over our head in problems. Now, there's a survey of the top 10 most cleanest cities in the world, not the United States, the world, and Minneapolis was in the top 10 for clean cities. So what do we think about the tourism, the people coming here to go to a cleaner environment as opposed to an environment we're going to pollute? And I don't think it's fair for these people making these decisions. This is Minnesota's -- the people of Minnesota's land. It's not necessarily these people that are making decisions for us -- against us. And I also want to say I think Governor Mark Dayton's a wonderful governor. We should be really proud of him. We need to carefully -- I want to say, listen, if we can pass gay marriage, we can vote against this.

Joe Bauer 11010 Pawnee Ave N. Stillwater, MN 55082 612-817-5487 After review of the information on the Poly-met proposed project/mine I support denying a permit to the company and all involved. I am a stock holder in ALLETE and feel the economic benefit is not sufficient to take the risk to our Minnesota environment. The technology proposed is not sufficiently proven for the proposed project. For these reasons please deny the PolyMet Mining Inc Project permit. Thank you, Joe Bauer

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please remember the literature, foresight, leadership and conservatism of Minnesotans like Oberholtzer and Olson. The work that they and so many countless other organizations and individuals accomplished to preserve the little that this great land has remaining would be for naught should this be allowed to transpire. What side will you be on in regards to legacy for our children and our children's children. I know that probably sounds cliché, but it is very true. If those individuals like yourselves do not incorporate sound scientific data and research along with the valuation of listening to the voice of the people--all people who work in and around and enjoy in their free time the Boundary Waters Area--our country is in for a world of hurt, the price of which will be paid ten-fold by future generations. As an avid canoeer of the Boundary Waters and northern Minnesota for the past 30 years, I urge you to listen to the voice of the people, follow the science, and think about those Minnesotans who have gone before and who have left a sustainable legacy for all of us to be proud of and in which to believe. Respectfully Joe F. Cook N8962 Hwy 162 Mindoro, WI 54644 Sincerely, Mr Joseph Cook N8962 Hwy 162 Mindoro, WI 54644 (608) 487-3808

Joseph Dahmen

18251

My name is Joseph Dahmen. D-A-H-M-E-N. I live in Aurora, Minnesota. I have property on Partridge River. I work on the Partridge River. I've lived on the Range. I was born on the Range. I hunt, I fish. Am I environmentalist? Yes, I'm an environmentalist. Do I work for a place? We make power on the river, you know, a power company. I am able to kayak home from work sometimes, I'm able to ride my bike to work sometimes living up there. For these people that complain about the pollution, if I live there and play there and work there, I'm sure not going to close my eyes to a company that would pollute. With that, some of the people that come there to visit and they see one little area and say it's beautiful, there's more than one little area that's beautiful. It's more than just the Boundary Waters. It's more than -- I kayak. I probably go down the river 40, 50 times a year, and I maybe see one other person. All these people complaining about mining and that, how come I don't see them on the river kayaking with me? How come they're not there enjoying how beautiful it is that it's a river that flows from the area of the mining. So I've been lucky enough to be able to live, work and enjoy that area. My parents retired from mining. They both -- my father and mother were able to work out there, made a good living, put us through school. I was able to put my three kids through college, through school. One out of the three is able to live up north, a police officer in town, and it would be nice if all three would have good-paying jobs to live up there, but it doesn't work that way. They enjoy to come to visit. They all three hunt with me, up on the Range, right next to the river, but there's more than one area that's beautiful on the Range than just Boundary Waters, and that's where I'm saying we're all watching the PolyMets there. We're not going to just stand by and let them pollute things. We're watching things. Everybody's watching. That's it.

---Original Message--- From: josephrfoss@gmail-com [mailto:josephrfoss@gmail-com] Sent: Tuesday, March 11, 2014 10:32 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Joseph Foss 359 66th Ave NE Minneapolis, MN 55432-4402

Joseph Hann

54557

As a native Minnesotan I am very concerned that our natural resources in Northern Minnesota. Polymet's plan for mining sulfide-bearing ore will be detrimental. 500 years is NOT possible to treat. You must extend the SDEIS to 180 days. You must take measures to delay this ridiculous attempt at mining.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Joseph Merz 111 W. Lincoln Ave, #305 #305 Fergus Falls, MN 56537 2189983145

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I have been coming into the Boundary Waters Canoe Area Wilderness for 20 years, bringing 1, 2, or 3 groups of youth and adults each year into an area that is as close to true wilderness as is accessible in the United States, particularly for canoeing. When we've spotted soap suds on a shore, or campers got careless and dumped something into the lake, it has been a teaching moment about pollution and care of wilderness. I've asked them to dip a cup into the 'sudsy' water and consider drinking it. I remind them of the over 200,000 campers going through the BWCAW each summer. If a mining company, who has a HUGE vested interest in the facts and assumptions used in compiling an SDEIS, and making decisions on a mining operation upstream from the BWCAW is permitted to be even more careless, or intentionally negligent in its supposedly honest SDEIS statement, I will understand that the EPA, USFS, MNDNR, and the Corp didn't protect the Boundary Waters from profaning this wilderness. This Federally protected wilderness area will no longer be the wilderness area that I, and over 200,000 have enjoyed annually, and I for one, will not be back. The economic development of mining in NE Minnesota is GREAT. Yet not even with zoning restrictions is one landowner allowed to adversely effect a neighbor's property. As a Federally protected Wilderness Area, the BWCAW belongs to all the people of the United States as a very special area of particular significance and value, AS A WILDERNESS AREA. It is not the dumping ground for the likely consequences of mining operations that will almost certainly significantly degrade the wilderness. I would welcome mining around the BWCAW, IF they do not harm or alter the wilderness. Let those who have the power of decisions about this, including those with the mining companies draw all their water for drinking, eating and living from downstream of the mining operations, like the mining company is asking canoers to do if the mining is allowed to move forwaRd Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streaMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accur

The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete pre

My name is Joseph Pratte, I am a student at Como Park Senior High in St. Paul. Paul Danyser[SPELLING] an activist from the Friends of the Boundry Waters organization came to talk to us last Friday in our AP Environmental Science class. Of course as you may guess he ridiculed and criticized the building of the mine. Although I see the economic benefits of this mine and the boost it will bring to the local economy. There are no words to describe my utter disgust and disappointment for the proposed construction of this mine. Since I was in seventh grade I have been visiting the boundary waters every summer. As I have gotten older my love for the outdoors has grown as has my admiration for the north shore. I acknowledge that mining is a necessary and vital part of our economy, but at what cost? I cannot go back to the places that I love in twenty years with my children and see the kind of degradation that this mine will create. I know you will make the right decision and decide to not approve this monstrosity.

MN DNR, 01-16-14

The PolyMet Mining environmental review / supplemental EIS and Executive Summary was well thought out and informative. I support the PolyMet Project. I believe PolyMet will operate a modern mine that will meet or exceed all regulations, safe guard the environment and produce quality jobs and long term tax revenue for the State of Minnesota.

I have children in Minnesota colleges and have children who have completed studies at Minnesota colleges. It has never seemed fair that my children have to pay more for a Minnesota college education than in near by states. If the state would promote natural resource development such as PolyMet, my kids student loans and my college debt load would be less.

The EIS demonstrates long term impact to the lands and waters of Minnesota will be protected. One of my son - in - law's is a UMD graduate chemical engineer who is employed by General Electric. He has looked at the EIS and believes that reverse osmosis is the best method to treat mine discharge water and that there will not be a down stream impact to Minnesota waters. I have a lake cabin on South Twin Lake, a few miles south of Aurora, MN., I do not fear that my lake will be impacted by PolyMet mining. I work in the explosive manufacturing industry and many of our employees live in the communities of Hoyt lakes, Aurora, Lakeland and Biwabik. Everyone of our 30 employees are for non ferrous mine development, none of us fear PolyMet will harm the environment.

I am a PolyMet investor and proud my investment will provide quality jobs for future generations of Minnesotans. I am the father of eight children, all of them live in Minnesota. My children and grand children will need jobs, Polymet Mining could very well be my child's employer. Enough already, PolyMet will meet every regulatory concern, provide taxes and provide employment.. Please permit this mine to move ahead with development. Every employee of PolyMet will be watching out for the Minnesota way of life, PolyMet will be watched by its employees 24 / 7- What more could you ask for.

What better place than the former LTV property for a new open pit mining operation. The roads, utilities, RR, water, mill, crusher and tailing basins are all ready to be used again. Hundreds of former LTV employees are ready to go to work, the state needs tax dollars and the EIS shows mining, tourism and recreation can co-exiSt It makes perfect sense to move this mine forward, please approve the mining permits to PolyMet Mining.

Best regards, Joseph W. Hejny General Manager / Iron Range Dyno Nobel Inc. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Joseph Wenzel 33 Larpenteur Ave E Maplewood, MN 55117

To Who it may concern, I do not think you should build a mine near the boundary waters. They should be preserved people love to go there. If you build that mine then a lot of people are going to be really mad. And if a lot of people it won't be good for you. You will destroy a very wonderful and thriving ecosystem. You will kill alot if not all aquatic life in the area. Think about all the buisnesses you could potentially ruin. All the people you could end up putting out of a job. Or even the homes you would wreck. You may believe the ecosystem will rebuild itself, which is true but take into consideration how long that would take. There are other places you can build the mine – somewhere else. Please take my opinion into high consideration.

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Joseph Woods 5511 Waseca Industrial Rd Duluth, MN 55807-2148 (218) 624-4040

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Josh Gregorich 5217 5th Ave N Grand Forks, ND 58203 March 4, 2014 To Whom It May Concern: I would like to start by saying thank you for the cooperative effort by the co-led government agencies and teams that have dedicated their time and effort in creating the Supplemental Draft Environmental Impact Statement (SDEIS). You may ask yourself, why I've decided to write and comment on the SDEIS. I was born and raised on the Mesabi Iron Range, but currently do not live there due to my current job. Most of my family still resides on the Iron Range and I frequently travel back to visit and enjoy the outdoors. Regardless of where I reside, this area will always be home. It is very important for us, the public to be able to voice our opinions and concerns surrounding projects of this magnitude. After spending time reviewing the SDEIS I have some questions, concerns, and comments which are addressed in the following text. In doing so, I've grouped these by category for easier reading and navigation.

Process and Methods Associated with the NorthMet Project The SDEIS mentions that PolyMet will be responsible for monitoring and measuring of air and water quality to ensure compliance to all environmental standards. Will there be oversight from government agencies, such as the Minnesota Pollution Control Agency (MPCA), Minnesota Environmental Protection Agency (MNEPA), or others. Will there be random sampling of water and air within the direct area of the Mine Site, Pit Site, and surrounding areas to guarantee compliance. Next in this category, the proposal is to have PolyMet collect only 90% of the water seepage from the tailings basin and treat the water at a Waste Water Treatment Facility (WWTF) at the Mine Site. Why was 90% of the water seepage used as the basis. Why wouldn't this rate to be higher. Why should any seepage into the environment be accepted. A higher/increased rate of collecting and treating this water will only mitigate downstream effects. How long will the liners at the tailings basin protect the environment. During construction and mine operation, an open pit proposal would remove wetlands and other parts of the ecosystem. Once mining ends after approximately 20 years, part of the reclamation process is that PolyMet would restore parts of the Mine and Plant Sites and the surrounding ecosystem to native habitat. Why wait until mining ends. This would then be approximately 20 years that the ecosystem is not active in removing and/or filtering out environmental contaminants, ie CO₂, NO_x, and SO_x. Even with the proposed Land Exchange, there would be a net loss of wetlands, river habitat, forests, and plant life within the state of Minnesota. Currently the land in the proposed Land Exchange is doing the same, but we still also have the land at the Mine site as a functional wetland. To compensate for the net loss, PolyMet should actively restore displaced habitat even if they help fund restoration elsewhere in the NE portion of the state. During and up until the time which the East Pit would be backfilled, the proposal is to store category 2 – 4 waste rock on liners. What is the potential impact of these high concentration sulfides interacting with the oxygen in the atmosphere throughout this time. Is the only impact that there can be seepage through the waste rock via water and then it would be caught by the liner(s). Also, the category 1 waste rock should be stored on liners to alleviate any seepage. How would the different category waste rock be separated successfully at the Mine Site. What are the environmental consequences if they are not properly separated. During and/or after the 11th year of mining operations, the proposal is to backfill the East Pit with category 2 – 4 waste rock (highest in sulfide concentration). With the idea that this will mitigate sulfates and metals from entering the environment. Why is backfilling the East

My name is Josh Greenwood. And from what I learned I guess from all the showings and some of the stuff I've learned I would like to see PolyMet go through as long as everything is clean and what they say it is. And I don't have a whole lot to say on the subject. But as long as they follow through with their permitting and everything I think it would be a good thing. I'm from Duluth. I actually worked in the mine once before when they demoed it. And they did a very good job at that time under different ownership. So it would be a good thing to see for the economy and for the future of mining and everybody around it.

Hi my name is Josh Hoban, I live in Duluth, MN. 4 years ago my wife and I bought land up North of Isabella. We chose this area because of the beauty, wildlife, water, and quietness. We have spots to go watch moose, deer, birds, and fish for walleyes. These things will all be greatly impacted if this goes through. I know you guys have heard it all, but I just don't understand why you would ever let this project move forward. Big businesses all over the country and world are devastating our lands everyday. Whether it is an oil spill in Michigan, coal sludge contamination in North Carolina, Coal extraction chemical in West Virginia's waters, air pollution in Texas from fracking, water pollution in Pennsylvania from fracking, and the list goes on and on. The list of Sulfide mines also is long whether it is in Montana, Colorado, South Dakota, Wisconsin, Idaho, and of course this list also goes on and on. I don't know why anyone would ever believe this is going to be done safe. They all same the same thing, new technology, this time it will be different, but it is the same result time after time. This project will ruin parts of the North and it will never be the same. The clean up moneys is always about a 1000th of what is actually needed. The pollution fines are just drops in the bucket, never even making them change their practices. O yeah and all that about the jobs and community, of course this will be the usual boom and bust 20 good years of a couple thousand jobs and forever in bad years and billions in cleanup after Polymet makes their money and moves on. Those resources most likely will not even benefit the US, just sell them to the highest bidder, polymet cares nothing about Minnesota or the US for that matter. It is all about the money who will pay the most. That's just like the Keystone pipeline saying their minerals are staying in the US. We all know that is laughable, just like Polymets minerals. I don't know why people would even consider 20 years of money for a private company, vs endless years of tourism to a beautiful place and money going directly into the economy and forever making it stronger. I don't believe one word that Polymets say and how can we this practice has never been done safely before, why test it in Minnesota on such a large scale. Why use it anywhere in the world. These companies will cut every corner just to save a buck and we all know that's been proven. Thanks a lot for your time, Josh and Tara Hoban Duluth, MN 55805

Josh Northey

47038

Lisa Fay, I do not have strong opinions on whether the PolyMet project goes forward or not. I trust the state agencies responsible for evaluating whether the proposal meets all applicable environmental standards will do so to the best of their ability. The main thing I want to put a word in is what I feel is fear mongering and hysteria from some opponents of the project. I repeatedly hear claims, privately and in the media, that this project might "ruin the environment of NE MN", or "destroy the northwoods tourism economy", or "pollute the whole of Lake Superior" (all actual quotes). As far as I am aware there is zero chance the project will do any of these things in a meaningful way. It has a small footprint, and is using relatively safe low impact technologies, compared to what was done over the past century on the iron range. Moreover, much of that previously mined land is now used recreationally. The majority of the debate concerning the PolyMet project seems to be less about the actual risks/costs/benefits and particulars of the project, and more about giving people a chance to philosophically stake out a position as to whether they value the environment or the economy more. They decide what camp they are in first, and then go looking for arguments/information, rather than the reverse. Certainly, if any large project like this is mismanaged, or willfully flouts the rules, there could be negative impacts. But only focusing on extreme (and at times entirely fanciful) worst case scenarios is not productive. Neither is worrying about what will be going on in the area environmentally 500 years from now. 500 years ago our ancestors were mostly still serfs in Northern Europe without access to plumbing. With the rate of technological change worrying about what people will be doing even 200 years in the future seems obtuse, much less 500 years. If our descendants value the pristineness of this particular patch of land in 500 years, they will be able to clean it up much more easily and cheaply than we can imagine. As someone who grew up in Duluth, but now lives in Saint Paul, I am struck by how much of the opposition to the project comes from people living in the metro area who might use the northern part of the state as a recreation destination, if at all. The idea behind environmental regulations is not that some subset of society should get land use veto on land use decisions in the whole state. Instead it is that you set up a set of rules and requirements, and to the extent projects can meet those, they are allowed to proceed. The northwoods is very big, and this particular project is not going to significantly impact 99-9% of it. Maybe there are real concerns relating to pollution control, or project planning, or management/monitoring infrastructure, I leave that for your experts to decide. In the end the decision here doesn't matter. There is only so much copper and nickel in the world, and eventually humanity will extract this patch of it, as well as the Manganese under Emily, MN. When just depends on how quickly scarcity drives up the value of the resources, and how quickly technology drives down the cost of extraction and environmental remediation. Joshua Northey

Dear Ms. Lisa Fay, EIS Project Manager, I do not support the PolyMet mining project. It could affect multiple wetlands, lakes, and rivers, including: Mud Lake, Yelp Creek, and the Partridge River. It could also cause a decrease of 11 different plant species in the area. Yes, it could make more jobs, and it could help with our mineral capacity, but I still think that wildlife is more important, but that's just me. I think that PolyMet has a plan that is good, but can be improved. They have planned out the area and what would happen to that area, but they ignored that they could damage land areas, maybe permanently. I don't think that the mining of copper-sulfate will benefit Minnesota. Copper-sulfate can kill roots, bacteria, plants, and other organic things. If anything goes wrong, then lots of animals could die. Copper-sulfate could also affect the water, killing many organisms, in the water and otherwise. Certain cultural resources can be affected. The Mesabe Widiu (or Laurentian Divide) would be affected, and Beaver Bay would also be affected. Areas given to the Bands, (multiple Native American Tribes), would be affected. I do not agree with the land exchange offers. It occurs in a National Forest, which should be left alone. It also only benefits one company. I do not think that the mining would affect me, because I live far away from where the mining is taking place. If something went wrong, and the lands were polluted, then it could cost my family a lot of money to help the state clean it up. Sincerely, Josh Sarver

My name is Cory Anderson. C-O-R-Y, A-N-D-E-R-S-O-N. I want to give my time to Josh Skelton. Hi. My name is Josh Skelton. I'm from Coleraine, Minnesota, but I originally grew up in Hoyt Lakes. So thank you to the agencies for the opportunity to comment on the SDEIS. Appreciate the hard work your staff that they've completed, and the commitment to better quantify and qualify the environmental impact of this project. I fully trust the review process your agencies have sponsored to best protect our natural surroundings. I'm a licensed professional chemical engineer in the state of Minnesota, like a number of your staff that have contributed to this report. I understand the rigors to obtaining that professional license and the obligation we carry in our work to uphold the integrity. In reviewing these documents supporting the SDEIS, I can appreciate the application of these principles that were used in this compilation and completion. It also gives an insight into as to why the model assumptions are subjected to such rigorous sensitivity analysis and stretched to ensure they cover major areas of concern regarding public health and environmental impact. While not perfect these models identify the impacts and assure that we have the ability to maintain our resources to the standards of today and well into the future based on best engineering practice. I have two general areas I would like to address regarding water quality modeling done as a part of this SDEIS. The first relates to the executive summary and whether water quality standards could be met with this project, and that mechanical water treatment as part of the model of the PolyMet proposed action for the duration of the simulations in 200 years for the mine site and 500 years for the plant site. The intent of the statement and the modeling was not to predict the actual duration of water treatment but rather to determine the impacts of water quality at key points in the watershed over stated periods of time in the model. 200 and 500 years, respectively. The outcome of the model actually is stating that water quality standards will be met well into the future, not defining the timeframe for treatment. A second area of address relates to the recent measured deviation in water quality models for the Partridge River. The baseline assumptions groundwater (inaudible) CFS for a monitoring point 17 miles from the mine site. More recent information is showing that closer to 1.3 to 1.8. Instead of distracting from the validity of the model of the sulfate, more credence should be given to the sensitivity analysis done with the model. Simulations were run with flow as lower in the basin than 0.5 and as high as 2.4 CFS, and they still showed water quality standards will be met. And the new measured data was well within the range of analysis. I feel fortunate (inaudible) Northern Minnesota where I grew up. We are close to losing the passion of the generations that built the communities we live. Without these types of jobs for our young families to build lives and careers, we only face further erosion. The culture of the Iron Range is not seeking a life of luxury by meaning of salary, it's grounded by the ability to work hard and be fairly compensated to earn a living. The luxury is in the neighborhood, schools, and recreation the region offers. (Inaudible) we have high standards of ourselves and others. That's why I believe there's no better time to do this project, no better place to do this project, and no better people to assure it's done right. Thank you.

For the record, my full name and address: Joshua A. Williams 4453 45th Ave S. Minneapolis, MN 55406 Also, I have made a minor addition to my comment. Feel free to disregard my previous email. Sorry for the trouble. Full, amended comment below: In order to adequately evaluate the potential impacts of the proposed project, the SDEIS needs to consider the financial feasibility of remedial activities at and around the mine site. As the project proposer will, of course, be financially responsible for the remedial activities, the SDEIS therefore needs to evaluate whether or not NET profits from the mine (eg. after all capital, labor, operating expenses etc are covered) will be sufficient to cover remedial costs, and how the required financial assurances for remedial activities will be structured. To be adequate, this analysis needs to consider a wide range of scenarios for mine output, metal prices, and start-up and operational contingency costs. The analysis also needs to consider, in sufficient detail to allow evaluation of feasibility, the mechanism by which sufficient funds for remediation will be held (or access to sufficient funding otherwise secured), how continued access to sufficient funds to covers costs of remediation over time will be ensured (given the potential for hundreds of years of remedial costs), how and at what rate funds will be set aside during the projected 20-year operational life of the mine, and how this last relates to projected profit during the period of mine operation. I believe this might be termed a probabilistic analysis. Put another way, engineering controls, no matter how well designed, will not work if they are never put in place, or if they are not maintained. The mine will operate for 20 years, and the impacts to water coming of the site will last 100s. Any evaluation of the potential environmental impacts of the proposed project needs to include consideration of how control of these impacts will be paid for when the mine-and the company that wants to develop it-is long gone. An EIS that fails to consider costs of mitigation-in the form of engineering controls for site remediation and short and long term water quality treatment-as a function of projected project profits would not achieve the statutory purpose of environmental review to inform permitting. As part of permitting once environmental review is completed, permitting agencies will need to ensure that sufficient financial assurances are in place to cover the cost of mitigation measures identified by the EIS. Such considerations will be of sufficient complexity that they will be impossible to adequately evaluate during a time-constrained permitting process without a thorough analysis, as outlined above, during environmental review. Best, Josh ----- Forwarded message ----- From: Josh Williams <HYPERLINK "mailto:josh.a.williams@gmail-com"josh.a.williams@gmail-com> Date: Thu, Mar 13, 2014 at 3:48 PM Subject: SDEIS comments To: HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us In order to adequately evaluate the potential impacts of the proposed project, the SDEIS needs to consider the feasibility of remedial activities at and around the mine site. Good morning, I am strictly apposed to new mining operations near the BWCAW in northern MN. The area is home to the richest wildlife in MN, and major parts of the upper US. The uniqueness of the clean water, solitude, and low populations helps to improve the habitat there, as well as the overall impact in the area. As the US, and MN, continue to increase in population, we need real solutions using alternative energies, recycling programs, and the like- that limits our impact on the environment. It would be quite the contradiction to have one of the most pristine and protected wilderness areas on the planet, surrounded with a perimeter of mining. That is NOT the message to be sending to our young people. I have seen in western ND the impacts of the oil country literally drunk, high people driving around in cars and shooting off guns near hiking trails with significantly increased violent crimes. The sort of community fostered by a materialistic desire for Earth's minerals is not the kind of community that such a beautiful and pristine place deserves. Please, MNDNR, do not allow this mining to continue, we need to say "No," and make better investments for the future of Minnesotans, and the rest of the country. Much appreciated, Josh Borchardt Space Studies MS Student John D. Odegard School of Aerospace Sciences University of North Dakota, Grand Forks B.S. Joshua Houdek

42482

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Joshua Houdek 2820 37th Ave S Minneapolis, MN 55406-1718

Joshua Knieff

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Joshua Knieff Litchfield, Minnesota

Hi. My name is Joshua Sparber, S-P-A-R-B-E-R. Two comments. One, I have concerns with the macro understanding of an economic impact on a region driving a singular project. This project is not going to impact the entire -- as the mayor of Hoyt Lakes indicated, empty region, economically-depressed region. Another comment was the entire population of, you know, Tower, Ely, Virginia, Biwabik, the major Iron Range cities, would not currently reach the capacity of the Excel. Well, 400 jobs isn't going to make an impact on such a diverse problem. The environmental possible impact is not worth the minimal economic return to that region. The company is a Canadian company. The majority of the profits will leave the state in terms of reinvestment. Yes, you would have short-term environmental -- excuse me, economic improvement for a very limited amount of people, and there would be a generational -- a one-generational benefit, but as the closing of the taconite mines has shown, you've sustained four generations on those taconite mines, and that built, over many generations, an area. One very small generational window is not going to improve that area, and the amount of economic impact is astronomical. The other similar point I would make is that if you added up, my assumption is of the average wage, if every one of those 400 workers made on average \$75,000 a year, you still would get less money over a 20-year period of time, gross, than it's going to cost to build the Vikings stadium. And the Vikings stadium is not going to have a 2- to 500-year environmental possible impact. There is no clean way to mine these resources. If there was more than a 20-year window to do it, I would be more supportive. Such a short window does not equate with such a long impact. Thank you. And a short addition is my impression of the majority of proponents for the project are lobbyists and paid advocates in the industry, and the majority, I would imagine, have already made their comments placed on the record, so they used quite a bit of time to reiterate comments on the record that are well documented. Thank you.

I find it disturbing that the opposition to PolyMet's project keep bringing up failures from the paSt Technology and information is constantly changing. We can use this new technology and past mistakes to learn from and improve our processes. I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations. Sincerely, Josiah Loeffler Josiah Loeffler 900 5th Ave SW Little Falls, Minnesota 56345 The views and opinions expressed in this message my own. Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Josie Lilly 1111 Harrison Ave Apt C Astoria, OR 97103 US

josie nelson

45166

Please do NOT allow the polymet mining project to go forward I am very concerned that the SDEIS is flawed, and that this project will seriously harm water that we all must have to live. I am also saddened that it will destroy a beautiful resource in our state and habitat for animals. Native people will also likely be harmed, since wild rice is sensitive to sulfur. The jobs created by this project will be temporary, but the project will harm generations to come. It doesn't cost anything to leave the minerals in the ground, but we may all pay a tremendous amount to clean up after the potential disastrous results. One small miscalculation could lead to consequences that cannot be reversed. If we allow this to move forward, we are sacrificing the good of all for jobs for a small segment of our population. Thank you for your time. Josie Nelson 239 Peninsula Road Medicine Lake, MN 55441 763-540-6884 <https://mail.google-com/mail/u/0/images/cleardot.gif>

Josie Winship

Hello, I am writing to strongly oppose the proposed PolyMet Northmet copper-nickel mining plan. I am not at all convinced that the short term goal of mining is at all worth the inevitable pollution it will cause. Nor am I convinced that that PolyMet will be able to reverse the damage to water and land to its original healthy state. I vacation every year on Lake Superior, the largest body of water in the world. I cherish it and am proud to live in a state that boasts this gorgeous treasure of a lake. Please think of what is good for the earth and its people and stop this dangerous plan. Thank you for reading this. Sincerely, Joanna Winship 2909 E. 22nd St Minneapolis, MN 55406

Journey Roberge

15453

Katy Olson: 2345 Woodbridge St Roseville, MN 55113 Copper Mining in Minnesota, Why We Shouldn't Allow It. Copper mining is a process where geologists find the richest deposits of copper that they can locate. Miners then separate the rock with the deposit in it away from the earth, break it all up, then separate the valuable materials from the rest. Once they do this, they concentrate the metals from the deposit. Using a hydro-metallurgical process in a pressure cooker is how the metal is concentrated. This is called sulfide mining. This process is very similar to mining for iron ore. Minnesota is considering mining for copper because there is an estimated 4 billion tons of copper deep under the ground in the Duluth Complex. It is worth far more than one trillion dollars. Copper mining in Minnesota is a dangerous thing and should not be allowed to take place. To start, sulfide mining for copper should not be allowed in Minnesota because of the mining company that would be operating the copper mine, PolyMet, has never operated a mine before. They are going to use unproven techniques to extract the copper from the ground. That to me, is not a reliable process and could prove to be harmful. Because something could go wrong and put the whole mine in jeopardy. This is one reason why we should not allow the sulfide mining to take place in Minnesota. The second reason the copper mining should be allowed to start in Minnesota are the environmental concerns. When it rains on sulfide ore waste, sulfuric acid is produced. Unlike iron ore mining, where, when it rains on iron mining waste, it creates runoff. Sulfuric acid can contaminate lakes, rivers, and groundwater but also harm human life, aquatic life, wildlife and damage whole ecosystems. Even though companies claim that sulfide mining has minimal environmental impacts there has been destroyed wildlife around the world, contaminated drinking water, and much more pollution. Sulfuric acid being produced and harming the environment is the second reason why copper mining shouldn't occur. The final reason sulfide mining for copper shouldn't occur in Minnesota is that mining companies often abandon their mines and leave the cleanup to taxpayers. Even though Minnesota requires companies to provide financial assurances for the cleanup, many mining companies go bankrupt and cannot help with the aftermath of the mines. This poses a large problem because many families don't have much money to start with so paying for the cleanup is a problem. That is my final reason why copper mining in Minnesota should be out of the picture. In conclusion, sulfide mining for copper should not take place in Minnesota because of the environmental concerns with water pollution, the fact the PolyMet has never operated a mine before. Also, most mining companies abandon their mines because they go bankrupt, thus forcing taxpayers to have to pay for the cleanup. My opinion should be considered because I have included the three large reasons why sulfide mining for copper is a bad thing. Sources: Source #1 <http://www.dnr.state.mn.us/volunteer/julaug12/nonferrous.html> Source #2 <http://www.miningtruth-org/minnesotas-environment/#.Uu64uGRDtSS> Source #3 <http://www.friends-bwca-org/issues/sulfide-mining/>

Joy Barth

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The Great Lakes is too large an area to experiment and have the likelihood of an enormous consequence that can't be remedied. For instance they give the figure of 500 years before the water would be salvaged again and that is likely questionable since we don't have a period of time that length to presently prove that. At this rate we won't have any pristine water and we'll all depend on the expensive process of desalination. It's a life and death risk. Sincerely, Sister Joy Barth Sincerely, Joy Barth 1001 14th St NW Rochester, MN 55901-2590 (507) 282-7441

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. This document is enormous and the issues are extremely complex. One needs a great deal of time to examine the information and to comment on this information. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Joy Schochet 828 W. George Street Chicago, IL 60657 773-327-6592

Dr Jonathan Green Dr, Joy Schochet 2310 Rose Lane, Ely, Minnesota 55731 828 W. George Street, Chicago, IL 60657 March 11, 2014 Ms Lisa Fay EIS Project Manager MNDNR Division of Ecological and Water Resources Environmental Review Unit Re: Proposed NorthMet Mining Project and Land Exchange Citizen Comments on Supplemental Draft Environmental Impact Statement (SDEIS) Dear Ms Fay: We wish to make the following comments regarding the PolyMet/NorthMet SDEIS. We find that the SDEIS does not address or does not address adequately many of the issues pertinent to the evaluation of this proposal. Among these inadequacies are the following. 1- Copper According to Gavin Mudd (International Journal of Sustainable Development, 2013), the price of copper has steadily declined since 1900- He states in an email to the journal Science: "The critical issues already constraining the copper industry are social, environmental and economic issues. Any process intended to extract a kilogram of metal locked in a ton of rock buried hundreds of meters down invariably raises issues of energy, water consumption, pollution, and local community concerns. And such environmental and societal constraints are getting stronger" (Science, 343:722-724, 2014). Thus, the consequences of copper mining in an environmentally-sensitive and economically-fragile area are such as to preclude such mining activities, particularly in a downward-trending market for the metal. Under such circumstances, copper mines are a risky investment, and mining companies could well close or fail to undertake remediation and restoration as promised, leaving the mining site environmentally compromised at best or destroyed ecologically. 2- Environmental Issues The Superior National Forest (SNF) covers 3-9 million acres, of which over 445,000 acres are water, some 2,000 lakes and rivers and more than 2,000 miles of streams It is a national treasure in that, while it is only 0-2% of the contiguous USA land mass, it is home to a disproportionately large fraction of the US's fauna and flora. In addition, it hosts a great number and variety of transient species and provides them with sustenance, shelter, and breeding areas. Moreover, the diversity of landforms in the SNF, compared to its area, is unmatched. The impact of mining on the Superior National Forest and the Boundary Waters, as well as the Quetico Park and Lake Superior, would be substantial and detrimental. The environmental degradation, water and air pollution, the local, national and worldwide impacts of this proposal have been neither adequately appreciated nor discussed in the PolyMet SDEIS. Most significant of all is for us to recognize the value of a scarce ecosystem. Wilderness areas are continually decreasing in size and quality throughout the world, no less here than in the "developing" world. In an increasingly degraded and crowded world, must we not preserve the inherent value of these scarce environments, both for their own sake and for the health of the planet. Not only do they provide innumerable "ecosystem services" to us (and other species), but they provide unexcelled recreation and enjoyment for many and other non-quantifiable benefits. The BWCAW and its surrounding forests are invaluable to our planet, but the BWCAW cannot survive as an isolated "island" amidst ceaseless exploration and exploitation. Its loss will accrue to us all; as we will have sacrificed an irreplaceable resource for the short-term economic gain of others. One of the major impacts of the PolyMet mine would be on wetlands, of which nearly 1000 acres would be completely destroyed. While PolyMet states that they will convert other (distant) areas to wetlands, it has been established by many scientific studies that such "restitution" wetlands are not at all the same as natural wetlands. They are much less biodiverse and provide much less habitat, nutrition and water services than natural wetlands. Therefore, no amount of reconstitution will suffice t

I am strongly against and opposed to allow copper mining in Minnesota. Please do not permit this atrocity. To compromise the quality of health and life for all living creatures due to the ramifications of copper mining would be not only a disaster but also an injustice to all future generations. Joy Elizabeth Windseth-Zerr

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. It is crucial to protect Lake Superior, the watershed and Superior National Forest from toxic pollution. Unless there are proven methods that prevent this, the risk is too great. If this happens I'm concerned that we can never restore the damage. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Joyce Blomquist 1980 Skillman Ave W Roseville, MN 55113-5403 (651) 631-0688

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining is forbidden in Wisconsin. Up to now it has not been done in Minnesota. There are reasons for those two facts: sulfide mining threatens wetlands, rivers, lakes, and streams where it is done. In Minnesota, that includes all across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. For almost a century, generations within my family have enjoyed the wilderness in this part of northern Minnesota. My Father-in-law went fishing there every year for years. My husband grew up near there and took his canoe into the area with friends as a teen. Together, my husband and I went many summers up into that area, all the way from Indiana, to enjoy the canoeing as well as the botany and wild life of the area, which included black bear, moose, wolves, and nesting bald eagles. My son and daughter both enjoyed several long canoe trips into the area as teens. And now, last summer, one of my grandchildren, a teen, went on a long canoe trip there with the girl scouts. She hopes to do it again next summer. Her younger sister also hopes to do it next summer. I would like their children to be able to have their wilderness trips in northern Minnesota, too, as generations of the family have. However, I am concerned that that might not happen if sulfide mining is done in the area, for Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Inevitably, it would happen in Minnesota. I have grave concerns beyond the impact on my immediate family. This project's potential impacts on that region's natural resources and public health are many, including: 1- risks to water quality 2- loss of wetlands 3- harm to wildlife such as the threatened lynx and declining moose populations 4- many cumulative impacts from mining. There is no doubt that the Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Please do not allow it. Sincerely, Joyce Harrington 1604 Hoover Ave South Bend, IN 46615-1313 (574) 288-8811

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Joyce Malwitz 4137 bridgewater circle Vadnais Hts, MN 55126

Good Afternoon- I support PolyMet in their efforts to regain the ability to mine and produce products to help build this country. Obviously they have to do it cleanly and an eye to the future and they should be treated fairly by the groups doing the evaluations. Regards- Evans Connelly, Jr. Evans "Chip" Connelly, Jr., CRPC®

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, juan cruz 2440 Young Ave Bronx, NY 10469 US

Juan M 54224

Dear Lisa Fay: I'm writing this letter to you in regards of the Polymet sulfide mine. We have reviewed the maps as a class and came to conclusion that they should be redrawn and re-looked at because of the bogus scaling and drawing that took place. The map should be carefully looked at, and re-examined because there is a creek connected to the swamp that leads to the boundary waters, and it will pollute the water and diminish the cleanliness of it. Also the water should be tested to make sure that if this event were to happen, we would be able to fight it. Therefore, this should all be looked at and reviewed so we don't have to face this in the future. Lots of economical problems could happen without all this being taken seriously. I am just a student at Humboldt Senior High, but I'd hate to see my economy get destroyed over some bogus scaling. Sincerely, Juan M. [ILLEGIBLE]

Juanita Nelson 47514

I agree with the Northland Doctors, They say sulfide mining releases toxic pollutants known to cause dangerous health effects like cancer, lung and heart disease. Don't we have enough health hazards and pollution all ready. I don't think we need more. I have read they will be here for 20 years but it will take 50 years to clean up, That is not worth it Juanita Nelson

As lifelong residents of this wonderful state, we would like to express our concern over the proposed PolyMet mining in northern Minnesota. We are getting to that retirement age soon and would love to move up north but are concerned about this project and the impact it will have on not just northern Minnesota but the state as a whole. We have put off retiring and moving until we know who's side of this issue Minnesota will land. We really don't want toxic waste in "literally" our backyaRd Minnesota would be "penny wise and pound foolish" to give up so much for a couple hundred jobs for 20 years. It's not worth the risk involved when PolyMet packs their bags and moves on to rape and pillage another wilderness area, leaving Minnesota taxpayers with the cost of cleaning up their mess. The fact that this type of mining has never been done cleanly anywhere in the world without leaving a toxic waste dump should be a giant red flag. Why would we take that chance. It saddens us to think that there are people in this state that think this is a good idea. A few hundred mediocre paying jobs. Really – we're ready to pollute the Boundary Waters, of which there is no other place on the planet like it, for a few hundred jobs. This mining has NEVER been done without leaving toxic waste in river, streams and lakes EVER. We sure hope Minnesota is smart about this and tells PolyMet no. As life-long residents and hoping to stay that way, we would be sad to see this state go down into a dump full of toxic waste. Judi and John Vitek North Branch, Minnesota

Judi Mikolai 45123

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: After reviewing the PolyMet proposal and attending the St Paul comment meeting, I have serious reservations about PolyMet mining in northern MN. There are numerous problems I see. Anyone who has a basement in MN can testify how difficult it is to not have water find its way where it is not wanted. You simply cannot contain water. It seeps into the smallest crack and follows the path of least resistance. Until we have the technology to truly contain water, we cannot produce contaminated waters that endanger our ecosystems, groundwater and surface waters. There is a lot of blind faith and wishful thinking going on with the PolyMet proposal. While we all would like to rely upon such empty hopes, we have to be realistic. When other mines show they can run a clean operation, then, let's consider it for MN, too. PolyMet should have to show proof that the mining can be done without contaminating the site the minerals are, the millions of gallons of water that would have to be used to extract the target products, and the storage ponds that would be used to try to hold the water until it can be cleaned. Other mining sites where the same processes are used are described as a "moon-scape." We love to go to northern MN. We love to camp, canoe and recreate in the quiet and beauty of the wilderness. But, I have to say, if the wilderness WERE to be damaged, we would not be visiting there like we do now. The landscape is anything but a barren wasteland now. The solitude, the extensive forests, the potable lake water, the rugged topography draw us in. If there water were contaminated, if the trees were removed, the land leveled, the wildlife harmed, or the silence replaced by the noise of a 24x7 industrial mining operation, we would look for an alternative site. And it is senseless to mine in northern MN now anyway. From what I understand, there is a surplus of copper and some other substances that are to be mined by PolyMet in Northern MN. The company would greatly, because of the high prices they could get for the minerals and metals, but the price of MN's wilderness is too high a price. The company is not even MN-based - most of the money would follow the company. There would be some taxes paid to MN, but the profits would go to another country. There would be some local jobs, but are the locals going to land the jobs. Miners jobs aren't unskilled labor as they used to be; unless the But, even so, the cost to MN is too great. We can't afford to sacrifice our water. We have to make hard choices and not be lured by money when it has irreconcilable costs. We cannot replace wilderness; we can recover ground, but not water. Where do we find a new source of water. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Judi Mikolai 2080 Long Lake Road New Brighton, MN 55112

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Judi Poulson 1881 Knollwood Drive Fairmont, MN 56031

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Judi Poulson 1881 Knollwood Drive Fairmont, MN 56031

There is already evidence that privately held land is being destroyed and the owners are suffering the effects of the noise and pollution. This is appalling. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dmiinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

I believe that water--clean water--is our greatest resource in Minnesota. The value of water will only increase with time. To squander this resource for future generations by contamination now is shortsighted! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dmiinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Judith Haglund 935 N. Beneva Rd Sarasota, FL 34232 US

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, The only thing more precious than water on this planet, is our children. If we risk our water with acid mining, some may find considerable profit, buy Things for our children one day, as the water of the planet becomes more and more polluted, irreversibly, and we stand there and think, we were sure this wouldn't happen, what will our children drink. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Judith Moe PO Box 12141 Omaha, NE 68112-0141

Judith Screaton 2474 Oakgreen Ave N Stillwater, MN 55082 651-439-7860 [HYPERLINK "mailto:rjscreaton@gmail-com"rjscreaton@gmail-com](mailto:rjscreaton@gmail-com) Dear Ms Fay, There are still so many unanswered questions about the PolyMet Mining proposal that I believe it can not go forward without significantly more questions being answered. 1- How is it possible to sacrifice many, many acres of precious National forest for a commercial venture of questionable benefit to Minnesotans. 2- How many of the 350 proposed jobs would be filled by local residents rather than specialists brought in to run the mine. 3- What has been proposed by the mining company to control pollution in the area. Who would pay for the cleanup. 4- Is it significant that this mining company has NEVER operated a mine before, is run by a foreign company and financed by another foreign company. How is it possible to hold them responsible for the massive pollution that will result from their venture. 5- Safe unpolluted water is one of the most valuable resources we have in Minnesota. We must preserve this important resource, or it will quickly disappear. 6- Other departments of the DNR have recently been cited for not being good guardians of our water supply. Wouldn't it be odd for part of the DNR to work on preserving our water, while another part of the DNR is complicit in possibly creating massive pollution. 7- How many tourists will this displace, and what would be the effect of massive pollution on our tourist industry. I am anxious to hear from you, Sincerely, Judith Screaton

The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Judith Straub 6221 Idylwood Lane Edina, MN 55436

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Judith Weir St Paul, Minnesota

Judith Zetting 29956

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I'm a 77 year resident of two GREAT LAKES STATES and I would like the GREAT LAKES to CONTINUE TO EXIST till the end of the world. I do not want to see Lake Superior, Lake Michigan or any of the others to dru up, become a sewer, or a blight on this earth. THIS GREED to squeeze any and all of anything from the world around us HAS TO STOP, OR THERE WILL BE NOTHING LEFT Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt Sincerely, Judith Zetting 6229 W Villa Ln Brown Deer, WI 53223-3454

Judy Ament 16668

I would like to go on record Not to allow this for the sake of preserving the water resources I have been reading pro's and con's- it would be a short term benefit but there are too many concerns for the long term survival and preservation of water. Judy Ament 804 Chestnut Ct St Cloud MN 56303

Judy Baxter 45412

Dear Ms Fay, Dear Federal and State Agency Leaders: I am really seriously concerned about the quality of the analysis of impacts of the mine in the PolyMet SDEIS. How can you propose destroying 900+ acres of irreplaceable wetlands and damaging 7000 without looking into alternatives. These wetlands protect and maintain the area waters, and replacements outside the watershed will not do. Fish in the area already contaminated with mercury so that consumption warnings are issued. Adding more sulfide mining pollutants will make this worse, and is unacceptable. The idea of putting tailings and waste heaps in an unlined tailings basin, designed in the 1950's on top of streams IN ORDER TO LEAK, is totally ridiculous. This is an example of cavalier disregard for preventing or reducing pollution. Of course it would leak acid,sulfate, and toxic metal processing waste. They say for 500 years. Are we supposed to believe that they will mitigate that for so many years after the mine closes. I can't. This SDEIS is totally inadequate - please reject it and deny the permit to mine or a Section 40 wetlands permit. Sincerely, Judy Baxter 1425 W 28th St, Apt. 301 Minneapolis, MN 55408 6128715125

Having been to the BWCA we fear for its well being if this company should be allowed to operate. Up North is a destination we've been to often and had hoped to return to. We realize the issue of jobs has been put forth as a reason to operate this mine but we believe that PolyMet will do more to diminish, rather than enhance the overall quality of life for the people in this area. Minnesota deserves the best Sincerely, Judy and Doug Bjork Pam Christoferson

Judy Busse

47493

There are two critical reasons why my husband and I are opposed to giving PolyMet what it wants: first, there is no way PolyMet can assure citizens there won't be grave environmental consequences somewhere down the line and while there might be some jobs created for a time, that number could pale in comparison to damage done to people as well as to the land; second, if we don't want PolyMet's project we don't have any reason to want them to receive financial assistance on any level. Sincerely, Judy and David Busse 110 Bank St S.E., Minneapolis, MN 55414

To: MN DNR From: Judy Galbraith 832 Meadow Lane So Golden Valley, MN 55416 I am writing to express my complete opposition to the proposed PolyMet Mine. This mine will pollute not only Minnesota waters, but the relatively pristine waters of Lake Superior. It would also destroy 900 acres (or more) of wetlands with toxic contamination. There's no way PolyMet can contain or effectively treat contaminated water, which would remain polluted for hundreds of years. Anything they claim to the contrary is defied by past mining records and disasters. They are about one thing and one thing only, and that's making money with little regard to the environment (and the animals and people who depend on it for survival). In addition, the PolyMet mine would have a serious long term negative impact on a large part of the Superior National Forest which is the largest designated Important Bird Area in Minnesota. This area attracts many tourists and residents who value their beauty and environment they live in. Are a few thousand temporary jobs really worth the destruction of one of Minnesota's most valuable natural resources — our clean water and beautiful wilderness. The logical and common sense answer is no. Arguments have been made that we need more and more copper, nickel and mercury. But the absolute truth is that with more comprehensive recycling efforts the demand for these minerals would seriously diminish. Also, many jobs could be created if we developed more recycling programs Please deny any and all permits for this proposed mine. Sincerely, Judy Galbraith

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. The short-term job gains are not worth the long-term and permanent environmental damage this mine would cause. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Judy Galbraith 832 Meadow Ln S Golden Valley, MN 55416-3419

Dear Ms Fay, Dear Federal and State Agency Leaders: March 8, 2014 To: Waterlegacy-org re: PolyMet Lisa Fay, EIS Project Manager Douglas W. Bruner, US Army Corps of Engineers Tim Dabney, US Forest Services From: Judy Kreag, Citizen of MN and USA Re: PolyMet NorthMet Sulfide Mining SDEIS I sometimes feel that as just one citizen I have little power to make a difference, but when it comes to the water that my children and grandchildren will be drinking I need to speak out. This is big. Polymet's open-pit sulfide mine plan should be rejected for many reasons but the biggest is that it will pollute the largest freshwater lake in the world, possibly forever. The company has no concrete plan that will make my statement false. It may bring a few jobs to the area for a few decades but will leave us an unheard of problem for anywhere from 300-500 years or more. I live in Duluth. I drink Lake Superior water. My daughter and grandchildren do too. We all deserve clean, fresh water. This earth is all we have When the water is no longer drinkable, then what. I read the news with sadness. Many accidents pollute the earth, water and other resources and those large companies that cause it do not take responsibility to correct it. Who suffers. The people close by and in many cases others who are not even that close. I am close by this project and I do not want it to be approved. I hope you will listen to the people who would be the ones to suffer. Life on this planet is not all about money. It is able integrity, compassion, love and care for our earth, the only home we have Thank you for listening. Mar 6, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. There are too many variables involved. At what cost are you willing to pay with Minnesota lives to have PolyMet in Minnesota. I feel money being the ultimate player here. This is not Vegas, where if Minnesotans lose, they can just walk away as PolyMet would do if they did not get their money from investments. Will they invest in CLEAN-UP AND RECOVERY PROGRAMS should they arise. Why is it greed that drives every gold-digger (in example) to our state. Our natural resources is the crown jewel we have Not those in the ground you cannot see, but the hills, the forest, the lakes, the forest animals, but mostly the people who make this state great. But others love it to death and will not be happy until MN is dead and void. No reason to come back. Use us up and spit us out. For what .for a mine. Think about the responsibility you have Department of Natural Resources. Not to exploit but to hold for generations to come. To be enjoyed, not by corporate greed, but by those who can appreciate Minnesota's beauty. Have you been to one of their mines. Go and see what they do. Talk to the people. Is PolyMet a good neighbor. Many corporations ARE NOT. They strip the land and contaminate the water. But the people want to have a job, so they say nothing. Department of Interior , BLM , is selling out to corporate greed in the Western states for mining, big oil, welfare ranching, all in the name of progress, and is exterminating the Wild Horses and Burros from the land. Then there became a law to protect them and now the law cannot even protect them. Don't let that happen to Minnesota. Become informed. Sincerely, Mrs Judy Lane 2400 Timberidge Ln SE Rochester, MN 55904-8601

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. My family has fond memories of many camping trips to the Boundary Waters area. To think that our state is willing to irrevocably change the pristine nature of this very special area for the benefit of a multinational corporation whose only goal is profits is unconscionable. No government entity has the right to make decisions that would negatively affect the health, and economic well-being of people for the next 500 years. Do not approve this threat to our state's greatest natural asset. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Judy Urban 1007 Cliff Rd Eagan, MN 55123-1908 (651) 454-3834

Judy Young 52182

To whom it may concern, I am concerned: we do not have sufficient information to guarantee environmental protections to land and water safety for wildlife and people. I lived twelve years on the Range and I also vacation many times a year near Ely. Before allowing consideration of mining proposals, I urge decision makers to be certain that the following clean water and environmental protection principles can be guaranteed: 1- BWCAW waters remain safe and clean; potential impact on health and safety of residents and visitors be studied. 2- Strong safeguards are in place in the event anything goes wrong – for centuries in the future. 3- Mining companies must leave the site maintenance free (in accordance with existing MN mining rules) I strongly urge careful scrutiny of proposals that have the potential to disturb and/or pollute the BWCAW; to disturb habitat for deer, wolves and other mammals and birds; to disturb the fishing climate of anglers of all ages and species. This eco climate and geography is precious to the well-being of future generations; wilderness cannot be replaced with museums of what used to be. Judy Young 6711 Lake Shore Drive S. #503 Richfield, MN 55423 612-821-3789 A

Jukka Kukkonen 863

I just wanted to bring your attention to a story of the Talvivaara mine in Finland that can be used as an example what we can expect to happen here in Minnesota with PolyMet. The Talvivaara mine was opened in Finland in 2008- It turned out to be an environmental disaster and the company is now facing bankruptcy. http://en.wikipedia.org/wiki/Talvivaara_Mining_Company It is pretty easy to make a comparison between these projects. Nickel mining, similar climate, etc The environmental disaster was caused by waste water and treatment pond leaks in 2012 and 2013- When we think about the heavy downpours and flooding that Duluth experienced last summer, there is no (financially sustainable) way to build levies that could handle that kind of extra stress. Jukka Kukkonen Highland Park, St Paul

Julaine Heit 20162

The Supplemental Draft Environmental Impact Statement is inadequate. It does not provide any reassurance that this mining will not result in irreparable harm to the environment in Northern Minnesota. Polymet's proposed mine threatens our clean water and public health. Please do not allow this to proceed. Julaine Heit 5205 Upton Ave S Mpls, MN 55410

Julia Billmeier 18268

My name is Julia Billmeier. I am 11. I think that they shouldn't mine because it -- because there is a very, very high risk. 20 years of mining is not worth 500 years of cleaning up and 500 years of nobody being able to use it or have fun or do anything there. And I'm only 11 and I only went there a couple of times and I want to go there a lot more times, and I think if they mine, I won't be able to. Please, please, please do not mine because then it won't be wild anymore.

Feb 27, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Do not allow this sulfide mining in Minnesota. I do not want even the slim possibility of our great state's water being polluted. Please think of future Minnesotans and keep this mining out of Minnesota. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Julia Hupperts 7 Sunset Ln Saint Paul, MN 55127-6455

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, The PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement is clearly a threat to the water quality and environmental status of large natural areas PLUS Lake Superior. Open pit mining is the most environmentally destructive form of mining and considering that this impacts a large part of a NATIONAL PARK, how can any such permission be given to this project. Also, what is Polymet's history in care of the environment. What will the company be charged for this privilege to destroy a large tourist attraction and public water supply. Who could allow such destruction. It's pure madness - or bribery. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have huge concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. This project is so harmful to our state. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not at all in the public interest. Sincerely, Julia Kleppin 7038 N Lincolnshire Cir Milwaukee, WI 53223-6343

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. As a student, I am very concerned about the future environmental and public health of our state. The Polymet mine would reach the end of its useful life within my lifetime, and I think it's unfair that my generation as well as many generations to come would have to suffer the negative consequences of sulfide mining. Minnesota has a lot to lose in terms of precious cultural and natural resources, and it is not in the interest of the people in our state to make such a sacrifice. It's seen over and over again that even when people assure/expect systems to work, systems fail, and when considering the pristine natural resources of our state, this isn't a risk we should be willing to take. Finally, I don't believe it is morally right to destroy irreplaceable natural beauty, clean water, wild rice areas, and animal habitat for the sake of temporary profits. Nor can it be economically right either - taxpayer funded cleanup for hundreds of years is just as shortsighted. Please maintain our state's vital natural resources for my generation and generations to come. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Miss Julia Kloehn 4036 Xerxes Ave S Minneapolis, MN 55410-1146 (612) 926-9968

Dear Ms Fay, Dear Federal and State Agency Leaders: I'm concerned about several things with the PolyMet mine. Too many to list in a single comment, as far as I can see. So I'm picking a couple of the major ones. My overall concerns is with the possible contamination of the groundwater and what that means. There are several parts to this. 1- The tailings are destined for unlined pits, including using an existing pit that is known to leak. That doesn't just create the possibility of leaking, it essentially guarantees it. 2- This is the part of the drainage into Lake Superior. The Great Lakes represent 20% of the fresh water in the world. Not the US or even North America, the world. All of the projections are that water is going to be a precious resource this century and probably after. Taking any sort of chance on contaminating that large and important a resource is frankly insane. While the Great Lakes are large, poison is poison and there are already sources dumping in there. Don't add to it. The importance of the cumulative effect should be considered. 3- Effects on the local biota is also a concern. There has been a recent study (University of MN at Duluth was involved) that shows even low levels of sulfides have a notable and long-term effect on wild rice. There is no reason to think that would be the only effect, and even that is going to affect the living and the finances of the population in the arrowhead region. Plus any effects on the wildlife. 4- Climate change is happening. Even aside from the cause, it's happening and there is going to be continuing change through the century and beyond. One of the predicted effects is a greater frequency of severe rains. The SDEIS does not address this, despite the fairly recent experience in the Duluth area, which is clearly not far away. My preference is to simply not allow the mine. I don't see enough potential advantages to offset the risks. But at a minimum the final EIS should address A. The effects and mitigation of heavy rainfall (of at least the 100-year severity), including having something of that intensity at least on a decadal basis. B. Better control in any case of the tailings and drainage from them. Line the pits, start the reverse osmosis immediately, and impose a significant fine if the standards are not met. Sincerely Julia Nelson Julia Nelson 812 Queen Av N Minneapolis, MN 55411 612 588 8910

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay: This comment pertains to the effects the proposed NorthMet mine would have on two avian species: northern goshawk (*Accipiter gentilis*) and Boreal Owl (*Aegolius funereus*). The habitat requirements of these two species are similar, and the proposed mine would affect them similarly. The Supplemental Draft Environmental Impact Statement does not adequately address the status and outlook for these species in Minnesota. Section 4-2-5-1-2, Species of Greatest Conservation Need, of the SDEIS contains the following: Mature upland and lowland forest is the most common habitat type at the NorthMet Project area (primarily at the Mine Site). Section 4-2-4 provides a more detailed discussion of vegetation cover and habitat types. Northern goshawk, spruce grouse, black-backed woodpecker, and boreal owl were observed in these forests (ENSR 2005). These species represent a group that generally requires large forested blocks and/or minimal human intrusion. Section 4-2-5-1-3, Regional Forester Sensitive Species, misstates the status of northern goshawk and boreal owl in Minnesota. That section states: Four of these RFSS species are state-listed ETSC species (ie, gray wolf, bald eagle, wood turtle, and eastern heather vole) and are discussed above. Seven other species are on the SGCN list and are discussed by habitat type in Table 4-2-5-1- These species include the boreal owl (*Aegolias [sic] funereus*), . And: The northern goshawk (*Accipiter gentilis*) is not federally or state-listed. In fact, the Minnesota Department of Natural Resources added both species to the list of Special Concern species in August, 2013- The Minnesota DNR defines Special Concern species, in part, as follows: A species is considered a species of special concern if, although the species is not endangered or threatened, it is extremely uncommon in Minnesota, or has unique or highly specific habitat requirements and deserves careful monitoring of its status. Both the northern goshawk and the boreal owl meet this definition. In fact, when the DNR proposed this listing, Audubon Minnesota objected, stating that both species should be listed as Threatened rather than Special Concern. Here is Audubon Minnesota's justification for the Threatened status of both species: Northern Goshawk – Audubon Minnesota believes that the Northern Goshawk should be listed as Threatened. Listing this species on the Special Concern list, as proposed by the DNR, does not properly reflect the current status of this bird and will not provide an appropriate degree of protection to ensure its future in the state. As noted on the Species Status Sheet, there has been an average of only 29 territories found in MN annually in the recent past, in spite of intensive surveys by the DNR and the US Forest Service. Additionally, as the SONAR shows, the Minnesota population has lower productivity than found in populations in other parts of the country. While we recognize that the species habitat needs are not fully understood in this part of North America, there is strong evidence suggesting that large patches of mature forests are very important to the Northern Goshawk. This habitat is currently in decline in Minnesota, and recent land management decisions are likely to exacerbate this slide. There are no plans to increase this habitat type in the future. Boreal Owl – Audubon Minnesota believes that the Boreal Owl should be listed as Threatened. The proposal by the DNR to list this species as Special Concern does not adequately address the needs of this species in the State nor ensure its survival. It is reasonable to believe that this species has never occurred in high numbers in the State, and the decline in numbers over the past decade indicates that the population is in danger

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Juliana Day st louis park, Minnesota

As a lifelong Minnesota resident, I do not support the copper mining proposal. The negative environmental impact will long outlast the temporary boost to the economy. It threatens to do permanent damage to Minnesota's recreation and tourism industries. Recreation and tourism could continue to provide jobs for decades to come, much longer than the proposed mining jobs. If the project causes long-lasting damage to our natural resources, especially our water, the tourism and recreation industries could be destroyed. As we have seen in the past, companies come and go, and the promises a company makes disappear when it goes out of business or changes ownership. In the meantime the state, its people and wildlife will suffer the consequences for decades or even centuries to come. Julie Vennewitz Sent from my iPad

Julie Anderson

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Lisa Fay MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement(SDEIS). In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. My first concern would be the details of the proposed water treatment systems, specifically is there a system that has been tested that is capable of handling six million gallons a day. Have they tested the systems, how about a back up system, if they have to switch to a back up, can it handle six million gallons a day. How long will the system last, and what are the plans to replace it at regular intervals. What are the contingency plans for mishaps such as pipeline spills, accidental releases, and failures of water collection and treatment systems My second concern is how this water treatment system is going to be paid for, and maintained and monitored for up to five centuries. The mining industry is responsible for the largest and cost costly environmental clean-ups in our nation. I would expect at a minimum Minnesota taxpayers are protected. What are the financial safeguards that are proposed. What happens when the company goes out of business, either bankrupt or closed because its useful life has ended. Are they putting up earnest money, if so what percent of the typical cleanup are they putting up, who is going to manage the funds and safeguard them for the general public. Are they buying insurance policies, if so how do we know they will be around in 100 or 200 years. What is being proposed could potentially and negatively effect one of Minnesota's most precious resources, water. Please do not jeopardize Minnesota's water resource in exchange for a short term profit of copper, nickel and other metals unless water is protected for all Minnesotans for 500 years and beyond. Respectfully, Julie Cahoy 16501 30th Ave North Plymouth, MN 55447

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Lisa Fay, I am strongly opposed to the copper, nickel, paladium, and gold mines propped by Twin Metals and Polymet that would be located south and west of Ely, Minnesota. The Boundary Waters Canoe Area Wilderness is America's most visited wilderness area and one of the oldest designated wilderness areas in the nation. Despite what proponents of the copper-nickel mines say, creating new mines within 50 miles of Ely would be extremely detrimental to our local economy. The mines will not only be an eyesore, they will also increase rail and truck traffic, which would negatively affect tourism in the area. The noise from drilling and moving material destroys the wilderness experience on the southern end of the Wilderness area near Spruce Road and Birch Lake. Most importantly, there is no evidence that our most precious resource, the interconnected system of pristine waterways, will adequately be protected. Acid mine drainage in our waters is unacceptable. Sulfide-bearing rock brought to the surface will turn into sulfuric acid and leach into our waterways, resulting in irreparable damage to our biotic community. **DO NOT ALLOW ANY HARD ROCK MINING WITHIN 50 MILES OF ELY MINNESOTA.** Thank you for your time. - Julie Howard Native Fisheries Biologist Utah Division of Wildlife Resources Moab Field Station 1165 S Hwy 191 Suite 4 Moab, UT 84532 [HYPERLINK "mailto:juliehoward@utah-gov"](mailto:juliehoward@utah-gov) juliehoward@utah-gov 435-259-3781 (office) 435-630-1066 (cell)

JULIE HURLBUT

41054

Greetings, It has come to my attention that use of land in northern Minnesota is being considered for the Polymet sulfide mine. I have done my best to educate myself on the issue, being a person who spends nearly all of my vacation time in the far north of the state. The land there is a true treasure for the whole nation. No price can be put on the resources of beauty, serenity, renewal and unspoiled land that is offered in the currently protected areas. We know from so many sources that mining is a dirty, dangerous and negatively transforming activity, that the cost of clean up is high and the time for ecosystems to return to a healthy state is quite long .and sometimes they don't recover completely ever. There is too much at stake to allow Polymet to despoil the land and water of Minnesota. Many people are dependent on well water in the proposed area, and if, as in many other parts of the nation, the wells become toxic, how will they ever be restored. What will the people do. There are some things at this point in history that are too valuable to be jeopardized. Water is one of them. We stand at a point in history where even in this nation there quite likely will be unrest over the issue of water. California, Nevada and other places are coming up against severe shortages and where will they look for additional water. To the aquifers and the Great Lakes, that's where. As water is shared more and more, the need for clean ground water becomes greater and greater. We simply cannot take a chance on the water resources of the northern Minnesota wells. It seems in every quarter, the most basic requirements for human health, clean water and clean air, are being sacrificed in the name of profit and a relatively small number of jobs. When will we begin to take seriously the needs of future generations for these resources. What's the sense of having a job if it means ravaging and polluting the environment which in term leads to the damaging of your children's and your grandchildren's health. Please, please have the decency and courage to stand up for the health of the people and the resources entrusted to you of the beautiful state of Minnesota. Sincerely, Julie Hurlbut 2433 Davisson Street River Grove, Il. 60171 [HYPERLINK "mailto:JULS60171@yahoo.cpom"](mailto:JULS60171@yahoo.cpom) JULS60171@yahoo.cpom

Julie Jeatran

Dear Ms Fay, Dear Federal and State Agency Leaders: I am asking that you reject the exchange of Superior National Forest land that would allow PolyMet to move forward with its proposed open-pit mine for the following reasons: 1) It would conflict with the forest plan for the Superior National Forest which is your primary responsibility and my and my family's heritage to our children. 2) It would violate Federal statutes and laws to create a windfall of profits for a private company, while causing harm to the resources and wildlife in the area. You cannot put a price on this land. 3) The people who are being affected should have a say in over 6,000 acres being given away and traded for what parcels of land. Will they be accessible to us, useable by us for recreation, hunting and fishing, as valuable as what is being traded away, etc. 4) A separate environmental impact statement by law needs to be done investigating the impacts of this exchange. I have the right to see this and comment on it. Thank you for your consideration of my comments. Julie A. Jeatran Julie Jeatran 2121 E. Third Street, #1 Duluth, MN 55812 218-525-4595

Julie Jeatran 38738

Dear Ms Fay, Dear Sir/Madam: After researching and studying Polymet's SDEIS, I ask that you reject it as inadequate and INACCURATE. The PolyMet SDEIS is an expensive boilerplate document full of fake science. It's size is daunting but it does not deceive if you just consider the following: 1) An independent geological study shows fault lines directly below the (unlined) tailings basins. This means that the amount of seepage that PolyMet estimates has to be inaccurate. I would like to see more studies about this. 2) No studies have been done on the impact of arsenic, mercury, nor asbestos-like fibers that will be a by-product of this open-pit mine on human or animal health. Already endangered moose populate this area. 3) It doesn't analyze the effect of pollution our Northland's most precious resource: WATER. What are the mine's effects on drinking water, surrounding wetlands and/or the rivers and streams we love to fish from (not to mention the contamination of the fish we then eat from them).. 4) Stating that pollution from the mine would need to be treated for 500+ years and saying that they would responsibly do this is pure science fiction. Where would the money come from and where are the guarantees. We can be more creative. There is more copper in our landfills ('mining' which would use much less energy and produce much less waste) than that which is estimated in this mine. Thank you for your consideration of my comments and concerns. Again I ask that you reject PolyMet's SDEIS. Sincerely, Julie A. Jeatran 2121 E. Third Street, #1 Duluth, MN 55812 218-525-4595 Julie Jeatran 2121 E. Third Street, #1 Duluth, MN 55812 218-525-4595

Julie Klassen 58006

Wild Rice, fish, & all living creatures need clean water not polluted water from the mine for 500 years. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Julie Lochowski-Haney 47223

Mar 12, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. PolyMet's study of the impact of their proposed mine states that water from the mine site will need at least 500 years of treatment. 500 years ago - the year 1514 - Henry the Eighth was King of England. What sane person would believe that a modern company could provide 500 years of protection for Minnesota's waters. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Julie Lochowski-Haney 1384 Sargent Ave Saint Paul, MN 55105-2327 (651) 291-0482

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Julie MacRae 18900 Rutledge Rd Deephaven, MN 55391

TO: Minnesota Department of Natural Resources HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us FROM: Julie Nester, 4800 Lyndale Ave S, Minneapolis, MN 55419 HYPERLINK "mailto:jnester4800@msn-com"jnester4800@msn-com DATE: 2/23/14 RE: Comment on PolyMet sulfide mine SDEIS The PolyMet SDEIS has been shown to rely on an inaccurate water model and provides incomplete information about the health and environmental consequences of its proposed sulfide mine in Minnesota. I feel strongly that Minnesota DNR must require PolyMet to provide a plan that addresses the following: 1- Does the proposed mine plan keep Minnesota's water safe and clean. · The USEPA gave the proposed mine its lowest ranking: Environmentally Unsatisfactory and Inadequate. Polymet's SDEIS clearly shows that after 20 years, there will be three enormous pits up to 696 feet deep full of water polluted with sulfuric acid and toxic heavy metals. Treatment at the mine site will be required for a minimum of 200 years and at the plant site for a minimum of 500 years. Mine tailings will be added to an existing tailings basin that is currently leaking polluted water. I don't think there is anyone arguing that the mine will keep our water safe and clean. In fact, we will be responsible for polluting water for countless future generations. 2- Does the proposed mine plan put safeguards in place for when things go wrong. · There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin failure. These are foreseeable events that should have emergency plans developed and articulated so the public knows if the company has the ability to respond to a crisis. Glencore, PolyMet's largest investor has a long history of environmental pollution. Tony Hayward, the former CEO of BP is the interim chairman of Glencore's board We must require PolyMet to disclose plans for dealing with environmental disasters on the scale of Glencore's and BP's past accidents. · The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates in the Lake Superior watershed. In the event of a likely accident, how would PolyMet prevent polluted water from reaching Lake Superior and the rest of the Great Lakes, which contain 20% of the Earth's fresh water. 3- Does the mine leave the site clean and maintenance free. · A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. How will PolyMet ensure and pay for pumping after the mine is closed. · A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. The SDEIS does not address in sufficient detail the amount of mercury and methylmercury released into the Embarrass River. 4- Does the mine plan protect Minnesota Taxpayers. · We cannot wait until the permitting process to answer this question. It is unfair to Minnesotans that this SDEIS does not address whether the financial assurance is adequate. Given the uncertainty of the amount of anticipated and unanticipated water pollution and the required treatment period, how will Polymet and the DNR protect taxpayers centuries into the future. The financial consequences of this project will outlive everyone, every mining company, and even every governmental institution we know today. The PolyMet SDEIS gives no details of the amount and type of damage deposit adequate to cover the cost of treating water for countless generations into the future. The consequences of our decisions on sulfide mining are guarant

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

As a resident of Ely, I certainly understand the need for good paying jobs. I feel that allowing this mine could potentially do such harm to our environment that it's not worth the risk. Especially given the fact that our water supply is already dwindling. Thank you.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

To whom it may concern: I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I am a mine engineer with Cliffs Natural Resources and have experienced first-hand the environmental and safety regulations the State and Federal agencies have in place. It is my opinion that PolyMet will be held to the same high standard where the people and the environment will be protected. I find it irresponsible that people hold a double standard when it comes to mining and the minerals required to maintain the lifestyle we have ALL come to rely on. Developing these mineral resources in Minnesota, where we hold a high standard for safety and environmental behavior, ensures that the minerals are extracted responsibly. I support the thorough evaluation completed by numerous agencies, I attended many informational sessions throughout the process, and I support the decision to move forward with PolyMet. Thank you for your efforts in presenting a complete and thorough evaluation- Sincerely, Julie M. Varichak 13149 Watson Bay Rd Side Lake, MN 55781

Julie Viken

I am writing to you with many concerns over the Polymet proposal. First is that the earth only has about .3% freshwater, and Lake Superior would be ruined by this mining. Second is that this proposal does not pose any money for after they mine, and that is very important. Look at WI and see why they restricted mining until they can prove they haven't ruined the environment for 20 years. Finally if this proposal is approved then other similar mining proposal would most likely be fast tracked and the next one would ruin the BWCA, one of the most visited natural areas in the world. Please turn back this idea that jobs are more important than the environment. Thanks, Julie Viken 1964 Prior Ave N Roseville MN 55113

Juliette Wilson

57887

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project. As long as PolyMet (or anyone) says "it's handled"--it isn't. When will we learn to stop making things worse, things that can never be mitigated even though in our hubris we think nothing will go wrong or if it does, it's fixable? Please don't let short-term views override long-term costs.

During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I'm all for the development of our natural resources in safe, ethical ways. I have been enjoying the BWCA for years with my family and friends; it has incorporated itself into a large part of my self identity. Let's use our natural resources in a way that doesn't jeopardize an irreplaceable part of our national heritage. I understand that opening a new mine means new jobs and money, but the BWCA is already a large tourist draw and supports the local and state economy. There seems to be limited upside with significant potential downside; fiscally and ethically it doesn't seem like it's worth the risk. If mining must be done, then couldn't a pilot program be run in a less environmentally sensitive part of the state. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Justin Dzelzkalns 4866 N Rockwell St Apt 1w Chicago, IL 60625-2851

DNR, I am absolutely against the mining proposal. However, I understand the environmentalists against the project do not offer any alternative to job creations in the north woods. Fully expecting the short-term gratification of job creation, tax revenue, and company profits to silence the obvious negative impact sulfur mining has on the environment, I ask the DNR, state legislators, and the governor to impose extremely harsh financial penalties on PolyMet if, for whatever reason, environmental destruction occurs. Too many times companies involved in this industry get away with "slaps on the wrist" penalties or go to court with their slew of lawyers and gain unjust victories. I want PolyMet to put their money where their mouth is and allow massive financial penalties to occur if the mine does eventually leak sulfur into our state's waters. Justin Hockensmith Sent from my iPhone

As a union delegate organizing in Duluth, MN, I cannot support the proposed PolyMet project. Regardless of what the project may be, anything backed and primarily invested in by Glencore or any group involved in anti-union, anti-worker, anti-human rights should and must be opposed. No workforce, including here in the MN northland, should be subject to the exploitations of Polymet and this industry. Justin M. Anderson PO Box 3232 Duluth, MN 55803

Justine King

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Justine King 444 East 75th Street #7C New York, FL 33433 US

I wish you comment that I think the mining of heavy metals in the state is bad for Minnesota. Despite good intentions, this action will pillage our fragile environment beyond repair. The negative impacts on human health through water and heavy metal toxins will cost much more than the short-term benefits the jobs will provide. The community throughout the state and adjuacent states will be negatively impacted if this project is allowed to continue.

K Helms

40442

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Protect our water! Hooded Mergansers swim in northeastern Minnesota's pristine marshes, ponds, and rivers, feeding on fish, crayfish, frogs, and insects. PolyMet Corporation is proposing to destroy thousands of acres of pristine habitat to mine sulfide ore at the headwaters of the St. Louis River - a major waterway that flows over 180 miles to Lake Superior. PolyMet's, a company with 0 years experience, proposal calls for 20 years of mining, and they acknowledge that 500 years of toxic runoff will need to be collected and treated. Please do the math. Just like the Hooded Merganser, our children and grandchildren all deserve clean water. Let clean water be our legacy - not toxic pollution from mining! Companies w/many more years of experience mining still walk away from mines they can't afford or don't know how to clean up!

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Multinational corporation PolyMet is seeking permission for an open pit sulfide mine on National Forest lands near the Boundary Waters Canoe Area Wilderness and Lake Superior. If approved the mine will pollute Lake Superior, threaten our clean water and wildlands, and endanger public health for generations to come. A decision in favor of PolyMet's proposal would open a floodgate for more sulfide mining in a large area near Lake Superior and surrounding the Boundary Waters Wilderness - considered by some as one of the most beautiful wilderness areas in the world. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes, and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, K Weller 533 S 28th St Lafayette, IN 47904-3217

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. It is about time to ignore the dollar and protect our land. Cash Luck Sincerely, K. Cash Luck 6091 Fort Thunder Dr NE Remer, MN 56672-3056 (218) 566-2902

Feb 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuri

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I am writing you to ask you to reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. I am concerned that the PolyMet open-pit sulfide mine would damage the wild rice that naturally grows in the Partridge River watershed. My family has harvested and eaten wild rice as a large part of our diet for my entire life. This is a tradition and a way of life that I wish to pass on to my children, and a tradition that would be threatened by the water pollution caused by the PolyMet open-pit sulfide mine. For this reason I ask you to reject the PolyMet NorthMet SDEIS. I am also concerned that the PolyMet open-pit sulfide mine would increase Methylmercury contamination of fish all the way to the St Louis River estuary resulting from mercury and sulfate pollution and impacts to wetlands. Fish is another important staple that I harvest as sustenance for my family. But if the fish become too contaminated with Methylmercury they will no longer be safe for my family to eat, and we would be forced to discontinue this tradition as well. This saddens me because the PolyMet open-pit sulfide mine would threaten my ability to teach my children how to support themselves by fishing and harvesting wild rice. For this reason I ask you to reject the PolyMet NorthMet SDEIS. I am also concerned about the long-term cost of water treatment that will be left to the public at the rate of \$3,600,000 - \$6,000,000 per year for the next 200 – 500 years. This is a huge expense that should not be left to the public and future generations. Last month 59 groups in Minnesota, Wisconsin and Michigan asked the United States Environmental Protection Agency to do a cumulative analysis of the effects of mining on the Lake Superior Basin. These 59 groups included Duluth businesses, non-profits, and faith groups, like Whole Foods Community Co-op Duluth, Institute for a Sustainable Future, Idle No More Duluth and Peace United Church of Christ Food, Energy and Environment Team. On January 6, Congress woman Betty McCollum sent a letter urging the EPA to use the funds provided by Congress to conduct an assessment and inform the citizens of the “generational consequences of sulfide mining to impacted ecosystems, human health and the basin’s tremendous water resource.” The PolyMet PSDEIS doesn’t study impacts that could affect mercury contamination of fish in the St Louis River estuary, let alone impacts to habitats and tribal resources in the region. A collative effects analysis of mining should be done before the PolyMet SDEIS gets finalized. That would permit us to know the consequences before opening up Minnesota’s Northeast to a sulfide mining district. The PolyMet SDEIS artificially limited cumulative effects discussion of water quality to just the Partridge and Embarrass Rivers. The St Louis River was left out completely. This cuts out anyone who fishes or eats fish caught downstream in the St Louis River or Lake Superior and ignores impacts on Fond du Lac tribal waters. It is not good science. The PolyMet project would increase mercury in the Embarrass River and could increase mercury methylation near the mine site as well. Increases in mercury or sulfates at PolyMet could increase mercury in fish in the St Louis River. Both existing LTV tailings seeps and other mine discharges flowing into the St Louis River also carry high levels of specific conductance, which the EPA has found can be toxic to fish. Tribal research shows that specific conductance is a water chemistry “signature” for mining discharge that can take more than 100 miles to dissipate. (SDEIS, Tribal CEA, pp. 16-17). Cumulative analysis of water quality impacts in the SDEIS must include the St Louis River and

Dear Fellow Leaders of the Minnesota Department of Natural Resources - I write to you not with scientific reasoning as to the numerous reasons why PolyMet's SDEIS is inadequate, but with demands for the DNR to uphold its mission, goals and responsibilities as it has been established to do so and as the leaders of this agency have been entrusted by the State of Minnesota. The DNR mission states, "The mission of the Minnesota Department of Natural Resources (DNR) is to work with the citizens to conserve and manage the state's natural resources, to provide recreation opportunities and provide for commercial uses of natural resources in a way that creates a sustainable quality of life." I hope that the leaders of this PolyMet project recognize that that mission statement is more than a sentence. It is a mission that they are expected to uphold. A definition of "sustainable quality of life" is defined by "a life that can be continued given the natural and social resources available and not at the expense of an acceptable quality of life for current generations, future generations and other nations." To uphold this sustainability, Minnesota law requires that sulfide mines be maintenance free at closure. Leaders of the DNR, uphold your responsibility to create a sustainable quality of life and deny PolyMet's proposal to mine until they can ensure that the entire site be maintenance free at closure. The Minnesota Department of Natural Resource's Strategic Conservation Agenda stated that "Minnesota is predicted to grow by more than 1 million people in the next 20 years. With population growth and associated development come increasing demands on natural systems – our lakes and rivers, forests and grasslands, wetlands and shorelands." It continues to say, "Conservation-based approaches are imperative for creating sustainable developments that protect, restore, and enhance the natural environment – the foundation for long-term economic benefits and quality of life." Conservation-based approaches are imperative. I demand, again, that the current leaders of the DNR uphold their responsibility to carry out these agendas which have been established in the absence of a singular biased event such as this PolyMet proposal, go through numerous government and public layers of review and approval, and are created with purpose - purpose to be utilized and defended in situations like this. Defend the DNR, your, Strategic Conservation Agenda by not allowing vagueness and future uncertainties in PolyMet's promises to be conservation-focused. Leaders before you have done this and we future generations have been burdened with maintaining numerous Superfund sites. Have the leaders who will ultimately allow or deny this proposal intently studied those past projects, their permits and the reality of the aftermath. We have established cleanup initiatives, directed more tax-payer funding and put forth energy not assumed when those Superfund sites were permitted mining actions. Current leaders of the DNR, stop this cycle of history repeating itself for our future generations by denying PolyMet's proposal to mine until there is absolutely no vagueness or uncertainty, and that all possible situations and unexpected events have established procedure that maintain the responsibilities set forth under the original permitted actions. The Strategic Conservation Agenda also states, "Two-thirds of Minnesota's public water supply comes from groundwater. Demand for water is increasing faster than population growth is increasing. As demand grows, some communities are struggling to find adequate supplies of clean water. As testing proceeds, the number of impaired waters will increase and the challenge of restoring them while protecting our healthiest waters will become even greater." One of the three long-term desired outcomes is that, "Groundwater and surface water are used in a way that does not degrade them for future generations." Again

Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. The SDEIS acknowledges that amphibole fibers are present in the rock to be mined, that crushing the rock for processing releases these fibers, and that these fibers are suspected of causing mesothelioma in workers. The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the PolyMet mine and plant site. A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process. Specifically, the DNR should: 1) Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length 2) Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure 3) Revise the SDEIS to eliminate inaccurate characterizations of the University of Minnesota mesothelioma study. Specifically, eliminate statements that imply that commercial asbestos is the primary risk factor for mesothelioma risk Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. I want the future generations to be assured access to these experiences as well. My home is built miles from the nearest highway, we have no power (other than a generator we use to power a battery) or running water/ septic. We drink directly from the lake that borders our property. My family lives well below the poverty line, but we always have plenty to eat. We spend our money on gas to get to work, propane for our lights and other man made necessities. We afford all we need to because our food is mostly grown on our own land or harvested out of the woods around our home. Our vegetable garden needs water, and during the dry weeks, when we are not able to collect rain water, we haul water from the lake. The average family eats pasta or store bought rice 4 meals a week. Both pasta and store bought brown rice are significantly less nutritious than wild grown wild rice. My family doesn't buy pasta or rice, we harvest wild rice. Animals, which we hunt and eat, depend upon the water too. This and the surrounding lakes will not be protected and will be polluted past the point of sustaining life when and if the polymet mine leaks po

Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. I want the future generations to be assured access to these experiences as well. My home is built miles from the nearest highway, we have no power (other than a generator we use to power a battery) or running water/septic. We drink directly from the lake that borders our property. My family lives well below the poverty line, but we always have plenty to eat. We spend our money on gas to get to work, propane for our lights and other man made necessities. We afford all we need to because our food is mostly grown on our own land or harvested out of the woods around our home. Our vegetable garden needs water, and during the dry weeks, when we are not able to collect rain water, we haul water from the lake. The average family eats pasta or store bought rice 4 meals a week. Both pasta and store bought brown rice are significantly less nutritious than wild grown wild rice. My family doesn't buy pasta or rice, we harvest wild rice. Animals, which we hunt and eat, depend upon the water too. This and the surrounding lakes will not be protected and will be polluted past the point of sustaining life when and if the polymet mine leaks pollution into the water system. My food source will be extinguished if this happens, an event I cannot sit by and let happen. Once I can be assured that the water systems are 100% free of being poten

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. I want the future generations to be assured access to these experiences as well. My home is built miles from the nearest highway, we have no power (other than a generator we use to power a battery) or running water/ septic. We drink directly from the lake that borders our property. My family lives well below the poverty line, but we always have plenty to eat. We spend our money on gas to get to work, propane for our lights and other man made necessities. We afford all we need to because our food is mostly grown on our own land or harvested out of the woods around our home. Our vegetable garden needs water, and during the dry weeks, when we are not able to collect rain water, we haul water from the lake. The average family eats pasta or store bought rice 4 meals a week. Both pasta and store bought brown rice are significantly less nutritious than wild grown wild rice. My family doesn't buy pasta or rice, we harvest wild rice. Animals, which we hunt and eat, depend upon the water too. This and the surrounding lakes will not be protected and will be polluted past the point of sustaining life when and if the polymet mine leaks pollution into the water system. My food source will be extinguished if this happens, an event I cannot sit by and let happen. Once I can be assured that the water systems are 100% free of being potentially polluted, I too will support the mine. Until then, I live in fear that someday I will not be able to feed my family or spend my life in the area I have chosen. Ely is a part of the Iron Range and was founded as a mining town, there are large mines in the near by area, these mines are not the same as the proposed polymet mine. Taconite or iron ore mining are in a completely different category than copper sulfate mining. Although neither benefit or promote the surrounding ecosystems the effects of copper sulfate mining are potentially, significantly, vastly more detrimental than those of pit mining. The proposed mines are not responsible for or directly effected by potential problems that may arise. The minerals are not going anywhere - I urge you to move towards further - non bias- research. The development of new, less destructive mining techniques could be just around the corner. Someday the minerals will be safely accessible, then we will be able to h

Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standard The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this test PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142). The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction. Lastly, the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. I want the future generations to be assured access to these experiences as well. Ely is a part of the Iron Range and was founded as a mining town, there are large mines in the near by area, these mines are not the same as the proposed polymet mine. Taconite or iron ore mining are in a completely different category than copper sulfate mining. Although neither benefit or promote the surrounding ecosystems the effects of copper sulfate mining are potentially, significantly, vastly more detrimental than those of pit mining. The proposed mines are not responsible for or directly effected by potential problems that may arise. The minerals are not going anywhere - I urge you to move towards further - non bias- research. The development of new, less destructive mining techniques could be just around the corner. Someday the minerals will be safely accessible, then we will be able to have clean water, protected environments and mining. Until then, put the safety of our land, water, and natural systems above that of consumerism and capitalism. Humans, particularly the DNR must act as advocates for the environment and the species that cannot speak for themselves. If you have looked at newspapers in the arrowhead region in the last few years, you will have noticed that the moose population is facing huge depletion. These animals are dying, and although they are being studied to find out why, further stress on their natural habitat could potentially push them over toward endangered. Another species, facing endangered status because of human development is a shame to say the least, but to put our own goals, which will not be affected negatively by waiting 5 to 30 years (other than different people get rich), ahead of a unique species is unforgivable. I thank you for your time and respect. Sincerely, Ms Ka

Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. I want the future generations to be assured access to these experiences as well. If you have looked at newspapers in the arrowhead region in the last few years, you will have noticed that the moose population is facing huge depletion. Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of the cumulative effects of habitat fragmentation and loss on the Canada Lynx (*Lynx canadensis*). The Canada Lynx is a threatened species listed under the federal Endangered Species Act. The NorthMet project area is in designated critical habitat for the lynx, and the SDEIS notes that the proposed action would destroy over 1,400 acres of critical lynx habitat at the mine site. The designation of this area as critical habitat is supposed to trigger analysis of whether the proposed action, and the cumulative effects of other reasonably foreseeable actions place the Canada Lynx in jeopardy. In addition, the incidental death of Canada Lynx due to increased vehicle traffic between the mine and plant site is noted, but inadequate attention is paid to mitigation measures that could limit incidental deaths of lynx. Despite this, the SDEIS contains contradictory statements about the use of roads as travel corridors by lynx. The cumulative effects analysis section of the NorthMet SDEIS fails to adequately account for a number of reasonably foreseeable projects. Specifically, the Twin Metals and Teck American projects are listed as "speculative" in Section 6-2-2-1-21 and are not analyzed for their cumulative effects. No evidence or rationale for excluding these projects from the cumulative effects analysis is offered. In Section 6-2-3-6-4, the Gray Wolf is the only "Special Status Species" for which even limited analysis of cumulative effects is conducted, despite the Canada Lynx's status as a federally threatened species. Please take the following actions: 1) Include the Twin Metals and Teck American projects as reasonably foreseeable projects in the cumulative effects analysis in section 6-2-2, since the disposition of the NorthMet SDEIS and subsequent permitting decisions could make these projects more likely to be built. 2) Include the Canada Lynx as a "Special Status Species" in Section 6-2-3-6-4 and conduct a cumulative effects analysis of the impact on Canada Lynx. 3) Analyze and include mitigations such as tunnels and fencing to limit the possibility of incidental take of Canada Lynx by increased road traffic associated with the NorthMet proposed action. 4) Remove contradictory language in SDEIS about Canada Lynx utilization of roads as travel corridors. For example, on p. 5-628 the SDEIS states "Lynx utilize snow packed trails and roads as travel corridors," while on p. 5-366 it says "this species does not rely on roads for travel." 5) Analyze and include mitigation such as accelerated re-vegetation of the mine site after closure to decrease the amount of time the mine site would be inhospitable to Canada Lynx. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. I want the future generations to be assured access to these experiences as well. My home is built miles from the nearest highway, we have no power (other than a generator we use to power a battery) or running water/ septic. We drink directly from the lake that borders our property. My family lives well below the poverty line, but we always have plenty to eat. We spend our money on gas to get to work, propane for our lights and other man made necessities. We afford all we need to because our food is mostly grown on our own land or harvested out of the woods around our home. Our vegetable garden needs water, and during the dry weeks, when we are not able to collect rain water, we haul water from the lake. The average family eats pasta or store bought rice 4

Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. Mar 3, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. I want to urge you to put support behind a deeper investigation on the consequences of the mine. I am not against mining. I am an Ely Minnesota native, a 21 year old who hopes to be able to return to the North Woods with my fiance, to raise my children and make my life. I grew up in the woods, surrounded by healthy trees, lakes and diverse ecosystems I am a biologist because of the experiences I had growing up there. Dear DNR I am a 10 year old boy who lives on Lake Superior in Duluth. I know that there have been no known sulfide mines that haven't polluted water systems Every year I take a trip to the Boundary Waters where I love to swim in the water and drink the clean water. If sulfide mining starts, all those lakes I love to visit and swim in will eventually be polluted. After many years Lake Superior will be polluted as well. This is where I live and I want to be able to enjoy it for the rest of my life. Others will be harmed as well, and no tourists will want to come to northern Minnesota to see polluted lakes. The lakes will no longer be safe to drink or swim in. Please stop sulfide mining. Kai Hoffman

Kaia Anderson

I am an 18 year old from Prior Lake, Minnesota. As I came to the turning of the age where I can voice my opinion, I will make it clear here. This mine will destroy an area, leave harmful pollutants, and create an unfit environment for the animals living around the area. Even if it brings slight economic benefit do you really think Polynet will remain relevant and support the clean up for 200-500 years. Really. The choice is clear. The Boundary Waters are too valuable. I do not support this mine. Kaia Anderson.

It took a while for me to collect all the information I thought I needed on this issue. Although I was aware of PolyMet's mining plans, I didn't not completely understand the severity of this issue. After reading, what I believe to be sufficient information, I believe that the costs to sulfide mining proposed by PolyMet dramatically outweigh the benefits reaped from the mining. The mining will inevitably negatively effect the MN environment far into the future. Forever effecting the pH and polluting the waters. In addition, the plans for protecting this pollution are not complete enough to be a safeguard. If the mining were to continue and pollute there are not concrete plans of who would be responsible nor sufficient safeguards to fix what would go wrong. The benefits of the mining would not be worth the potential benefits reaped from the sites.

The PolyMet mine sounds too destructive of our natural resources to be allowed to go through. Let's put attention to brining in jobs for the Iron Range that are not detrimental to the environment.

Kaija Ornes 44587

I have lived in Minnesota for all my life . 16 years. I can tell you that I have been to this area of Minnesota at least once a year every year starting when I was four. I can say that it is to dense with resources and beauty to ruin it for an economics gain for about 20 years. The consequences far out live the economic gain. With the time to clean it up being around 500 years. I hope to be able to bring my children up to north east mn. I even have had the idea of getting married up there from the time that I was 10- Economics can change in an area over time but ruining an area for 500 years is a long time. Did any companies from Columbus's time still exist today if so I would love to know. Do we really think that this company will be around to make sure the clean up is up to par, in 500 years. I don't think it will be and this is my point. I am currently in ap environmental science. I have learned a lot about pollution and why it is so deadly. I hope that this will never happen because I want to be able to go north and see the beauty I fell in love with as a kid. Kaija Prior lake

Lisa Fay, EIS Project ManagerMNDNR Division of Ecological and Water ResourcesEnvironmental Review Unit500 Lafayette Road, Box 25St.Paul, MN 55155-4025Dear Ms. Lisa Fay, EIS Project Manager,To start off, there are a lot of advantages to the proposal of the land site, but there are a lot of disadvantages. One thing that caught my eye, was the fact that it would affect the Ojibwe people. They are native to the land andI don't think it's fair for them to take their land away. It would also affect the Beaver Bay which could possibly ruin their habitat. Like they said in the fact sheet of cultural resources, is they are not sure whether or not it would affect animals.This land exchange would gain a lot of things such as: 2 plant species, vegetation, 9 additional plant species, etc. I think it's cool how they would gain so many things, but there are also a lot of things that they would lose. Something big that we would lose is 11 plant species. They would also lose about 1,000 acres of floodplains which they aren't super worried about. Something that I noticed was that there is very small deposits of mercury in ore and rock.My opinion would be to not take so much land because there are a lot of plant and animal life you would take away. Also, the Ojibwe people had the land for a long time and that's their land to have. I would decrease about 1,000 acres in different spots and let the Ojibwe people stay on their land. I don't have a problem with mining the land, but the animals are my biggest concern.Sincerely,Kaitlyn Culver, 8th grade

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kaitlyn Pommrehn St Louis Park, Minnesota

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Kaleb Vold 4085 Pleasant St SE Prior Lake, MN 55372

Kane Jeffery And Melissa Rust

18241

The name is Kane, K-A-N-E, Jeffery, J-E-F-F-E-R-Y and Melissa R-U-S-T. We are property owners in Finland and Isabella, over 90 acres. This is 20 miles, approximately, east of the location of the mining operation to be proposed. We are against this because we purchased this property in the effort to wipe off our carbon footprint for what we use, and we feel that the actions taken by the mine undermine our personal beliefs in that area, and they outweigh -- our beliefs outweigh the proposed economic input to that area compared to the saving of the natural environment. Period.

Mar 11, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Karen Baker 2 Bindowan crescent Maryland, None 228)

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Karen Blaha Bryant Mpls., MN 55409

Feb 14, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Hello, I live in northern Minnesota. I have to tell you that the feeling up here is overwhelmingly against the copper mine. We see the proposed 500 year damage to the environment as absurd Our Nation is less than 500 years old. There is not a company that has lasted that length of time yet you are considering allowing this mining company to do that kind of damage with their assurance they will clean it up. Ridiculous. even were they to obtain significant outside insurance it would still be absurd as no company, no amount of money can really reasonably guarantee the clean up and safety of the earth and its people. There is no compensation that provides for the destruction of the earth. The small number of jobs dangled before our eyes does not come anywhere close to the jobs that will be lost due to the loss of environment that no doubt will occur. If this kind of mining can be done safely, then why isn't it being done safely anywhere else. Because it can't be and won't be, because this is all about companies like this one making huge profits and then getting out, leaving disaster in their wake. The bigger picture, for me, is this: when does it stop. When does the greed and voracious gobbling up of the earth stop. Where is the line. When does the earth and its citizens come before corporate greed and market driven need. We do not need the products that have driven this destruction so badly that it compensates for what is lost, lost forever. I'm not going to be around in 500 years and neither are any of you reading this. We can't even conceive of that length of time, yet we feel we can risk it for the money. Minnesota is one of the few places left with some even remotely unspoiled places. I know, I've lived all over the country and I've seen what these kind of choices look like. Lake Superior is the largest body of fresh water on this continent. No one has the right, for money or any other motivation, to destroy that Lake, that Water. We all know that this company, this mine, is just the beginning. We have no right, and no need, to make decisions to serve greed that will take and take and take from the earth, from its inhabitants, from the way of life of indigenous peoples. I urge you to say Minnesota is not for sale. It stops here. Thank you for your time, Karen Cedarmoon Hovland, MN

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, karen chartier 45 Rivocean Dr Ormond Beach, FL 32176 US

Toxic sulfates will destroy Minnesota's streams, river, and watersheds. I enjoy spending time in Northern Minnesota and own a house near Lake Superior. I don't want to see the watersheds and the lake become polluted. I want my grandchildren to be able to enjoy an unspoiled environment. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dmiinage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Karen Graham

Dear Ms Fay, Dear Federal and State Agency Leaders: The 2014 plan by PolyMet is still inadequate. After an additional 3 years to provide more in-depth details and planning. The company failed to meet the basic requirements to achieve their ultimate goal. If they won't accept responsibility for producing a quality report, what makes you think they "plan" to do anything different when operating the mine. To put the at least 500 years of toxicity from tons of mine wastes into perspective, consider that our country is 238 years old. At 238 years, the USA hasn't even reached the half-life of the waste produced by this mine. Think of this again, it will take maintaining environmental processing of tons of waste spread out over acres, twice the age of country and then some -- if we're lucky. Go back to the book - stop this plan. Sincerely
Karen Graham 11600 37th Ave N Plymouth, MN 55441 763-551-9572

Dear Ms Fay, Dear Federal and State Agency Leaders: The 2013 report from PolyMet is inadequate. In spite of the fact that you gave them 3 more years to study and provide more in-depth information. How compliant is the company, if they can't meet the needed standards of a report. Let me put the at least 500 year toxicity producing waste into perspective. Our country is 238 years old. This means that the USA hasn't reached the half life of the toxicity predicted by this plan. Consider this again, the plan will produce tons of waste needing constant environmental control for more than twice the age of our country. Go back to the books - don't allow the PolyMet open pit mining. Sincerely Karen Graham 11600 37th Ave N Plymouth, MN 55441 763-551-9572

From: Karen Graham [mailto:gramkl@comcast.net] Sent: Tuesday, March 11, 2014 3:30 PM To: Fay, Lisa (DNR) Subject: Re: Reevaluate the PolyMet Mining Proposal
Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The plan is flawed, vague handling of data and specifications, and oblique assurances of PolyMet being a good partner in a 500+ year environmental disaster. I respectfully request that the MNDNR and PolyMet answer the questions raised by the Fond du Lac tribe of Chippewa, Water Legacy organization, and the Audubon society to their satisfaction. I request the proposal be rejected until the specifications and requirements are written in a full proposal that meet the above mentioned tribe and organizations, and the requirements of health, water quality, biological survey, and environmental protection agencies and departments of Minnesota and the United States of America. The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity 5) Write a concentration range of sulfide contamination in water treated through the reverse osmosis plant to provide clean water: - specification on the reverse osmosis system for handling the waste water - purity of treated water in holding water. a) Recalculate the number of reverse osmosis systems needed to handle water purification treatment. b) Rewrite to require water treatment facilities be built before mining commences. Proposal stipulates that facilities won't be built for 40 years after the mining process begins. As the mine is expected to operate for about 30 years. It is also only designated to handle the mine's intentional surface water discharge. c) Rewrite proposal defining how the centuries of operations, maintenance, monitoring, and reconstruction of water treatment facilities will be handled and financed. No details are provided in proposal addressing these issues. 6) Develop program to treat seepage from mine pits, waste rock, and tailings piles to be treated to produce clean water.

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I respectfully request that the MNDNR and PolyMet answer the questions raised by the Fond du Lac tribe of Chippewa, Water Legacy organization, and the Audubon society to their satisfaction. I request the proposal be rejected until the specifications and requirements are written in a full proposal that meet the above mentioned tribe and organizations, and the requirements of health, water quality, biological survey, and environmental protection agencies and departments of Minnesota and the United States of America. The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. I respectfully request that the MNDNR and PolyMet answer the questions raised by the Fond du Lac tribe of Chippewa, Water Legacy organization, and the Audubon society to their satisfaction. I request the proposal be rejected until the specifications and requirements are written in a full proposal that meet the above mentioned tribe and organizations, and the requirements of health, water quality, biological survey, and environmental protection agencies and departments of Minnesota and the United States of America. The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge Ri

Feb 24, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." I am writing to comment on the SDEIS. I have never commented on an EIS before but I am very concerned about the impact of sulfide mining on our Minnesota. I am shocked that we would even consider something that will require careful monitoring and oversight for 500 years. I will write about 3 concerns: clean water, sustainable jobs and long-term oversight and accountability. 1- Clean Water. What is the plan for catching and monitoring all water exposed to sulfide tailings for 500 years given fractured bedrock and fluctuating water tables. How does a mine that needs hundreds of years of monitoring comply with Minnesota law that requires mines to be maintenance free at closure. Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Extend the water pollution model and account for changing water tables and fractured bedrock. 2- Sustainable Work. Jobs are so important in our state and especially in Northern Minnesota. I am concerned that the jobs generated will be short lived, largely utilize imported workers and be divisive in the communities we hope to support. Demand that Polymet and Glencore produce documentation about the numbers of local jobs they expect to produce; to describe how they will train and protect Minnesota laborers, how they will protect existing economies (wild rice, winter and summer tourism, fishing) that depend on clean water, silence, low light pollution; to describe methods for enhancing sense of community rather than creating tension and hostility that we see over and over in communities (most recently in our neighbor North Dakota) where new mining industry disrupts and does extensive damage even while providing jobs to a relatively small number of local workers. Demand that Polymet describe and include local jobs prod

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest I'm 75 years old and have loved the BWCA and its surrounding areas since I was 20 and was a canoe guide taking delinquent kids on canoe trips for a camp. The change in those kids was remarkable and it is in all who experience the wonder of the wilderness. Please don't ruin the water and woods in order for some company to make money. There are things in this world that aren't replaceable and once water, air, and land have been poisoned there is no way back. Surely our next generations deserve to have their inheritance protected. Sincerely, Karen Johnson 28311 County 93 Laporte, MN 56461-4313

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. People have been asking if Minnesota and the DNR can trust PolyMet to stand behind their mining operations. That is the wrong question. The DNR and other involved officials need to be asking: Can we trust Glencore XStrata, PolyMet's primary owner. A quick review of the XStrata labor and environmental history in the more than 100 copper mines they own world-wide shows that we cannot. They routinely violate laws and standards with impunity and seem to be large enough that they are not held responsible for their actions. There's no reason to believe they would be any more responsible here than they are everywhere else. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Karen L Dingle 3938 Cannon Ball Lake Rd Duluth, MN 55803-8209

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According to the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I have recently been asked by State Representative Jason Metsa to sit down and write up bullet points . things that need to be addressed in the SDEIS and this was one of the very things I was going to bring to the forefront. The exact area where the proposed mine is to be is major moose habitat. Bog Berry Lake. The moose is already on a dangerous path. This mine, if it happens, will destroy what few we have left in the area. Plus I found a statement about eagles in and around the proposed mine site that was a complete fallacy. They obviously were 'not' looking up. My husband and I have seen with our own eyes eagles maturing. That is changing from their brown head to white heads. Hence, there are obviously nests. The same goes for osprey. And I would like to add eagles [do] live, hunt, fish, etc. around small lakes. The report stated "that they are found around large bodies of water so eagles will not be affected." This simply is not true. Sincerely, Karen L. Lackner 302 5th Street South Virginia, MN 55792 Sincerely, Mrs Karen Lackner 302 5th St S Virginia, MN 55792-2731

Karen Ladner

I have been listening to the debates and trying to be objective about whether the PolyMet mining in Northern MN is a good idea. I vacation in the Ely area 2-3 times a year, both winter and summer. I have met many local residents who wish there were more jobs in that area, but allowing this mining to take place does not seem like the best answer. The number of promised jobs is not really that many. And the unknown impact to the land, wildlife and BWCA as a whole is to risky given the facts as they state them to be. Please do not let this mining go through. We can do better by MN and by the people of that area by fostering the tourism and offering incentives to non-mining companies to locate there. These are my humble opinions. Karen Ladner 4024 93rd Ave N Brooklyn Park, MN 55443

Please do not permit PolyMet as the pioneer in sulfide mining. The company's lack of experience is a red flag for its ability to cleanup, to insure proper pollution controls in the process. Surely the abysmal rating on its initial EPA proposal gives sufficient cause to turn down the application. If sulfide mining is ever approved, please assure it will be on control of an experience, proven company. Karen Main 3314 Riley Road Duluth, MN 55803

Karen Peterson 54129

I DO NOT support Polymet mining--no way, no shape, no form. Bad for our planet. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

54130

I do NOT support PolyMet mining and shame on you/Allete for doing so. You whitewash the truth for the Almighty Buck. I would rather have less dividends--then getting money from such a bad immoral project! [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

54131

I think there is a grave conflict of interests here that you, Mr. Hodnik, are on PolyMets Board of Directors. I am NOT confident that PolyMet can and will hold dear what Minnesotans hold dear. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

54132

I do NOT support PolyMet mining. Even the name sounds hokey. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Karen Ringsrud 39277

I am concerned and oppose the Polymet mining proposal currently being considered by the DNR. I feel there are too many problems with this proposal, including the fact that sulfide mining of this sort has never been done safely, without environmental damage, anywhere in the world. I urge the DNR to deny the permit to Polymet. Karen Ringsrud 1948 Drew Avenue South Minneapolis, MN 55416 rings001@umn-edu

Karen Stady 57179

I strongly believe that the BWCA needs to be preserved and protected for the enjoyment of all people, now and for future generations. Mining near this area isn't worth the risk of contaminating it. If there is mining in the watershed, contaminants will be washed into the bodies of water. Please put the environment ahead of profits. Karen Stady 1950 Palace Ave Saint Paul, MN 55105

Karen Stickney 42428

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Public lands are just that public. The land doesn't exist for the purpose of commercial ventures that benefit a few. And, the possibility of a few jobs being prevented doesn't equal hundreds of thousands of people losing their natural resources which were purposely saved for their enjoyment and healthy living. Voting 'NO' is a no-brainer for those who serve the public rather than catering to the few who would destroy anything that gets in their way of amassing wealth. Do the right thing. Sincerely, Karen Thompson 1104 Chestnut Ln NE Ham Lake, MN 55304-4828

Karen Voigt 14659

To whom it may concern, I would like to chime in with my concern and disapproval of allowing the mine in northeast MN. Any possibility of pollution (even with strict control) is not something I would approve of for that area of our state. We need to leave some things untouched and protected. Chalk me into the disapproval column please. Thank you so much, Karen Voigt Brooklyn Park

Karen Williams 45874

Nonferrous sulfide mining with its consistent historical record of pollution and SDEIS projected 500 years of water cleanup should never be seriously considered. Disastrous consequences would result. This kind of mining has never been successfully nonpolluting in similar environments. A brief Internet search reveals numerous lawsuits against mining companies for environmental damage, water pollution, and human health issues. Because sulfuric acid pollution is toxic to aquatic ecosystems, this area in northeastern Minnesota is a high risk location. Dangerous contamination of water is inevitable which would destroy wetlands, pollute underground water, rivers, and lakes, and endanger fish and animal habitat. The current decline of the moose population may be related to water issues. Of course, human health would be in jeopardy. Economic and financial concerns need to be addressed. Loss of tourism dollars would negatively impact the economy when the recreational opportunities and beauty are lost due to sulfide mining. According to revised information from the mining company, only 25% of the proposed 360 permanent jobs would be local hires. Much is in jeopardy for only 90 jobs. Little financial security has been provided by NorthMet for the inevitable clean up - expected to be more than 500 years worth. It appears that taxpayers, the very people who would be subjected to health problems and ruined environment, would be responsible for the burden of cleanup at astronomical expense. Other states now require hundreds of billions of dollars to be held for reclamation and clean up. Obviously there is too much at stake. Why allow this disaster to happen. No nonferrous sulfide mines should be allowed to exist until mining technology has been proven safe for all - forever. That is the only responsible, ethical, conscientious decision for all of us, including future generations. Karen Williams 6316 N Temple, Indianapolis, IN 46220 9260 Birch Lake Rd, Ely, MN 55731

Kari Block 44300

Greetings, I am not in favor of the proposed PolyMet Mining, Inc. project. I do not want this in our water supply. Nothing is 100% safe. This could cause severe ecological consequences. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kari Hovorka Kari Hovorka 4930 Arrowood Ln N Plymouth, MN 55442

Hello, I am submitting my comments for the NorthMet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement . My comments are attached to this message, and also pasted below. Kari Jacobson Hedin 1323 N 7th Ave E Duluth, MN 55805 3/11/2014 To whom it may concern, Water quality in the St Louis River Area of Concern has improved in recent decades, due to the cooperative efforts, funding and endless rounds of planning by a multidisciplinary group that includes scientists, resource managers, agencies, and citizens. In his 2014 State of the City Address, Mayor Don Ness portrayed the City of Duluth as having a vibrant future in part because of the improvements to water quality in the St Louis River. All of that work, and the quality of life that comes with improved water quality on the St Louis River, will be lost if PolyMet is allowed to mine in the upper reaches of this watershed. I am deeply concerned by the modeling results in the SDEIS that show water must be treated in perpetuity to prevent the St Louis, Partridge, and Embarrass Rivers from becoming heavily polluted by copper, lead, sulfate, aluminum, and other pollutants. Water treatment for centuries has never been done, and the probability of such long-term water treatment being successful is highly unlikely. To propose such a thing as a matter of course is deeply immoral and saddles future generations with a terrible burden. The precautionary principle puts the onus of responsibility on the project proponents to accurately assess risk to human health and the environment and consider all costs. However, NEPA documents such as the SDEIS for PolyMet have repeatedly shown that they are not reliable in predicting water quality problems (Maest and Kuipers, 2005 Predicting Water Quality at Hardrock Mines). This is glaringly clear in PolyMet's SDEIS, as it was recently discovered that the models predicting flow rates and hydrology in the Partridge River are deeply flawed. The claim in the SDEIS that no water quality exceedances will occur during or after mining is based on this flawed model, and so any predictions about water quality and quantity based on these models must now be ruled out as false. The groundwater models in the SDEIS are also flawed and seem to claim that no impacts will occur outside the area of permitted action. PolyMet seems to be proposing in general that there will be no environmental impacts outside of its area of potential effect, as if the mine operates in a vacuum. Mining proponents claim that sulfide mining is right for Minnesota because of this state's robust set of environmental regulations. However, regulations are only effective if they are enforced. For example, Minntac continues to discharge sulfate from its tailings basin that exceeds the 10 mg/L legal limit for waters that contain wild rice. While this discharge continues, the state of Minnesota is granting them and other mines permits to expand their mining operations. The Minnesota Pollution Control Agency's track record in regulating taconite mines on the Iron Range is not good, and it is likely that there will be little political will to enforce regulations when PolyMet begins to have its own water quality exceedances. PolyMet and mines like it are allowed to dump toxic tailings and overburden into streams and wetlands because of two mining loopholes in the Clean Water Act. I support the National Wildlife Federation's call to the EPA and the US Army Corps of Engineers to close these two loopholes through a rule change. Without a change, PolyMet will be allowed use nearby waters as disposal sites for untreated industrial waste. The Clean Water Act's "waste treatment system exclusion" should apply only to manmade waters and the definition of "fill" should be amended to exclude waste disposal. PolyMet downplays the direct and cumulative impacts the mine will have on the landscape. Losses will include 1,741 acres of Minnesota Biological Survey

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I would like to offer some comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement and the GTAC Penokee Range Project in Northern Wisconsin which will both heavily impact the whole Lake Superior watershed in a very negative way. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness and the Penokee Mountain area in Northern Wisconsin. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Also in the Penokee Range Mining done by GTAC, rocks containing asbestos form minerals have been found causing much alarm about mining in that area. I have grave concerns about these project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's and GTAC's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Kari Sealund 302 S. Wilshire Lane Arlington Heights, IL 60004

January 29, 2014 Dear Ms Fay, Mr Bruner and Mr Dabney, I went to the PolyMet event last night, and it was packed-not just with people who oppose the mine, but with people who think jobs should come first at any price. I asked a few questions of the experts at the many displays and learned that Polymet is new, has no mines yet and is owned by Swiss and other international investors. I learned that the numbers used for stream flow were hugely underestimated by the company and the first Environmental Impact Statement therefore got a failure grade by the EPA. The mine would be in our Superior National Forest lands-how can the state consider allowing public lands to be exploited (and certainly polluted, possibly permanently) for private investor profit. It seems to me that it would be saner, safer, cleaner and cheaper to use state funds to employ all these willing workers in green or at least neutral jobs than to allow the destruction of our north country water. Jobs, certainly, are a priority, but not short term and not at this coSt Water is more precious than any other resource on earth and getting moreso as climate change dries up supplies in many states, and fracking destroys water in still more states. Please reject the PolyMet NorthMet SDEIS. The mine will have tragic environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. Sincerely yours, Karin Winegar 1832 Carroll Ave St Paul, MN 55104 -- Original Message-- From: *NorthMetSDEIS (DNR) To: Karin Winegar Sent: Mon, Feb 3, 2014 5:49 pm Subject: RE: Reject PolyMet's NorthMet Mining Proposal Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. We will review the comments you have provided. Responses to all substantive comments will be included in the official recoRd If you have provided your address, you will be included in mailings or electronic distribution of the recoRd

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan will have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. The PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS' rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Karin Winegar 1832 Carroll Ave St Paul, MN 55104

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

58169

In the 21st century water is and will be the most precious substance on earth. Our northern water and Superior National Forrest should stay protected and intact. It is a public resource, not a site for corporate exploitation and profit of international investors. It would be wise and more economical both the short and long term to provide good jobs (using state funds of necessary) than to expect or trust a mining company to provide well paying, long term significant numbers of jobs in northern Minnesota. Mining has a long and disastrous history in both environmental damage and job loss.

Karl Koenig

1942

To whom it may concern, I oppose any and all mining activities proposed by PolyMet Mining Inc. The risk of damaging fragile ecosystems is far too great to justify any type of mining activity on National Forest lands. Furthermore, I feel that mining activities are not consistent with the management objectives of any National Forest land areas. Thank You Sincerely, Mr Karl Koenig 108 E. Maple Ave Frazee, MN 56544

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. I urge you to reject the PolyMet mine. Mapping done by the PolyMet miss represent the boundary of the 100 mile swamp implying that the drainage of the swamp is in one the direction only and away from the boundary waters. In the maps drawn in the US government atlas www.nationalatlas.gov/streamer the 100 mile swamp flows into two watershed areas. One of which drains to the boundary waters. This contradiction in mapping presents evidence that danger to the boundary waters is being under reported in the environmental impact statement . At a minimum plans for hydrologic testing before operations and continual monitoring of water during mining operations flowing from the swamp in both directions is nessasary. This plan needs to be in place for full understanding and protection of the water quality in the area. Lacking this basic protection PolyMets proposal is deficient for clear assessment of the danger to the water flowing to the boundary waters. Sincerely, Ms Karla Faith 1090 County Road E New Richmond, WI 54017-8409 (651) 247-9100

karlene plante Jim Etzel 44897

Minnesota has already seen plenty of destruction with iron ore mining in the Northern tier of the state. The destruction from that will be seen for many years to come. This new proposal should not be considered as it will cause a significant amount of damage to many acres of wild habitat for many creatures, both terrestrial and aquatic. Tell the mining company to start mining the many dumps throughout the United states for the metals they seek. There should be plenty of it there. No more mining in Minnesota .. January 16, 2014 To: The officials and state and federal agencies reviewing the PolyMet permit I am writing today to express my absolute opposition to the PolyMet Mine. I have many ways that I think of myself: naturalist, author, adventurer, wife, and mother, but the most important title I bear is Grandmother. I am not an American Indian, but I strongly believe in the philosophy of Seven Generations, which means that we do not make any decisions or take any actions which do not take into consideration the impact on those people who will come after us. The owners of this proposed mine can offer us all the assurances in the world that they will be good stewards and guarantee us that the pollution created by the dangerous chemicals created by and used in this mining process will not impact or impair our waters. But all the studies done and experiences with mines such as this in the past prove incontrovertibly that such assurances mean nothing. There WILL be pollution and it WILL make its way into our waters, whether surface or underground. The studies have shown that these polluted waters would have to be treated for hundreds of years. Who of us alive today can guarantee that people in the future will have the funds or ability to sustain this sort of mitigation. Minnesota prides itself, in fact, brags about our freshwater resources. We are the Land of 10,000 Lakes. This is how we advertise ourselves to others – to settle here or at least visit. If those waters become seriously polluted we will have to amend our title and I can't think of a good addendum. Can you. This proposed mining project will give short term financial gain to an international company and some residents of the region, but the overall benefit will be far, far less than the overall negative impact. All we have to do is look to West Virginia to see how a community is affected when its freshwater is ruined by a chemical spill. The ultimate results of that disaster will not be known for a long, long time. So, as I said at the beginning, my values about our environment and the future are absolutely bound to my grandchildren and to all of their friends and classmates and all of the children they will one day have. We have a moral obligation to protect the water we cannot live without, into perpetuity. This mining project must not go forward. Sincerely Kate Crowley 82119 Bennett Rd Willow River, MN 55795 [HYPERLINK "http://www.lakesuperiormagazine-com/cat/gfc.html"](http://www.lakesuperiormagazine-com/cat/gfc.html)<http://-www.lakesuperiormagazine-com/-cat/gfc.html><http://www.lakesuperiormagazine-com/cat/gfc.jpg> Available in May Going Full Circle A 1,555-mile Walk Around the World's Largest Lake by Mike Link and Kate Crowley "Earth provides enough to satisfy every man's need, but not every man's greed." Gandhi "I hope you love birds too. It is economical. It saves going to heaven." Emily Dickinson

Dear Ms Fay, As a mother of two young children and long-time resident of Grand Marais, MN, on the edge of the Boundary Waters Canoe Area Wilderness in NE Minnesota, I am acutely concerned about the proposed PolyMet open-pit sulfide mine and wastes proposal. I believe the project's risks to human health would be unacceptable, and it is with great earnestness that I ask you to reject PolyMet NorthMet SDEIS and the mine and wastes proposal. One of my top concerns is mercury. At a time when one out of ten babies in MN's Lake Superior region are being born with dangerous blood levels of mercury, it would be unconscionable to accept a mine and wastes proposal that would only cause that percentage to grow. To support this concern, we only need to look at what has happened downstream of the PolyMet project, where the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes have become legally impaired due to the toxic mercury level in fish. Having attended a very detailed and well-supported presentation by NE Minnesotans for Wilderness advocate Jane Reyer and former State Representative Frank Moe in Grand Marais on Feb. 19, everything I learned leads me to the conclusion that the PolyMet SDEIS analysis of mercury risks is misleading and inadequate. Through Ms Reyer's careful explanation, I learned that the SDEIS' claims that sulfates and mercury and sulfates will be captured are unreliable. I learned that their information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks is extremely poor and full of gaps. I learned that impact of lead, aluminum, and manganese in water causes damage to the human brain. That air emissions of nickel and other particulates, diesel, and asbestos-like fibers can lead to cancer, as can arsenic. I am alarmed that there is no reference in the SDEIS to potential human harm-notably our most vulnerable community members: infants, children and elderly people. Additionally, the SDEIS does not assess worker at-site risks or residential well risks. Its lifetime risk assessment of 30 to 40 years is half what it should be. The SDEIS does not take into account the effect of toxic pollutants when accumulated in fish, game, and wild rice-notably the effects these toxins have on high-level consumers of these products, including regional tribal members, low-income families, hunters, fishermen, and countless children and elderly people. The PolyMet SDEIS fails to adequately assess human health impacts. The proposed PolyMet mine and mine wastes would be an unacceptable risk to our health. That is why I am asking you to please reject the PolyMet SDEIS and the PolyMet mine. Sincerely, Kate Fitzgerald Grand Marais, MN

Kate Flynn-Kitzmann

Due to the unavoidable pollution effects of sulfide mining and high environmental and monetary costs I strongly urge Minnesota to say NO to this mine. There is no way this company will be in existence to cover cleanup costs and the money they set aside will not be enough. Do NOT sell our pristine wilderness, no amount of money would be worth it; allowing this business to ruin our state is short sighted and Minnesota has always planned for long term. Many businesses in that area depend on tourism; pollution of the area would cause them to fail. I can't believe this is even up for discussion. If it passes the DNR and those responsible should hang their heads in shame. Kathleen and Gary Kitzmann [HYPERLINK "mailto:kfkitz@gmail-com"](mailto:kfkitz@gmail-com) 5230 60th Ave SW Rochester MN 55902

To begin with, please consider the people and companies involved with this sulfide mine copper nickel and other minerals mine plan. PolyMet is a new foreign company with no experience. It is backed by, controlled by, and has given exclusive rights of sale to a thoroughly disreputable foreign company which is chaired by a thoroughly disreputable man. PolyMet is a Canadian company, funded and controlled by Glencore, a Swiss company which has been involved in environmental disasters, labor violations, and human rights abuses all around the world. Glencore's chairman, Tony Hayward was the BP CEO in charge when the Deepwater Horizon oil rig caused the largest oil spill in history in the Gulf of Mexico, while he showed no compassion for the environmental destruction or the people who were so devastated by the disaster. Is this what we want in Minnesota or anywhere in the United States. We have a responsibility to do as little harm as possible to the environment. We have this responsibility to the Creator, to ourselves, to our children, and grandchildren. We have a responsibility to our government. First of all we are responsible to NOT poison our land, our air, our people and our fauna and flora. And that is exactly what sulfide mining does. Secondly we have a responsibility to our government at every level to not give away resources which if used at all should be used for our own benefit. I personally believe they belong left in the earth, that we can live without them as has been done for most of history and obviously will be done in the future. The challenge is to learn to live in peace with nature, not to plunder the earth and poison ourselves and everything on it while scrambling for power, war, and devastation. But I do know that many people separate themselves from moral responsibility when making financial decisions-government personell often feel that personal payoffs are more important than the people they represent. We all know the devastation caused by this mining. We all know that there would be no benefit to the people, and much disaster in the way of poisoning the land, the people the water, the wildlife, the fauna and flora. This is my plea to NOT give any permits to any foreign company to mine our precious earth and destroy our people and land in doing so. Catharine Mader 3152 29th Ave S. Mpls, MN 55406

Dear Ms. Lisa Fay, EIS Project Manager, I disagree with the PolyMet Mining going to happen in Minnesota. The Copper-Sulfate Mining is a big project and I don't think it will benefit Minnesota enough to make it worth the tune, land, and money that it would take to go through with the mining. Yes, it would create jobs in Northern Minnesota, but is that really the only positive thing that will come out of all this? We use all of this land to create jobs in Northern Minnesota and it's not like the jobs will be there forever. They will be filled for the 20 year span when the mining will take place but after that it will be back to square one with 13,000 acres of land destroyed from mining. The Polymet Mining will have a large effect on the cultural resources being that there are four or five locations that would be affected from this mining process. The Land Exchange is another big problem I see coming from the mining. The company PolyMet, would like to use a bunch of public land as well as gain private land. I don't think it makes one bit of sense to lose a bunch of public land so that a company can mine it, and then leave it as a piece of crap that will never be the same again. This mining would affect me in major ways. We use this land and its what makes Minnesota, Minnesota. I was told to write this paper as a school project, and if this wasn't assigned I would most likely never have looked into this. Thank goodness it was though, because now I realize how many dumb things could happen to our state without the voices of our local citizens being heard. Sincerely, Kate Mahonen

Kate S

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kate S n/a Inver Grove Heights, MN 55077

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Kate S n/a Inver Grove Heights, MN 55077

Kate Smith

Without a doubt, a great deal of effort has been expended to generate this extensive plan. Involvement has included several local, state and federal departments as well as PolyMet's mining experts and consultants. Mining copper, nickel and precious metals is a means to an end, money. What seems to be missing in the EIS is an accounting for the flow of money both as future costs and benefits. Without that information, it is impossible to know if the project is viable and environmentally sound. Poly Met

- Having already spent \$65 million, it is clear that PolyMet expects to make mega-bucks selling metals.
- Controlling costs is paramount to making a profit. How can the public know if corners are cut during design, construction or operation?
- In the event of a mishap during construction or operation, what penalties can be enforced? Is the amount of money set aside by Poly Met sufficient for monitoring and maintenance for 500 years?
- If Poly Met goes bankrupt, is dissolved or is purchased by another mining company while still in operation, what fiscal and environmental protections are in place?
- Is PolyMet responsible for anything in the 500 years following closure?

Local People

- The SDEIS states that 500 people are expected to be employed during construction of the mine about one year, 360 employed during operation for 20 years and 322 indirect jobs are expected to be created in the local community.
- How many of the jobs will be technical experts brought in from distant places?
- The higher the number of locally hired miners, the fewer indirect jobs will be needed since local people already have local services.
- The more people that are hired and then move into the area, the more indirect jobs will be created. However, these newcomers will take the mining jobs from the local people.
- The number of jobs for local people will be less than the sum of the number of mining jobs added to the indirect jobs, 682.
- How many jobs will be lost the tourism industry?

Government Entities/ All tax payers

- How many tax dollars have already been spent on this project?
- What is the anticipated tax revenue generated from 20 years of mining?
- How is that divided between Federal, state and local entities?
- What is the expected cost of post-mining site management for 500 years?
- Who picks up the cost for post-mining site management for 500 years?
- What tax funds will be withheld for anticipated post-mining site management?
- Who picks up the bill if waste containment is not confined for 500 years?
- What is the net gain or loss for combined government entities?
- What provisions for future expansion of mining and processing have been inadvertently

The following are my comments on the PolyMet Sulfide Mine DEIS: 1- The proposed mine plan does not keep Minnesota's waters safe and clean. 2- The proposed mine plan does not provide contingency plans should an accident occur. 3- The proposed mine plan does not leave the site clean and maintenance free. 4- The proposed mine plan does not account for how treating polluted waters will be paid. I am especially concerned about the impact such a mine will have on resident, nesting, and migratory birds. I am also concerned about the impact to the Superior National Forest. Please reject this plan, as it imposes unacceptable risks to Minnesota's environment. Thank you. Kate Winsor

Kate Zimmerman

54360

Dear Ms. Lisa Fay, EIS Project Manager, I am writing you to express my opinion on the PolyMet mining project. I do not support the project for the following reasons. The first reason is that the proposed project could affect the endangered or threatened species that live in this area. They could be affected by the noise, traffic or vibrations caused to their habitats by the projects. Their habitats could also be destroyed or removed by the construction of the mine. They could also be affected by water pollution or changes in the quality of the water or the air caused by the waste products of the proposed mine. Another reason that I do not support the project is the effect it could have on the Ojibwa that live in this area. The waste products from the project could affect the animals and plants in that area. Some resources that they use could be affected as a result of the proposed project. The proposed project could also affect other cultural resources that are located in or near the area of the project. Another reason is that the project will affect the quality of the water in that area. The project is located on a site that is near the Partridge and Embarrass rivers. These rivers then flow into the St. Louis River and from there will flow into Lake Superior. The project could add to the water Mercury that might be present in waste materials. Metals could also be released that will affect organism in the water even if it is a low concentration of the metals. It could also add sulfate to the water from the chemical reactions of the waste products. This sulfate could affect the growth and viability of wild rice that is grown on the rivers. The proposed project could also affect the wild rice that is grown downstream of the site for the project. Wild rice is an important environmental resource of Minnesota and also has a cultural significance to the Ojibwa people of Minnesota. To conclude there are many reasons why I feel that the proposed project is not a good idea. The project will affect different cultural and environmental resources of northeastern Minnesota. Thank you for taking the time to read this letter. Sincerely, Kate Zimmerman

15080

Katie Soukkala Ms Olson Chemistry, Hour 4 1/30/14 Copper Mining Aka Contamination. Copper mining is the excavating of a natural resource called copper. Recently, a large copper vein was discovered near Babbitt and Hoyt Lakes, Minnesota. This state has been considering excavating the extremely useful metal. Right now, experts are weighing the effects on the environment versus the profit for our economy. Sulfide mining has a few benefits, however I believe the detrimental impact it will have on our environment outweighs all of the potential gains. I am against copper mining in Minnesota for many reasons. The first reason being that when mining copper, sulfate is released, and when mixed with air and water this creates sulfuric acid. Sulfuric acid will lead to the production of toxic heavy metals in water. This will lead to the methylation of mercury. Methylmercury is the kind that accumulates in fish which can put humans in danger of having mercury toxicity. Another reason that I disagree with letting PolyMet mine in Minnesota is because the mine would be in the Superior National Forest which is rich in peatlands. Cutting down the forest would not only kill many plants and animals, it also would destroy peatlands. Peat is the first stage in the process of creating fossil fuels. In our fossil fuel driven world, we cannot afford to destroy valuable hydrocarbon. The final reason that I oppose mining near Babbitt and Hoyt lakes, Minnesota, is because the mine would only be open for twenty years and there would be over five hundred years of environmental damage. It seems like a huge habitat loss for such little gain. PolyMet should find a cleaner, more eco-friendly way to mine the copper. If they can do this, then maybe it would be more reasonable to possibly consider mining the ore. Harming our delicate ecosystem is not something to be taken lightly. As one can see, I do not agree with PolyMet's way of mining in Minnesota as of right now. If they were to figure out a way to protect the environment, I would reconsider my opinion. Too much of our ecosystem is at risk with the current mining plan. It is important for you to consider my input as a fellow Minnesotan. This issue will directly affect people that live anywhere near the mine and the watersheds it is located near. Thank you for your time.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, katharine odell 1415 Vilas ave Madison, WI 53711 US

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Katharine Rauk 1924 Drew Ave S. Minneapolis, MN 55416

Katherine D. Doerr 19984

I am shocked that the state of Minnesota is considering this proposal in light of evidence that this project threatens the quality of a major water shed and would create serious air pollution in a highly valued tourist area. Please consider the value of our state's public health, especially the air and water resources, which would be prohibitively costly to rectify, if damaged. A private company whose aim is to profit cannot override considerations of public health and safety. The long term costs to our northern communities with the loss of safe drinking, bathing water and breathable air cannot be overlooked. The idea that providing jobs is worth such a trade off is ludicrous and very short sighted. We have an obligation to be good stewards of our natural resources and prevent waste and destruction for private, short term profit at the expense of general welfare. The Department of Natural Resources has a moral duty to protect Minnesota's treasured land and her people. Economic gain from our natural resources needs to be sustainable and safe for everyone. Katherine D. Doerr 112 Edgewood Court Wayzata, MN 55391 612-396-8000 Katherine D. Doerr kadedoe2@gmail-com

Katherine Doyle 41813

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Although mining jobs are important to Northern Minnesota, a healthy habitat for humans, animals, and plants is certainly more important. At some point, the mining industry may be able to protect Minnesota by treating dangerous pollutants before they are expelled into the environment. This is not currently the case. If this does become mechanically and financially feasible, please make sure the mining companies are able to pay for the substantial costs of dealing with the pollution. The unmeasurable and unpredictable long term costs should not be shifted to the tax payers. As with physicians who must take the Hippocratic Oath, the Minnesota DNR's first job should be to do no harm and protect the environment. Columbus arrived in America a little over 500 years ago. It is impossible for us humans to predict what the world will be like in 100, let alone 500 years. Yes, Minnesota has one of the largest copper nickel deposits in the world, and hopefully someday we will be able to extract these precious metals without the risk of serious environmental harm. At this moment in time, however, the risk is very real and should not be tolerated by an agency with the responsibility of protecting our precious environmental resources. Pollution is not progress, and jobs which pollute the environment are not blessings. I urge you to reject the proposed PolyMet mine, and to make sure all future mines do not endanger our wilderness, watersheds, wildlife, and the personal health of the people you have the responsibility to protect-whether they are currently living or our great, great, great, great, great, great, great, great, great grandchildren. Respectfully Submitted, Katherine Doyle 2232 Vermilion Road Duluth, MN 55803 Sincerely, Ms Katherine Doyle 2232 Vermilion Rd Duluth, MN 55803-2216 (218) 724-0589

katherine lewis 41821

Please do not let centuries of environmental damage occur in exchange for brief commercial gain. We should be recycling our copper rather than selling it abroad and doing some unnecessary mining here. And on public land, for private profit. OPPOSE the POLYMET MINE. Thank you Katherine G. Lewis

41827

To whom it may concern- Please do not allow centuries of environmental damage to occur in exchange for short-term personal gain. We need to recycle copper, not sell it overseas, and not mine it unnecessarily here. This mine will create some temporary jobs but cause enormous damage on public lands. NO TO POLYMET MINE..
Katherine G. Lewis

Katherine Loban 39626

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Katherine Loban 4772 Oak Dr Moose Lake, MN 55767-9208 (218) 485-8777

NO MINING NOW! WAIT UNTIL THE TECHNOLOGY IMPROVES1. New untested mining procedures should not be tested on our state2. 500+ years of pollution is too long for so few jobs and so little money3. We would save money by funding 350 jobs instead of paying for clean up later. Let's find 350 green jobs or environmental jobs up north4. You can't expect to live in pristine wilderness and also necessarily have a good paying job (I moved to the T.C.)5. Why Polymet! Why not a state run mine?

To Department of Natural Resources regarding Polymet Environmental Review The following are comments from: Kathleen Anderson 3388 Petrell Rd Brimson, MN 55602 David Olafson 1235 Pequawayan Lake Rd Duluth, MN 55803 Alicia Hachfeld 619 North St Apt 3 St Paul, MN 55106 Brian Hubbard 619 North St Apt 3 St Paul MN 55106 Department of Natural Resources, It is our understanding that there is a mission of the DNR and laws that direct you to protect our natural resources. We also feel that we have a moral obligation to care for the Earth and insure that it is treated in a way that does not harm people and animals. We have great concerns with much of the information in the Environmental Impact Statement and are opposed to granting any permits to Polymet. Regarding Economic Impact, Minnesota law states that sulfide mines be maintenance free at closure. Waste rock and water will need to be contained for hundreds of years. This company has not indicated that it will guarantee that it will be in business this long or that it will pay for the maintenance/clean up for any pollution. How can we be assured that there will be a company or adequate money if there are any problems. This is a concern because in the history of sulfide mining , mining companies are unable to point to a sulfide mine that has ever been developed, operated or closed with out producing polluted drainage. The US EPA identified hardrock mining as our nation's top toxic producing industry. In 2010 the metal mining industry was responsible for 41% of all toxins in the environment. The history of sulfide mining is filled with companies going bankrupt or lacking financial resources to respond to pollution. The Summitville Mine, Colorado, the Zortman Landusky Mine, Montana, the Gilt Edge Mine, South Dakota all bankrupt and the taxpayers are paying millions for clean up. The Flambeau Mine in Wisconsin has surface water runoff and does not meet Wisconsin water quality standards. It is closed and Wisconsin has a moratorium on this mining because it can not be proven to be safe. Polymet has not proven it will not pollute, just because it says it won't and they have a computer analysis that says it won't. There will be water runoff. This is northern Minnesota, there are heavy rains, floods, snowstorms, . the rock and water cannot be contained permanently and safely. There are many statements about computer models. Who has done these models. Are they really done by impartial and totally scientific methods. Has the company had any input, are they reliable. The standards and quality we want have never been met in a real sulfide mine and that is important to consider. The DNR itself has a report confirming what tribal scientists have said for years that the actual rate of ground water base flow is 200-300% higher than in the SDEIS. This puts in question many statements that Polymet has made. It has been shown that this mining has by products of arsenic and thallium which have been linked to increased risk of cancer. We live and work downstream of this proposed mine and do not want our water contaminated and Polymet has not proven that it will not be. Also on the economic impact, we work at a tourism business very close to the proposed Polymet. They may create jobs but they will also negatively impact existing businesses. Our business depends on clean water, clean air, quiet, wildlife and a reputation for these things. Have you really checked out how much tourism exists by sulfide mines. Our guests come from all over the world because of our pristine natural resources. We are being sold out and once we are polluted, it will never be the same. Tourism is a sustainable industry and has not been considered adequately for the negative impact it will have on us. Also have property values been considered. I already know of people who will not buy in this area because of the mine. Another grave concern mentioned

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest When these toxins reach the air, they will leach into the ground water and into the local rivers, streams and water sources. Minnesota is the home of the Mississippi and of the largest fresh water lake in the world, Lake Superior. Both of these bodies would become contaminated forever. Once we allow permits, Glencor Xstrata is ready to buy out Polymet company and take over. They are known worldwide for their poor quality in care of the environment. They have poured acid directly into the rivers of Africa and Peru is filing lawsuits against them for their destructive policies. We cannot let this happen here. We must stop them before it is too late. Sincerely, Kathleen Brown 7244 York Ave S Apt 130 Edina, MN 55435-4415 (952) 393-6418

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I had lived in the Arrowhead for 17 years and watched and witnessed the struggle to reclaim the scarred land from pit and taconite mining. The tailings polluted Lake Superior and no amount of clean up will ever recover all that was lost. Copper mining is even MORE devastating and the years of pollution doesn't begin to justify short-term job gains. It just isn't worth it once the mines are depleted and the waste is left behind for generations. My grandchildren will be left with this and wonder why I ever let it happen. I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Kathleen Groh 114 Bichner Ln Mahtomedi, MN 55115-6810 (651) 777-0991

Mar 12, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved, because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. If this permit is issued and the project continues, it will be nothing less than a disaster. In addition to the irreparable harm it will do to the water and the wildlife and people who depend on it, the destruction to the landscape will be heartbreaking. Northern Minnesota is already under great risk from climate change. The last thing we need is to add to that. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. This decision should not be based on popular opinion, but on the facts of the situation, which show undoubtedly that the trade-off of twenty years of a few mining jobs for hundreds of years of pollution of sensitive habitats and a permanent ugly blot on the landscape is not worth the risk. Sincerely, Kathleen Hills 2015 Greysolon Rd Duluth, MN 55812-2108 (218) 349-5955

kathleen klinkenberg 52241

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, kathleen klinkenberg 712 4th st se apt 2 Minneapolis, MN 55414

Kathleen M. Sullivan 42282

I wish to state unequivocally I am totally AGAINST permitting PolyMet to mine in NE Minnesota. The poses too much of a danger of contaminating the precious waters and watershed of the area that is our one last hope of unspoiled wilderness. The sulfide residue will leach into our waters for way too long a time to risk it for 20 yrs of jobs. NO. No permit. Kathleen Sullivan 28 Mort Meadow Rd Grand Marais, MN 55604

Kathleen McGee 58126

Polymet Sulfide Mine is a bad idea and should be rejected- it is not a sustainable profit model. I am not native to Minnesota and in the past 17 years that I have lived here have slowly discovered the beauty of the north woods. I am used to the heights of the Sierra Nevada but the Boundary Waters is like no place on earth. I tell everyone I can to make sure that the boundary waters are on their list of trips they must take. Why then would anyone agree to risk polluting this amazing wilderness area in order to realize short-term profits that benefit a multi-national company- Glencoe? Would the state really prefer to have jobs in the short term but a polluted landscape in the long run? The negatives are just too great: • There has never been a sulfide mine that did not pollute • The state will have to pay for cleanup after the company is gone so ROI on a sulfide mine are greatly diminished • Future water quality standards cannot be guaranteed by the company • The state would be a fool to move ahead with this project and see the waterways polluted and the beauty of the boundary waters destroyed. If history is a lesson, this pillaging of the land leads to harm to humans, the land and wildlife. The cost is too great. Please do not proceed with this misguided plan.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Kathleen Miller I am a property owner on White Iron Lake and will be affected by these important decisions that are being reviewed. I expect that these meetings will be very well attended and not likely to accurately reflect the interest by residents unless more opportunities are offered. Three meetings is ridiculously few for this important issue. I do health research at the University of Minnesota and am expected to get far more community input for decisions that affect far fewer individuals. Kathleen Miller 153 Sunset Road Ely MN 55731, MN 55731 612-203-2459

The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kathleen Soehl 65055 340th Ave Lake City, MN 55041

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. While I myself do not reside in Minnesota, my children, grandchildren and other relatives do. My husband and I are frequent visitors and plan to reside there in the near future. I am always proud to disclose my Minnesota ties to others, not only boasting about the pristine beauty of the many untouched areas in the State, but the fact that The great state of Minnesota cares about preserving and protecting its natural resources for generations to come. I hope I am not wrong. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Kathleen Walker 622 Captains Way Reedville, VA 22539-3236

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kathleen Zurcher Prior Lake, Minnesota

Kathleen Zweber

45003

As a Minnesota citizen, I oppose the mining project proposed by PolyMet because I believe that the risks to the Northern Minnesota ecosystem and to our State's economy are not worth taking. Although some have pointed out benefits like job creation from this project, such benefits are short-term and there is too much potential for mining profit to come at the expense of existing livelihoods and cost more in the long run especially if Minnesota's taxpayers end up with a bill for cleaning up after the mine closes. Minnesota's unique environmental and natural resources are priceless and should be preserved for generations to come. Kathleen J. Zweber 1418 Torgeson Road Duluth, MN 55804 (218) 522-0007

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

I am submitting comments as a concerned citizen of northern Minnesota. My name and husbands name and address are as follows: Kathryn and Dirk Hanson 1491 Pyhola Ctwy Ely, MN 55731- I have noted specific comments in the attached files. Overall, we are concerned that: 1- The public was not given sufficient time to digest the very long document. 2- Input parameters going into the various numerical models may not reflect the true range of uncertainty and hence the results of the modeling may not accurately represent the hazard. It would seem that additional analyses or sensitivity studies are warranted to show that the model results are sound. 3- The economic downsides of sulfide mining-impact on recreational property value, tourism, short-term negative impacts on communities of transient workers-are not adequately accounted for. The cache of the lake country around Ely, MN, the reason why I relocated here in 1984 along with a number of key innovators and business owners, is being irreparably damaged by the threat of long-term pollution for short-term mining profits. 4- There is no reason to assume that the State of Minnesota will not be left paying for the pollution that will ultimately ensue. I am not willing to bank on yet unproven mitigation measures and non-mechanical post-closure promises.

Jan 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Kathryn Keiner 2688 61st St Fulda, MN 56131-9599 (507) 425-2788

Thank you for the opportunity to comment on the PolyMet. I have reviewed the SDEIS and believe that while it is not perfect, it is a detailed, thoughtful consideration of environmental, social and economic impacts of the project. I believe the SDEIS shows a need for the project and shows that it can be done successfully, minimizing impact to the environment. I trust the process and I trust the State and Federal Agencies that will be granting permits for the project. I am impressed that PolyMet will use and existing Brownfields site and reuse existing infrastructure. Based on my review of the SDEIS, I am convinced that PolyMet will provide a needed service (producing metals that are in demand) in an environmentally responsible manner that will also generate a positive economic effect on Minnesota and the entire United States. Respectfully Submitted, Kathryn Larson 120 Greenwood Lane Duluth, MN 55803

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project. Lake Baikal is at risk already. The world needs MN freshwater protected. Tx facilities require maintaining. We can NOT predict the future. The risks are too great.

Kathryn M Stingl

43097

To whom it may concern: I have grave concerns about preserving the St Louis watershed from any contamination from the results of copper mining. The habitats are pristine. The water all leads to our "Big Lake" Superior. I also have concerns about the effects of closure of the mine on our water sources . Thanks for "listening". I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Lets get moving . The people are desperate for decent paying jobs. This has been drug out long enough. NAME Kathryn Marschalk ADDRESS 6382Birch StApt 21 North Branch,Minnesota 55056

44181

Dear Ms Fay, Dear Federal and State Agency Leaders: Our family owns property and resides seasonally near Ely, Minnesota. We believe the PolyMet SDEIS is inadequate and that this destructive project must not proceed as currently proposed because of the 1) widespread and severe environmental damage inherent in the PolyMet project and 2) the failure of the SDEIS to include a cost/benefit analysis and specific provisions regarding amounts and sources of financial assurance. We believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: 1) Economic Impacts -The SDEIS contains no cost/benefit analysis of the PolyMet mine. - The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. - The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. - What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. 2) Permanent Water Pollution -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. -The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. 3) Absence of Planning for Inevitable Accidents and Failures -The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate (see below), the SDEIS does not tell us how the costs of responding to such failures will be covered. -The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The Mine Plan Requires an Absurd and Unachievable Level of Monitoring and Maintenance for Many Centuries -Minnesota Rules 6132-3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment. -526 acres of land, covered by more than 167 million tons of waste rock, would be covered by a plast

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely, Kathryn Rod Kathryn Rod 4048 Fairview Rd Duluth, MN 55803

There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Kathryn Schmitz 202 Allen Ave Green Bay, WI 54302-4404 (920) 468-8972

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, Not only are Minnesotans, but I also am very concerned,with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. The cost of potential damage to the wetlands, wildlife and habitat to wildlife is a real possibility. In addition, there are far reaching problems with impact on human life and quality of water and soil damage for miles and miles, should there be leakages or inability to handle waste products. This is an extremely real possibility. Are you willing to risk so much on this project. Future generations will have you to thank for this poisonous fiasco should leaks and human mistakes come to pass. I understand that the products gained are important to all of our lives but the risks are too great. Our Federal lands should be protected from this type of exploitation. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mrs Kathryn Stoneman 1501 Claremont Ave Richmond, VA 23227-4031 (804) 264-8709

I'm writing to you today to express my views on the proposed copper mine in Northern Minnesota. I attend a Y camp in the boundary waters on Burnside lake. For years I've enjoyed the pristine wilderness. The clean water and the fresh air that I can find in that area away from the city. The opportunity to fish and see wilderness is a novel one for a child raised in the city with parents who are fundamentally opposed to camping. Due to my fantastic experience in that area I oppose the use of sulfide mining. The proposed copper mine would produce 99% waste, far too high a price to pay for the pine trees. It could pollute one of the purest watersheds in the area, far too high a price to pay for the fish. The degradation of the environment would diminish future revenues from ecotourism. Far too high a price to pay for short term, dirty, unsustainable jobs. Please do not approve the copper mine so that future generations can enjoy the wilderness like I have. Any amount of degradation or habitat loss is too high a price to pay.

Kathy Alvig

19999

Dear Sir, I grew up just outside of Duluth. I heard horror stories about iron mining mishaps for miners and companies all the time. When my friends' loved ones started dying from the impact of iron mining, there was nothing any one could do but go to the funerals. The mining companies were always in control. Also, we know there is significant damage to the earth, ground water, and also wildlife habitat that comes from the greed mining operations bring. There is no such thing as real recovery from this. Once the soil earth is damaged, once ancient trees are Knocked down (called overburden by miners), and wildlife habitat is impacted, there is no true reclamation. We lived through the rape of the land during iron mining (still suffer from it) in northern Mn. Take a look around Chisholm and Hibbing and see what the land looks like. Do we want that area looking like a huge open sore. When will the whole state of Mn understand that there is a huge price when there is profit from such mining . When will today's decision makers understand that a decision to support mining does not support current land owners who do not hold mineral rights. There is a huge price to pay. Mining copper in Mn will bring much profit to the mining companies who I understand are based in South America.. Not even from the USA. All of the mining companies profits will go to South America on the backs of the people who live up near Hoyt Lakes. South American companies and share holders will profit on the backs of our childrens safety and good health. This area that makes northern Mn a tourist destination will suffer from air and water pollution, congestion from transportation of the ore, and company controls and bullying. I hope the lobbyists who have been hired by the mining companies do not win. I hope the legislature is smart and strong and does not succumb to pressure regarding this issue. Kathy Alvig Sent from my iPad

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. Dear EIS Project Manager Lisa Fay, My understanding is the proposed open pit sulfide mine is to extract copper, nickel and other metals. In other states sulfide mining is associated with long lasting water pollution and has never operated without polluting its nearby waters. Looking at a map, besides the nearby lakes, the Embarrass River runs right by the plant site, flows into the St Louis River and then into Lake Superior. The Partridge River winds around the mine site and does the same. As you must certainly know this type of hard rock mining of sulfide ores react with oxygen in the air and water (precipitation and other water sources) and forms sulfuric acid. We know this acid is harmful to fish and other water organisms and causes toxic heavy metals in the rocks to leach out. We know these toxic heavy metals are harmful to people and wildlife alike. Acid mine drainage can stick around for more than a millennium. Many sulfide mining companies have failed to provide financially for dealing with this long lasting pollution and then go belly up. As a taxpayer I am not willing to be responsible for the liability of clean up. In early 2010 the EPA gave the rating of Environmentally Unsatisfactory and Inadequate for this project plan PolyMet set forth and I am leery that the standards even come close to protecting our waters and environment for the long term. It is disturbing that there were no contingency plans included with their proposal for accidents from failures of collection and treatment systems, tailings basin failure, accidental releases, etc Where is the plan regarding treatment of the water should a plant break down and what is the plan for where the toxic polluted water will go when this inevitably happens. One is left to wonder why was this not included. This lack of information is a red flag. Yearly, 11 million gallons of polluted seepage from the tailings basin plus over 5 million gallons of polluted seepage from the mine site will go untreated into the ground water. I foresee an additional 6-2 + million gallons of contaminated toxic water per day being released directly into the environment when treatment plants breakdown. With something so obviously needed to safeguard environmental safety, yet not included in their proposal, I see no indication that PolyMet is committed to clean mining. I find this of grave concern especially when the waste water treatment plant located off site would need to run for the next 200 years and a long 500 years for the water treatment plant on site. Allowing this mine to go into production for the short anticipated life span of 20 years is clearly for short term gains. 200 years, 500 years and 1000's of years of treating the toxic pollution created by this mine is a long term commitment with long term consequences consequences that we would be forcing upon our future generations. I don't know anyone who would consider this acceptable or ethical. I find this mining process dangerously irresponsible, on a multitude of levels, thus strongly disagree with allowing this to happen anywhere and that includes here in our own back yaRd Sincerely, Kathy Burkett 14820 13th Pl N Plymouth, Mn 55447 763 208 9171

Kathy Glover

Kathy Holander

18243

Kathy Hollander, K-A-T-H-Y, H-O-L-L-A-N-D-E-R. My name is Kathy Hollander. I'm a Minneapolis resident who also owns lands in St. Louis County in Pequaywan Township. I love the swaying birch and spruce trees of Northern Minnesota and how clean the air smells. My family goes there to escape the smog of the Twin Cities. I have drunk the water from the lake near our land, used it to wash dishes and my child, as well as swim in it. When it came time to put in a well, we did that. I have seen the lake swell to an all-time-high level during unprecedented rains and dwindle down to very low levels during periods of drought. I am concerned about water and land use. At the legislature last year, I heard about some of the wells in Northern Minnesota drying up. I would like to know how much fresh water, both ground and underground this project is scheduled to use. I am not aware of anywhere in the SDEIS where the amount is specified. With climate change coming, there will be areas of drought and areas of heavier-than-normal rainfall that quickly run off. In a drought year, will there be enough water for people and animals to use for drinking water? Will the streams still flow? Will the stream-fed lakes dry up? Will the mining company be able to take all they want even in a drought year? I want this specifics in the SDEIS. And I'm also concerned about the land exchange. By law, an appraisal must be done on the land being lost in the Superior National Forest, and on the new land that will be exchanged to make sure that the new land is worth at least 75 percent of the value of the land being given up. We the people the of Minnesota own the land now, although it belonged to the Anishinaabe people before the European settlers. The Anishinaabe people retained their rights to hunting, fishing and gathering on this land and now even that will be taken from them. What kind of people are we that we do this to the native people of our land. The forest service should disclose to us, the public, all land appraisal information now and extend the comment period so we the taxpayers can comment on this land-exchange issue. On the current land, the state owns the mineral rights. The new lands have split mineral rights. There are no covenants to prevent mining. The land exchange proposed by PolyMet should be rejected since it's not in the public interest. PolyMet must find land where the public owns the mineral rights. No split mineral leases to sell off. And the swap is not equal. We will have a net loss of over 6,000 acres of lands with high biodiversity. We will have a net loss of over 2,000 acres of mature forests and be given less mature forests in exchange. We will lose over 1,400 acres of flood plains. The exchange should be denied as we, the taxpayers, end up with a lot less. It is horrifying that we have to fight you our own government to save the environment as Ansel Adams. Reject the exchange of the Superior National Forest land for the PolyMet project. Thank you.

Kathy Hollander

18228

That's rough being the last speaker. I think I would have rather been the first. My name is Kathy Hollander, and I vacation in St. Louis County. I love the white birch and the white pine trees of Northern Minnesota and how clean the air smells. Many people have spoken about our love for the environment tonight. I have drunk the water from the lake that I have a cabin on, I've used it to wash dishes, I've washed my child with it as well as went swimming in it. I've seen the lake swell to an all-time high level during the last, what was it, 100-year flood in Duluth, and also dwindle down to very low levels during the drought that we had last summer. I am concerned about water and land use. At the legislature last year, I heard about some of the wells north of Duluth are drying up. Who would have guessed? This is drinking water. I would like to know how much fresh water, both ground and underground, this project is scheduled to use. I am not aware of anywhere in the SDEIS where the amount is specified. With climate change coming, there will be areas of drought and areas of heavier than normal rainfall that quickly runs off. In this drought year, will there be enough water for people and animals to use for drinking water? Will the streams still flow? Will the stream-fed lakes dry up? Will the mining company be able to take all the water they want, even in a drought year. I'm reminded of the Aspac River in Northern Canada where the river runs dry when the mining company takes as much water as they need. Also, I'm concerned about the land exchange. By law, an appraisal must be done on the land being given up in the Superior National Forest, and on the new land that will be exchanged to make sure that the new land is worth at least 75 percent of the value of the lands being given up. We the people of Minnesota own that land now, although it belonged to the native people before the European settlers. The native people retained their rights to hunting, fishing and gathering on this land and now even that will be taken from them. What kind of people are we that we do this to the native people of our land? The forest service should disclose to the public all land appraisal information now and extend the comment period so we taxpayers can comment on this land exchange issue. On the current land, the state owns the surface minerals rights. The new lands have split mineral rights. There are no covenants to prevent mining. The PolyMet must find land where the public owns the mineral rights. No mineral leases to sell off. It is horrifying that we have to fight our own government to save the environments that Ansel Adams (inaudible.) We trust exchange of the Superior National Forest of the PolyMet project. It's not in the public interest. Thank you.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kathy Iverson 2641 Jersey Avenue South St Louis Park, MN 55426

18274

My name is Kathy Iverson. I am here to submit my perspectives on this big decision. We have had a cabin up by -- well, it is at the end of the Arrowhead Trail in northern Minnesota. So, as a girl I had had an opportunity to play and recreate in that wilderness area and came to appreciate the fishing with my father, with my brothers, and came to appreciate the beautiful woods, with canoeing. And, really, I mean it was so different from urban living, because I lived in Minneapolis my whole life. And so the thought that there are countless lakes and rivers that could be contaminated just, you know, to me is No. 1. That is something so precious that we cannot put a dollar figure on that. It is about heritage. It is about passing on to our children and our grandchildren our legacy that we have experienced in our lives. We have every bit of responsibility in protecting that environment and in ensuring that they are going to have the same experience that we had. That's all I got to say. Thank you.

All the plans for cleaning up the pollution caused by mining can never make nature as it was before. You can't buy that. Just don't mess it up in the first place. Please, no destructive acid pit mining in that beautiful area.

Kathy Klotz 39353

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Kathy Klotz 33619 County Road 32 Utica, MN 55979-4503

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Lisa Fay MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement ("PolyMet SDEIS") fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates. The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential sites. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate. For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project. We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction

Kathy Palmquist

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Kathy Palmquist 803 Glen Ln Winona, MN 55987-4138 (507) 454-5532

Kathy Sidles

9678

I'm against allowing the mining because the acid concentration of the waste water is too high and persists too long. Wildlife is sensitive to acid level, and the potential for destroying the water-dependant wildlife is too great. There is no way the company can guarantee they will pay for what the public - including other private companies - can loose. The risk of pollution and extent of pollution and the time frame for risk is too great. We have to think of other ways to create jobs, and not risk losing existing and potential jobs because of this particular type of pollution. Kathy Sidles 1380 Winchell St Saint Paul, MN 55106 651-771-7528

Dear Sirs; I am a resident of Minnesota and our family has long enjoyed trips to Northern Minnesota and particularly the Boundary Waters Canoe Area. I am writing to express my concern in regard to the proposed PolyMet copper mine in the Hoyt Lakes/Ely area. I am opposed to such an operation in that area and am gravely concerned in regard to the effect on not only the pristine Boundary Waters Canoe Area, a national treasure to be sure, but all water in the area and the safeguarding of that area for the generations who follow us. From what I have read, PolyMet does not seem to be able to give 100% guarantees that money will be there for the cleanup after the mining has ended, or that they themselves will even be there to see that the cleanup is done. I am strongly opposed to the proposed mining and would ask that you consider carefully and protect faithfully this beautiful area for ALL of us to enjoy long into the future. Sincerely, Kathleen Thonvold 1316 Co. Rd 9 SE Willmar, MN 56201

---Original Message--- From: Kwithero@umn-edu [mailto:Kwithero@umn-edu] Sent: Tuesday, March 11, 2014 9:32 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Kathy Witherow 12675 Tussock Ct Eden Prairie, MN 55344-3942

Katie Feterl

I am a third-year undergrad who attended a very well put together interactive presentation at Gustavus Adolphus College on the meaning and issues surrounding the proposed PolyMet Mining project near Ely, MN. I am not a resident of Ely, and have only visited the area once (it was beautiful). Even though I have no direct stake in the project, I have been moved to comment. What I learned reaffirmed something I've wanted for a long time—a shift in focus from the immediate short term benefits to the long-term consequences. 20 years of jobs is not worth lifetimes of a destroyed environment that presently largely contributes to the tourism industry of Northern Minnesota. The construction of this mine will only expedite the implementation of future mines in the area, accelerating environmental degradation. Tourism will most likely tank if the area is unhealthy and unsafe. The mine is not the only option for providing jobs. It does not mean the end of Ely if it is not constructed. If people believe that, they have little faith in their own ingenuity and abilities. However, it could put Ely in a much worse position in a few decades should there be large health consequences and/or reduced tourism due to acidic water supply that destroys the life system around it. Weighing the short and long term benefits and consequences, it simply doesn't make sense to take the risk of passing the PolyMet project. Sincerely, Katie Feterl St Peter, MN

Thanks for this opportunity to comment! The limited number of jobs provided by this project for a limited number of years is not a valid trade for the prospect of another economic bust in NE Minn when the mining is finished. We have seen the boom/bust cycle too often from extractive industries in this part of the state. When you add the prospect of remediating, pollution for centuries (when our Republic itself is only ca 230 years old), it seems clear that we in Minn and elsewhere in the world should focus on reuse and recycling of needed materials, rather than putting our waters and landscape at risk. Please see Barton Sutter's comments in the Star Tribune 1/26/14. He said this much better than I can.

Katie Haws 42882

I submit the attached comments for your consideration in the Polymet Mine EIS as part of the public comment record. Please respond to my comments and concerns. Thank you, Katherine V. Haws (address on the attached document)

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Katie Perkins 11311 133rd Ave N Dayton, MN 55327-9421

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Katie Smet Rochester, Minnesota

Feb 14, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

---Original Message--- From: enviros@hickorytech-net [mailto:enviros@hickorytech-net] Sent: Tuesday, March 11, 2014 10:58 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Katy Wortel 1411 Pohl Rd Mankato, MN 56001-5751

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Their proposal contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. It is time for these analysis to look at the implications to humans-not to their wallets. Greed reigns again. The health of all Minnesotans is at stake here-so a health impact assessment for the PolyMet project needs to be done and the results included in the EIS. The time for leaving out essential studies and information is over. We are tired of incomplete impact studies being done on human and environmental health effects. It is time to start worrying about the health of the citizens of the state of MN. The HIA needs to include an analysis of the social determinants of health. Sincerely, Ms Kay Beams 9539 Hartford Cir Eden Prairie, MN 55347-3149

Minnesota Department of Natural Resources To whom it may concern: I am writing regarding the SDEIS for the PolyMet mining project. The SDEIS is inadequate and doesn't provide any assurance that it won't be harmful to northern Minnesota. Any project that would require treating water for 200-500 years should be rejected out of hand because there is absolutely no guarantee that this will be done. This kind of mining has resulted in contamination of surface and or ground water with heavy metals and sulfates all over the world. PolyMet tailings will be added to an existing tailings basin that is already leaking polluted water. It will destroy bogs, tamarack swamps and degrade 7,300 acres of wetlands. It will leak polluted water into the St Louis River and eventually into Lake Superior. It will pollute our water resources at a time when, due to climate change, those resources are more precious than ever. Lake Superior is a huge source of freshwater, a resource that will absolutely need in the future. It isn't worth 500 years of cleanup for 20 years of mining. I would be somewhat more confident about the project if the companies that pollute our air, water and land would actually pay for the clean up they promise when these projects are approved. From the Gulf of Mexico to West Virginia just recently in the news, companies spend years in costly court battles to avoid efforts to make them pay for cleaning up their pollution and even declare bankruptcy to avoid taking responsibility for cleaning up the messes they make. The track record is abysmal. And it isn't just this mine we need to be concerned about. I have a map that shows at least ten sites in northern Minnesota where mining is being proposed or explored. These projects should be considered as a whole when looking at whether to approve any of them. The cumulative effect of all these projects needs to be considered, especially because it is inevitable that, like pipeline projects, once they get their "foot in the door," they will want to expand and destroy more our forests, waterways and lakes. Until companies can come up with a way to extract copper, nickel and other metals in a way that doesn't pollute our water for 500 years, let those metals stay where they are. Sincerely, Kay Erickson 27930 Smithtown Road Shorewood, MN 55331 _____ HYPERLINK "http://www.avast-com/" This email is free from viruses and malware because HYPERLINK "http://www.avast-com/"avast. MN regularly ships copper to China in the form of old alternators & motors which China recycles for use in tech mfg. Instead of mining we could do this here. The small amount of natural land that is left once lost is forever. We always use jobs as an excuse for something bad for us. Remember West Virginia. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I'm Kay Moore, from Idaho, and I have learned the value of clean drinking water, and water cool enough to support fish. The PolyMet Mining Corp. will be similar to Buck Mountain, in Washington. Mining Companies, play up the per't's. The realities are quite different, the mining company did NOT COMPLY, with the water quality, and the land restorations. Each year, the town, has meeting, and the mining company says "YES" , But does NOTHING,,,only talks, and show up with lawyers, but in essence, STEALS, livelihoods, and life, with polluted streams, and polluted land. IT is A RAPE. of the community, and a theft of the land. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Kay Moore 1029 Colt Rd Moscow, ID 83843-2456 (208) 882-8612

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kaydell Gaasvig P.O. Box 1420 Bemidji, MN 56619

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Please, please do NOT let this happen. Do not allow the PolyMet's proposed open-pit mine and ore processing facility near Hoyt Lakes and Babbitt. ENVIRONMENTAL IMPACT: The environmental impact will be significant and detrimental, and the supposed "clean up" many years down the road is a fantasy, as history shows. How can you actually "clean up" this kind of environmental destruction. The record shows that mining companies rip up and pollute the earth, make their profits, and then walk away or declare bankruptcy, after being permitted to do so by state officials. Please do not do it this time. Global warming has shown us that we must look into the future with a greater scope than we have up to now and this is a case of huge importance and impact. If allowed to go forward, this project and its pollution will be yet another contributor to the Extinction of the Species of Humans on Earth. FINANCIAL ASSURANCE: As Rep Phyllis Kahn has recently pointed out, the issue of financial assurance is also a major concern: She says: I. "In chapter 3, pages 136 to 138, you list information that includes the preliminary cost estimate of closure. The source cited is "Foth 2013-" I've looked at the Foth memo cited in the SDEIS. The Minnesota DNR has simply copied information from PolyMet's hired consultant without confirming or fact-checking their work. If the Minnesota DNR and its co-lead agencies are unable to fact-check the work they presented on financial assurance, how are we to expect that they are capable of the adequately protecting the citizens of Minnesota. II. This project should not go forward unless a third-party insurer, such as Lloyd's of London, can be found. The simple fact is, if a third-party private entity will not take on PolyMet, the state shouldn't. Private insurers have expertise in managing risk that the State of Minnesota can't match. Additionally, policymakers could tap the assurance funds for other purposes. Private insurance is clearly superior to a state managed approach in this case. III. In the SDEIS you say that financial assurance will be done in the Permit to Mine stage. Looking at the most recent MinnTac Permit to Mine document, there is one short paragraph on financial assurance. This project shouldn't go forward without robust public debate, and the opportunity for legislative hearings, if what we can expect is a paragraph from the DNR in the Permit to Mine phase. You must ensure that the public, including financial experts and those elected to represent the citizens of Minnesota, have a chance to weigh in on financial assurance. It has not been your practice to do so in the past; will it be in this case." CONCLUSION: As elected representatives of the taxpayers of the State of Minnesota, do NOT offer POLYMET an opportunity to do this kind of damage, make money from it, and then walk away. Do your research thoroughly and carefully and I think you will find out that it is best to say NO before the irreparable damage is done. Kay Taylor

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kayla Hiller Minneapolis, Minnesota

This mine should not and must not be allowed. The long term pollution is unacceptable. The "assurances" are more than inadequate – they're ludicrous. To imagine that twenty years of jobs is enough to offset permanent destruction of an irreplaceable landscape! The international conglomerate will reap the money and the benefits and leave a mess behind. Boom, then bust. Northern Minnesota has a thriving tourist industry. People come from all over the world to enjoy it. Don't sell it out. It's a world treasure.

Keely Gelineau

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Keely Gelineau 709 N Boundary Ave Proctor, MN 55810-2664

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Keely Gelineau 709 N Boundary Ave Proctor, MN 55810-2664

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Keely King 875 27th ave se Minneapolis, MN 55414

I don't think we should permit this mine as clean-up will cost more than the value of the ore. The trickle down or the pollution will be devastating to watershed to Lake Superior. Taxpayers should not get stuck at the end of the mining. Keith A Haglin 701 W. Ideal St Duluth, MN 55811

I urge the Minnesota Department of Natural Resources to deny permission for the operation of the Polymet Northmet copper-nickel mine in northern Minnesota. The Supplemental Draft Environmental Impact Statement for the proposed mine is insufficient in several regards. To begin with, the SDEIS is overly long and inaccessible as a document to encourage public comment. At 1,800 pages and full of technical language, it at once presents an abundance of data and a dearth of basic, understandable information. The SDEIS does not address exactly how long water treatment will be needed at the mine site, instead presenting a theoretical 500-year model that has done little except to sow public confusion about the actual duration of treatment. The SDEIS uses a flawed model for the amount of contaminated water flowing from the mine site, meaning the project's planned treatment plants may have to process larger volumes of water than expected. The document describes long-term reverse osmosis water treatment that is yet unproven at the scale, use, and time frame proposed. The SDEIS does not describe adequate safeguards against worst-case scenarios that could compromise the integrity the waste and water retention and treatment systems. Liners can and do fail. Extreme weather can and does occur, lately with increasing frequency. The SDEIS also describes an unacceptable amount of wetlands loss. Mining at the site would destroy approximately 1,500 acres of wetlands, one of the largest wetlands destructions ever permitted by the Army Corps of Engineers. Wetlands are an important resource for sequestering carbon and slowing climate change, and destroying them would release significant carbon into the atmosphere. "New" wetlands created elsewhere in the state to mitigate these losses are not a true replacement. Another reason I urge the DNR to deny permission for the Polymet Northmet proposal: We simply do not have enough information yet, and this comment period is closing before key pieces of information are even in hand. Financial assurances of Polymet's long-term commitment to cleanup and mitigation are key to the proposed project's environmental impact, and yet the public has been asked to let the DNR and Polymet work out financial assurance details after the comment period is closed. The current financial "assurances" outlined in the SDEIS are wholly insubstantial and not assuring to this citizen. Also, the Minnesota Pollution Control Agency has twice delayed its ruling on a state sulfate standard for wild-rice waters, so this vital information is also unavailable as the comment period closes. Finally, I urge the DNR to more closely scrutinize the players in this business proposal. Polymet, which Minnesotans are being asked to entrust with the stewardship of our lands and water, is a newly formed junior mining company that has acknowledged in financial documents that it has no history of mining, has little cash on hand, and can offer no assurance that it will make money. Its largest shareholder is Swiss-based commodities and mining giant Glencore, which has a disturbing history of environmental and ethical behavior. However, the SDEIS does not account for or even mention Glencore, which will own the first five years of minerals from the proposed NorthMet mine. I urge the DNR to require that the PolyMet EIS include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate, and to require that any permit to mine for PolyMet include Glencore. Sincerely, Keith Goetzman 1171 Century Ave S. Maplewood, MN 55119

From: Keith Jentoft 38 Varner Road Gunflint Trail Grand Marais, MN 55604 I am writing to STRONGLY oppose the efforts to mine the Minnesota Arrowhead for copper/nickel using sulfide to extract the metals from the ore. I believe that the study is flawed and unfairly promotes the interests of the mining industry. Specifically, the company proposes to excavate three enormous pits up to 696 feet deep. Waste rock would be stored next to the pits in 20-story high piles covering 526 acres. The waste would be added to piles of tailings that are currently leaking polluted water. The mine will destroy 900 acres of high quality wetlands, eg, coniferous bogs and tamarack swamps, and impact an additional 7,000 acres. The mine has a projected lifespan of 20 years; polluted water must be treated for 500 years. Leaking polluted water will flow into tributaries of the St Louis River and finally into Lake Superior. I strongly object to the impact the Sulfate releases will have on the wild rice in the drainage area. Please oppose this project. Regards, Keith Jentoft

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr KEITH KEMNITZ 1310 S White Iron Rd Ely, MN 55731-8253 (612) 819-0886

Keith Laken

18231

My name is Keith Laken. K-E-I-T-H, family name L-A-K-E-N, as in November, and I'm from Winona, Minnesota, and I'm here, today -- my public comment that I would like to make is very simple and straightforward. What I would like to see, if any mining permits are approved, that the mining company provide a surety bond for 10 times the estimated reclamation -- cost of the reclamation project, so 10 times. So if the project's going to produce, let's say, \$1 million of estimated reclamation for the next 40 years, it's 40 million times, times 10, or \$400 million post -- bond would have to be posted just for that specific piece of reclamation for that specific piece of river or land. So the idea is that the companies that are granted these permits cannot just create a shell corporation, issue their dividends to their investors and then walk away from the public. So my interest is basically that the public is served in the long run, not just the short-term interest of the profits for the mining or the resources that are being taken out of the ground, but that the other consequences of the mining that the -- that there's actually a bonding process by which the -- the resources are there to reclaim any damage that's done to the environment. The second thing is that those people that are responsible for approving the -- the project and for running the project, that violation of any federal or state law is a capital offense, not just a minor offense. That individuals and corporations are held accountable from a capital standpoint; in other words, these are severe crimes against humanity. That's my comment. Thank you very much.

Keith Monsaas 39226

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Keith Monsaas 1525 E Superior St Apt B Duluth, MN 55812-1640 (218) 260-3399

I am very concerned about the environmental impact of letting the current PolyMet mining proposal move forward I don't believe there are enough safety measures in place to adequately protect our wetlands and groundwater sources. Too many companies continue to dump their waste into nearby lakes and wetlands because of loopholes in current regulations. I fear this will end up just the same and cause catastrophic damage to our northern wilderness. Please stop the PolyMet Project Kelly Huxmann 2105 St Anthony Pkwy Minneapolis, MN 55418 Sent from my iPhone

Kellen Giblette

44378

Hi my name is Kellen Giblette. I'm 18 years old and wish to express my opinion on the proposed mine. I feel that the mine will have extremely detrimental effects on the Boundary Waters Wilderness Area. I have been to the Boundary Waters myself and members of my family have been going for years. The BWCA is the most beautiful area in Minnesota, and one of the most beautiful and untouched areas in the country. I would hate for that significant of an area to be ruined in any way for this small economic boost to the area. I concede that jobs are good. They stimulate the economy and change families and lives for the better. However, I do not feel that any amount of jobs for any amount of time is worth the possible (and in my opinion inevitable) destruction of such a special piece of land. The claim of your company is that you will financially support the overseeing of the mine for 200-500 years after. This to me is a laughable idea. Can you name many companies that have been around for 500 years. Me neither. I think that the mining industry has built a history of empty promises and deceit. I feel that, not to cast judgement upon your company or any individual persons, you have made such an empty promise. I personally do not feel that it is reasonable to say that you will be financially stable to oversee the mine for 500 years, or even that you as an entity will exist in 500 years. So I implore you to reconsider this proposal.

To whom it may concern, My name is Kellen Roberts. My home address is 3124 Columbus Ave Minneapolis MN 55407- I am deeply concerned about the environmental impacts of this mining project. I see in the report that Minnesota will be committing itself to treating the water at the site for at least 500 years. I think it is irresponsible to take on such a commitment. We cannot know how much this will cost and who will manage such a long term project. It is reckless to assume that whomever is in charge of that land 500 years from will have the resources or the interest to maintain whatever treatment process is created when the mine is closed. I strongly oppose this project unless there is a way to clean it up within a reasonable amount of time after the closure of the mine. We as a state cannot agree to take on this commitment. thank you, -
Kellen Roberts

Kelley 47708

Hello, I am writing to strongly oppose the proposed PolyMet Northmet copper-nickel mining plan. I am not at all convinced that the short term goal of mining is at all worth the inevitable pollution it will cause. Nor am I convinced that PolyMet will be able to reverse the damage to water and land to it's original healthy state. I vacation every year on Lake Superior, the largest body of water in the world. I cherish it and am proud to live in a state that boasts this gorgeous treasure of a lake. I am afraid the pollution will inevitably enter the near by Embarrass River and Partridge River which flows into the St Louis River that then flows into Lake Superior. Please think of what is good for the earth and its people and stop this dangerous plan. Thank you for reading this. Sincerely, Kelley Meister 2427 Chicago Ave,#2 Minneapolis, MN 55404

Kelley Eldien 1768

I support the Polymet project and believe it will bring economic stimulus to our northern MN region and ultimately benefit the entire state and our residents/businesses. I also believe Polymet will perform full due-diligence to ensure operations are done as carefully as possible to minimize all potential environmental impacts to our beautiful north woods/BWCA. Please strongly consider your full support of this project. Kelley Eldien Customer Communications Administrator ALLETE | Minnesota Power 218-355-3548

Say NO to non ferrous sulfide mining on the North Shore. Protect the pristine lakes and streams that bring tourism to this beautiful area. Kelli Danger Will Earnie, MN Sent from my iPad

Kelly Amo 42030

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kelly Amo Sauk Rapids, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate because open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality, and impacts human and animal life. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kelly Andrlle Shoreview, MN BWCA Camper Kelly Andrlle 1624 Knight St Shoreview, MN 55126

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. Good Afternoon DNR, I am writing to urge you to please put a stop to the proposed, permanent desecration of our treasured Minnesota Northwoods. I grew up in the Duluth area, left Minnesota for college, adventure, and career and recently returned with my husband to raise a family. I have spent weeks in the Boundary Waters and have always valued our homeland's greatest treasures, the lakes and waterways. The idea that a mining company could destroy the health of our most valuable resource (water, not copper/nickel/other metals) indefinitely (though they only admit to a 500 year issue) for the sake of temporary jobs and revenue is sickening. I have lived all over our nation and have seen the devastation left behind after mining companies closed their doors. Most notable to me is the Berkeley Pit in Butte, Montana, which is now a Superfund site with absolutely staggering environmental consequences. The jobs and money the mine once brought to Butte are but a distant memory, but the "pit of death" (in 1995, a flock of over 300 migrating snow geese landed in the Berkeley Pit and died from internal sores resulting from exposure to the lethal waters) remains, threatening to spill into the water table as its acid bath continues to rise. Polymet will almost certainly leave devastation in its wake, as every hard-rock mine in the United States has before it. History repeats itself. We cannot let it happen in our backyaRd Please protect and preserve the natural beauty and health of the Northland for our children and countless generations to come. Say NO to Polymet Mine. Thank you. Respectfully, Kelly A. Erbach, RN 4020 Clearwater Road, Apt. 213 St Cloud, MN 56301

Kelly Kraemer

Feb 19, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The potential short term gain is absolutely not worth the long term pain of what this mining will do to our environment and the health of our communities, both physical and financial. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Kelly Rogers 8818 Logan Ave S Minneapolis, MN 55431-2065

Kelly Strebig

9314

January 31, 2014 To: NorthMet SDEIS and Lisa Fey, EIS Project Manager I attended the public informational PolyMet meeting on January 28, 2014, in St Paul, and had planned to speak; however, my name was not drawn during the allotted three hours. I am therefore sending my comments to you to add to the information you have received from others. I hold a B.S. and an M.S. in mining engineering from the University of Wisconsin-Madison, and have over 30 years experience in improving workers' health, and improving air quality. I also have experience in fugitive dust control and mine land reclamation obtained while working for the US Bureau of Mines and the University of Minnesota. I have followed the PolyMet copper/nickel project for the last seven years. I had visited the site both when it was the Erie taconite mine and after Polymet bought the plant site. As a mining engineer, I agree with the EIS that this is a low-sulfur deposit. I have read the executive summary of the EIS and I find it thorough and that it addresses all the environmental issues. The dangers posed by environmentalists can and do exist in countries with no laws concerning the environment, and problems may have existed 60 years ago when the United States had few regulations. However, I feel that this mine will not threaten the environment because of the very strict Minnesota regulations, which PolyMet has shown it will meet. Minnesota mines can operate successfully while still protecting our much-loved environment. Therefore, I strongly support the NorthMet project. Kelly Strebig 261 Wentworth Av E W. St Paul, MN 55118

58155

I have a Bachelor and Masters degree in Mining Engineering and 30 years experience in working health and air quality improvement. I strongly support the NorthMet Project because mining and the environment can co exist in Minnesota.

Kelly Weber

6787

I am very disappointed in the State of Minnesota and the continuous roadblocks and delays that they allow to prevent a company like PolyMet from bringing to this State many jobs and tax dollars for both now and future generations. What's with all the delays. PolyMet has been working on this for many years at a tremendous cost of millions of dollars. I have been a Minnesota resident my entire life and certainly believe in protecting the environment. I also believe that the recent SDEIS demonstrates that precious metals can be mined in an environmentally sound manner. We all use these critical metals in almost all day to day activities and it's about time we allow a company (PolyMet), that wants to mine these metals in a safe and proper manner, to get started. The NIMBY thought process that continues to force these metals to be mined in other parts of the world where there are no environmental regulations at all, does not make any sense in today's world. LET'S GIVE POLYMET THE APPROVALS THEY NEED TO GET STARTED. Thank you, Kelvin (Kelly) Weber Sent from my iPad Kelly Weber, OUTSIDE SALES Brock White Company, LLC 4231 West 1st Street, Duluth, MN 55807 P. 1-218-461-4003 F. 1-218-628-2917 M. 1-218-348-9201 www.brockwhite-com kweber@brockwhite-com

Kelsey L. Reisdorph

43960

Hello, My name is Kelsey Reisdorph and I'm a senior at the University of St Thomas in St Paul, Minnesota. I'm very passionate about protecting the environment because it is where we live, we only have one environment and we only have one life to live in it. Whatever damage we inflict on the environment, we inflict on ourselves. I am emailing to express my concerns about the PolyMet Mining Project here in Minnesota. Based on PolyMet's own report on the consequences of open pit sulfide mining, it will take centuries to fix the damage for only around 20 years of mining. My proposal is that if PolyMet wants to do this project, they should establish a trust fund of an amount established and decided on by a third party and governed by the state, the purpose for which would be to pay for the damage that they are inflicting. Thank you for your time, Kelsey Reisdorph

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. 200 years of pollution to keep track of. It's absurd to think you would want to get involved in that kind of responsibility. For the sake of your children's children (Unless you plan to move away with them when this gets out of hand) please reconsider. Sincerely yours, Ken Chastain ken chastain 4728 10th ave S Minneapolis, MN 55407

Thank you for this opportunity to again express my major concerns to this proposed debated mine near the BWCAW. It surprises me that the process ever got this far. How could any of the responsible elected officials in the state of Minnesota ever consider putting the Crown Jewel of your state at jeopardy. Anyone who has ever been near or on a wilderness trip in this amazing area knows what I mean. I say NO to this mine now and forever in the future. There are not many areas of wilderness beauty left in this country let alone in this state where people can go to escape the routines of their urban lives to refresh themselves physically and spiritually in this wonderful area known as the Boundary Waters Canoe Area Wilderness. Thank you, Ken Chervenak Rowe Marketing 1200 N. Arlington Heights Rd Suite 430 Itasca IL 60143 p. 630-228-8846 f. 630-228-8852

Ken Engelhart 40936

Minnesota DNR, I am writing to express my opposition to the proposed copper-nickel (sulfide) mining in northeastern Minnesota for the following reasons: § Toxic pollution has happened at every sulfide mine site in the world to date, including the Flambeau mine site near Ladysmith, Wisconsin. Other sulfide mine sites have been declared Superfund sites. With this type of record, it is extremely doubtful that the outcome would be different for Minnesota, even though we are all "above average". § The proposed open pit mine is expected to operate for 20 years and create 300-400 jobs. By comparison, this mine would leave a legacy of millions of gallons of polluted water for hundreds of years in one of the more water-rich areas of the world. Sulfide mining would require measures to "treat" this polluted water for up to 500 years or more. It is unlikely that PolyMet and other current mining companies will exist in 100 years, and unimaginable that they will exist in 500 years. However, it is likely that Minnesota taxpayers will exist, and will ultimately will be the ones left to pay for the cleanup, if possible, of the toxic mess that is left behind after the mining companies are long gone. Other states with sulfide mines have been saddled with billions of dollars in clean-up costs. § Northeast Minnesota generates \$1-6 billion annually in tourism income. The BWCAW is the most-visited wilderness in the USA. The waters we have in northeastern Minnesota are unique and precious. The highly toxic process of sulfide mining has great potential to destroy these waters, as well as the tourism trade, native cultural heritage and wild rice that exist because of these precious waters. § In summary, sulfide mining is a highly toxic process that has caused pollution at every sulfide mine site in the world. It is a type of mining that has never been done in Minnesota and that would leave a toxic legacy of millions of gallons of polluted water in one of the most unique and precious water regions of the world. The short term "benefits" of mining do not outweigh the disastrous long-term consequences to our pristine northeastern Minnesota waters and land. I urge you to resist the allure of short-term "gain" for what ultimately will be long-term pain that Minnesotans will deeply regret. Kenneth Engelhart. M.D. 4160 Burton Lane Minneapolis. MN 55406

I'm very concerned about the environmental impact sulfide mining will have on the sensitive eco-system which is northern Minnesota. I understand the industrial need for copper and nickel and the significance of job creation but I find it difficult to accept that either of those issues should take precedence over the preservation of our natural environment-particularly water quality. I would like to believe mining technology has advanced to the point of at least a near guarantee of environmental protection but after following the issue closely for months I don't find in all the literature I've read (for and against the project) any suggestion Polymet or any other mining operation can even begin to assure the beautiful lakes region of northern Minnesota won't be significantly, negatively altered by their sulfide mining operations. The world will exert, I'm sure, heavy demand for the metals proposed to be mined but I find it unacceptable that mining should occur at the expense of our air and water quality. Are these metals really worth more than our clean water. I wish to register my opposition to this and other sulfide process projects planned for northern Minnesota until that time when environmental protections can be reasonably assured. Ken Hanson 2703 Kelly Ave Cloquet MN 55720

Ken Illegible

57279

Please accept these comments on the Poly Met Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage (AMD) and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as lynx and moose, exchange of federal land within the Superior National Forest, and cumulative impacts from mining. The proposed mine poses unacceptable risks to our waters and communities, and I support the No Action Alternative. I am concerned that a decision around jobs will outweigh the potential impact on the environment. Concerns around the impact on the environment should be a priority. The proposed mine poses unacceptable risks.

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and also reject the PolyMet open-pit sulfide mine and wastes proposal. This project would present unacceptable risks to Minnesotans well into the future, in terms of health, environmental contamination and financial liability. All of these long-term risks for about 20 years of mining by a Canadian company funded primarily by a Swiss commodities trading firm, and whose chief customer will be China. It is hard to believe that, absent corruption, this proposal continues to be seriously considered. When you also factor in the inevitable and long-term off-setting losses to neighboring recreational business, this proposal becomes absurd on its face. It is not one that will benefit Minnesota or US citizens in the long-term. Rather, us tax-payers will be left holding an empty but foul bag if this mine is permitted. Very truly yours, Ken Kaseforth 10724 Beard Ave S. Bloomington, MN 55431 952-888-3123

20043

I believe from reading the SDEIS that assessment of plausible neurotoxic risks associated with the Polymet project(s) has been inadequate. More specifically, I believe that several independent analyses by respected experts needs to be incorporated into the SDEIS, and that the models presented have relied too much upon industry data and speculation. Methyl-mercury contaminants can migrate into water, soil, and air, and their cumulative effects need to be evaluated in the context of other likely discharges (eg other approved mines, industry discharges, ambient pollution, baseline levels of neurotoxins in Lake Superior watershed, etc) No bond or financial guarantee will begin to cover health related sequelae if neurotoxic damage ensues. No mitigation, monitoring, abatement, restoration, reclamation processes and funding can address permanent neurological damage that residues from sulfide mining are known to occasion. One only needs to review recent "accidents" (discharges) in North Dakota, West Virginia, and North Carolina to realize that substandard regulation, permitting, inspections, and enforcement actions have imperiled the public health. This cannot be allowed to happen in Minnesota based upon a less than comprehensive and independent analysis of the risks entailed. The economic benefits to the region and state are paltry when they are viewed in juxtaposition to public health risks lasting centuries into the future. Needless to add, tourism will decline significantly if any "accidents" do occur given the current pristine nature and allure of this unique wilderness area. Thank you for your attention and consideration of my comment. Dr Ken Klein 12 Meadowlark Ln. North Oaks, MN. 55127

Dear DNR staff, Please consider health risks associated with the proposed Polymet mining operation. I am requesting that you confer with our Mn. Dept of Health and the MPCA in your deliberations, and commission independent research to evaluate human habitat (eg. health) consequences from mining residues. This is just one very troubling report re: heavy mining in South America. http://www.worstpolluted-org/projects_reports/display/89 Sincerely, Kenneth Klein Phd (St Paul, Mn.)

21524

2/22/2014 Dear DNR, I am very concerned that sulfide mining poses unacceptable risks to "human habitat" in the form of long term health risks from cumulative residues and byproducts (Including methylmercury) which can infiltrate the water supply, food chain, air emissions. These have been documented in the scientific literature by credible researchers writing for juried publications. I implore you to commission independent studies to evaluate these risks, to incorporate already known research findings in your deliberations and permitting process, and to very carefully weigh the costs in human terms (as well as financial burden) if health damage ensues from these operations. Reliance upon industry's own studies and assurances has shown time and again to be myopic. Accidents occurring recently in North Dakota, West Virginia, North Carolina, and elsewhere amply demonstrate the perils of sub-optimal regulation and enforcement. Posting of bonds (no matter the amount) might guarantee some degree of comfort to those contemplating monitoring costs, clean up costs, etc, but will not begin to cover the actual medical, legal, economic, and emotional toll if the health of current and future generations (in Minnesota, and in the surrounding area, eg. Lake Superior region) is imperiled or damaged. Please confer with the Minnesota Dept. of Health (Environmental Division) as you move forward Due diligence now may forestall this matter from winding up in the court system with prolonged litigation. Thank you for your attention and service. Sincerely, Dr Ken Klein 12 Meadowlark Ln. St Paul, MN. 55127

Dear DNR Polymet reviewers.. Please consider the full track record of previous heavy mining pollution globally, not just cherry picked data or representations from mining company officials. Cited below is one study of an actual long term operation that led to disastrous results for the environment and public health of the surrounding community. Regulators in Minnesota need to base their decisions upon worst case scenarios, not upon political pressures, or upon incomplete (at best) projections from vested interests which minimize long term risks to our state and future generations. Human habitat (eg health risks) must be foremost in your analysis, relying upon independent comprehensive studies from multiple impartial and knowledgeable experts, comparable to this one in scope and depth.
<http://eprints.ucm.es/20188/1/Mazarron.pdf> We cannot be asleep at the wheel (or turn a blind eye) as recently occurred in North Carolina, with the Duke Energy coal ash "accident" poised to happen from lax regulation. The costs are too great to ignore these disasters. Sincerely, Ken Klein Phd 12 Meadowlark Ln. St Paul, MN. 55127 cc. EPA

My wife and I have gone to most of the meetings and still have lots of questions about water quality and how any body will clean up after the mining is done. From all the information I've seen to date poly-met does not have a firm plan for keeping run off with in limits and they for sure cannot explain what or how to do it in the future. I have studied what effects sulfide ore does when in contact with air and water,and so far no other mining place has fixed this problem either. I have property about 20 miles from Hoyt lakes .I know how much work means to the range but is it worth destroying the area for years. PLEASE send this eis back to the foreign companies involved and make them understand WE want GOOD JOBS BUT NOT TO RUIN OUR STATE AND OR OUR WATER SUPPLY FOR GENERATIONS. this mine site is on top of three water sheds {Hudson bay,Mississippi,and lake superior} PLEASE DON'T DISTROY THEM FOR OUR GRAND KIDS TO TRY TO FIX IN THE FUTURE. THANKS
Ken Swanson

Ken Wainionpaa

Support for Palymet: As a retired USX foreman, I fully support the Poly Met mine undertaking. The project should be passed and given approval to start up. When I worked at Minntac, Mt. Iron, Mn. (USS, USX Pellet plant), we followed all the air, water, and noise rules. Improvements were ongoing. At PolyMet; New, more stringent rules will be followed and if any occurrences threaten the environment, they will be dealt with immediately. This project will bring millions of dollars to the state of Minnesota. Overly strict laws on mining and manufacturing have forced many American producers to out-source to another country. The MPCA is one of the causes of companies out-sourcing their manufacturing to other countries. The USA cannot survive if all of our products are out-sourced. The PolyMet project will follow the most stringent rules. It will not harm the environment. By using modern equipment and testing, the project will be safe. Kenneth Eckstein 19823

Sirs- Thank you for this opportunity to submit comments. I have vacationed and traveled in northeastern Minnesota and enjoyed the BWCA several times. I am concerned about the long-term environmental impacts of mining sulfide-bearing rocks and the effects it will have on the whole area. I have read tmost of the DEIS and my concerns about the adequacy of the DEIS are included below. Please forward the land exchange comments to the Forest Service. · Land Exchange: The DEIS does not adequately address all the biological and land use issues with the land exchange. Additional information on the natural heritage and timber resources of the exchange lands need to be gathered. The public is best served if the public gains much more public land than it gives up. The exchange ratio should be at least 2 to 1 and of high quality parcels. · Storage of Tailings: To prevent the oxidation of sulfide tailings a tailings basin must be designed to secure those tailings forever. Forever is a very long time. No made-made structure can be designed to last forever at this time, so at some point in the future the tailings storage facility will be compromised. At some time in the future the people of Minnesota will have to pay for and clean up the failing tailings storage facility. Large amounts of money put aside today for future remediation will fall short of what is really needed. Millions of dollars today will equate to pennies in the distant future. The DEIS should make very clear that the tailings storage facility will not last forever and at some time in the future the people of Minnesota will either pay huge amounts for a major cleanup or endure sulfide pollution in a large area. Think about the trade off of these few jobs and tax money compared to the value of tourism in this area. Kenneth C. Eckstein 5623 W. Howard Ave Milwaukee, WI 53220

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Kenneth Lapointe 2781 Mozart Ottawa, CA 90210 CA

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. When are we going to learn from the past and stop doing harmful things to the planet. After all it is the only one we have. Sincerely, Mr Kenneth Middendorf 340 238th St Osceola, WI 54020-5947

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Kenneth Neff 115 - 9th Ave SE Waseca, MN 56093

Kenneth Nelson

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: My name is Kenneth William Nelson My address is 3716 Norton Road Duluth, MN 55803 Kenwnelson5@yahoo-com 218-464-7512 I am a retired Electrical Engineer with three years of related experience in the design and construction of taconite plants. Based on the PolyMet SDEIS, I request that you deny the PolyMet permit to mine. My wife and I own 21 acres of property on Cadotte Lake within 25 miles of the proposed PolyMet site. We hunt and fish in the area and want to see our grandchildren to do the same. Compromising the quality of the water in the Saint Louis River and Lake Superior water shed is not responsible management of our environment. We are already limited in the size and type of fish that we can safely consume. Our efforts should be to reduce the amount of pollutants and not add to the liSt Any suggestion that the water treatment from the current taconite plants is acceptable and is an example of responsible mining is simply a sad commentary to our intelligence. Although the example of the costly Silver Bay on land tailings pond was better than direct disposal into Lake Superior, it is far from an environmental friendly solution. Sulfide mining presents its own added water treatment problems with even greater costs and challenges which we must solve before we open the flood gates to not only PolyMet but all the other mining operations waiting on the sidelines. A single limited scope sulfide mining operation similar to some of the taconite pilot plants might be something to consider for the first ten years of operation before allowing for full scale operation. Then if careful monitoring of all problems shows that indeed this mining is feasible and environmentally responsible, full scale operation can be considered. Sincerely: Kenneth W. Nelson Marcia C. Nelson Kenneth Nelson 3716 Norton Road Duluth, MN 55803

As a contribution to assessing public opinion on the Polymet EIS deliberations please consider the following examination of the Star Tribune Minnesota Poll published on Friday February 21 2014 with the headline "Nearly half favor PolyMet copper mine". The Star Tribune is not renowned for its support of mining and the headline infers that more than half did not vote in favor. However the poll recorded only 21% rejecting the application. Thus equally true headline would have been "Only 21% oppose PolyMet copper mine", or "One in five oppose PolyMet copper mine" The 33% "Not sure" is much higher than typical for this type of public opinion poll where numbers for undecided are generally around 10%. Although it is not possible to know how the 33% would have voted consider how it might have looked if only 11% were not sure and the other 22% had voted. If they voted equally pro and con the result would have been 57% pro, 32% con and 11% undecided. However, if they had been split in the same proportions as the 67% that did vote, either most pro or most con, the results would have been either a) 61%, pro, 28% con, 11% undecided or b) 53% pro, 36% con and 11% undecided Considering these realistic possibilities it would appear that the poll indicates that a majority of the public is in favor of enjoying the economic benefits of permitting mining and relying on government regulations, industry responsibility and good policing to minimize potential environmental risks. I urge DNR to approve the North Met SDEIS. Dr Kenneth J Reid Professor Emeritus, University of Minnesota 11068 Hyland Terrace, Eden Prairie, MN 55344, USA Tel: 952-943-8909 Email: HYPERLINK "mailto:reidx002@umn.edu"reidx002@umn.edu

The Boundary Waters Canoe Area Wilderness is a national treasure, just like the Grand Canyon. The BWCAW is the most pristine wilderness area on the planet. The residue left behind by copper mining seeps into the water, kills plant life, fish and wildlife. In a very short period of time, copper mining will ruin 500 Years Of Echo System. There are several mining companies ready to start mining in this area. As soon as one gets permission to begin mining, the other mining companies will be right behind Poly Met Mining Inc. All of these mining companies are not even US COMPANIES. They are for profit organizations and once they are given the green light, they will destroy this Pristine Wilderness Area. I implore you to take a stand, against allowing the mining companies, anywhere near, any waterway, tributary, stream connected to or running into a Boundary Water Area Lake Or Waterway. Several decades ago, one man stood up against a rich and powerful man, who wanted to dam up this area, to create hydro electric power, for the sole purpose of selling it and making even more money. Something's are worth more than money. The peaceful, pristine, soulful wilderness area, called the BWCA is one of them.. On behalf of my children, their children and your great, great, great grandchildren; PLEASE, SAY NO TO THE MINING COMPANIES SAY NO TO BIG MONEY . Carry on the legacy of the man who originally saved the BWCA. You are in a position to make a decision regarding this matter. On behalf of all of us and future generations, make it a good one. Thank you. P.S. Please forward to Lisa Fay, EIS Project Manager , too. Kenneth B. Rosemark, Rochester, MN. Sent from my iPad

DNR I urge you not to accept the SEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model In conclusion it is my opinion that the few hundred jobs and monetary gain for a corporation is not worth the perpetual damage and

Dec 21, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The proposed PolyMet mine would likely bring temporary short-time financial gain to the area, but the area also benefits greatly from tourist dollars and supports many outfitting businesses; these smaller local businesses, which otherwise might last decades, could well be jeopardized, and when the mine pulls out when it's work is done, would leave both its employees and the local environment (including economic and natural) in an overall weakened condition. Thinking critically, this project does not make long-term sense either economically or environmentally. Oppose it. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Kent Merkey 3307 14th Ave S Minneapolis, MN 55407-7200 (952) 454-3253

Kent Newman 30965

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please consider these comments, about the PolyMet Mining Corporation., NorthMet mining project, Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota. In its present form, it is a threat to wetlands, rivers, and lakes, across the Arrowhead Region of Minnesota, including Lake Superior, and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has taken place. I am very concerned about this project's potential impacts on this region's natural resources and public health. This includes: risks to water quality, and loss of wetlands, and harm to wildlife such as the threatened lynx and declining moose populations. Also there is the concern of the cumulative impacts, from sulfide ore mining. The Federal land exchange, of protected Superior National Forest land to ease the creation of PolyMet's destructive and polluting open pit sulfide mine, is not in the public interest. Sincerely, Kent Newman 2950 Washtenaw Rd Apt 2b Ypsilanti, MI 48197-1514 (734) 434-8643

39914

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, I am very concerned with protecting our clean water. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I have worked on efforts to stop, a sulfide mine in the Upper Peninsula of Michigan. I believe that the SDEIS is insufficient. It should not be approved because it lacks vital information about long-term water treatment and how the treatment will be paid for. All sulfide mines so far, have leaked some acid, into their waterways. Decision makers should keep that in mind. PolyMet would like to mine within the high quality wetland habitat that is owned by the federal government, as a part of the Superior National Forest. It is the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of bird habitat, sulfuric acid and toxic metals such as mercury, copper and nickel that are not captured for treatment will have a negative effect, on the aquatic organisms and habitats downstream. Birds that eat fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will probably lose habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Sulfide ore mining has not been made safe so far, anywhere it has been done. Twenty years of mining, will likely assure, hundreds of years of water pollution to both sensitive birds and habitat. Until sulfide mining is proven safe, it should not be done anywhere. With much better mining technique, this site, is still not worth the risk. Sincerely, Mr Kent Newman 2950 Washtenaw Rd Apt 2b Ypsilanti, MI 48197-1514 (734) 434-8643

Kent Scheer 7706

Dear Ms Fay, Dear Federal and State Agency Leaders: We have obviously entered a time in history when our population and its extraordinary materialism is visibly damaging the environment from which we draw our sustenance. You have all heard the full litany of environmental damage ranging from the dead zone to exhaustion of entire ocean fisheries. This is not the time for intelligent people to permit another massive extraction process risking lasting environmental degradation. Kent Scheer 850 Scheer Drive NE Wadena, MN 56482 218 631 3084

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kent Scheer 850 Scheer Drive NE Wadena, MN 56482

Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kent Scheer 850 Scheer Drive NE Wadena, MN 56482

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Kent Scheer 850 Scheer Drive NE Wadena, MN 56482 218 631 3084

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. It's hard to believe that allowing copper sulfide mining is even being considered, given the following: the public hearing period 90 days; but the clean-up period may be up to 500 years only 300+ mining jobs will be created; but how many more jobs rely on tourism, based on the natural beauty of the place, will be lost it's never been done before without environmental damage; but this is different, a special case So what have you been smoking lately The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Kent Simon 4733 Isabel Ave Minneapolis, MN 55406-2946

MNDNR: As an architect in professional practice for 34 years, I can say one thing with certainty – stuff leaks and systems fail - I deal with it on a regular basis. So it's a given that any well-designed open pit mining system comprising liners, computer controlled pumps, and block-off walls, will experience failures and will eventually need replacement. Regardless of whether the design is done according to best accepted practices, it cannot accurately account for some factors and will overlook others. It is simply hubris to think otherwise; no army of the best designers and engineers is capable of doing better today. In the design of the Polymet system, one factor that absolutely cannot be accurately accounted for is climate change and how it will affect precipitation and water flow levels. Despite the application of the best modeling tools science has to offer, there is no consensus on the rate of climate change over the next fifty years, let alone five hundred. Simply stated, water flows cannot be predicted with reliable accuracy. The only thing that is certain is that we are not perfect and the best laid schemes do go astray. And every system has an expected useful life, so well-considered contingency plans and replacement plans are critical. The lack of such plans in your report is glaring in its omission, all the more so because a leaking liner and drainage system burdened by a 200 feet mound of mining rubble is, for all intents and purposes, inaccessible. This would of less great concern if not for the fact that there will be a serious detrimental environmental impact when failure occurs. And we're not just talking about one mine here; this decision will be precedent-setting and if the Polymet venture is approved, the gate will be open. How many more mines will we be saddled with maintaining for 500 years. In the near future, better methods of sulfide mining will be developed; and technologies will develop that do not require the extensive use of copper for the manufacture of wind turbines, computers, batteries - you name it. It is prudent to wait until such time rather than to proceed, especially with a new mining company with no track record for anything except marketing. The time will come when the right proposal is made and we will recognize it as such. It will be a proposal that offers considerable economic benefits for all Minnesotans and preserves the environment, Minnesota's most precious natural resource. This is not that this proposal and this is not the time. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kenta Yamamoto Minneapolis, Minnesota

Kenzie

Dear Ms.Lisa Fay, EIS Project Manager,I think that the PolyMet Mining has a very good plan in place. I think that it is well thought out, I also think that they have planned every aspect of the project out very thoroughly. I think that this copper-sulfate mining process will definitely benefit Minnesota in some ways.The advantages to this would be that there would be less unemployment, and better lives for many Minnesotans. But there would also be some disadvantages; there is always a risk of population considering how close the mining project would be tho many rivers, lakes, and wildlife.This will affect cultural resources. A segment of the Mesabe Widjiu known as a sacred place to the Ojibwe people, occurs within the project area so it would be affected. A segment of the Beaver Bay to Lake Vermilion Trail, It also exists within the project area so it would be affected. The Project is also located on land that was awarded to the U.S by the Bands under the 1854 Treaty. The Bands reserved the right to hunt, fish, and gather on these lands. Resources like fish, plants, and animals might be affected by the project.The land exchange would involve the transfer of 6,650.2 acres of federal lands from public to private ownership, and up to 6,722.5 acres of land from private to public ownership, depending upon the results of the environmental analysis and federal real estate appraisals. The federal land proposed for exchange is one 6,650 acre tract. Nonfederal land considered for exchange includes five tracts throughout the SNF ranging in size from 32 acres to 4,651 acres. I think that this land exchange is ok. I think that the land that was public that would become private is unfair. I don't know what the public uses the land for , but for example: if I walked my dogs through this public land every day and then all of a sudden they built and mining project on it I wouldn't be happy. This project will not affect me. I think that this is for a good cause and if it needs to happen, it should. i just think that the land exchange should be more fair to the public.Thank you for taking the time to read all of our letters, we really appreciate it!-Kenzie

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The science as I believe proves there is no safe or environmental safe and sound way to for this mine like mining in Minnesota has been boom and bust no lasting good impact very few jobs no long term good for our water both ground and lakes and streams our lands or the creatures we share them with I vote yes for the life the future of all creatures and No vote for this mine.. Sincerely, Mr kerry martineau 13 Cypress Dr Duluth, MN 55810-1901 (218) 349-6869

Really feel this will have a devastating effect on our beautiful lakes & natural environment. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Mar 8, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Kevin Brungraber 1046 Fountain Dr Sun Prairie, WI 53590-3038 (715) 207-9736

I am sending this email in opposition of Polymets proposal for ore mining in the BWCA in northern Minnesota. Myself and a group of high school friends have been enjoying the camping and tranquility of this area for the last 30 years. There is no other place like it. This area is what Minnesota is all about. To have this area ruined by sulfuric waste polluting our waterways and land is unthinkable. Do we really want to have 500 years of cleanup and pollution destroying the last pristine place in Minnesota. I say NO I've read over and over that 100% of sulfur mining projects have polluted the surrounding environments. Granted it may create jobs in a struggling economy, but the ongoing aftermath of such a project doesn't add up. This proposal needs to stop right here and right now. This area needs to be preserved for generations to come. People from all over the country come to Minnesota to enjoy this serene area, so it's not just Minnesota that this mining proposal will effect. A wasteland is not a pretty site. Take the trucks, cranes and front end loaders and keep them in the sandbox where they belong Kevin Olsen This e-mail, including attachments, may include confidential and/or proprietary information, and may be used only by the person or entity to which it is addressed. Polymet must be able to open the mine. This is a huge opportunity for Minnesota and studies have been completed by Polymet as to not to harm the water. Mines have been in northern Minnesota for a hundred years without this issue. Please give them the opportunity to help Minnesota. Thanks.

Kevin Jones

57345

So my statement about the PolyMet project. Obviously, I think it is good for the State of Minnesota. I think it is important for Minnesota, as well as the United States, to show environmental stewardship by bringing leading edge technologies to the mining process. In addition to the many good things that I see the mine creating for not just Minnesota, but the local areas as well, I think it is -- I think it is an important opportunity for the U.S. to be able to showcase that we are really taking a leading, important role in environmental stewardship worldwide. Keeping it positive. You know, in addition, obviously, PolyMet will provide jobs to the area. But kind of going back, I think more important than the jobs and the revenue, and the taxes, and the money side of things, I think it is a great opportunity to really show how things can be done right. And that's it. Okay? Thanks.

The definition of FRAUD: 1- Deceit, trickery, sharp practice, or breach of confidence, perpetrated for profit or to gain some unfair or dishonest advantage 2- A particular instance of such deceit or trickery: mail fraud, election fraud 3- Any deception, trickery or humbug Basically, that's what the PolyMet proposal has come down to fraud. By knowingly allowing an environmental impact statement to use information on water flow that is incorrect and inaccurate, and if the DNR allows that information to be used moving forward, FRAUD is being committed. They are deceiving us about the true potential impact of pollution in attempt to profit by being allowed to mine minerals in Northern Minnesota. Any officials that move forward KNOWING that the information in the impact statement should be tried in a court of law as well. We should not mortgage the next 5 generations futures for the potential of a few hundred people to have jobs for 20 years. What is PolyMet going to do. They are going to pull the minerals out, make a ton of money and then leAve The state really isn't going to benefit, and the long-term costs of trying to prevent our precious waters from being polluted cannot be quantified by experts. Our waters will become polluted, and then not only will the state be burdened with the costs of trying to clean up the water, but that area will lose its beauty and revenue generator - tourism. Time and again we have seen sites become polluted, companies pull out or file bankruptcy and leave the people holding the bag. This company has no history in our state, no ties to us. They only want what is in the ground to make money and then leave the mess for us to deal with. We need to say no to this proposal. Their impact statement is knowingly false and inaccurate regarding water flow information that was used to determine potentials for pollution. If they are incorrect in a basic measurement like water flow, what more complex items in their report are also inaccurate. FRAUD is illegal for a reason. The state should not perpetuate FRAUD nor allow it to happen. Kevin Jorgenson 1421 Wildflower Ln NE Owatonna MN 55060

From: farmecologist@hotmail-com [farmecologist@hotmail-com] Sent: Monday, March 10, 2014 5:04 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Again, I strongly support the rejection of this proposal. Thank you. Sincerely, Kevin Kathmann 6339 Pebble Ln SW Rochester, MN 55902-2521

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please don't let PolyMet get away with submitting an analysis that is inadequate. The PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years. Lake Superior and the north shore is a beautiful and unique asset to our state. Don't let the North Shore environment be destroyed by mining that is almost guaranteed to pollute the ground water. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kevin Lee 2149 Temple Court Saint Paul, MN 55104

Kevin Milliken

40350

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Kevin Milliken 6385 138th Place SE Bellevue, WA 98006 US

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: What will your great, great grandchildren say when they hear how nothing was done to stop the destruction of Northern Minnesota. I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Kevin Myers 33 Riverside Dr Duluth, MN 55808 715 520 3085

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Kevin Novak 321 Grace St N Ortonville, MN 56278-1212

My input, for what it may be worth It is appalling that PolyMet would wantonly cause egregious harm to critical environmental systems and habitat for the sake of short-term profits. The toxins and poisons they are intending to spew into the environment with callous disregard for life will still be killing long after they are gone from there. Minnesota will be a better state if it takes action to defend these pristine habitats for us and our posterity to enjoy into the future. PolyMet must not be allowed to destroy for their profit what belongs to all Minnesotans. Please protect our legacy. Thank You Kevin Oak 15603 W. Munson Ln Detroit Lakes, MN 56501

Kevin OHalloran 6038

To Whom it May Concern: I am writing to strongly encourage cessation of this project. There is no need to risk any environmental degradation of this part of the state. Please consider halting this project and any others.

Kevin ORourke 43072

Regarding the environmental impact statement in connection to the proposed sulfide mine and tailing to be stored at the south east corner of 100 mile swamp. I saw the map that is currently being used by SDEIS, and when superimposed on an accurate map of the area, it is clear that a crime is taking place in that there is a coverup of the actual environmental degradation that will take place. The SDEIS map shows a part of the marsh area that is much smaller than the actual area, and also shows a flowage under the bridge to the swamp and a flowage out of the swamp. There is no real flowage out of the swamp, as the swamp is continuous into the BWCA. That is the cover up. It appears that PolyMet has a cartographer in their pocket. It is important to remember that PolyMet comes from "old European money", that is from a community that has long hired private mercenaries to go into third world nations, wage war, and take materials. Their ethical standards are a violation of the values of Minnesotans. We could resolve the issue, have the mines, the jobs, and protect the waters if Minnesotans and PolyMet would agree to share the cost of an advanced water purification system, so that no sulfide runoff would occur. It is important to note that once water is acidified by even a small amount, it will no longer sustain trout fisheries. With sulfide runoff going into hundred mile swamp, the chemicals will eventually reach the boundary waters, and the trout habitat destroyed all the way. Signed Kevin O'Rourke 2743-16th Ave South

Minneapolis, Minnesota 55407 From: mister.ericm@yahoo-com To: openprogressivemichael@gmail-com; rock@augzburg-edu; cedarislandgirl@gmail-com; thomaskorourke@msn-com Subject: RE: Submit comments about PolyMet and the BWCA before Thursday, March 13 at 4:30 Date: Wed, 12 Mar 2014 20:42:16 -0500

Hi, I just wanted to remind you that comments about PolyMet will only be accepted until 4:30 pm tomorrow, March 13- If you have a few spare moments and are willing to comment, comments can be submitted by email to HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us . Relevant comments speak to the environmental impact statement and require a full name and street address. One important thing to comment on is the maps in the environmental impact statement (SDEIS) are incorrect in a way that makes it appear the mine and the BWCA are isolated geographically when they're not. Mine runoff that contains acids and metals can percolate will drain to a swamp that is itself drained by two streams, one of which leads to the BWCA. What the incorrect maps do is simply cut off the portion of the swamp that drains to the BWCA.

What I and other people are requesting is for the MN DNR correct the mapping discrepancy, do hydraulic testing to determine what the split of waste to the two watersheds are, determine to what extent the BWCA is potentially affected, and to provide some protection for the BWCA by testing water flowing there. I'm attaching some sample comments as an example. I hope you will make some comments if you haven't already, Thanks, Eric From: Eric Morrison [mailto:mister.ericm@yahoo-com] Sent: Wednesday, March 05, 2014 11:47 PM To: openprogressivemichael@gmail-com; rock@augzburg-edu; cedarislandgirl@gmail-com'; Kevin O'Rourke (thomaskorourke@msn-com) Subject: Submit comments about PolyMet and the BWCA before Thursday, March 13 at 4:30 Hi, Please make comments about the PolyMet mine before the deadline, and make sure you tell everyone you know. Ms Fay: I have a brief comment regarding the Polymet project and others like it such as Twin Metals. This does not directly pertain to issues of water quality, et al, but rather to our behavior as a civilized, responsible society. I know that the EIS statement is not concerned with what I have to say, but I am trying to get my thoughts into the record where possible. I very much support our efforts to prevent pollution of all types and to maintain the purity of our water and other natural resources. However, when we say that we don't want a project like Polymet to happen in our back yard, we are, in effect, saying that we want it to happen elsewhere where it won't be our concern. To me, elsewhere means many places in the world where people and their environment have little or no protections from mining and industrial practices that would never be permitted in our country. I would propose to say that when we as Americans are ready to give up our I-Phones, all of our personal computing devices, our HD televisions, our GPS, our high-tech vehicles, and all of the myriad tools, medical devices and appliances that depend on a reliable supply of copper and other precious metals, only then ought we to consider not permitting ventures like Polymet to move forward and at least give them the chance to show what they can do to provide these resources while protecting the environment. I believe we have a moral responsibility to provide our own resources when we know that there will be unmitigated human suffering in other countries if we demand that they provide the resources we crave and depend on. It is no coincidence that companies like Apple are in China producing many of their personal electronic devices - a country that has horrifying levels of all types of industrial pollution and the enormously elevated levels of awful diseases that accompany that. With kind regards, Kevin Piron Hibbing, MN Kevin Kevin Piron Creative Director/Architect Architectural Resources, Inc. <mailto:kevin.piron@arimn-com> HYPERLINK "blocked::http://www.arimn-com/"www.arimn-com 704 East Howard Street Hibbing, MN 55746 tel: 218-263-6868 fax: 218-722-6803 *****Confidentiality Notice***** The information contained in this message (including any attachments) may be privileged and confidential and protected from disclosure. Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kevin Shannon Minneapolis, Minnesota

Kevin Swanberg

40822

As a citizen and a taxpayer of Minnesota, I strongly oppose the proposed Polymet mine. I feel it is dangerous for our environment. Here in Minnesota, land of sky blue waters, home to (more than) 10,000 lakes, we must treasure and preserve our wetlands, our forests and our waters. They are our greatest natural resource. Not only are they beautiful, they provide jobs in the tourism industry, give us food and keep our state clean. The temporary jobs that the mine will create will destroy many permanent jobs the tourism industry and farming industry give our state. What good is a few hundred jobs that will only last 20 years. Are they worth sacrificing our state's natural resources for. I don't believe so. Please consider this when making a decision on the mine. Don't put the fate of our state in the hands of people who don't even understand what Minnesota stands for. Thank you, Kevin Swanberg 632 E 3rd St Apt G Duluth, MN 55805 - Kevin Swanberg HYPERLINK "mailto:swanb034@d.umn-edu"swanb034@d.umn-edu (218) 260-5091

Mar 11, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Mr kevin tsui western ave seattle, WA 98121-2153

Kevin Viken

41876

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Kevin Viken 1964 Prior Ave N Saint Paul, MN 55113-5405

Kevin Viken

43110

To Whom it may concern about the NorthMet SDEIS, I am writing in regard to the NorthMet Supplemental Draft Environmental Impact Statement. I am concerned with the draft as it stands for the following reasons but I also feel there are opportunities to be had with more changes: 1- The water in the tailings ponds will be highly toxic without regard to the eventual pH of the water. Because the tailings are created from pulverized rock which has had its surface area increased infinitely and exposed to air/water, even slow rates of leaching will result in toxic levels of heavy metals/sulfides that will harm native flora, fauna, microbiota that are all critical for the proper functioning of the local ecosystem. Most importantly, the magnitude of time the toxic water within the tailings ponds has to be determined. At some point it will escape because nothing can be contained in perpetuity. 2- Financial assurance needs to be addressed and well laid out with adequate resources and adequate protections. This cannot be done until item #1, above, has been determined. The reason this is so important is the water WILL leach out without question at some point. Geological changes are slow but unstoppable and severe weather events must be expected and planned for during the term of water sequestration. ie if water is to be sequestered for 500 years plans must expect a 500 year weather event to happen or a 50% chance of a 1,000 year weather event. Cost of such a catastrophic weather event needs to be adequately determined. To have adequate funds 2 things are necessary: a. Ensure adequate funds given different scenarios for the long term economic possibilities. b. Adequate protections of the money that is set aside is critical and requires that how it is handled must be enshrined in the constitution. If it is not enshrined in the constitution one only needs to look as far as the state tobacco money to see what will happen eventually 3- I do not see anywhere within the SDEIS where they have taken a survey of the microbiota currently present in the ecosystem and how those organisms will respond to the potential levels of leachate from the tailings ponds. This must be assessed because it has become known recently the important role microbiota play in an ecosystem. 4- I would like the setup of a recycling technology research and production facility to be set up on the iron range so we can learn to effectively mine our waste of these materials. This could stimulate the economy both short and long-term until a way to handle the waste from mining can be found to be safe for the very long term. In reality as it sits currently it would be safer to dispose of radioactive waste on the iron range because that eventually becomes inert ie waste from our nuclear power plants would be dangerous for 10's of thousands of years or less than a 100 years if it was reprocessed for the next level of nuclear power. Waste from the NorthMet project that is leached in the water will be forever toxic because it doesn't have the advantage of radioactive decay that nuclear waste has. 5- Lastly I would like it to be considered that the mine be required to be underground below the water table and the waste be used to backfill the mined tunnels. In my view we currently have the technology for this to be done safely for the very long-term. Sincerely, Kevin Viken 1964 Prior Ave Roseville, MN 55113 Phone: 612 419-6290

Khang Le

54225

Dear Ms. Lisa Fay I'm Khang Le, an junior at Humboldt High School on E Baker Street. So Mr. Morrison is one of my helping teacher in my chemistry class. One day, he presented with our class about a topic that make me felt ridiculous and kind of unfair about it. It's about the Polymet's mining and their mining construction at boundary water. I don't know is it illegal if you changing the map and information that provide for the contruction. The map that the polymet company providing is wrong, absolutely wrong, they had been rewriting the map of the swap where the mine, are going to be place on. And also the mining company dumping their rock into a swpp that having sulfite init and when sulfite meet with water they'll produce sulfuride acid that can make a huge damage the impact of the environmental that can change the ecosystem of living species inthere. Also the company is untruthworthy, the CEO of the company is one of the top ten wanted in FBI and that me have a bad feeling about this. So I recommend you to tell the company stop or rewrite the map and provide that there will not be anything happen to the boundary water. Khang Le 266 Fuller Ave, Apt #12 St. Paul, MN 55103

Kiersten Wilson

54359

Kiersten Wilson Earth Science 2/10/2014 Dear Ms. Lisa Fay, EIS Project Manager, I strongly disagree with this mining project. There are definitely a lot of pros, but the cons absolutely outweigh them. I'd like to start by stating that the amount of endangered wildlife is horrendous. If there is any chance, which there is, of destroying or affecting this wildlife, the project should come to an immediate halt. We cannot afford to risk losing any wildlife. I do realize the effort to plant the endangered plants on a different piece of land, but what about the endangered mammals, reptiles and birds? What will they do during this project? Even if it doesn't directly affect the animals, the sound, water pollution and deposition of dust will surely affect their lives. I also realize that you plan to plant more wildlife and trees at the site after the mining is over, but what about those twenty years when the animals may be deprived of their homes? What happens when they drink polluted water? As I have said before, we cannot risk the lives of these innocent animals over one mining site in Minnesota. As you can see, it would be a great loss not to have this wonderful mining site in Minnesota, but the lives of the wildlife should come first. The lives of these creatures are at great risk, and it would be silly not to disengage this mining project. Sincerely,

Kim Christensen

57953

If you wreck the water, the copper won't matter. I am concerned about what by-products will be left after this mining is done. I do not trust the plans to clean up the mess. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Kim Hall

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Kim Schroeder

My name is Kim Schroeder. And my concern is that this is a for-profit company. What if they go out of business? What is our, I guess, guaranty that this mess will be cleaned up if they don't make it to the 40-year mark or the 500-year mark? What is the plan to keep this out of the taxpayers' hands? I'm very concerned about that. Thanks.

Kim Wolff

41267

As a resident of the North Shore I strongly oppose the proposed copper nickel mine in northeastern Minnesota. The eventual loss of jobs from the environmental desecration of our lakes that tourists fish, loss of wildlife that bring people to our area to view, will outweigh the temporary increase in jobs to the area. The environmental impact statement is inaccurate as to poor test sites relating to the rivers that feed our lakes. Projected rises in Mercury levels are not specified. Please ask the questions and demand answers for the what ifs for worse case environmental disasters. Thank you for your efforts. Please Do Not Allow This Mining Project. Hello, I am a citizen of NE Minnesota, a parent, a husband, and one who loves the outdoors. I have also travelled and worked overseas, and am aware of the global issues impacting the use and procurement of metals. I am also a physician. I am sure that you have been bombarded with comments on the proposed mine, both pro and con. My email today is a blessedly brief one. My initial reaction to the mine was fierce opposition. Several months ago, after stepping back a bit from the local impacts, and viewing the mine through a global lens, I supported it. I am now however firmly opposed to the mine for many reasons. The environmental impacts are long lasting. The economic plans to ensure ongoing water quality and mine maintenance after the mine has shut down, are, in my mind, flawed. The health impacts are unclear. This email will be forwarded along to Rick Nolan and Al Franken, our representatives in Washington DC. I will also contact Mark Dayton to let him know of my opposition to this mine. Thank you for your time and careful consideration in this matter. Sincerely, John Wood

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Kimberle Ganzer-Wiley 3839 Vincent Avenue North Minneapolis, MN 55412

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kimberley Wagner Finland, Minnesota

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Kimberlie Calkins 21505 Maple Ave Apt 303 Rogers, MN 55374-9673 (763) 428-9141

My family values the environment of northern Minnesota. The plan PolyMet has put forward to deal with contaminated waste water is NOT adequate. I don't want to have to explain to my children that it was "good for the economy" when they see our most unique and valuable ecosystem harmed for generations. Please deny PolyMet a mining permit and ask them to develop a better plan for dealing with waste water. Kimberly Zachman Minneapolis, MN

Kimberly Nieman

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Kimberly Nieman Orchid Circle Plymouth, MN 55446

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Miss Kimberly Ped PO Box 4595 Saint Paul, MN 55101-4595 (651) 366-7451

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I believe a "No Action" process should take place at this time. Environmental consequences of air, water, and ground pollution will take place. Lead and mercury will be leached into the land, air and water. I believe this Polymet Mine can take place at a later time when environmental processes and abatement procedures are improved. I don't believe Polymet can make a case that there is a shortage of Copper or Nickel that necessitates any mining to be conducted now or near term. Another thing is there is not enough transparency on the part of the mines in Northern Minnesota including Polymet. I never see anything published in local newspapers or voiced on the radio as to what the mines do to meet NAAQS and Clean Water Act requirements. Therefore no new Polymet Mine should be allowed to go forth at this time. V/r Kirby Stross 2303 3rd Ave W. Hibbing, MN 55746

Kirk D. Haldorson

21976

TO: MN Dept. of Natural Resources FROM: Kirk D. Haldorson 202 W. Superior St Suite 510 Duluth MN 55802 Dear MN DNR, I would like to voice my support of the PolyMet Mining Project in Northern Minnesota. I grew up in Silver Bay Minnesota, my father worked for Reserve Mining/Northshore Mining for 43 years. He was able to raise and provide for six children all because of the benefits of having a good paying mining job with benefits. Not one of his six children have ever worked in the mining business or ever have ever worked in a mine. All six of us children though have went on to college, get married, all have children and every one of us, every grandchild, every spouse all live in Minnesota, pay taxes to the state of MN and now, my father has great grandchildren starting to work in the state of MN and pay taxes. Again, all from one mining job. I personally have owned my own company for 21 years and have employed many throughout the years. My oldest brother has created a company in MPLS MN with over 100 employees (mostly engineers) for over 30 years building grain elevators for Cargill throughout the world. When I hear that PolyMet will bring 300 jobs to our wonderful state I step back and think, it's just the tip of an iceberg. If my father would have had to move to another state for a mining job, I can guarantee you none of us six children would probably be living in this state, paying taxes in this state, raising children in this state or creating jobs in this state. All from one mining job. I grew up planting trees for the US Forestry to earn money as a child, fished often in the Boundary Waters, currently live on a lake within 60 miles of the proposed mine, and support the environment as much anyone. I would be the first to say shut the project down if the technology doesn't work, such as what happened to Reserve Mining years ago, but we must give PolyMet and the technology to prove themselves as this project is the utmost important to our state and to our beautiful country. It is time to move this project forwaRd Thank you for taking this into consideration. Sincerely, Kirk D. Haldorson <http://mail.aol-com/IM/.sn=kirkdhandlocale=en-usandpd=0> Kirk D. Haldorson

Kirk Haldorson

18369

Hi. My name is Kirk Haldorson. I'm from Duluth, Minnesota. I'm a local business owner. I truly, truly thank you folks for being here, for taking the time to do this. I grew up in a mining family. I grew up in the Boundary Waters, enjoying the Boundary Waters every week probably in the summer. I have planted more trees in the state of Minnesota than I think probably anybody in room in my lifetime. I totally, totally enjoy the environment. But saying that, I grew up in a mining family. My dad put 43 years in the mine. Raised six kids from that one mining job. All six kids of us stayed in this state. I own my own company. I created jobs. My brother created a company in Minneapolis with 100 engineers that builds grain elevators for cargo all over the world. If we wouldn't have had that one mining job, I guarantee you none of us six kids would still be in this state if we had to move. And they did shut down reserve mining when I was growing up, and my dad had to wait for the technology to catch up so they could continue to work in this state. I believe the state can do that. And I don't understand why -- I love the environment like everybody. If it doesn't work, shut it down. But give them a chance. We wouldn't be here today, I guarantee you, without that mining. All six of us work in this state. We're all married. All our spouses work in this state. Every one of our kids stayed in this state. That is lot of revenue from one mining job. I don't want to ruin our environment. I would be the first one to say "shut it down." Honestly. I would never -- and they will shut it down if they don't have the technology to do it. We went through it with reserve mining. So they will do that. But we have to give the time in the sea of the technology. I don't want to be dependent on China or another world. Everybody that took us down here today used copper. Everybody that has a phone has copper. Where are we going to get this from? Our country -- our state and our country needs to be independent. So give them a chance. I so much appreciate you guys doing what you do. And I understand the other side. I love the Boundary Waters as much as anybody. I planted probably 2 million trees in Northern Minnesota that some of you are harvesting today. I walk through the forest, I see it. I would never ever support a company or a project if I truly thought it was going to hurt our environment. I've met with the management of PolyMet many times. I've never worked in a mine. The only person that worked in a mine was my father. None of six kids did. We all stayed here. That's a lot of jobs. That's a lot of revenue. When I see grain elevators going up around the world and 100 engineers working in this state because of one mining job, that's really important. And we have to give them a chance. Truly thank you guys for doing this. I appreciate it.

Kirstin van den Berg 47081

Dear Department of Natural Resources, I live in Grand Marais, Minnesota on the north shore of Lake Superior. Having lived and worked here in Cook County for nearly 20 years I appreciate the opportunity to live where clean water is accessible for recreation purposes and for drinking. My biggest concern with a copper nickel mine is the potential for contamination of our natural water systems. I understand that a potential water contamination analysis was done, but that it did not reflect the appropriate depths of drilling/mining and its effects on the surrounding water tables. Water tables are infinitely connected. We see that especially here in Cook County, and I would expect similar situations exist in the Babbitt/Hoyt Lakes area. A well that is drilled in one location can have an effect on another neighbor's well several miles away. I am worried that if a contamination situation should occur, that it could be dangerous. I do not believe that Polymet could control the contamination even if they had the financial resources to do it. Our water systems are too interconnected. From reading the fact sheets, they have not demonstrated to my satisfaction that their mining processes are safe and that the risk of contamination is non-existent or even minimal. More and more of our population (especially young people) are getting sick with cancers and other body systems disorders. Everything that we put into our air, soil and water contributes to our well-being. A copper-nickel mine that has so many risk factors is not an industry that will contribute to a healthy living environment in our state. Copper-nickel mining may seem like a good short-term solution for local jobs, but is not a good long-term solution for a state where we pride ourselves on our clean air and clean water. We are the "Land of 10,000 Lakes" and to put any of them at the risk of contamination would be a travesty. Thank you for considering my comments. Kirstin van den Berg 921 West 1st Street Grand Marais, MN 55612

The water modeling needs to be reworked. This WILL compromise our health and State. No to polynet

Kiyrie Abernethy 44367

As a young person, I feel that it would be a hasty and poor decision to go forward with the PolyMet Mining project. Though mining is an important economic activity, the proposed mine's economic boons would be short-lived compared to the environmental degradation caused. The project is estimated to create 50-100 jobs, but these jobs would be cyclical, causing an initial boom and then a bust for the workers. The environmental impacts could last 500 years longer than the jobs. Toxic chemicals used to extract copper, nickel, and precious metals can pollute waterways. Mine tailings will have to be treated for generations. Ph sensitive plants such as wild rice will suffer. Finally, this project would threaten the Boundary Waters Wilderness Area, the crown jewel of our beautiful state. We should consider the long term consequences of the PolyMet project before we do something we'll regret as a state. Kiyrie A. Sent from my iPhone

I am a member of a board which has as its primary focus protecting the quality of lakes in Northeast MN. We have been studying the proposals and feel that the money that is being set aside for clean-up is not sufficient. The mine will fail. The taxpayers will get the bill. The only ones to make money on this project will be the venture capitalists and company owners.

How can the DNR allow this copper mining in MN.. In 2008, Minnesota's voters passed the Clean Water, Land and Legacy Amendment (Legacy Amendment) to the Minnesota Constitution to: protect drinking water sources; to protect, enhance, and restore wetlands, prairies, forests, and fish, game, and wildlife habitat; to preserve arts and cultural heritage; to support parks and trails; and to protect, enhance, and restore lakes, rivers, streams, and groundwater. The fact that you are even continuing with this copper mining permit issues flies in the face of the above amendment. This copper is a want more than a need. We need to find more ways to recycle, reuse and even get into landfills to retrieve copper.. We need to be the state that refused to allow the destruction of our wetlands, forests and lakes for the short term gain of a few jobs and large financial gains for foreign corporations. The DNR appears to have conflict within itself re: this issue. There is no guarantee, and no proof of even one of these copper mining sites has ever left the mining site able to regrow vegetation, much less enhance, restore or improve our environment. For cripes sake read this: Summary of Damage Sites from the Disposal of Mining Wastes, prepared for the US Environmental Protection Agency, January 1984- The DNR appears to have conflict within itself, you are supposed to protect and manager our resources, not sell them out to the highest bidder, and to heck with the devastation it leaves in its wake.

To: Ms Lisa Fay SDEIS Manager MN DNR Dear Ms Fay: I see numerous problems with the NorthMet Polymet SDEIS, and request that it be rejected. The reasons include: 1) The SDEIS does not adequately take into account bedrock fault lines, which could channel unknown quantities of compromised water in unclear directions. Unforseen negative consequences may result. 2) The capture of polluted water is not necessarily as effective as the SDEIS portrays. The SDEIS should be re-done with a more realistic number. 3) With polluted water needing treatment far, far into the future, a proper financial assurance for funding for this activity must be part of the plan. This must include inflation calculations with a generous margin for error. The taxpayers of the year 2500 (yes, there will still be taxpayers.) do NOT want to carry the burden of miscalculations from 2014- 4) I believe that baseline water flowage data used as a basis for the SDEIS is grossly underestimated. The SDEIS must be re-done with flow rates closer to real-life and worse-case numbers. 5) The human cost to innocents is not adequately reflected in the SDEIS. Unforseen consequences can harm future Minnesotans for centuries into the future. An escrow account large enough to attempt to compensate harmed persons, individually or collectively, whether for medical consequences, loss of tourist trade, or other unforseen harms, needs to be included. It might be needed for 500 years, and should include monies to help defray legal costs so harmed individuals can obtain justice. I believe that the SDEIS is hugely flawed, and must be re-done. I request that you reject it. Thank you. Sincerely, Scott Lagaard MD 600 313th Ln NE Cambridge, MN 55008

Hi, I am a local Minnesotan living in the Twin Cities. I have heard about PolyMet through the local news and I'm writing this message to support it. PolyMet has shown that it can mine metals in a environmentally safe way while also creating jobs for local Minnesotans. This economical opportunity is what Minnesota needs. PolyMet can create hundreds of jobs that will support the families of northern Minnesota while protecting out beautiful nature in the north. Please allow PolyMet to dig. Thank you, A fellow Minnesotan Sendt fra min iPhone

Kolleen Kennedy

My name is Kolleen Kennedy, Duluth, Minnesota. But I wanted to say, something that was never even addressed was 300 jobs, 300 jobs for 20 years. Cats live longer than 20 years. How many jobs are going to be displaced? Outdoor recreation jobs, which is a huge industry in Minnesota, in 2011 -- I have it written down here somewhere -- Minnesota alone spent 11 billion dollars in outdoor recreation, and that brought in over eight million just in state and local taxes. No one has addressed those jobs that are going away because we are going to have this horrible mine. I am not against mining. I am against this mining. I'm (inaudible). This is a state that voted on a legacy tax, for God's sake. I mean who does that? To keep our water clean. I just feel that this money is unconstitutional. I mean this legacy tax that we voted in was to protect our waters and not to allow them to be destroyed. I don't want to be a state that 50 years from now puts a fence around it, like I think our neighbors are going to have to. I want to say that we were smart, we were smarter than that, and we are not going to do this. Maybe come back in a hundred years. We are going to need jobs in 100 years, too. But right now, this is very unsafe mining and it is wrong. Thank you.

Kory Koch

16987

To whom it may concern: As a person who enjoys the BWCA, and want to see my children enjoy it also, I think it would be a good idea to mine the natural resources. I believe the job creation of good paying positions outweighs the environmental impact by a long shot. I also believe the state of Minnesota needs the economical boost (just look at North Dakota). Kory Koch 18055 Echo Terrace Farmington, MN 55024

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Kris Beck 6970 Chaparral Ln Chanhausen, MN 55317-9226

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Tourism is so important to MN. The last thing we need is another source of pollution. Please do not let this business destroy our waters and land. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Kris Emly 3606 Oliver Ave N Minneapolis, MN 55412-1930

Dear Federal and State Agency Leaders, I am not a scientist, but I am a citizen of Duluth who drinks water, swims in local lakes and rivers, and who feels compelled to protect the beauty and integrity of the little space on the planet I have made my home. I am writing to ask that you reject the findings and claims of Polymet's SDEIS, knowing that many have raised doubts in regards to the study's merit and thoroughness. There are just too many unanswered questions and there is no study in the world that can provide us with definite answers about long-term outcomes. Our land, water, and health are simply too valuable to gamble with. Being that I am not a scientist, all of the information I have learned about this project has come from others who have expertise in the environmental impacts of sulfide mining. I know that many of these individuals have written to you with their better-informed arguments about why this is a bad idea, so I will not be duplicitous in repeating the same points I have learned from them. All that I can do is write to you as a living being who depends on the health and balance of the ecosystem where I live. All that I can do is appeal to you at an intuitive level from my heart, and for that reason, my letter may be quickly dismissed since we live in a culture that values science over feeling, economics over heart. I am frightened about the potential (perhaps certain) destruction to my home if companies like Polymet move in to expand on toxic and dangerous mining practices, all for the sake of economic gain. If we have any kind of collective conscience and heart (that we are willing to acknowledge instead of silence), then we know that our duty is to protect and preserve life as our first priority, far above any motives for profit or economic gain. Please take a moment to listen to that voice inside yourselves, as well as the voices of other citizens who are expressing this sentiment. Thank you for taking the time to read this and for considering my input amongst the tens of thousands of letters you have received on this matter. Thoughtfully and Sincerely, Kris Simonson 2316 Wilkyns Avenue Duluth, MN 55803 (218) 590-7182

Kris Tromiczak

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Kris Tromiczak 1600 Willis Ave South St Paul, MN 55075-1057

Krishna Woerheide

43612

I don't believe sulfide mining is a viable undertaking in Minnesota's Northland, nor do I believe the companies involved are entirely honest about the economic gains and the destruction they will cause here. In the history of mining, there has not been one case of a sulfide mine that did not contaminate the area waters, sometimes for hundreds of years after the process. To set about this sort of mining in a watershed which empties into one of the world's largest bodies of fresh water is very risky. Polymet has not shown that they can mine safely in this area, history and documents have shown that they have not done so before. The rock piles will need to be treated for 500 years after mining is complete. Are they willing to make that financial deposit before mining commences. Krishna Woerheide 157 Caribou Trail PO Box 278 Lutsen MN 55612

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Krista Weiland

54358

Dear Ms. Lisa Fay, EIS Project Manager, I have been reading and researching about the proposed mining project in northern Minnesota. After learning more about it I have concluded this project would not be a wise investment for Minnesota. It appears that the benefits of this project will not outweigh the potential risks. My concerns include the following: • Damage to natural resources • The Mesabe Widju of the Ojibwe people would be damaged • Animals losing their habitat • Affect on tourism • Water contamination • Effect on wild rice production This project would damage Minnesota natural resources such as lakes, forests, and wild rice production. It would also affect historic and cultural icons that are crucial to Minnesota. Many plants, fish, and animal species could be affected, which could affect Minnesota as a whole. This project also could affect wild rice production. Minnesota distributes much of America's wild rice. There could be a potential shortage if the wild rice production is disturbed. Another negative effect of this mining is water contamination. If this happened, you may have a whole city without water. It could possibly affect a larger region as well. This proposed project could cause long term unsettlement for animals and for the local residents. The pollution could even affect all of Minnesota residents. I think that there very few short term advantages and many long term disadvantages. I feel that this proposed project should be reconsidered. Thank you for considering my concerns, Krista Weiland (14)

--Original Message-- From: keggerling@gmail-com [mailto:keggerling@gmail-com] Sent: Tuesday, March 04, 2014 5:24 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: I am very concerned about Polymet's proposed sulfide mine. The risk far outweighs the potential benefit. Jobs are important, but few real, long-term jobs will be created. There are many sustainable alternatives to job and industry creation and they can be done with Minnesota companies that keep our money here in Minnesota. Creating jobs that are not sustainable is shortsighted and a waste of our precious resources. Our health and the health of the earth will very likely be negatively impacted. Our ground water, our surface water, our boundary waters are far too critical to gamble. And, the risk will continue for years and years after the mine has closed. How is that fair to our children and our grandchildren and their grandchildren. PolyMet's proposal is fatally flawed. We must be diligent in analyzing their proposal. This diligence reveals how poorly planned this mine is. Please don't sacrifice Minnesota's legacy. It is just not worth it. Sincerely, Kristin Eggerling 425 3rd St SE Hallock, MN 56728-4129

Comments on the NorthMet Mining Project and Land Exchange, Supplemental Draft Environmental Impact Statement Directed to: Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay: First of all, thank you for agreeing to extend the comment period. Well aware that you have received tens of thousands of comments already, and that the comment period is almost closed, I will make my comments opposing the approval of this copper-nickel mining proposal as pointed as possible, leaving greater specificity to the many people already provided it. I am a long term pastor serving an ELCA congregation in Mountain Iron, the "taconite capitol of the world", where iron ore was originally discovered, and I well know the importance of mining in the economics of the households and community I serve. While many of the families who have earned their living from mining are categorically supportive of any mining venture, others recognize that corporate profit from exploiting natural resources does not necessarily coincide with the interests of human health, economic and social justice, and community well-being. The fundamental objections could be summarized as this: limited short term gain at the cost of the risk of incalculable long term damage to human and environmental health. From my understanding of the study, major questions remain in the areas of equitable land exchange levels of toxins including carcinogens in water effect in the health of infants and children damage to endangered, threatened, and special concern plant and wildlife species, including our already declining moose population the effects of the introduction of non-native species in reclamation efforts legality of authorizing an operation where clean-up will be ongoing possible negative effects of this mining on other sectors of the local economy As a pastor in this community, I teach stewardship of all that is entrusted to our care. This includes responsibility for the well-being of future generations of people, and the long term health of the land, water, air, and other creatures upon which we fundamentally depend. In the balance, a gain of 300 or so jobs and their spin-off economic gains for the next 20 years, given the above unanswered questions and risks, does not constitute this stewardship. Thank you, The Rev. Kristin Foster Senior Pastor, Messiah Lutheran Church, Mt. Iron Resident of 8580 Johnson Road, Cook, MN 55723

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I am writing to express my concerns regarding the the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. We have already seen the damage that this practice can do, including acid mine drainage and heavy metal contamination. I am also concerned about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. In conclusion, the Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Thank you for your time. Sincerely, Kristin Lang 5410 Conn Ave NW Apt 302 Washington, DC 20015-2822 (202) 332-2556

Kristin Linson 41958

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kristin Linson Maple Grove, Minnesota

kristin palmer 4566

Hello, As a Minnesota resident and supporter of the DNR I implore you to decline PolyMet's proposal for mining. The destruction that will happen (look to all past sulfide mining projects as examples) would destroy not only the livelihoods for the people that live there but also the tourism industry and all the money that brings to the area. The promise of jobs to the area is not permanent, but the pollution will be. The risk of this mining does not out way the benefits. Please do NOT allow this mining project to go forth. Thank you for your consideration, Kristin Palmer 1431 Frankson Ave Saint Paul, MN 55108

Kristin Wharton 45170

To whom it may concern, As a registered nurse who works with pregnant women and children on the North Shore, I am concerned about the potential health impacts of sulfide mining on our communities for generations to come. The impact of sulfide, mercury, and other byproducts of sulfide mining on human health have not been adequately addressed in this process. It is my opinion that a Health Impact Assessment should be conducted on the polymet and other proposed precious metals mines in Northeastern Minnesota. On the North Shore, the Minnesota Department of Health has already identified a high level of mercury in newborns. We are currently a study area of concern. As the fourth generation of my family to live on the North Shore, I can remember back to stories of how my grandmothers father moved to this area after falling ill working in the copper mines of Montana. Clearly mining has changed since it took the life of my great grandfather, months before his daughter (my grandmother) was born. But it is no less dangerous to human health for those of us living in this area. Until the state of Minnesota can assure me that my family, my children, and the future generations of children born on the North Shore will be safe from by products of sulfide mining, it's not a risk that we as a community or state should accept. The potential threat that the polymet mine poses to human health is not a risk that I accept. Respectfully, Kristin DeArruda Wharton, Registered Nurse, International Board Certified Lactation Consultant Po box 1403 Grand Marais, Minnesota 55604 Sent from my iPhone

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Ms Fay, I am writing to discuss my concern regarding the proposed PolyMet NorthMet mine and submit the following as comments for review of the joint Army Corps of Engineers, US Forest Service and Department of Natural Resources (DNR) Environmental Impact Study (EIS). For the following 5 reasons I am hoping the DNR will take no action on the mine and prevent PolyMet from opening the NorthMet project. First, I am concerned the EIS is not clear on how long pollution control, reclamation and water treatment will take after the mining operations cease. The EIS estimates that water treatment may take 500 years, but even PolyMet officials have admitted publicly that they are uncertain about the length of time and will not know about potential contaminants until they begin unearthing them. I am gravely concerned about initiating a multi-million dollar project which will have a centuries-long impact on Minnesotans without hard, concrete facts regarding the potential harm to water and river flow in the region. I suggest the DNR prohibit PolyMet operations from commencing until we have more information on the long-term environmental impact. Second, I am concerned the EIS itself contains flawed and/or inaccurate data concerning the effect the mine will have on the Partridge River flow. Recent developments have shown the DNR has admitted that estimates of the proposed mine's impact on the river are nearly three times too low. A study that has a 33% inaccuracy rating should be re-researched, re-reviewed and re-submitted for public commentary as this type of inaccuracy regarding state environmental and fiscal impacts is unacceptable. I would recommend DNR examine the research, redraft the study and analysis and submit the EIS to the public again for a more accurate review of the proposed mine. Third, I believe that the costs of the mine greatly outweigh the benefits and am concerned the DNR did not conduct a proper cost-benefits analysis. Specifically, the small amount of copper and nickel deposits available in the Mesabi range do not warrant excavating 533 million tons of earth. Furthermore, if PolyMet were given notice to proceed, once it began selling nickel on the stock market, the supply would substantially increase, thereby flooding the markets and driving down the price of nickel. This could not only damage the viability of PolyMet as a company, but if the corporation experiences hardship, this could reduce the number of available jobs at the mine. Financial analysts contend that PolyMet has overvalued the price of nickel in its submissions regarding the mine and nickel futures are selling for 60% less than the \$10-14 per pound price PolyMet has presented to the public and the DNR. These are the issues that must be investigated further and examined before any mining is allowed to move forward. Additionally, copper futures have shown a consistent downward trend on NYSE and other markets, evidencing that it will likely not produce the revenue or return on investment (ROI) that PolyMet has alluded to the public and the state. Fourth, because PolyMet does not have a concrete estimate on how long the environmental reclamation will take, it cannot fully guarantee that it will exist for the next 500 plus years required to restore the environment. To illustrate PolyMet's instability, one must look to its corporate leadership. Glencore Xstrata, a company which owns over 25% of PolyMet's stock, has suggested that - if it fully exercised its rights - it would own 34% of PolyMet. However Glencore is owned by Marc Rich, who has been charged with tax evasion and illegal business dealings. Minnesota prevents businesses who commit fraud from doing business in the state, therefore why would we allow a corporation with illicit leadership to construct this mine. Additionally, PolyMet has not operat

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Kristina Anderson 6655 Jackson Rd Ann Arbor, MI 48103 US

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I ask that our state agencies take the following actions: actions by the lead agencies: • Reject the SDEIS as inadequate and the PolyMet project as environmentally harmful. • Deny the wetlands destruction permit (Section 404 Permit). • Reject the exchange of Superior National Forest Land that would allow the PolyMet project to move forwaRd • Deny PolyMet a state permit to mine. Having worked my entire life both as a public (DNR Waters, Met Council - collective 12 years) and now private sector (brownfields consultant 9 years) balancing environment and economic considerations in use of our land and resources, this SDEIS is not ready for approval. The lack of clarity in long-term environmental and human impacts as well as lack of full analysis of alternatives,leaves large gaps in ability to provide a solid decision. A decision to approve is not acceptable. It is well understood that we continue to use more resource than is sustainable, and as a result our ecological and climatic times are very uncertain. Reckless/Forced decision-making (lack of full understanding of implications) is the way society historically responded to mining and other possibly impacting applications, it is simply unacceptable to relive this precedence. We cannot continue to favor short-lived economic gains compared to long-lived environmental fragility; as the real long-term economic costs are almost incalculable. I expect and ask our state and federal agencies, with the legislative authority in which you are given, to reject the SDEIS based upon the four bullet points above. Sincerely, Kristina Smitten Marine on St Croix, MN

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Kristine Davis 40563 County Road 15 40563 County Road 15 Saint Peter, MN 56082 5072465004

Kristine M. Maurer

43335

To whom it may concern: My name is Kristine Maurer and I love Minnesota. I grew up in the twin cities but nothing shaped my life more than the time I spent in the woods, on the prairie, in the streams, and on the lakes of Minnesota. Specifically, time hiking the north shore and camping in the Boundary waters inspired a passion for water resources and ultimately a career in environmental science. Minnesota is home to so many beautiful ecosystems and places that are treasured by millions of people and I feel it is only just that these ecosystems are protected and preserved so that future generations of Minnesotans can enjoy and observe them in the same condition and capacity as we do today. Practices that are inherently destructive to the condition of these ecosystems should not be tolerated. Evidence from peer-reviewed research and the environmental consequences observed in states where sulfide mining has been employed, strongly suggest that allowing this type of mining operation to exist in the same watershed as some of Minnesota's most valued wilderness areas and sensitive ecosystems will be catastrophic to the legacy and condition of these areas. Many of the lakes in Northern Minnesota, including Lake Superior and those in the Boundary Waters, have low alkalinity and therefore have a low buffering capacity against changes in pH. When pH decreases (becomes more acidic), say as a result of sulfuric acid in mining effluence, calcium carbonate becomes less available and the solubility of silica is reduced. These consequences of increased acidity can reduce the viability and success of biota such and snails and clams which need calcium carbonate to build their shells, and to diatoms which need silica to build cell walls. Studies have demonstrated that waters acidified by acid mining drainage (AMD) can cause complete changes in the community composition of diatoms. Diatoms are a main primary producer in oligotrophic (low primary production) systems and alterations in their community composition could cascade into issues and changes throughout the food web. Acidification is not the only problem AMD can cause for Lakes and rivers. Because water bodies in northern Minnesota are oligotrophic and often have long water residency times, the influences of mining contaminants can be long-lasting. Decomposition and growth is slow in these systems which can equate to more accumulation of toxins in sediments and increased bioaccumulation of toxins in the tissues of animals such as fish. These consequences could impact the fishing industry and the health of those who consume fish (eg, humans, birds, other wildlife) from areas exposed to AMD. The removal of wetlands is also a serious concern. Wetlands are like ecological kidneys; filtering and decomposing contaminants and retaining sediments that could otherwise end up in streams, rivers, and groundwater. As a result, they play an invaluable role in the condition and safety of municipal water. Removing over 1,000 acres of wetlands for mining would reduce key habitat for migratory birds and would be detrimental to water quality in the surrounding watershed. I recognize there is potential for job development with the success of sulfide mining. However, its economic return is short term. Like hydraulic fracking, sulfide mining is unsustainable and in the end will leave in its wake irreversible and costly destruction. I urge you to think of the billions of dollars the wilderness areas and ecosystems in northeast Minnesota are worth, not only for their tourism and industry value, but for the ecosystem services they provide (eg, mitigating floods, cleaning ground and surface waters, providing critical habitat), and the intrinsic value they have. Please allow the ecosystems of northeast Minnesota to inspire future generations. Please think of the long term consequences of the action you take. Please set a standard and precedence of intolerance for pra

I strongly oppose this mining proposal in Minnesota, near the Boundary Waters area. I understand that this company has little experience, is not focused on Minnesota and keeping the area free of contamination, but is instead happy to dig up the land near our pristine wilderness and lakes. I grew up in Cloquet, Minnesota and have spent much time in and near the Boundary Waters Wilderness area. I read, today, in the Star Tribune that PolyMet has a poor environmental and human rights record and has an agreement to sell copper concentrate to China. IS this for real. This is NOT a good move for the State of Minnesota. Sincerely, Kristine Norton, 7007 Cornelia Drive, Edina, MN 55435

Kristine Osbakken

18083

I'm Kristine Osbakken. I'm not from Glendale; I'm from Duluth. My Uncle Ole worked for decades as a mining engineer on Mesabi. My Aunt Dagmar and Uncle Leif worked for the railroad that brought the ore to the ships. My dad was turned away -- he worked for the railroad in Two Harbors. He was turned away at the gate when he went to talk to the union organizers. He was never given a berth and he never went back to work at Two Harbors. The PolyMet -- I'm a writer and I'm a teacher. PolyMet SDEIS is not a plan. It's an experiment. It would put Minnesota's clean water at risk forever. The SDEIS makes predictions, but it doesn't provide the basic information to support those predictions. These questions are not answered. How much polluted wastewater is going back and forth through nine miles of pipes? What is the total volume of wastewater in the tailings and the processing residue? Just how polluted are the wastewater and waste rock piles in the pits, pump ponds, tailings basin and the hydro-metallic waste dump? These answers are missing. Without this basic information, we can't estimate what will happen if PolyMet's own perfect assumptions, not based on anything real, don't come true? The SDEIS admits that this is an experiment. On page after page it says that, "In the event the modeling shows violations of water quality, PolyMet will 'adaptively manage the problem.'" This SDEIS is not adequate. To be adequate, it must reveal wastewater volumes and pollutant levels of every step and it must have facilities from day one to meet standards. Once pollution is in the groundwater, it will be too late to fix. It will affect the Partridge, Embarrass, it will affect the whole entire St. Louis watershed. The estuaries, already, people catch and throw those fish. It will make it even more polluted.

18381

Hello. My name is Kristine Osbakken. Peter Shook talked about the effect of pollution on his drinking water and the drinking water of communities below the Embarrass and the Partridge Rivers. I would like to talk about the effect of the mercury pollution on the lower St. Louis River the raised mercury levels at the proposed PolyMet mine will produce, but the PolyMet SDEIS does not adequately address the effect on the lower St. Louis River. The SDEIS states that the sulfide mine and the tailings basin will increase mercury in the Embarrass River by approximately 3 percent per year. That's SDEIS page 5-207. PolyMet claims that this increase in mercury to the Embarrass River won't affect mercury in fish in the St. Louis River because of the water treatment plant that will operate when the mine is closed and the west pit is flooded. Referring to SDEIS page 5-8. However, it will be 40 years until the treatment plant kicks in. What about all the mercury pollution within that 40 years? The fish are not fit to eat in the already heavily polluted lower St. Louis River. People catch and throw. The Minnesota Pollution Control Agency studied the St. Louis River mercury crisis and proved that the lower river has higher rates of mercury contamination than nearby waters and then further upstream. The agency, however, did not complete their total maximum daily load study, the TMDL. The PolyMet SDEIS should not be finalized, nor the project approved, until a full study of the TMDL of mercury in the St. Louis River proves that PolyMet increased mercury loadings will not increase fish contamination.

58187

My name is Kristine Osbakken and I would like to speak to the raised mercury levels that the proposed PolyMet mine will produce, but that the PolyMet SDEIS does not address. The spelling of my name is Kristine, with a "K." And Osbakken is O-S-B-A-K-K-E-N. First, the SDEIS states that, "The sulfide mine and the tailings basin will increase mercury loading in the Embarrass River by approximately three percent per year." (Reading.) And this refers to SDEIS Page 5-207. "PolyMet claims that this increase in mercury to the Embarrass River won't affect mercury in fish in the St. Louis River because of a water treatment plant that will operate when the mine is closed and the west pit is flooded," according to SDEIS, Page 5-208. (Reading.) "However, it will be 40 years until the treatment plant kicks in." What about all of the mercury pollution within that 40 years? Fish are not fit to eat and they already have polluted the lower St. Louis River. People catch and throw. The Minnesota Pollution Control Agency studied the St. Louis River mercury crisis and proved that the lower river has higher rates of mercury contamination than nearby waters and then further upstream. The agency did not complete their total maximum daily load TMDL study. The PolyMet SDEIS should not be finalized, nor the project approved, until a full study of the TMDL of mercury in the St. Louis River proves that PolyMet's increased mercury loadings will not increase fish contamination. I think I am done. Thank you.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Kristine Schmitz 2004 Randolph Ave Saint Paul, MN 55105-1750

Dear DNR Environmental Impact Statement Reviewers and Decision Makers: I have many concerns about PolyMet's proposed copper-nickel mine in Northern Minnesota, where my brother lives and where I might someday live. All in all, I believe that the risks and wetland losses outweigh the possible (and short-term) economic benefits. I do not believe such a mine is truly necessary at this point in time; as far as I know, there is not a shortage of either of these minerals and recycling has also not been done maximally. The market urgency just is not there to justify this mine in this water-rich location. As for jobs created. Economic considerations must always take a back seat to environmental-resource considerations. The wetlands and waterways that would be lost and/or contaminated are precious to everyone in Minnesota. I say only partly in jest that if we want to create jobs, let's start a public works program and get all our state's potholes filled. In all seriousness, I am conservative enough that I do not believe the state "owes jobs" to any population or region. I would love a job up near Lake Superior - please help me get one. I have been reading a very interesting book by a conservative author titled "How to Think Seriously about the Planet." The author argues that the political right cannot cede environmental issues to the political left. On p. 149, in a discussion of market solutions to environmental problems, he states: "Minerals are not renewable, and rare minerals that are, or have become, vital to human well-being may be depleted at rates that threaten the long-term interests of our species." He notes that copper wire has been largely replaced by cheap glass fibre and suggests with a sense of optimism that other new materials will soon emerge to replace copper in other products. Even if I thought copper was in short supply, and even if I felt the company were a Minnesota company that would care about its legacy here, I would oppose this project. There is no way PolyMet could provide financial assurances sufficient for a real disaster, and we all know real disasters can and do happen. Some disasters cannot be cleaned up with dollar bills. I leave the technical arguments to the many fine tribal and other scientists who have devoted themselves to this cause. I have learned enough to worry about the water issues, including any potential mercury and other pollution of the treasure that is Lake Superior. Sincerely, Kristine Vesley 1598 Edmund Avenue Saint Paul, MN 55104 (651) 645-2606

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Kristy Mock Cologne, Minnesota

Kristy Snyder 58066

No mine pollution! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Kurt 43702

I am not convinced that the SDEIS adequately considered alternatives to the project as designed. The option of an underground mine needs more consideration. The SDEIS did not demonstrate that the technology proposed to prevent acid mine drainage will work at scale and over the many decades necessary to protect Minnesota's water quality. Nor did it demonstrate that the funding will be available to implement that technology over the next several centuries. Kurt Alan Rusterholz 171 Vernon St St Paul, Mn. 55015 Sent from my iPhone

Kurt Seaberg 44647

The proposed Polymet copper/nickel sulfide mine is a bad deal for Minnesota. The number of jobs generated will be small and temporary and the risk of irreparable damage to Minnesota's environment will be enormous. There has never been a sulfide mine operation anywhere in the world that has not leaked poisons into the watershed. We cannot jeopardize the water quality of our state for the next 500 years. Please deny the permits for this and any other future sulfide mining operation anywhere in the state. Sincerely, Kurt Seaberg, 2000 Seabury Ave, Minneapolis, MN 55406

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely Ky Christenson 12309 fiona ave N White Bear Lake, MN 55110 6124371860

--Original Message-- From: kcrocker@paulbunyan-net [mailto:kcrocker@paulbunyan-net] Sent: Wednesday, February 26, 2014 5:59 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: I have lived nearly all my adult life in northern Minnesota. During this time I have active in my local lake association, serving as its informal 'science officer.' In this capacity, and in work with other conservation efforts, I have learned a great deal about lake and wetland ecology and hydrology. I have also learned - painfully - about the deep inadequacies of much historical data and the short-comings of many EIS findings. The Supplemental Draft EIS for the PolyMet proposal for the sulfide mining operation based in Hoyt Lake is very deeply flawed. As has been shown, much of its data on the hydrology of the sensitive areas concerned is outdated and/or misconstrued. This is especially true of the proposal to dump tailings from the mining process on top of the former LTV Steel.s tailings basin, which was built in the 1950s on top of three streams, and was designed to leak. There is also general inattention to contingency planning for a number of very possible failures that could have devastating effects on the whole of the St Louis River watershed, as well as related one and Lake Superior itself. Recent events in several extraction industry operations have demonstrated that 'customary practices' assumed safe often lead to 'accidents' and failure to plan complete contingency scenarios have had serious toxic, long-term consequences. With PolyMet the 'long-term' runs to hundreds of years, far beyond any immediate benefits the project might produce. I worked for the State of Minnesota for nearly 30 years, a professor with MnSCU. I have also worked closely with many DNR employees, and count them as friends and colleagues. While I am proud of these activities, I have also witnessed many mistakes, poor decisions, confused priorities, and other organizational failures. Even the seemingly smallest of these can have irreversible consequences for people and our environment. A case in point. When MnDoT took over the jurisdiction of several railroad easements, it also inherited the engineering problems of this once vital industry. On the lake where I was raised, MnDoT's failure to address severely compromised drainage under one of these rail beds brought unprecedented flooding in 1996- The loss of native shoreland vegetation and the erosion has brought problems to this habitat and those of us who live in that can never be corrected. This case represents the smallest kind of parallel to the potential catastrophe of the PolyMet proposal. The slightest inattention to existing or unforeseen practicalities can be compounded beyond any hope of remediation. Life is always about risk calculation. The PolyMet SDEIS does not begin to properly evaluate risk, much less plan for an array of potential and very long-term failures. It must be withdrawn and completely re-envisioned, not simply redrafted. If and when it is resubmitted, the DNR must utterly divorce its science from short-term political distortion. Thank you for your consideration of my comments. Sincerely, Kyle Crocker 806 Balsam Ridge Rd NW Bemidji, MN 56601-5587

To whom it may concern: Though I was born in the Twin Cities area, I was only a few weeks old the first time I went “up north”. My grandparents built a home near Biwabik in 1958, and my parents purchased a neighboring property in more recent years. The area of our state near Hoyt Lakes has been my favorite place on Earth for as long as I can remember. The lakes and rivers have played a primary role in so many people’s enjoyment of northern Minnesota. But enjoyment is not the only thing that the water provides. Freshwater is essential to the survival of countless species, and it is growing scarcer day by day. Because most water on Earth is not freshwater, and most freshwater is contained in glaciers, only a fraction of a percent of the water on our planet is available for supporting humans – population 7 billion and growing. Among the world’s freshwater lakes, Superior is the largest by surface area and third-largest by volume. The idea of endangering one of the most important freshwater sources on our planet by approving the NorthMet mine proposal is dubious at best. It is an accepted fact that the byproducts of sulfide mining pose an environmental threat for hundreds of years. It is unsurprising, then, that the practice of sulfide mining has an ugly track record of harming ecosystems worldwide. Even in areas that lack a delicate and pristine water table like the one that surrounds the proposed NorthMet site, sulfide mining has wreaked havoc on the environment. There are three ways in which a disaster like these might be prevented in the case of the proposed NorthMet mine. The first possibility for avoiding environmental havoc is for PolyMet to monitor the NorthMet site and actively prevent any acid mine drainage. PolyMet is a Toronto-based company founded solely for the purposes of extracting resources from Northern Minnesota. A large portion is now owned by Glencore Xstrata, a huge Swiss-based company whose track record is riddled with environmental and social irresponsibility (“Controversial” would be the mildest adjective with which to appropriately describe this secretive multi-national). It is nothing short of ludicrous to think that, hundreds of years from now, either PolyMet or Glencore Xstrata will not only exist but also take responsibility for an area from which they’ve long since squeezed their last profits. The second possibility is that, given the unlikelihood of centuries of active intervention, PolyMet leaves the NorthMet site with a sound infrastructure to passively prevent acid mine drainage. I am currently completing a Master’s Degree in Mechanical Engineering at the University of Minnesota. For my research, I work in a lab which specializes in the mechanical design of hydraulics – extremely durable equipment. As a mechanical engineer, I can assure you that nothing is designed to function for hundreds of years. Nothing. One can attempt to design for long periods of operation, but it is impossible to guarantee such durability. Especially with the sensitive implications protecting freshwater resources, it is either naïve or willfully disingenuous for any engineer to proclaim confidence that his apparatus for acid mine drainage prevention will remain sound for centuries. This brings us to the final way to avoid polluting the water of Northern Minnesota – do not approve the NorthMet mine proposal. I must make it clear that I am in no way “anti-mining”. My grandfather was an engineer for Minntac, and my mother and uncle worked in the taconite mines near Virginia, Minnesota. Mining is an essential part of producing the goods we use. But sulfide mining is fundamentally different than taconite mining. I am sympathetic to the economic woes of the Iron Range in recent years, but we must remember that the decision on whether to approve this mine has global impacts. I am twenty-five years old – I have a lot of life ahead of me. My unborn children and grandchildren have their entire

Kyra Quillen Adv. Science Miss. Olson 1/29/14 Copper Mining Copper mining is when people are removing copper from mines. Minnesota is considering this option to create more jobs. They are also doing this so that Minnesota would have more copper in their possession. I feel that although this would create jobs, it would not be good for Minnesota. This is what copper mining is and what my opinion is towards it. The NorthMet Project is substandard for Minnesota. Even though the PolyMet Company will provide jobs for 20 years to many people, the taxpayers will be responsible for cleaning up mining sight. This will cost the taxpayers billions of dollars which would force our economy into a recession. This is one of the reasons I am against copper mining in Minnesota. Another reason why this is not in the best interest of our state, is because copper mining will ruin 26 square miles of our beautiful forests. Copper mining will pressure Minnesota to tear down this area and we have already lost plenty of our forests. We will not only be tearing down 26 square miles of our illustrious forests, but much more to build homes for the miners. This is another reason why I am not in favor of this project. If we go through with this plan, the mining will cause 500 years worth of polluted water. This is due to all of the mining equipment and vehicles that will be used in this area. Who is going to keep a close eye on the pollution. The Local hydrologists will be responsible not the PolyMet Company. We will only get 20 years of mining out of this area and it will ruin a great deal of our water. This will definitely destroy this area and will end with a very sizable mess with lots of pollution. This is my third reason that I think this is an atrocious idea. To conclude this is a terrible idea, the PolyMet company will make the taxpayers pay for all of the clean up. We will end up with 500 years of polluted water and over 26 square miles of destroyed forests. This is an unacceptable idea and I think that there should be no hesitation to completely dismiss the copper mining project. Then we can continue to focus on less destructive business proposals. Sources <http://www.miningtruth-org/> HYPERLINK "<http://www.google-com/url.q=http%3A%2F%2Fwww.polymetminning-com%2Fnorthmet-project%2Foverview%2Fandsa=Dandsntz=1andusg=AFQjCNFKipKIK8m9NNWkFm53fKOjR4IIQQ>"<http://www.polymetminning-com/northmet-project/overview/> HYPERLINK "http://www.google-com/url.q=http%3A%2F%2Fwww.startribune-com%2Flifestyle%2Fhealth%2F234755311-htmlandsa=Dandsntz=1andusg=AFQjCNH3GRrz9u9U4v_WxaNHuEt0i4z4qg"<http://www.startribune-com/lifestyle/health/234755311-html> <http://www.dnr.state.mn.us/volunteer/julaug12/nonferrous.html> ` HYPERLINK "<mailto:17kyraqui@flaschools-org>"17kyraqui@flaschools-org HYPERLINK "<https://docs.google-com/logout>"Sign out View in: Mobile | HYPERLINK "[https://docs.google-com/a/flaschools-org/unsupported.continue=https://docs.google-com/a/flaschools-org/document/d/1P8BPPWMLzLFJQ-b0zC46q1XFqR3S2YHrh4kr6pFMrvo/edit.override%3Dtrueandcancel=https://docs.google-com/a/flaschools-org/document/d/1P8BPPWMLzLFJQ-b0zC46q1XFqR3S2YHrh4kr6pFMrvo/edit.override%3Dtrueandcancel=https://docs.google-com/a/flaschools-org/document/d/1P8BPPWMLzLFJQ-b0zC46q1XFqR3S2YHrh4kr6pFMrvo/mobilebasic](https://docs.google-com/a/flaschools-org/unsupported.continue=https://docs.google-com/a/flaschools-org/document/d/1P8BPPWMLzLFJQ-b0zC46q1XFqR3S2YHrh4kr6pFMrvo/edit.override%3Dtrueandcancel=https://docs.google-com/a/flaschools-org/document/d/1P8BPPWMLzLFJQ-b0zC46q1XFqR3S2YHrh4kr6pFMrvo/mobilebasic)"Desktop ©2012 Google

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota, as described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should NOT be approved because it is lacking vital information about long-term water treatment and how it will be funded. This is important information needed for proper evaluation of the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms L.L. Kauffman 643 Meridian Cir Unit F Cold Spring, KY 41076-4200

I am opposed to sulfide mining in Minnesota, for the following reasons: 1) Sulfide mining has never been done, anywhere in the world, without significant environmental damage and water pollution. Never, anywhere. Why would Minnesota gamble that somehow, some way "it will be different this time", when the stakes are a precious and fragile natural environment that is the crown jewel of Minnesota and the clean water that makes it so. Clean freshwater is a precious commodity in the world, and in the coming decades and centuries, with the advent of global warming and an increasingly crowded and polluted world, will become the most precious commodity of all. Wars will be fought over water. To sacrifice it for a handful of jobs and some tax revenue is simply foolish. 2) 300 jobs. When I first saw that number, I thought it was a joke. We're talking about potentially trashing a beautiful ecosystem for 300 jobs. It wouldn't be worth it for 3000 jobs, but 300 is insignificant. I'd be embarrassed to trumpet that as a reason to do this. 3) Centuries of waste water treatment, 200-500 years worth (but they aren't really sure how long, that's just their best guess). I can't believe anyone would seriously entertain the notion of an ongoing project of any kind that would need to be maintained without interruption for *centuries*. The Roman Empire existed for 500 years in total, with the advantage of existing during a time of only a glacial rate of change in conditions and with a monolithic state that could order anything it wanted, and we think we're going to keep a single water treatment operation going for that long. There is no guarantee that the United States or the State of Minnesota as a political entity will still exist in 500 years, and history teaches us that it is very unlikely. Certainly the companies involved will not exist for even a quarter of that time. Long after everyone involved today is dead, future generations will be left holding the bag for a polluted mess, and what recourse will they have. None at all. 4) The cutoff wall. Polymet says they will build a five mile cutoff wall anchored in bedrock to contain water that flows through the tailings. But how can they guarantee there will be no fractures anywhere in the bedrock or the wall, before, during or after construction. People I've talked to who live there and have been involved in mining say that the bedrock contains many fractures. It only takes one to leak. Polymet's entire plan, including the wall, requires perfection to succeed. You don't have to be an expert in anything to know that perfection cannot be achieved. 5) Financial guarantees. At a recent legislative hearing, talk of financial guarantees amounted to vague hand waving about financial instruments and an admonition that "this will be addressed during permitting." Try again. Given a requirement of centuries of ongoing cleanup efforts, any talk of financial instruments that will endure for centuries is laughably foolish. The entire global financial system nearly collapsed in its entirety in 2008- The risk is still just as high, and will grow along with the hypercomplexity and interdependency of the global system. Complexity is the enemy of stability; hypercomplexity inevitably results in a catastrophic failure somewhere in the system. No one can guarantee anything stretching centuries into the future, least of all in financial terms. In any case, no amount of money can compensate for the degradation of ecosystems. Once the groundwater is contaminated, the damage is done and cannot be undone. 6) Most of the benefits do not stay in Minnesota. PolyMet is a Canadian company that has never operated a mine (.) and that's where the profits will go. Glencore is a Swiss company with commitments to sell copper to China, and that's where the copper will go. Minnesota gets some crumbs in exchange for trashing its environment. That's a bad deal. 7) Glencore's record is abysmal. Th

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Lance Hentges 928 Franklin Ter Minneapolis, MN 55406-1101 (612) 387-6724

Lance Johnson

18227

I'm Amanda Johnson and I'm giving my time to Lance Johnson. Lance Johnson, L-A-N-C-E, J-O-H-N-S-O-N. I want to thank the DNR, US Army Corps of Engineers and the US Forest Service for the years of diligent work that have gone into this environmental review process. In the last couple of days, I noticed a story saying there's a specific data point regarding groundwater contribution to the Birch River. The SDEIS modeling shows groundwater contributing .5 cubic feet per second of flow to the Partridge River. Additional data from a new stream flow gauging stage and different location miles away shows the groundwater contribution of between 1.3 and 1.8 cubic feet per second. However, drain sensitivity analysis scientists utilize numbers as high as 2.4 cubic feet per second. At the 2.4-cubic-feet-per-second level, the model showed no negative effects. This is a testament to the extensive modeling that has been done on this project that in my opinion has gone above and beyond what is needed for this phase of the project. I would like to state that in my opinion, this -- is that the SDEIS is more than sufficient and it is time to expedite the final EIS in preparation for this project. I'd also like to touch on the socioeconomic aspect of this. I'd like to mention what a project would bring to the Iron Range. After graduating from college, a lack of job opportunities on the Iron Range forced me and my family to relocate to the Minneapolis/St. Paul area, where we were for about 12 years. Approximately five years ago, I was able to relocate my family back to the Iron Range because of some companies up there that are willing to reinvest in Northeastern Minnesota and the Iron Range by utilizing new technology to redefine what is possible in the mining and processing industry of the Iron Range. PolyMet will do the same. PolyMet will provide fantastic opportunities on the Iron Range by providing great-paying jobs for their direct-hire employees and -- and not just those 320 jobs, but -- and employees of Iron Range contractors and engineering firms, vendors, and other support industries. PolyMet will also generate millions of dollars in taxes for the State of Minnesota, and more importantly, millions of dollars that will go directly to the school districts and improving educational opportunities for our children. Let's move forward with this project. Thank you.

Lance Kupka

18097

My name is Lance Kupka and I live in Aurora, Minnesota. I teach at Mesabi East and I am very proud to be the president of the -- co-president of the Mesabi East Teachers Union, Education Minnesota, Local 1255. I enjoy the natural beauty of the state and believe mining can co-exist. I want to talk to you tonight about how the PolyMet project can make a huge, positive impact for our schools. It is estimated that PolyMet will pay 15 million dollars in state taxes annually, once mining begins. Six million of those dollars are considered an occupational tax, which is distributed statewide. And 40 percent of the six million will go directly to the elementary and secondary education statewide fund. That means 2.4 million dollars more in our school coffers. This money will help provide more programs for our schools, more technology for our schools, and ultimately more opportunities once -- for the children once they graduate. Seven million of the 15 million in state taxes is a net proceeds tax. It will be distributed locally. 20 percent of that pie, or 1.4 million dollars, goes directly to schools in northeastern Minnesota. Ten percent, or \$700,000, will go to the Northeast Range School District. Take each of those numbers times 20, because the mine is being permitted to operate for 20 years, and you get some even more staggering numbers. 48 million dollars for schools statewide. 28 million dollars for schools in northeastern Minnesota. 14 million dollars for schools in the Northeast Range School District. I will do a little bit more math for you and add those numbers up. That's 90 million dollars, for a total of nearly one billion dollars more for our schools in Minnesota. We know that Minnesota has some of the strictest environmental standards in the nation. We know that state and federal regulators have looked at this project from all angles and have published a comprehensive document that shows exactly how the mine will operate. We know that the mine can operate safely and that PolyMet has committed to monitoring and treating the water for as long as need be. What is the decision? This mine will be safe. It will generate great income for the local workforce, and as I have outlined in detail above, it will have a tremendous positive impact on our schools and on our children for decades to come.

Larry

9503

The SDEIS does not address any contingencies for possible problems for the next 200 years at the mine site and the next 500 years at the tailings pond. This is pure foolishness and should not be accepted until potential problems and their solutions are considered. Also, this SDEIS assumes these sites will be superfund sites, paid for by the taxpayers in the future, since no company in existence today can predict they will be in business 40 years from now, much less 200 to 500 years. Based on what I see in the SDEIS I would not be surprised if the government ends up building the reverse osmosis system when it is needed. Politicians seem more interested in reelection and immediate tax revenue than protecting the environment. I am not optimistic on the outcome of this review process and the impact on Minnesota waters. We are headed down the same path as Montana. Larry Kraemer 1025 Maple Grove Rd Duluth, MN 55811

Larry A. Stone 4289

---Original Message--- From: Larry Stone [mailto:lstone@alpinecom-net] Sent: Monday, December 30, 2013 7:45 AM To: Fay, Lisa (DNR) Subject: polymet Ms Fay: I'm writing to comment on PolyMet Mining Company's proposed NorthMet sulfide mine. As a frequent visitor to northeastern Minnesota, I'm attracted by the clean water and wild character of the region. The proposed mine would jeopardize those natural resources. The supplemental draft EIS does not give adequate assurances either that the mining itself could be carried on without environmental damage, or that the site could be reclaimed in a way that would guarantee long term stability and environmental integrity. I do not believe that the short term gains of extracting the minerals would justify the potential for permanent, long term damage to the natural resources that are the backbone of Minnesota's economy. Thank you for your consideration. Larry A. Stone 23312 295th St Elkader, IA 52043 563-245-1517 cell 563-419-6742
Lstone@alpinecom-net

Larry and Val Johnson 17301

Dear Federal and State Agency Leaders: According To the SDEIS: PolyMet's water pollution from the permanent mines site waste rock pile would need treatment for at least 200 years and pollution from the tailings piles would require treatment for at least 500 years. Pollution seeping out of the mine pits would "continue in perpetuity." Forever. According to Minnesota Administrative Rules 6132-3200 CLOSURE AND POSTCLOSURE MAINTENANCE. Subpart 1 Goal: The mining area shall be closed so that it is stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free. How can 200 to 500 years of water treatment be considered maintenance free. Please protect Minnesota's water, our most important resource and deny permits for this proposal. Thank You, Lawrence L Johnson 3421 East Alger Grade Two Harbors, Mn 55616 HYPERLINK "mailto:silvercreek73@gmail-com"silvercreek73@gmail-com 218-834-5456

Larry Anderson 39454

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Larry D. Anderson D.V.M. Larry Anderson 1385 Peninsula Road Ely, MN 55731

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Larry Beck 8876 Compton Ln Inver Grove Heights, MN 55076-3397 (651) 451-3273

Larry Bogolub

18280

My name is Larry Bogolub. It is B, as in boy, O-G-O-L-U-B. And I am making a statement for my son, Louis Bogolub, who is 16 years old, who wrote this letter to the editor of our local newspaper. "Over the past four summers I have gone on multiple trips to the Boundary Waters Canoe Area (BWCA). The trips have been some of the most memorable weeks in my life. The beauty and peacefulness of the lakes, rivers and forests on which I traveled are unmatched by anything else I've experienced in my 16 years. I sincerely hope that the future visitors will be able to experience the BWCA in the same way. It is because of this hope that I am against the proposed copper-nickel mining in northeastern Minnesota. The potential for harm to the BWCA is too high. It would be shameful to risk the eternal well-being of a national treasure for a short-term economic expansion. With the hustle and bustle of our daily lives, the BWCA is one of the few places where one can truly escape from it all. It is a testament to the wisdom and foresight of the American people that we protect this area for future generations." (Reading.)

40064

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Larry Chial Moorhead, Minnesota

Larry Cuffe

18128

Thank you. My name is Larry Cuffe, C-U-F-F-E, and I'm a resident of the City of Virginia and I'm also on the City of Virginia City Council. I've been here ever since this place opened up, and I have a speech prepared and something to talk about here, but it's going to be redundant of what everybody else has already said. I'm a fourth-generation Iron Ranger. My father is of Italian descent and my mother is Ojibwa. We have a very strong family background, a strong family heritage. Mining has been in our family for years. My grandfather was a miner, my other grandfather was a miner. We all shared those experiences. If it wasn't for mining, my grandfather wouldn't be here, my father wouldn't be here. My family would not be here, and if you look at the iron ore mining and compare it to the PolyMet Project, there is a comparison here. Now, there's been a lot of talk about opposition about the water, about not having the study done properly, but what I'm telling you right now, we live in the United States of America. The most advanced industrialized nation in the world. We have the cleanest water. We have the cleanest environmental protection. We have the Minnesota Pollution Control Agency that's a pain in our butt, but it's necessary because they do their due diligence. I rely on experts to make decisions. Every time you take a risk in life there's a risk. There's never going to be an absolute, but when you take every precaution and you spend hundreds of millions of dollars and 10 years of investment in order to do something that's going to be economically boon to a community that is dying on the vine. The City of Virginia had a population when I was growing up of about 18,000 people when the mines were booming and the construct was going on. Now, we have about 8,800 people. We have a housing crisis in Virginia. These houses are abandoned. People left because there are no jobs. This United States of America is built on the people. And I heard it spoken from other kind -- everybody here, it's -- it's the people working together. Well, we have a community here; Virginia, Eveleth, Gilbert, Biwabik, Aurora, Hoyt Lakes, all across this Iron Range is based upon our bread and butter, our way of life in order for us to live. Mining is the major contributing factor to our ability to survive and to raise our family. We as a City Council, we as a family, all my friends, we all support the PolyMet Project. There's a lot of things to say about the water, the quality. I read through the EIS study. I find that this is just -- they've done their due diligence. Let's move forward.

Larry Derksen

Larry Dolphin 45336

To: Minnesota DNR From: Larry Dolphin 54769 180th St Austin, Minnesota 55912 E-mail address: alphaflpr@gmail-com Subject: Comment on Proposed Polymet Environmental Impact Statement I will keep this brief. We are blessed with some of the most abundant freshwater in the world. Why would we want to jeopardize the purity of our water. This is what concerns me most about the Polymet proposal is the need for Polymet to treat the water for at least 500 years and provide the financial wherewithal to accomplish it. It is not realistic and in fact it is ludicrous to expect that to be accomplished. Based on that information alone I believe the permit cannot be awarded. "A society that is satisfied with short term economics while deciding the source of its own survival cannot last" --Mary Berry- Water is essential for all life. Respectfully submitted, Larry Dolphin

Larry Hennis 6706

Please - no mining is necessary. We need to stop selling out our futures to short sighted, short term profit interests. The environment is just too important to allow a project like this. Thank you. - Larry Hennis ljhennis@fastmail.fm Larry Hennis 630 S Aspen Ct Saint Peter, MN 56082-1687

- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Larry Hennis 630 S Aspen Ct Saint Peter, MN 56082

Feb 17, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Larry Johnson 19521

I'm Larry Johnson from Superior, Wisconsin, and I believe that we all use copper nickel in our lives, so we need to get it from somewhere. So is it okay to get it from somewhere else? And the nickel, don't forget about the nickel. We have to import 100 percent of the nickel in this country right now. I love the Boundary Waters, I love the environment, and this will be the cleanest place to get it, and it will benefit all of our citizens in this area. So that's my statement. Thank you.

Hello, Thank you for the concern, research, and dedication of your team for the citizens of Minnesota, as well as the well-being of this country. Having attended most presentations, talked to professionals in the mining industry, researching past and present mining operations, having read the documentation as outlined in the SDEIS, it is my professional opinion we can be assured the impacts to the air, water and land will be minimal, and most likely superior to the existing ecology. This SDEIS demonstrates PolyMet can develop this resource in a sustainable manner with logical, engineered solutions proposed for any potential impacts. PolyMet will generate millions of dollars in local and state taxes for the support of our communities and educational institutions. The result of this project will contribute to the state and local economy at this time when we need jobs and a sustainable economic growth. This project, using the existing infrastructure and land is the ultimate in recycling. I am impressed by the extraordinary precautions proposed by PolyMet such as proven reverse osmosis technology and look forward to having them in our community. I am confident the professional team assembled by PolyMet will provide financial assurance to cover all required closure costs. Sincerely, Larry Krohn 506 Mission Road, West Bloomington, Minnesota 55420 Rockbottom506@me-com

Hello, I would like to thank you for the great job you are doing. I am writing in regards to the PolyMet mining project in northern Minnesota, I am in full support of this project, I started out skeptical. However after reading the ESS reports and all of the steps PolyMet has taken to ensure no water contamination, safe holding ponds and safe mining practices, I feel they have gone above and beyond. I am now in Full Support of this project, for jobs, MN growth, revenue, even a kickback will go to MN schools (Land Use Trust /PSF from the founding of MN 1858). It looks like a win win to me. Thank you for your time. Sincerely, Larry Krohn Bloomington, Minnesota

To Whom It May Concern: I have done a lot of studying of this project because I have friends that live in the area of Hoyt Lakes. Polymet in my opinion has done all of it's homework. I am convinced they have the technology, financial means, and moral intentions to properly operate safely the proposed mine.. If you haven't visited the "Range" lately than you should take a trip up there (unless of course you live north,east,or west of the site) This area needs the economic input that Polymet will provide. The jobs that polymet provides are only the beginning of the job growth for this area. The housing market will benefit as well as retailand the list goes on . The facts of other mines whether good or bad are only relevant if Polymet plans to do the same things that they did. Polymet has in my opinion gone above and beyond anything that any other mine has ever done, to insure safe clean nontoxic mining. Besides the fact that they are willing to put money in an escrow account in case that any emergency may arise. Signed Larry OConnell

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Don't allow it. Please. Sincerely, Larry Perrott 500 Maple St Farmington, MN 55024-1565

Larry Petersen 26357

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Larry Petersen 1000 NW 3rd St Gresham, OR 97030-6910 (503) 666-8656

Larry Popovich 7630

To the DNR, First of all, may I commend your agency on all of the hard work done in this process to date. Being in a business that works with the DNR, the MPCA and EPA, I can say first hand that the methods used by the agencies promote "best practices" for operation of companies in Minnesota. This will be no different for Polymet and the production of copper/nickel and precious metals on the area of Northeastern Minnesota. Technology continues to advance and so it will with the Polymet project. As required, they will be monitoring their process and doing the correct treatments to minimize any effects of mining. As time passes, technologies and treatments will continue to improve and we will end up with an even greater outcome. The "do nothing" option offered up by protesters of the project is the worst approach possible. We have the perfect opportunity to have a business come in to a brownfield site, prepare the site and do treatment on it for years to come. The money paid out in taxes and fees will support this treatment, along with millions of dollars for the communities and schools in our state. Let us not forget the jobs that will come with it, along with spin-off jobs resulting in mining; these communities desperately need help, as they have suffered with declines in many areas for years. We must support this project and will the laws in place and the great people we have at the agencies monitoring this process, we will have a successful outcome. Thank you for the opportunity to express my opinion, Larry D. Popovich Lead Production Coordinator Laskin Energy Center Minnesota Power/Allete Extension 4804 (218-225-4804) Cell 218-491-3222

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. We have heard of the problems with sulfates and their longterm effects on our watersheds. I have heard nothing of all the other chemicals that are required to extract metals from the tailings. What other chemicals will be used and therefore added to our water.. Thank You, Larry J Ronning 1203 Ronning Dr Two Harbors Mn. 55616 Sincerely, larry ronning 1203 Ronning Dr Two Harbors, MN 55616-3013 (218) 834-3249

Larry Smith

37868

We are homeowners on White Iron Lake in Ely, Minnesota. We are writing to comment on the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS). We are very concerned about plans to develop copper/nickel mining in our area. Specifically we are opposed to the PolyMet mine proposal. We are opposed for the following reasons: 1- Permanent water pollution will occur – Copper/Nickel mining is different from iron ore mining. To our knowledge this type of mining has never been done without doing severe environmental damage. And to do this type of mining here so near to the Boundary Water is risky at best Why would we take a chance of permanently polluting this wonderful ecosystem. As Lutheran Pastors we are personally aware of the current copper mine remediation going on north of Chelan, Washington. Holden Village is completely closed to visitors as crews try to clean up and reroute creeks. We will face similar problems in our area if copper and nickel are mined here. It is virtually impossible to prevent seepage from the mine and tailings. Perhaps millions of gallons of seepage from tailings and the mine site itself will enter ground water without being treated. PolyMet admits that water pollution by sulfuric acid will last for at least 500 years. The Gutenberg printing press was invented 500 years ago. The United States of America is 238 years old. How can we possibly plan for pollution that will last over 500 years. 2- Mining companies do not have a good history of protecting the environment - Just this week we have learned that one of the nation's largest coal producers will pay a \$27-5 million fine and spend \$200 million to reduce illegal toxic discharges into hundreds of waterways across five Appalachian states. Who will pay for the ongoing cleanup here. This type of mining company behavior does not bode well for copper/nickel mining in our area. 3- PolyMet fails to plan for inevitable accidents and failures – Pipeline spills, accidental releases, failure of water collection and treatment infrastructure and tailings basins failures are virtual certainties. There are no details in the PolyMet plan how to deal with these situations. 4- Social costs and decline of property values – We are not convinced that local Ely people will benefit from copper/nickel mining. PolyMet does not commit to the number of jobs available for local people. There may be an influx of the number of people coming to Ely, but these folks will come and go elsewhere when the mining jobs aren't here. Mining is a Boom Bust economy. Ely will not benefit in the long run. Those of us that have property on the area lakes will likely suffer decline in property values. We have planned retirement on White Iron Lake for 25 years and have recently built a new home here. Polluted waters will make our property and home undesirable. And the attraction of the Boundary Waters will decline. 5- Inadequate comment period - Please increase the length of the comment period for the SDEIS from 90 days to 180 days. Allow for more comment time. Please listen to the community – there is too much at stake to rush this. For these and other reasons we are opposed to copper/nickel mining in our area. Sincerely, Pastors Larry and Susan Smith 3217 Big Rock Dr Ely, MN 55731

We do not support the PolyMet Mining project, now or in the future. It is apparent that science and the politics don't mix well; they represent different worlds. Neither do harmful chemicals and pure water. Sometimes, it takes many years to see the negative impacts in our waters. But, you should learn from your mistakes when it comes to damaging Minnesota's waters. There are many examples to learn from in Minnesota. Cities used to drain sewage into rivers and lakes. It was acceptable science of the time. Highway departments built curb and gutters to drain road run-off (oil, gas, salt) right into the lakes and rivers. It was a cheap way to make roads safer. Businesses, like 3M, disposed of "waste products" into the soil and ultimately, into ground water. Profits were so huge that the cost of clean-up was just the cost of doing business. Did you learn from your mistakes. From experience, you should know that you are not as smart as you think. When someone dangles dollars and votes in front of politicians, the politicians cause the water to boil like a school of piranhas. Politicians subtly threaten environmental staff to approve bad ideas in the name of economic development. It is wrong that environmental issues are decided by politicians for short-term economic gains. A wise person said: "I believe there is only one conflict, and that is between short-term and long-term thinking. In the long term, the economy and the environment are the same thing. If it is unenvironmental is it uneconomic. That is a rule of nature." Mollie Beattie (1947-1996, former director US Fish and Wildlife Service If the state agencies and politicians do not approve of the project, I assume that PolyMet will sue the good people of Minnesota. This would be a bullying tactic. But, it might be better to be tied –up in court for a few years, rather than have our waters destroyed for ever. The preponderance of evidence in the PolyMet case, both scientific and social evidence, proves that the vast majority of the informed citizens in Minnesota do not want to risk the long-term quality of their water and related eco-systems for a few hundred short-term jobs. Everything else discussed in this search for a solution is nothing but smoke to confuse the issue. If approved, PolyMet will be followed by applications for more exploitation of our natural resources in the name of jobs. This is the REAL cumulative impact of a PolyMet mine. We urge MDNR to deny the permit to mine and all of the other permits associated with this project. Larry and Marilyn Wannebo 39911 County Road 66 Manhattan Beach, MN 56442 218-533-4622

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr larry yank 171 McKnight Rd N Saint Paul, MN 55119-4663

Larry Zelenz

10724

After reviewing the fact sheets and executive summaries on this project, it seems to me that what may be critical is how effectively Polymet's performance is monitored with regard to the safeguards they intend to put in place. Woefully underfunded government agencies, constrained by bureaucracy with weak punitive powers may be ineffective in assuring that the stated standards are met. I would suggest that Polymet be required to fund an independent group that includes representatives from the DNR, USFS, USACE, MPCA and citizens representing environmental groups with interest in the region acting jointly, to monitor the project on a full time basis in perpetuity. This entity should have the power to curtail or shut down operations and have standing with regard to directing punitive measures if Polymet fails to meet stated environmental safeguards. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Larry Zelenz Larry Zelenz 323 Wildwood Drive Duluth, MN 55811

Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Larry Zelenz Larry Zelenz 323 Wildwood Drive Duluth, MN 55811

The potential benefits in terms of a small number of jobs over a short range of time and extracted minerals versus the long-term impact of pollution is not worthwhile. I know that people who have been examining the environmental impact reports much more than I do have much more insightful things to say, so I won't elaborate further here. I hope you will carefully examine the issues of whether the estimates of 90% of the water being captured are at all accurate and experimentally verifiable, or are just plugging in the required numbers to come to the desired result. Larry Roberts

I neglected to include my name and contact information below. They are: Ms Laska Nygaard 1088 Hyacinth Ave E St Paul, MN 55106 612-518-8371 [HYPERLINK "mailto:laskaandbrent@comcaStnet"](mailto:laskaandbrent@comcaStnet)laskaandbrent@comcaStnet Thanks. _____ From: laskaandbrent@comcaStnet To: "NorthMetSDEIS dnr" <NorthMetSDEIS.dnr@state.mn.us> Sent: Thursday, March 13, 2014 3:47:03 PM Subject: polymet - paying for the pollution Do not permit the PolyMet mine. The proposed PolyMet mine is not the way to test out the first sulfide mine in Minnesota. The proposed location is located in sensitive environmental areas in Minnesota. These are precisely the types of areas that we need to protect and maintain in Minnesota. These are the areas we need to protect in order to protect citizens' health, in order to keep the tourist industry we hAve Minnesota has a history of thinking carefully and not permitting to-good-to-be-possible projects; it has a history of protecting its people and assets. This history must be continued. There is no way to guarantee that PolyMet would complete 200 to 500 years of necessary cleanup. There is no way to be certain 200/500 years in the future the extent of the damages that would need to be assessed and addressed. Duration of the environmental harm. If PolyMet is allowed to have the mine, Minnesotans and Americans will be required to have a polluted area of a current NATIONAL FOREST for 200 to 500 years. A national forest is intended to be protected. Treating it in a way such that it is harmed for ten to 50 generations puts unacceptable burdens on those generations: (1) the area would not be free from harm and therefore unable to rehabilitate as a safe environment over the lengthy period of time; (2) there is no telling whether the procedures and actions necessary to keep on cleaning the pollutants for 200/500 years would be completed, as we cannot see into the future; (3) there is no way to ensure PolyMet would pay for the cleanup or other remedies for the environmental damage. Perhaps 100 years would be a different matter, given that the actual people involved in the operations would be removed from the polluting acts by approximately only 5 generations, and we can only hope the world will not have changed as drastically by then. Forcing 500 years' of Minnesotans to suffer for the decision of making money now over a period of a mere 20 years - ONE generation - is illogical. Forcing them to live on hope of having the damages taken care of is illogical. The number of things impossible to foresee and that therefore could go wrong in 500 years is incalculable. Under the proposed plan, water treatment at the mine would be required for 200 years, and 500 years at the facility. So we know the duration would be AT LEAST 500 years, and we know the pollution would be BAD;they could be much worse. 200 years ago the world was not industrialized, the levels of pollution we have now were inconceivable then. We now have the ability to inflict progressively more and worse environmental harm more efficiently, quickly and easily, only we have many times more the population than 200 years ago and many times less the clean, healthy environment. No telling how our ability to exploit will grow, no telling how damage in one area can affect another. Betting on cleaning up over 200 and 500 years to be the same as now is fool-hardy. The world will be a very different place by the time those eras are reached. Money is good. I do not begrudge PolyMet it's wanting to make money. I begrudge it wanting to make money in such an inherently dangerous fashion, in an area of vulnerable environment, in an industry in which the history of cleanup is poor, such that states in which such mines exist/have existed before (and so suffer from pollution, particularly water pollution) have suffered from the pollution AND companies have failed to pay for and ensure the cleanups. When the companies cease to exist, what can a state or a peop

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The most precious and life-giving commodity that we have on the planet is water. No amount of rationalizing can prove that this proposed project will bring about more benefits than irreparable damage. Sincerely, Mrs Laura and Mr Neal Deaton 3820 Forestview Ln N Plymouth, MN 55441-1337

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Manoomin (wild rice) is recognized as a significant resource for Minnesota's tribes, access to which is protected by the Treaty of 1854- Even low levels of sulfates are proven to affect wild rice stands, a fact recognized by Minnesota's protective wild rice sulfate standaRd The PolyMet mine plan identifies wild rice beds downstream of the mine and plant, including part of the Embarrass and Partridge Rivers and Wynne Lake. Since sulfate levels in wild rice beds downstream of the proposed mine already exceed the standard, the proposal must demonstrate it "would have an acceptably high probability of not increasing sulfate concentrations in these areas" (p. 5-5). The mine plan does not meet this teSt PolyMet claims they will meet this standard by using water treatment (including reverse osmosis) to eliminate sulfates before wastewater is released. However, the mine plan predicts that 5-2 million gallons per year will seep out without treatment at the Mine Site after closure, and 11 million gallons of untreated water per year will escape the Tailings Basin (5-8). This seepage will surface and enter streams and rivers nearby. The standard to protect wild rice is 10 milligrams grams per liter of water. The waste rock left behind at the Mine Site will create runoff with sulfate levels of 2,000 to 4,000 micrograms per liter after closure, 5 million gallons of which will escape untreated every year. In fact, the SDEIS predicts that many years after closure this could violate the sulfate standard to protect wild rice, requiring additional measures (5-142). The SDEIS is contradictory, on the one hand relying on mechanical water treatment for hundreds of years in order to seemingly meet the sulfate standard, but also describing possible passive treatments that may be developed that would seasonally violate the protective sulfate standards. The EIS should eliminate that contradiction. Lastly, the SDEIS inadequately characterizes wild rice waters downstream of the PolyMet sites. The Great Lakes Indian Fish and Wildlife Council has provided additional wild rice sites other than those included in the SDEIS. The EIS should be revised to include these additional wild rice waters. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Wild Rice is Minnesota's state grain, and crucial for its cultural significance and importance for subsistence of Minnesota's Native Americans. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. The SDEIS acknowledges that amphibole fibers are present in the rock to be mined, that crushing the rock for processing releases these fibers, and that these fibers are suspected of causing mesothelioma in workers. The SDEIS further acknowledges that there have been few studies of the risk from fibers of the size that would be created at the PolyMet mine and plant site. A number of mesothelioma cases were found in mine workers who worked in the LTV Erie Plant that PolyMet proposes to use as part of their mine plan, and the SDEIS inaccurately characterizes a University of Minnesota study of mesothelioma in mine worker as showing that this risk came exclusively from the use of commercial asbestos products in the mine. In fact, the University of Minnesota did not exonerate dust from crushing ore, and is continuing to study the health impact of exposure to short amphibole fibers of the type contained in the ore that PolyMet would mine and process. Specifically, the DNR should: 1) Revise the SDEIS and conduct a formal health assessment of the risk to public health and worker safety from the amphibole fibers present in the ore at the PolyMet mine site. The SDEIS should specifically conduct a formal health assessment of the risks from asbestos-like fibers less than 5 microns in length 2) Revise the SDEIS to provide details of the air monitoring at the mine and plant site and in nearby communities, and describe contingency plans to address the risk to public health and worker safety if asbestos-like fibers are detected during construction, operation, closure and post-closure 3) Revise the SDEIS to eliminate inaccurate characterizations of the University of Minnesota mesothelioma study. Specifically, eliminate statements that imply that commercial asbestos is the primary risk factor for mesothelioma risk Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please require PolyMet to prove there is no added mesothelioma risk to workers and the public. The PolyMet NorthMet SDEIS does not adequately examine the risks to worker safety and public health from asbestos-like fibers found in the rocks that they propose to mine. I ask the DNR to require a more comprehensive public health assessment of the risk to workers and the public than what PolyMet has provided in the SDEIS. Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please fix the inaccurate water data and redo the water model in PolyMet's mine plan. Feb 14, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest I have read that PolyMet believes that it will have sufficient safeguards in place to prevent contamination; however, I do not have confidence that this is the case. It is my understanding that there is potential for contamination to occur for the next 500 years and I don't think it is realistic for us to believe we can prevent any water pollution from occurring over such a long period of time. Over 500 years, there will be many variables that we cannot predict. This is too big of a risk us and for future generations. I read that the jobs created by this project will last for 20 years. That seems great now but, if you look at the big picture, I do not believe it is worth the risk. Sincerely, Laura Carrero 956 Gorman Ave Saint Paul, MN 55118-1412 (651) 457-7980

To Ms Lisa Fay and the Minnesota Department of Natural Resources: I am registering my OPPOSITION to the proposal by PolyMet to engage in sulfide mining in the state of Minnesota. The very FACT that sulfide mining produces corrosive acid destruction to our lands and waters should be enough reason to say NO to PolyMet. I urge our Department of NATURAL RESOURCES to keep protecting our environment; allowing this mining will do exactly the opposite. We live in Cook County, on Birch Lake, on the Gunflint Trail. Like many of our neighbors in Cook County, our lakes are our ONLY source of water. Yes indeed, Birch Lake is clean and clear and, using only a modest filtration system, perfectly safe to drink. The fact that water contaminated by sulfide mining will require treatment for as many as 200 to 500 years makes it abundantly clear to me that only a few will 'benefit' from the economic ramifications of PolyMet's industry, but we ALL will pay the environment price. That is certainly not fair, nor does it make sense. Please do not allow PolyMet to proceed. Sincerely, Laura Popkes 69 Birch Lake Rd Grand Marais, MN 55604 218-388-9491

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Dr Laura Feuerborn 8816 38th Ave SW Seattle, WA 98126-3619 (206) 854-4182

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Minnesota’s public lands and water resources are part of what makes our state so incredibly unique. They are assets both now and in the future, and across the country and the world we are known for our blue waters, our beautiful forests, and our wilderness. It just seems so shortsighted to cause such an enormous blight on such an amazing resource for the short-term good of a relative few. Speculating on how this mine could be made safer than the examples of the past is not worth the potential destruction it could have on our state’s natural resources. Mining in this way has yet to be done safely. Even if PolyMet states that they have a solution, do we really want them to debut their solution in a location that could destroy so many of the resources around it, if their claims are incorrect. Trusting a company to provide cleanup for the next hundreds of years is tenuous at best. Economic growth is important to consider, but at what expense over the next short term period of time (20 years seems to be the popular number), when that expense could impact us far beyond what we can see. It’s just not worth the uncertainty and the risk to move forward with this. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely, Laura Grangaard
Laura Grangaard 1900 Colfax Ave S
Minneapolis, MN 55403

Laura Hedlund

We need to think of more than our needs RIGHT NOW. How can we with open eyes and a full heart even consider something SO RECKLESS as the polymet proposal which will pollute for more than 500 years. The need for jobs is based on economic system which we can change. There has been a slow movement toward local beer creating more than 500 jobs. We do not have to sacrifice our environment for temporary and PERCEIVED economy gains. let's start doing the hard work to fight for a just working economic system. I love the Made On the Range website. Let's support real, sustainable jobs that do not compromise our environment. We all do better when we all better. The pollution from the polymet proposal is likely to impact fishing and hunting rights - the true sustainable economy. Please say no to recklessness. Laura Hedlund 1364 Wilderness Run Drive Eagan, MN 55123 651 755 5253

4/12/14 Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Email: [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"](mailto:NorthMetSDEIS.dnr@state.mn.us)NorthMetSDEIS.dnr@state.mn.us Re: NorthMet Supplemental Draft Environmental Impact Statement Dear Ms Fay, I am a biological sciences major and environmental science minor at University of Missouri-Columbia and am writing to you about my concern with the NorthMet Proposed Action in Superior National ForeSt With my interest and concern with the environment, I believe that there should be no action taken in the Superior National ForeSt I am mainly concerned with the effects that the copper-nickel mining would have on wildlife habitat, native species of the area, nature of the land, and water quality. First, the amount of wetlands that would be destroyed is incredibly significant and would affect the organisms that inhabit them. Many species such as the lynx, bald eagle, gray wolf, eastern heather vole, wood turtle, yellow rail and many more could be affected by the mining. The executive summary itself says these species may be affected by the project and that restoration of the areas after the project could take decades. These species may not even be able to re-inhabit the areas, due to extinction or altered adaptations due to changes in the area. Aquatic organisms that find their home in the streams and rivers connected to the wetland would most likely be adversely affected with the change in streamflow, loss of connectivity of the streams and the poor water quality. Although there are no known endangered or threatened species in the area that would be affected, there is no way to predict how the species already present would be affected. There may be more species added to the threatened species list once the mining would begin. Another concern is the affect on the water quality in the area. There are already high levels of mercury in fish tissue without mining operations. The copper-nickel is locked in to the rock with sulfides. When sulfide comes into contact with oxygen, it produces sulfuric acid and releases soluble metals including mercury, iron, copper and nickel. This would increase the already high levels of mercury in the water. Contaminants like these could leach into groundwater and surface water even after the mining operation would end. This could be lethal for the citizens of the area, as mercury targets the nervous system of humans as well as aquatic organisms With an increase in sulfides in the water bodies, the wild rice that is grown in the area would be adversely affected and possibly wiped out. This wild rice feeds many in the region, including tribes in the area, citizens of Minnesota and migrating birds. PolyMet themselves say that treatment of the water will continue for decades and possibly even centuries. Economically, the PolyMet mining would create many jobs for local citizens. This is an incredibly valuable reason to establish the mining operation. Citizens of Northern Minnesota need jobs and there would be \$332 million made per year from the extracted minerals. Although these are significant short-term benefits they are outweighed by the long-term costs. It will cost \$200 million to close the mine after 20 years of operating and an estimated \$3-5-6 million to annually treat the water, which could take decades or centuries. Overall, the costs to remedy the damage done by the mine would cost more in the long run than the earnings during the 20 years of operations. There are also factors that are of crucial importance that are difficult to put a price tag on. What is the value of native species and a thriving national park. What is the value of clean water and the health of our children and grandchildren. These are the questions that must be considered before deciding to build the NorthMet mine. Overall, I believe that the NorthMet mine operation shou

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 9, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Please reject the proposed PolyMet mine. The project presents unacceptable environmental risks. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. Economic development that threatens tourism and many of our natural resources is not a good decision for the state of MN. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Laura Millberg 1504 Summit Ave Saint Paul, MN 55105-2241

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Laura Platcek 331 3rd Ave Two Harbors, MN 55616-1626 (218) 834-0788

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Laura Schauland 9609 Arrowhead Road Isabella, MN 55607

I oppose the the PolyMet open pit mine for the following reasons: 1. Pollution on an unprecedented scale in MN, and in perpetuity, according to PolyMet's own revised environmental impact statement and review of existing U.S. sulfide mining superfund sites. 100% of sulfide mining operations in the U.S. have violated water quality standards and are currently the costliest to the U.S. Taxpayer of all superfund liability, estimated by the EPA at between 20-54 billion dollars. 2. I oppose the permanent loss of our water quality in the most important fresh water resource on the planet, The Great Lakes. This project would impact Lake Superior, the largest fresh water lake in the world by surface area, and impact the St. Louis River watershed, its largest tributary and home to multiple species of fish. In addition this mine would destroy more than 1300 acres of high value wetlands and convert more than 6,650 acres of what are now public and tribal lands to private mining company property. Drinking water would be subject to toxic levels of mercury, arsenic and manganese. The mine would produce high concentrations of sulfuric acid and result in acid mine drainage, leeching chemicals out of rock which are toxic to water, ecosystems and toxic to wild rice. 3. For too long tribal peoples have been the test case against corporate rape of the land. The very placement of reservations was influenced by the distribution of wild rice, fishing and hunting places. The treaties of 1837 and 1854 which have been upheld by the U.S. Supreme Court guarantee the tribal rights of hunting, fishing and ricing upon these lands, rivers and lakes. The PolyMet open pit mine would interfere with these treaty rights by ceding surface rights of tribal lands into corporate hands and polluting tribal lands and waters of the Anishinaabe. The PolyMet mine and tailings would also increase mercury levels in the downstream reservation waters of the du Lac nation and places where the Grand Portage people fish. I oppose the mine project in support of the position that the Wild Rice/Sulfate Water Quality Standards of the Clean Water Act which was previously upheld in multiple courts must be maintained to ensure the health and well-being of the Ojibwe-Anishinaabe nations and the affected Fond du lac tribes downstream. I would also remind decision makers that according to Federal Land Management policy, National Forest Management policy, and National Environmental policy, full consultation with affected sovereign tribal governments is required for consensus on matters concerning tribal nations.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Laura Zimmerman 3515 KINSROW AVE APT 210 EUGENE, OR 97401 US

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I'm writing about the PolyMet Mining Corporation North Met mining project's Supplemental Draft Environmental Impact Statement. Sulfide mining would put at risk the wetlands, lakes and waterways throughout the Arrowhead Region of Minnesota, and most significantly, Lake Superior and the Boundary Waters Canoe Area Wilderness. Heavy metal contamination and acid mine fluids have polluted waters everywhere that sulfide ore mining has been done. We know what's at stake, and we know the irreversible damage that'll be done. Do not allow PolyMet's open pit sulfide mine: it promises to ruin this extraordinary natural area - that belongs to the public - and is definitely not in the public interest. Thank you for making the right decision for the greater good. Laura-Christina Cobb Sincerely, Laura-Christina Cobb 260 E 10th St New York, NY 10009-4802

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Our forests in Minnesota are more precious than gold. We depend on a clean environment for so many things: the air we breathe, the water we drink, the foods we grow, and the fish and game animals who thrive here. The birds, fish, insects and other animals also depend on a clean environment to thrive. There is nothing more important or precious to living things than a clean environment. Minnesota's forests and farmland are important not only to those of us who live and work here, they are important to our country, indeed the world, to provide wild places to visit and oxygen to the atmosphere. The mines PolyMet proposes are not conducive to any of the above. Please reject their proposals as a citizen in good conscience and for the future generations who want nothing more than a chance to live healthy. Sincerely yours, Laureen Guyer Laureen Guyer 419 S 19th Ave E Duluth, MN 55812

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Laurel and Bill Ehlert 3908 Avondale St Minnetonka, MN 55345-1803 (952) 200-2091

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Lauren Bywater 25 Bowling Green Close Birmingham, ot B23 5QU GB

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lauren Gedlinske 13476 Georgia Ct Apple Valley, MN 55124

Feb 15, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, The law requires that you thoroughly evaluate the environmental effects of any proposal, particularly in high quality wetland habitat under federal ownership as a part of the Superior National Forest-more than 900 acres of wetlands with an additional ten square miles downstream to Lake Superior. Birds that need this habitat include: Belted Kingfishers, Hooded Mergansers, Common Terns, Common Loons, Black-backed Woodpeckers, Spruce Grouse, Northern Goshawks and Boreal Owls. As a concerned citizen of the USA, I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering mankind's future. Sincerely, Ms Lauren Hammer 2900 4th St Apt 16 Santa Monica, CA 90405-5513

Lauren Lederle

9606

Hello, I was born and raised in MN. I now live in California, and I come home every summer to travel to the boundary waters with friends and family. The BWCA is my true home in MN, and I know many other MN natives feel the same way. The tourism that the BWCA, not to mention the clean water and plant and wildlife, provide much more for the state of MN than a Mine ever will. The polymet mine risks the safety of drinking water for northern parts of the state indefinitely. Please keep the BWCA safe, as a place where young minnesotans can go to be stewards of the wilderness, and a place that inspires them to become environmental leaders where ever they go. If this mine is allowed to move forward it would be a tragedy for me personally, for the state of MN and for future generations. Please reconsider. Sincerely, Lauren

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I am writing as a life-long resident of Minnesota, including a 4-year resident and frequent visitor of Duluth and the North Shore of Lake Superior. The backbone of Northern Minnesota's beauty and economy is the integrity of its environment. We must protect its integrity from contamination that may take hundreds of years to reverse, if it is possible to reverse at all. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. For 350 jobs we are willing to sell the environmental integrity of the BWCA. Never has a more short-term, ill-conceived bargain been made since Esau sold his birthright to Jacob. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Laurence Risser 4904 Thomas Ave S Minneapolis, MN 55410-1804 (612) 922-6596

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

47431

I have serious concerns about the inadequate Financial assurance and the careless disregard for potential disastrous environmental effects. This should not go forward without public discussions about these issues. Legislator Kahn has brought up the need for a third party insurer. The proposal is sorely lacking in both instances, it's inadequacies are dangerous. Please do not proceed with such a poorly thought out proposal. You owe further examination of these issues to the citizens of Minnesota. Sincerely, Laurice Jamieson 610 SE Sixth Street Minneapolis MN 55414

From: laurieb@tcq-net [mailto:laurieb@tcq-net] Sent: Wednesday, March 12, 2014 9:44 PM To: Fay, Lisa (DNR) Subject: Polymet mine To [Decision Maker], The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. - Laurie Bruno 7532 Oakland Ave So Richfield, MN 55423

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Laurie Gaudino 2545 Anderson Rd Duluth, MN 55811-3808 (218) 341-4544

Laurie Matson 40020

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Laurie Matson 409 5th Ave SW Waseca, MN 56093-2105

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. As a taxpayer of Minnesota this toxic mine would take our minerals for export and leave the rest of us with the financial burden. =Corporate profits over the health and beauty of our state! No to the destruction and desecration of Minnesota! And no to a precedence it would start. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Lawrence Severt 54156

No I don't! I don't believe the mining industry is capable of honesty. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Lawrence Spears 57609

The Spears 2132 Miller Creek Drive Duluth, MN 55811-1882 212-727-8462 [HYPERLINK "mailto:spears@btinet-net"spears@btinet-net](mailto:spears@btinet-net) January 9, 2014 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 Saint Paul, MN 55155-4025 [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us](mailto:NorthMetSDEIS.dnr@state.mn.us) Subject: Oppose PolyMet NorthMet Copper-Nickel Mine Lisa Fay, We oppose the issuance of the permit for any PolyMet NorthMet Copper-Nickel Mine near Hoyt Lakes. The sulfur pollution is long-term and devastating to the environment. The promised mining jobs are few, short-term and phantom. The copper extracted is very small. The benefits to Minnesota will be minimal. The mining company is likely to disappear in bankruptcy leaving no protection against the long-term environmental destruction. There is no demonstrated significant national resource interest in this mining in Minnesota. Please deny the permit for any PolyMet NorthMet Copper-Nickel Mine near Hoyt Lakes. Joanne and Larry Spears Cc: Senator Franken Senator Klobuchar Representative Nolan

Lawrence Suchy 39845

Dear sirs: my wife and I have a second home on Echo Trail north of Ely. We spend more than half of each year there. I've read all available articles on the proposed mine, and heard many diverging opinions on that mine. I believe that there is too much to lose in the environment if something goes wrong during the life of the mine, and the centuries after. As now proposed, I wish for the proposed mine to be turned down. Respectfully yours. Lawrence Suchy 10803 Linwood Forest Drive, Champlin, mn. 55316- Sent from my iPhone

Lawrence Thompson 11894

Feb 14, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. PolyMet wants to mine in wetland habitat that is presently in federal ownership as a part of the Superior National Forest. More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The Supplemental Draft Environmental Impact Statement (SDEIS) proposes NO mitigation for the indirect wetland impacts. In addition to wetland destruction, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will damage the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: BLACK-BACKED WOODPECKER, SPRUCE GROUSE, NORTHERN GOSHAWK AND BOREAL OWL. Thank you. Sincerely, Dr Lawrence Thompson 1069 Felicia Ct Livermore, CA 94550-8134

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Sulfide mining in Minnesota by the PolyMet Mining Corp would threaten wetlands, lakes and rivers in the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I have deep concerns about this project's potential impacts on our region's natural resources and public health because acid mine drainage and heavy metal contamination have polluted waters everywhere sulfide ore mining has occurred. Therefore, the Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine would be completely against the public interest. Sincerely, Lawrence Thompson 1069 Felicia Ct Livermore, CA 94550-8134 (925) 455-9473

Leah Robshaw

20202

Dear DNR leadership, I am writing to ask that you do not allow PolyMet Mining to open up a Copper-Nickel mine in Northern Minnesota. I am thankful that the USFS does not believe that the mineral estate gives PolyMet the right to surface mine NFS land to access the minerals below. I believe national lands should be used to support the long term interests of the plants, animals and people of the United States. The proposed Copper-Nickel mine does not achieve this goal. I reviewed the environmental impact reports compiled by the Environmental Impact Statement. I am concerned about the destruction of wetland habitat within the Embarrass River and Partridge River watersheds which will disrupt the plants and animals who live there. Likewise, the increased levels of aluminum and lead in the water impacts the entire food chain of species - including birds of prey and larger carnivores. I am also extremely wary of the so called financial assurances that PolyMet would set aside to mitigate further environmental destruction. The amount of funds needed to clean up a mine site and/or prevent intense pollution is not a known amount. What if the amount of funds PolyMet agrees to set aside is not enough. What if they go bankrupt and jump ship mid way. Who is left to foot the bill. Taxpayers. PolyMet is not interested in this mining project because they care about the long term economic or environmental health of this region. They care about the profits they can make. They will exploit every loophole and squeeze taxpayers of every dollar possible so they can increase their profit margins. Please help conserve and preserve our government lands and watersheds for future generations. Do not approve the PolyMet Copper-Nickel Mine. Sincerely, Leah Robinson 3210 W 44th St Minneapolis, MN 55410 612-729-9831

Leah Rogne

43366

I would like to register my opposition to the proposed PolyMet Mining project in northern Minnesota. I do not believe that the risk to the environment, particularly to the water in the region, is justified. I have not seen evidence that the company has the capacity to monitor and remediate the problems that are expected to occur for centuries to come. The natural resources in this region are too precious and the health of humans and animals too much at risk. Please do not allow this project to move forward. Thank you. Leah Rogne, Phd 3460 N. Range Line Road Gheen, MN 55771 Phone: 218-787-2212

Protect our water. Hooded Mergansers swim in northeastern Minnesota's pristine marshes, ponds, and rivers, feeding on fish, crayfish, frogs, and insects. PolyMet Corporation is proposing to destroy thousands of acres of pristine habitat to mine sulfide ore at the headwaters of the St Louis River - a major waterway that flows over 180 miles to Lake Superior. PolyMet's proposal calls for 20 years of mining, and they acknowledge that 500 years of toxic runoff will need to be collected and treated. Just like the Hooded Merganser, our children and grandchildren all deserve clean water. Let clean water be our legacy - not toxic pollution from mining. I'm tired of permanently destroying and poisoning the environment in the name of JOBS.

Lee Beaty 48019

Dear Ms Fay, Dear Federal and State Agency Leaders: Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan, I believe the mine should not be built as described. The entire process is Far Too Risky. The most important resource on earth is WATER. We need clean water to survive. It is also the "crown jewel" of our state. Do not allow anything to jeopardize our most precious resource. We must protect the people, environment, wildlife, etc. We must think in terms of the long-run, not the short-sited monetary gains which will help only a small handful of MN residents for a short while. And then "poof" we'll be left with devastation on many fronts: our land, our pristine water, our tourism industry (long-term income), and our great Northern Sanctuary. Remember that old saying: "Penny Wise and Pound (\$\$) Foolish". Please Do Not Grant PolyMet Any Permits for anything until you have in your hands thoroughly-documented, absolute, and long-term evidence/facts that their processes are 100% safe. Please not sell out the well-being of Minnesota and all her inhabitants for a small pocketful of cash. It is critical that we protect our resources, not squander them. In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely, Lee Beaty (concerned citizen of MN and resident since 1968) Lee Beaty 2801 42nd Ave So. Minneapolis, MN 55406 612-721-7108

Lee George Aide 44083

Dear Minnesota DNR: I am requesting that the PolyMet Mining Project be stopped because of the great environmental cost. This area of Minnesota is internationally known and very ecologically fragile. The cost are too great to move forward on this project. I am requesting that PolyMet be terminated as it now stands. Thank you and best regards, Lee George Aide 5549 Dupont Avenue South Minneapolis, MN 55419

Lee Gilbert 54481

lee k anderson 4367

It would be a major mistake for this new mine proposal to be approved. We do not need 200 or more years of cleanup which might never work. Remember when they told us it would be safe to dump Iron Ore tailings into lake Superior. The 300 or 400 good paying jobs for 20 years is a terrible trade for long term pollution exposure we face. There are 1,000's of good paying jobs in North Dakota. The Range needs to realize that it's major resource is the adventure people have in visiting the Wilderness and not another Pit. This only benefits the owners of the mine and the world does not need any more copper and other metal that will be recovered. Look at the price of copper today and who needs another mine producing more. Please don't allow this to go further. LA

Mar 11, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. As a resident of Northeastern Minnesota, I am disturbed by the deception used in promoting the PolyMet Mining proposal. Despite their repeated insistence that mining has been done safely in Minnesota for years and that we have the strictest environmental regulation in the country, they are doing everything they can to bypass these regulations with a completely untested technology that is nothing like the mining practices that have been used in the state before. This technology threatens our water supply, along with the timber industry, the tourism industry, wildlife, and our basic way of life in this part of the state. While sulfide mining has never been tried in Minnesota, its history in other parts of the country is clear - acid mining byproducts and heavy metal contamination have polluted waters in all other places where sulfide ore mining techniques have been used. I am, frankly, amazed than anyone who is not directly on the payroll of PolyMet would think this is a good idea. Please stop this absurd project before it is too late. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Lee Kaplan 2175 Pinewood Rd Duluth, MN 55803-8722

Lee Keeley

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I am confident that PolyMet will be long gone and Minnesota will be left holding the cleanup bag in this case. Our country has been around for ~225 years - less than half the time that PolyMet has admitted will be needed to mitigate water pollution. It truly is crazy that this is the best plan they have to offer. If PolyMet cannot offer a plan that could mitigate the pollution threat in a more reasonable timeframe that would lend confidence that a) pollution will actually be dealt with and B) the mining company will actually pay for it - then I am strongly against this plan. I would say that 50-75 years would be more reasonable - with commensurate costs to fully mitigate in that timeframe. As it currently stands, the future costs of mitigation seem WAY undervalued and are so far in the future - it truly is unfathomable to human beings. I am firmly against this proposal as it currently stands. Sincerely, Lee Schatschneider 420 7th Ave NE Minneapolis, MN 55413

Dear Ms. Fay, I'm a student at Humboldt High School in St. Paul Minnesota. I would like to inform about the problem with the environmental impact statement on PolyMet Mine. As a student at an environmental school I'm concerned about what PolyMet Mine will do to our environment. The map on the PolyMet Mine set is wrong. The map mislead the public so they don't know about how dangerous it can be and their children lives. They need to fix the map and give people the right information. For the safety of everyone and benefit everyone in the future. Thank for taking your time to read this letter. Sincerely, Leh Leh Win

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Leif Bjornson 5151 Alameda St Shoreview, MN 55126

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Leif Eugen ginstvägen 3 Ystad, ot 27171 SE

To Whom It May Concern, The people of Minnesota deserve better than a short term employment gain at the cost of polluted water for 200 years. It is astounding to me that we are even considering allowing this mining to happen. As you are well aware, clean water is becoming the single most important issue worldwide. Look at what is going on in California and the chemical spill in Charleston, WV where residents are not confident in their water supply. And also remember that people are still suffering from the BP oil spill and the man that "wanted his life back" is now involved with Polymet. Do not take a short term gains approach. Our resources need to be managed well because our children and grandchildren deserve to live in a clean environment where they can breathe clean air and drink the water. You are responsible for keeping our environment clean for all. The proposed Poly Met mine should not go forward because the SDEIS, which is seriously flawed, has not shown that mining of precious metals in rocks with sulfide can be done safely in this environment, without serious water contamination and destruction to wetlands and habitat. Recent DNR documents agree that the water flow model of the current SDEIS is inaccurate. This calls into question many of the forecasted impacts to water quality, wetlands, and rare habitats. With more water moving through the site, polluted water from pits and waste rock will more easily and quickly reach lakes and rivers. It is thus likely that more area will be polluted, and that the pollution will be greater than anticipated. The SDEIS seriously underestimates the destruction of wetlands, and has an almost “fantastical” proposal for mitigation. The size of the potential wetland destruction (up to 6000 acres) is breathtaking. Much of the modeling was based on inaccurate water flows, so more wetlands would likely be destroyed. Secondly, bogs and coniferous swamps which will be affected, are extremely difficult to restore. Do we actually know it can be done. In addition, the land swap is not a swap of equal value. Habitat destruction is also not adequately addressed. In addition to the issue of more water flow than expected destroying more wetlands than expected, the number of trucks going back and forth, the 24/7 noise and vibrations of running the plant and the mine will disrupt habitat. The assumed performance of water capture systems in the SDEIS is of 90% or greater. This high level of performance is not realistic. Engineering controls include the seepage capture system at the flotation tailings basin, the cap and liner system and the hydrometallurgical tailings basin, and the discharge control feature for the west pit lake. Failure or under-performance of any of these features will result in water quality impacts that are not described in the SDEIS. How can we know we can treat polluted water for several hundreds of years, let alone into “perpetuity”. Think of how much change occurs in our lives in just 50 years, let alone 500- The assumption that human constructed water capture and treatment facilities will last 100 years is not believable. Do we seriously think Poly Met is going to be around 300, or 500 years from now. False Assumption: We’ve studied this for so long that we know enough and should just get going. Actually, the opposite is true. If Poly Met were able to mine without problems, their project would have been approved years ago. We should not take one of the most beautiful, natural areas of the world and will destroy it forever. Do we really want to pollute our rivers, underground water and Lake Superior. This is the opening to vast areas of mining. Should we aspire to be the next Pennsylvania or West Virginia. The beauty of this area is what makes our state unique. I see a lot of “magical thinking” (predicting) in this project. It’s not worth the risk. Len Jennings, 2222 Hillside Ave, St Paul, MN 55108

Len Anderson

19512

LEN ANDERSON: My name is Len Anderson. I live at 130 Twin Lakes Drive, Cloquet, Minnesota. I would like to speak to the lack of cumulative impact in the EIS. Cumulative impact is mandated by NEPA, and I think the attempts at cumulative impact were not adequate to what NEPA policy demands. I'll give examples of that. Cumulative impact for sulfate and methylation of mercury I think is one of the biggest weaknesses of the document. The cumulative impact is calculated and discussed for the Partridge River and the Embarrass River and then stops at the mouth of each of those rivers, and it appears that the authors think that the movement of sulfate stops at the mouth of those rivers, but in fact, it continues all the way down the St. Louis River to the estuary, and the modeling for cumulative impact of sulfate on methylation of mercury needs to be done all the way down to the estuary. We have fish consumption advisories. This body of water is listed under 303(D) of the Clean Water Act as impaired from mercury, and our children are being born with dangerous levels of mercury in their cord blood. There is no TMDL yet for the St. Louis River, even though it has been a work in progress for 16 years. The MPCA said in February of 2013 that we do not know enough to do a mercury TMDL for this watershed, but now as I read the SDEIS, they claim that we know enough about mercury in this watershed to permit this mine which will be generating mercury and sulfate. Somebody is wrong. Is it that we don't know enough for the TMDL? Or if that's the case, how do we know enough to permit the mine? The mercury TMDL is scheduled for the Embarrass chain of lakes for 2015. If permitting cannot wait, if we have to permit it now, then the adaptive water management plan has to be changed so that it can accommodate recommendation from those TMDLs. Cumulative mercury impacts were addressed in the EIS but there was no accommodation made for the recommendations that would come out of the TMDLs, and that change has to be made in the adaptive water management plan. A permit must not grandfather in mercury and sulfate releases that then compromise those TMDLs. I'd like to also address the need for an extension of this comment period. I can give an example from the impact of sulfate on wild rice. We all know that at certain levels, sulfate damages wild rice. The State of Minnesota Legislature allocated funding for two years of study of sulfate impact on wild rice. Those two years are coming to an end now. The Wild Rice Research Team will be doing a review of study results and preliminary recommendation from the last two years of research in the spring of 2014. For example, the projected seasonal release of high sulfate water appears in the EIS to be just a wild guess about when it would, if ever, be appropriate. There is no research cited that if you release large amounts of sulfate water in the months of September and October, that you're home-free for impacting the sulfide in the sediments of those waters. Nathan Johnson has been researching the seasonality of sulfate impact on sediment chemistry but is not complete and he's not even referenced in the EIS. Sometime this spring, we should get those results, and our 90 days are going to be up. So I am asking for an extension of the comment period, and I'm just giving that one example of additional research that is coming -- really significant research that's coming online sometime shortly after the comment period is over. Thank you.

Len Jennings

21780

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Would you really consent to getting into "bed" (business) with GlencoreXstrata, the company whose CEO Ivan Glasenberg, worth \$6-6 billion, reaped a 2013 dividend of \$182 million after receiving \$173 million for 2012- Whose vilified ex-BP boss, Tony "I want my life back" Hayward, hired to oversee environment and safety, was given a British university award as a "distinguished leader" but whose award ceremony was stopped on multiple occasions by jeers and walk-outs. The above company is so corrupt, so wallowing in cash, that it could hire this man (He entered a yacht race while BP Horizon gushed.) without a question. This guy in Minnesota. He's not us. Doesn't get us. How will this company guarantee our lakes and waters for the next 500 years. Please look again. (Warning: Hold your nose.) Len Jennings 2222 Hillside St Paul, MN 55108 612 963 2733

40091

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Len Jennings 2222 Hillside Ave Saint Paul, MN 55108-1609

Lena K Gardner 58099

I believe that it is an error to base a decision that will have such big impacts on a flawed water study. I encourage the MNDNR to consider the impacts of long term pollution. And that cost isn't worth the short-term employment gains, especially at a time when the company PolyMet is showing signs of economic instability and historically when mining companies go bankrupt. The public foots the bill and leaves an even worse economic situation.

Lenore Reeves 41936

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Lenore Reeves 19934 Hickory Stick Ln Mokena, IL 60448-1368

Leo Babeu

19307

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Although I write you as a member of Water Legacy, I also write as a concerned citizen of northeast Minnesota, as a trained environmental scientist who is familiar with the need to evaluate the veracity of data, hydrological and biogeochemical activity models and their assumptions and flaws, and most of all as a disappointed witness to the kind of political pressure being brought to bear on our regulatory structure and your fellow professionals entrusted with environmental review of this landmark project. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS seems to be one-sided. Well-documented tribal Major Differences of Opinion call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles and tailings heaps won't seep pollution, that mining won't dry out wetlands and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Leo Babeu 7100 Mikkonen Road Two Harbors, MN 55616 218 834 2247

Dear Lead Agency contacts: My name is Patricia Schmieder, of 7100 Mikkonen Rd Two Harbors MN 55616- I want to list the areas of my greatest concerns about the issues inadequately addressed or left out of the Polymet NorthMet Mine SDEIS 1- I want to see considerably more analysis of the details of the greenhouse gas emissions impact of all the activities, from electrical to mechanical to long-term treatment systems of the 200 plus year horizon of all activities related to the project. 2- I would like to see better details and more complete impact analysis on the health risks from the following: fugitive air emissions of dust and asbestos-like fibers, the exposure profiles for workers and residents of the area evaluation of the cancer risk from the exposures to fibers, dust, nickel, and other contaminants expected to arise from the mine activity. the risk to drinking water from priority pollutants like arsenic and other minerals (eg manganese), both in local surface waters such as Colby Lake, and in ground water susceptible to mine and waste rock pad and tailings pond leaks and seepage the risk of both new sources of mercury and the prospects for increased mobilization of mercury already in the receiving waters, eg the Embarrass River, the Partridge River, the St Louis River, and the Lake Superior Basin. That mobilization can be expected to involve both increased methylation of historical loads of mercury and new mercury inputs, as well as bioaccumulation by migrating and resident fish species. 3- I would like to have the authors justify the use of active treatment processes for resolving potential contamination over the 200-500 year horizon. This is in direct conflict with stated statutory provisions for permitting a mine project. 4- I object to the replacement of intact functioning wetlands with less diverse and healthy wetlands within the watershed and find the replacement of over 2/3 of the acreage of wetlands outside the Lake Superior basin to be of very low functional ecological benefit. Additionally, the 5,000 plus acres that will be indirectly impacted by redirection of ground water and other impacts are not subject to replacement or a mitigation plan in the SDEIS. 5- The land exchange with USFS provides fragmented tracts, does not maintain the value of public assets, gives us public land with severed mineral rights and thus poor protections, and comes nowhere near replacing the ecological functions lost in the St Louis River Watershed. 6- I use predictive models in my own work. I understand that all models are wrong, but some are useful. I find the use of a water quality model that can't predict current WQ parameters to be highly problematic. Please beef up and redo the application of the GoldSim if necessary. 7- Most of the optimistic projections for the protection of water quality in the receiving waters around this project rely heavily on estimates of average and seasonal flows over, through, and under the site. Accurate groundwater flow rates are crucial to realistically predict pollution and seepage from PolyMet's mine pits and waste rock piles to the Partridge River. As I understand it, the XPSWMM model underestimates by at least three-fold the volume and rate of flow across the relevant site terrain. I recognize that these models can be improved, but the data for improving them and the ensuing adjustments of base flow and the assumptions they change about water quality impacts must be thoroughly, systematically evaluated to determine what the real impacts on metal solutes contamination and elevation of sulfate in the downstream reaches may be for the centuries beyond active mine operation. 8- Please amend the SDEIS to adequately enumerate fully the direct and indirect potential losses to hunting, fishing, and gathering rights, as well as access to culturally sensitive areas, for the tribal members who ha

Hello Lead Agencies, MDNR, USACE, and USFS: My name is Leo Babeu, and I reside at 7100 Mikkonen Rd, Two Harbors MN 55616- I have worked in both federal and state environmental protection entities (primarily in research, not regulation), so I am well aware of the burden placed upon the employees of such agencies. I also have a high regard for the vast majority of individuals working for these institutions, often under significant implied pressure to move projects along to some deliverable outcome. My sharp criticisms of the Polymet environmental review process is focused on what I perceive as the dangerous outcome and precedent for future negative outcomes that I believe the process embodied in the SDEIS produces for Minnesota's ecosystems and residents. I do not mean to say that any lead agency's employees willfully produced an overly optimistic or inadequate document, rather that a host of factors led to a collective process and product that portrays an unprecedented project and proponent, whose outcome is fraught with risk and uncertainty, as technically and ecologically tenable for the proposed project area. This comment period should have been expanded for at least another 60 days. The DNR Commissioner has repeatedly emphasized the need for comments to be technically relevant if they are to be useful. That means plowing through 2,169 pages of material which is not in a format the average lay person can readily absorb. Given that at least 30% of Minnesotans have very poor internet service, ie no broadband, the process of reviewing and responding to the SDEIS is a greater burden for many outside the Metro areas. These extra days of review would really make but a small difference in the total project development time, and would assure every relevant perspective is heard. Pressure to bring this project to fruition should not be allowed to disadvantage the average citizen, who is not to blame for the checkered past of the 2009 DEIS or subsequent work required to address the original inadequacies of the review process. I am very disappointed in the co-lead agencies' resistance to extending the comment period, and the holding of the three public hearing so soon after the release of the SDEIS. I also wish to request that you consider each area of concern that I and others raise in the context of what's best for the public, as opposed to how the status of the lead agencies may be affected by the critique. The 33 pages of Appendix A raise concerns that you already have a rubric for sorting a host of relevant public comment concerns into schematic boxes that you believe have been adequately responded to in the 155 or so thematic responses that you have prepared. How will you weigh the validity of those most frequently and intensely expressed concerns as you move forward. Reliance on reference in the thematic responses to the section and page where an issue is addressed becomes, at some threshold of expressed public concern, an insufficient response to a broadly perceived weakness in the evaluation of the project. What are the metrics and feedback built into the next stage of environmental review that could give weight to public perception of future mine related externalized financial and environmental costs, such that additional supporting materials should be made public, or further studies and revision and ground-truthing of models required. Having made my biased critique of the comment process and the institutional resistance to careful weighing of those comments, I offer my own issue specific concerns over the SDEIS. However, it requires me to step back and consider the totality of the problems entailed in reviewing a proposal to site, operate, close, and eventually reclaim a copper-nickel mining operation near the Laurentian Divide in a water-rich environment. The issue that this SDEIS cannot and does not address is the existential case of whether, all knowable physical and socio-economic facts and historical trend

Feb 14, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

To whom it may concern, I am Leo Gross Jr. I've been paying attention to what has been going on with polymet for a few years now. Polymet can do the process safe I don't see any reason it should not go forwaRd I believe the SDEIS is complete and gives regulators what they need to give polymet the permits to move forwaRd I have family and friends that live on the range and they could use the good paying jobs in that area and we all know the state can use the extra revenue. I've seen what a lack of good paying jobs can do to a town after we lost 3 OSB mills here in northern MN. Leo Gross Jr 27087 Obrien CK RD NE Hines, MN 56647 Sent from Windows Mail

My name is Leonard Anderson and as I mentioned in my previous comments, I have a M.S. in Biology from St Mary's University in Winona Minnesota, with an emphasis in aquatic and terrestrial ecology. My professional career was teaching at the high school and college level. I have studied the ecological dynamics of the St Louis River watershed for forty years. I apologize for sending these additional comments in at the very last minute, but there has been two big developments in the last two days that have a strong bearing on the PolyMet proposal. First, was the EPA announcement that they have dropped their approval of the Mesabi Nugget variance for how much sulfate they can dump into Second Creek which is a tributary of the Partridge River. One aspect of that variance that is now disallowed, was to allow them to store high sulfate waters during the summer growing season and then dump high sulfate loadings in the fall. The PolyMet proposal submits on page 5-216 of the SDEIS that they will use the same seasonality approach for their release of sulfate to waters used for the production of wild rice. They have no data to show a complete year long surface water sulfate-porewater sulfide mass balance to support such a high sulfate release after the growing season. They must be forced to meet the wild rice sulfate standard of 10 mg/L at a minimum, at all times. The second big development in the last two days was the release yesterday, 3-12-14, by the MPCA of the Preliminary Analysis of the Wild Rice Sulfate Standard Study. Table #1 of that report shows that for wild rice the protective concentration for sulfide lies in a range between 150 and 300 micrograms/L derived from the hydroponic exposure experiments". Figure 3 shows that as sediment porewater sulfide concentrations increase, there is a decrease in wild rice coverage in the field. They conclude that the "field data as represented in Figure 3 are broadly compatible with the likely protective sulfide concentration range of 150 to 300 microgram/L. It shows that wild rice coverage decreases as sulfate concentrations increase. Then on page 16, they tie sulfate to sulfide production. They say, "Higher quantile percentages predict that sulfide concentrations of 150 to 300 micrograms/L relate to sulfate concentrations below 10 mg/L. This is supported by Figure 10 which shows a decline in wild rice coverage with even small increases in surface water sulfate concentrations. In conclusion, from the lab to muck, this research has shown that surface water sulfate by way of porewater, sulfide damages wild rice. If you are going to deviate from that conclusion, you have to integrate a complete suite of factors, including stream velocity and wave action, upwelling of ground water, abundance of dissolved iron, oxygen penetration of sediments, presence of available carbon and temperature. The PolyMet proposal has not done that for either the Partridge or Embarrass River rice beds and therefore should be held to releases of 10 mg/L or as this new research indicates, less than 10 mg/L of sulfate. Now that we are relating sulfate to sulfide, we need to look at the impacts to freshwater fauna as well. We need to consider animals living immediately on or in the sediments that would be contacted by sulfides produced in the porewater. Macro invertebrates such as Ephemeroptera and Odonata larva are present in PolyMet receiving water sediments. Also fish lay their eggs on those sediments. Remember that sulfate levels below 10 mg/L produced sulfide concentrations between 150 and 300 micrograms/L. The EPA National Recommended Water Quality Criteria for sulfide is only 2 microgram/L. This is backed up by research. Colby and Smiiti-i (1967) found that concentrations as high as .1 to .02 mg/L were common within the first 2 mm of water above the sediment. Walleye (*Stizostedion vitreum*) eggs held in trays in this zone did not hatch. Adelman and Smith (1970) reported that th

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Leonard Madsen Leonard Madsen 233 Page St E Saint Paul, MN 55107

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please specifically address the issues of 1) the long-term need for protection from the toxic material in the crushed and pulverized mining wastes produced by the proposed PolyMet mine and 2) the degree of effectiveness of their proposed system for keeping the entirety of the wastes produced over the lifetime of the mine separated from and completely sealed off from the natural environment over the time-period the wastes will remain toxic. Please consider the very serious likelihood that the approval of the PolyMet mine will require between 200 to 500+ years, or between 10 to 25+ generations, of scrupulous, 100% effective large-scale environmental protection to keep huge areas of northern Minnesota ground water free from highly toxic pollutants. If there were even a moderate or mild possibility that this mine could exact such a burden upon your great grandchildren's great grandchildren's great great grandchildren, conservatively estimated, with the risk of failure being devastating destruction to our precious natural resources and life supporting eco-systems, how can you possibly not exercise the utmost due diligence in determining the long-term consequences of approving the PolyMet mine proposal. Putting the viability and environmental safety of a great portion of northern Minnesota at risk for a period of 200 to 500 years or longer is a moral and ethical responsibility that tens of thousands of Minnesotans like myself believe absolutely overrides the economic benefits of 20 years or so of operating the PolyMet mine. I look forward to your response to my concerns in a revised PolyMet NorthMet SDEIS. Sincerely, Mr Leonard Major 8435 Red Oak Dr Mounds View, MN 55112-6148 (763) 717-9168

Les Herman

Mining all across northern Minnesota should be allowed. The people need the jobs, and the State needs the Tax revenue. I know that between the State and the companies they will do a fantastic job to protect the environment, and as the mining is going on and after, access to hunting and fishing areas will be improved. Thank-you for the chance to state my opinion,

Les Herman

Mar 10, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Lesley Stansfield 681 27th St San Francisco, CA 94131-1811 (415) 641-8824

Leslie Baken 24432

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I am writing to comment on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. 1- Sulfide mining is untested in Minnesota, a region rich with wetlands. This project unjustifiably threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. 2- Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I oppose the Federal land exchange of protected Superior National Forest land to facilitate PolyMet's open pit sulfide mine. This is definitely not in the public interest nor it is an environmentally sound venture. Our wetlands, including Lake Superior and The Boundary Waters are national resources which must have their protection above all other interests. This area is both a critical source of fresh, clean water to its residents and the local environment, and contains unique and pristine national parks. Sincerely, Leslie Baken 4316 Glencrest Rd Golden Valley, MN 55416-3319 (763) 374-2381

Leslie Davis 44929

Earth Protector, Inc. P.O. Box 11688 622 Lowry Avenue North Minneapolis, MN 55411 612/529-5253 March 13, 2014 Ms Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Re: Comment on PolyMet Draft Environmental Impact Statement Dear Ms Fay, When I came to Minnesota with my family in August 1962, and saw the vast fields of corn and soybeans, the enormous water resources of Lake Superior and the Mississippi River, and our under-ground water supplies, it was breathtaking. One day I took my family to the Mississippi River shoreline in the Twin Cities where we saw signs that read, don't swim in the river, don't eat the fish, and don't drink the water. The Mississippi River. How could that be. This wasn't Bayonne, New Jersey and the Hudson River. It was the Mighty Mississippi in pristine Minnesota. An open sewer in the heartland that rivaled any sewer in the eaSt Who did it. Why was it allowed. Why is it still allowed. What I learned over time was that our impressive resources were polluted with chemicals ranging from arsenic and atrazine to lead and mercury, and hundreds more. How could that be. Who was protecting these resources. How could companies like 3M and Koch Refining each be allowed to take 3 billion gallons of publicly owned under-ground water for practically nothing, turn it into toxic slop after using it in their manufacture processes, and then dump it into the Mississippi River where it makes its way to Lake Pepin in Wisconsin and on to likely add to the dead zone in the Gulf of Mexico. I found that all much more breathtaking than my first impression of Minnesota's resources. Over time I learned how this happened, and how it continues to happen. It's because the people want it. The people want it and Koch Refining and 3M are delighted to provide it. They also provide thousands of jobs, lots of taxes, stock for shareholders and pension plans to fatten up on, and an army of governmental lobbyists and lawyers to make certain that no one stands in their way of providing their products without interruption. Because the people want it. The people want the gasoline from Koch Refining, the tape from 3M, the electricity from the nukes, the chicken legs from the anti-biotic stuffed chickens raised in confinement barns, and the pieces of hogs whose only chance in life to see the sun is if it's out on their trip to the slaughter house and the horror awaiting them. The people want it and the Department of Natural Resources (DNR), Pollution Control Agency (PCA), Army Corps of Engineers, and a multitude of other agencies, screeners, and authorities, at every level of government, make sure they get it. That's their job. Make sure that industry can provide what the people want. For example, the people of Minneapolis want to dump their garbage, with minimal effort, into a big bucket, and have the garbage fairy take it away to a huge burner in the heart of the city, where it's burned for them, and the most toxic air emissions mankind ever produced are spewed from huge smokestacks, directly into the air intake ventilation systems of nearby buildings and neighborhoods, and onto the pitchers mound of their neighbor, the Minnesota Twins ballpark. The people want it that way and the City of Minneapolis, Hennepin County, Metropolitan Council, Pollution Control Agency, state legislature, all made sure they got it and that they're protected. Now PolyMet says the people want copper, as if there's not enough copper available from around the world. Copper for wind turbines, lap tops, electric cars, and other gadgets. Now the multitude of companies waiting in the wings for PolyMet to clear the way for them so they can also please the people with gobs of copper, enlisted their union allies and their connections, the school leaders destined to get a piece of the action, and all their political friends, union buddies, and r

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Leslie Stewart Saint Paul, Minnesota

I have the misfortune to have a polymet employee,neighbor from hell -thief,liar anything to get more land,along with another land trickster accompless polymet worker. I don't know if polymet looks for people of this callibr,the trickster likes to attact old land deads (back then the lag. and lat. numbers had to be figred out with pencle and paper) -with the gps all of the real old deads are off -but the land was bought,and aggred apon by the seller and the buyer - my neighbor from hell destroyed the old property fence which was older then he was and then lied about it's even being there - all the good neighbors know better. The point is can we trust polymet land trust with people like that or is that the norm for this kind of company.

40165

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described.I believe polymet,LTV are just company raiders that have a bad track recoRd I worked for Erie Mining and then LTV for 33 1/2 years. First off the concentrator was leaking acid years ago,and all floor wash goes out to the tailings pond,which was course to-fine ground waste rock,the water flowed through the dike,and into the Embarrass. Polymet is way to slopply to trust the prime wildlife habitat , the moose ,deer herds ,large fish in the old abanboned ore pits,and the birds from the eagles ,partridge, ducks, geese and many kinds of small birds. I have seen wolves,fox,and bear on the property . With the more dangerous chemicals ,needed for polymet to extract the metals thay want , would poison the water supply of the whole state. I have the misfortune to have a polymet self proclaimed big shot neighbor or better known as the neighbor from hell ,and if he is a preview of coming events ,polymet shoud not be permitted to operate in this state. People what don't respect property lines, destroy boundry fences = are criminals,thieves = this is to important ,to trust tricktters ,thay want more freedees, and thay don't plan to pay any cleanup for the mess thay will cause to the habitat, all the wild habitat will die,the ground water will be poisoned for five houndred years may be forever. Sincerely, Mr Lester Haveri 5179 Road 51 Aurora, MN 55705-8434 (218) 229-2784

Letitia Noel

41608

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Letitia Noel 55 W Goethe St Chicago, IL 60610-7406

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 11, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Leya Klingsporn 1830 County Road D W Saint Paul, MN 55112-3515 (651) 955-3914

Liese Reisinger

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Liese Reisinger 2215 Blaisdell Ave Minneapolis, MN 55404-3359

SDEIS Input, Has PolyMet done this type, sulfide mining, of extraction before. Does PolyMet have a track record How long have the primary 20 executives for PolyMet been working together. What other mines has PolyMet worked with. What other mining operations have the people in charge of PolyMet worked for. How have those other mining operations done. Is there a track record for the type of mining that PolyMet is proposing. Where has PolyMet operated, successfully, in the past Who are PolyMet's environmental protection employees. Where have PolyMet's environmental protection employees been employed most recently. What other mining companies have PolyMet's environmental protection employees worked at over the past 20 years. Thank you, Virgil Boehland 9 Amber Lane Esko, MN 55733 218-260-0784

52545

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404 " Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation " wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please: • Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance. • Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS. • Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions. • Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect " wetlands losses. • Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin. • Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands. Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

I think the mine is a bad idea. It does not guarantee any longterm jobs and will destroy the already striving economy and culture up there. There is evidence that it's not going to work so don't do it.

Alphabetical by sender's first name

Lily 54347

Dear Ms. Lisa Fay, EIS Project Manager I think that if the Polymet Mining plan were followed exactly then everything would wonderful, but it seems like that is unlikely. Although the jobs the project promises would be good for Minnesota, likely quite a few would temporary jobs, and it seems like there wouldn't be very many permanent jobs. So the jobs wouldn't really be very beneficial to the state if they are just temporary. The environmental effects of this mine seem as if they would be devastating and permanent, impacting the state for hundreds of years. It seems extremely unlikely that it would be possible for Polymet to continue the water rehabilitation for the two-hundred plus years that would be needed. As someone who lives in Minnesota, I was sad to see that the plan for this mining includes the complete destruction of nine hundred and thirteen acres of wetlands. Especially since wetlands hold so many of our native plant and animal species. I was also sad to see that the plan included the possible destruction of several already endangered species and eleven different plants, since wildlife means so much in Minnesota. Yet another thing that I was appalled to see, was that the mining might prevent the control of Invasive species, while so many native ones would be destroyed. Another major concern of mine was that there seemed to be a pretty large amount of the Superior National Forest that would be destroyed once the mining was done. I read a public opinion piece that stated that the value of these minerals will only increase over time, since I believe this is true I think that the mining should be halted until Polymet can come up with a plan that significantly decreases the harmful lasting effects. As a young adult who cares about the future, I was appalled and alarmed that the plan included some possibly harmful and lasting air pollution that would be incredibly hard to undo in the future. Especially after the PolyMet had moved on to another project. I have the same concern about the pollution that would be deposited in the rivers in Minnesota, because water is a necessity of today and tomorrow. And once water is polluted it becomes harder and harder to undo, just like air pollution. Please don't go forward with this mine. I don't think the harmful outcomes make it worth it. Sincerely, Lily

Lily Nelson-Pedersen 39805

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Lin Hipp 39350

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Lin Hipp 33129 Nueman Trl Lindstrom, MN 55045-9121 (651) 308-8787

Lin Hipp 39351

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Lin Hipp 33129 Nueman Trl Lindstrom, MN 55045-9121 (651) 308-8787

Lincoln Brown 18289

Lincoln Brown. I am six. I just turned six in January. I just think that they shouldn't be mining that.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Linda Centorrinio 10002 TERRY ST FAIRFAX, VA 22031 US

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining is a dangerous chance to take with our precious water resources. It threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I am deeply concerned about this project's very likely harmful impacts on our region's natural resources and public health, including: damage to human health, risks to water quality, loss of wetlands, harm to wildlife, and cumulative damage to the environment from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Linda Cooke 8570 Greenway Blvd Apt 306 Middleton, WI 53562-4738

We understand the need for jobs, but the potential downsides of an environmental disaster are just too great. We were assured by BP that everything was safe. We were assured by Exxon that everything was safe. Both those were disasters that are still with us today. The risks are just too great.. We are losing natural habitats daily. We have to put a stop to it.. Take pride in Minnesota and what we have and are. Protect Minnesota Linda <https://mail.google-com/mail/u/1/e/gtalk.35C> Have a Great Day. Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Linda Forcier 7055

I strongly oppose the proposed mining of copper etc in northern Minnesota. The paper has reported it will bring 300 jobs for 20 years to the area. This is very shortsighted compared to the hundreds of years of possible pollution. After 20 years the area will not only be possibly devastated by pollution but also be more destitute of jobs than now. Especially if the mining decreases tourism. The risks to trees, wild rice, animals, birds, and even people cannot be ignored. With the global threats related to earth warming, this is not the right time to add to the problems. We should be learning from the W. Virginia spill that companies will NOT be around to clean up. Thank you. Linda and John Forcier, 5411 O'Brien N, Stillwater MN 55082, 651-439-6366

Linda G Powless 57234

Please do not allow PolyMet in No Minn. Our land & waters must be preserved. I was raised in the copper country of NE Mich and know how the land/water is ravaged – and the money sent elsewhere. Linda G. Powless 4912 Wyoming St Duluth, MN 55804

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Linda Garrison Winona, Minnesota

Linda Glaser

Dear Ms Fay, Dear Federal and State Agency Leaders: I'm very concerned and horrified that we are considering the PolyMet sulfide mine proposal. Is it right to put our water resources at risk, when clean water is a when the risks will impact generations long after we are long gone. No amount of clean up money can restore the loss and contamination of ground and surface waters, along with the loss of forests, wetlands, and wildlife. Land dominated by leaching mine waste rock piles, tailings basins, and open pits is no longer usable. PolyMet's SDEIS needs to be shelved. The PolyMet SDEIS doesn't even analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't even examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. We can't accept a proposal that allows pollution to seep from mine pits into the Partridge River surficial waters "in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely, Linda Glaser Linda Glaser 4215 Luverne Street Duluth, MN 55804 218 525-4986

I am very concerned that the SDEIS states that 200-500 years of clean up will be required. Yet the MN Rule 6132.3200 does not allow perpetual treatment. It requires that once a mine is closed, it must be maintenance free. This proposal is irresponsible and frightening. Please address this issue before giving permission to mine.

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Linda Gridley 607 Clifford St Saint Paul, MN 55104-4907 (651) 341-0908

Linda Hansen 40989

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Linda Hansen Linda Hansen 2021 Carnelian Ln Eagan, MN 55122

Tim Dabney
U.S. Forest Service
Superior National Forest
8901 Grand Ave. Place
Duluth, MN 55808
Dear Mr. Dabney,
As a concerned citizen of Minnesota, I believe in supporting what is best for the people of Minnesota. We are known for our strong environmental laws which were legislated to protect our beautiful natural resources. Unfortunately, these laws have not been uniformly enforced. In this regard, I have some comments on the proposed PolyMet NorthMet Mine Proposal as described in the SDEIS. I am concerned about the loss of high-quality wetlands in exchange for moderate and low-quality wetlands in the land exchange. Wetlands keep our waters clean, prevent soil erosion, sequester carbon dioxide and provide vital habitat for waterfowl and other wildlife. These some 6,000 + acres will be adversely affected both directly and indirectly by the NorthMet Mine. How are carbon releases from impacted wetlands measured? How can we allow for such a large loss of wildlife habitat and the negative impact on wildlife travel corridors? Where is the data on the effects on migratory bird species? Additionally, I have difficulty understanding how MN Rule 6132.3200 can allow for a perpetual water treatment following a mine closing. It seems to be a matter of semantics whether it is called "long term" or perpetual: 500 years says perpetuity to me. Thirdly, what are the contingency plans for accidents which occur at most mines of this type? Such accidents include pipeline spills, failure of water treatment systems, accidental releases of contaminated water and tailings basin failures. What about the known fractures and faults in the area of the tailings basin? Contingency plans need to be detailed in the SDEIS so that the citizens of Minnesota have all pertinent information before permitting begins. In conclusion, when the risks to the environment over hundreds if not thousands of years are weighed against the relatively short term and unimpressive economic gains, it is clear that the public will not benefit. I urge you as one of the agencies responsible for the protection of our precious resources, to refuse the land exchange and thereby deny the permitting process to the PolyMet NorthMet Mine. Thank you for your consideration of my request,
Linda Herron
2617 E. Fifth St.
Duluth, MN 55812

49592

Dear Mr Dabney, As a concerned citizen of Minnesota, I have been examining the SDEIS pertinent to the PolyMet NorthMet proposed mine and the US Army Corps of Engineers Clean Water Act Section 404 wetlands dredge and fill permit. I find that due to the following, I am unable to complete my examination by the March 13, 2014 deadline: 1- the SDEIS is extraordinarily long 2- it is complicated and difficult for a non-scientific person to understand; it appears to be written for the scientific community rather than the general public 3- information on geological conditions such as earth fractures under tailings pits is missing 4- water flow data on the Partidge River has been questioned by the tribal community and therefore this data needs to be re-examined by the USACE 5- data on carbon losses due to destruction of wetlands is missing In light of these reasons, I ask that a 90- day extension be made for comments on the SDEIS and the Section 404 wetlands permit. Thank you for considering my request as quickly as possible. Sincerely, Linda Herron 2617 E. Fifth St Duluth, MN 55812

Ms. Lisa Fay DNR Mining Project Manager
Mr. Ken Westlake TJSRP
Mr. Douglas Bruner US Army Corps of Engineer
SMr. Tim Dabney TJS Forest Service
Dear Madame and Gentlemen,
As a life-long Minnesota (65) years I want to express my great concern about the well documented dangers of sulfide mining, and ask you to reject the Poly Met NorthMet SDEIS as inadequate. Research and experience show the proposed mining operation would probably poison our groundwater forever. I'm a regular consumer of hand harvested Minnesota wild rice, which I understand cannot grow in water with elevated sulfate levels. I'm not too excited about elevated mercury levels in children either. This type of pollution would also have a negative effect on tourism and fishing, making it additionally an economic issue. I hear that recent news of internal DNR documents show serious flaws in the research on this project, leading me to question whether any research was based on sound science. Please do the right thing for our beautiful Minnesota environment, for our economy, for our food sources and for future generations. Please reject the Poly Met NorthMet SDEIS. Thank you for your attention to this issue. Sincerely, Linda M. Huhn

Linda Johnson

Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources
To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According to the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The eroding conditions of the planet demand that we are prudent in our activities from now on. With an increasing world population, we need more not less from our natural resources. The top of the list is water to sustain life and likewise, air. There seems to be a growing 'need' to have mined products like copper, uranium, etc to create and power all of our 'first world' wants (not truly needs). Of course I understand that the materials are vital for our world today, but I'm sure there are remedies to be found that are better for the environment, even if it's costlier. This shouldn't be an all or nothing situation. Before any mining is allowed in a protected area, it should be mandatory to use known methods that are better, not cheaper. Owners and others who profit should pay in advance for truly independent inspections with 'conflict of interest' clauses enforced. There have been many cases of the mine owner(s) reaping the profits and not helping the workers when there are accidents. This should be fixed, now. Safety trumps profit. Regulators should also be required to fully disclose the dangers and provide (at the owners expense) for monitoring and care for anyone impacted by the mining activities such as cancer clusters for instance. If this mining activity is allowed, we will be poisoning our environment further, including the non replaceable fresh water which is a known casualty already. 500 years cleanup. If we continue on this path, we may not be around in 500 years. I believe it is immoral to continue plundering for profit without having the ability to successfully mitigate the results. This has to be evaluated carefully. I believe it is in the best interest of our State and the Country to say no; or at least not until you can prove a more successful mitigation for this project. A very limited number of people will reap the lucrative benefits while destroying an environment that benefits everyone, practically forever. If they can't do it responsibly now, they should be denied a permit at this time. Short and quick profit resulting in destroying pristine lands forever is penny wise and pound foolish.. A slowdown on this may provide the opportunity for entrepreneurs to develop and implement better

Lisa Fay, EIS Project Manager DNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Ms Fay, My husband and I own a cabin on the shores of White Iron Lake, which is a prime walleye lake east of Ely, Minnesota. We have spent the last eleven years investing several hundred thousand dollars in the local economy while developing this valuable property. We feel we have much at stake in the protection of our investment and our enjoyment of the clean waters of this lake where one day we plan to retire. There is currently exploration and development occurring just south of White Iron Lake around and under Birch Lake. The waters flow north in this area and the Kawishiwi River flows directly from Birch into and through White Iron Lake on up to Farm, Garden and Fall Lakes into the BWCA. The proposal made by PolyMet, if approved, opens the door to mining all along Birch Lake, South Kawishiwi and other areas on north to the BWCA. We have seen the devastation that copper/nickel mining has caused in areas such as Sudbury, Ontario, Canada and how a community suffers when left to clean up the waste of companies who have no interest in the area once they have taken from it what they want. We do not feel that any precautions PolyMet is proposing will be adequate to prevent devastation to the land and waterways as well as the economy in our beautiful area. As you know, if there is the slightest chance that waters will be polluted the fishing guides, resorts and outfitters will lose much more revenue than the region will gain from the few hundred permanent jobs PolyMet is proposing for the area. If you were planning a fishing or camping trip would you go to a region where there is a "possibility" of polluted water. Had we known of the proposed copper/nickel mining eleven years ago, we would not have chosen this area to build our cabin. Real estate values could suffer dramatically, which will affect the tax base for waterfront properties in the region as well as homes and businesses in the cities in these regions. If the drinking water is affected, that will add even more devastation to the area. Other items that need to be considered are the effects from noise and air pollution. With the amount of mining that is proposed, this type of pollution is inevitable to an area where people come to enjoy clean air and peaceful quiet days. Please consider all of these aspects in addition to the other provisions that PolyMet has failed to address adequately in their proposal. As in all things it is better to be proactive than reactive when it comes to the environment and our natural resources. Thank you, Linda Laumb 7870 Guild Ct. Apple Valley, MN 55124

Linda Malick

39296

Dear Lisa Fay, I am strongly opposed to the copper, nickel, paladium, and gold mines propped by Twin Metals and Polymet that would be located south and west of Ely, Minnesota. The Boundary Waters Canoe Area Wilderness is America's most visited wilderness area and one of the oldest designated wilderness areas in the nation. Despite what proponents of the copper-nickel mines say, creating new mines within 50 miles of Ely would be extremely detrimental to our local economy. The mines will not only be an eyesore, they will also increase rail and truck traffic, which would negatively affect tourism in the area. The noise from drilling and moving material destroys the wilderness experience on the southern end of the Wilderness area near Spruce Road and Birch Lake. Most importantly, there is no evidence that our most precious resource, the interconnected system of pristine waterways, will adequately be protected. Acid mine drainage in our waters is unacceptable. Sulfide-bearing rock brought to the surface will turn into sulfuric acid and leach into our waterways, resulting in irreparable damage to our biotic community. **DO NOT ALLOW ANY HARD ROCK MINING WITHIN 50 MILES OF ELY MINNESOTA..** Thank you, Linda Malick - Linda Malick 715 386 5962 malicklinda@baldwin-telecom-net

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, Like many people, I am very concerned with protecting our clean water. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Linda Morgan 10 Cherrywood Ct San Pablo, CA 94806-3767 (510) 236-4022

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Linda Morris 3229 Colorado Ave S 3229 Colorado Ave So St Louis Park, MN 55416

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Linda Morris 3229 Colorado Ave S 3229 Colorado Ave So St Louis Park, MN 55416

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Linda Morris 3229 Colorado Ave S St Louis Park, MN 55416-2052 (763) 525-0311

Dear Ms Fay, Dear Federal and State Agency Leaders: To give away our natural heritage for the generations to come, for a few years of profit and destruction is maimed thinking. Please put the environments health, over a few years of profit, as the priority. I am totally against this fiasco and will consider moving away if it comes to pass. We all know this has never been safely done so how can they have the gall to state they can do so. And even if they would have the money to clean up the mess, I personally do not want the mess to destroy MN treasures of clean water, the woods, my wild rice, my clean air etc for generations to come. We have a responsibility to the people who come after us and to the earth. In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Linda Ronchetti 15 N. Erie Street Aurora, MN 55705 2182293782

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining in Minnesota threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. It is a known fact that acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. What can be so important about this mine's harvestings that we are willing to pollute our land and the water we drink again and again. The serious consequences of such a project as sulfide mining, especially in our wilderness areas, is incomprehensible to me, which leads me to having grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Linda Rossin 13 Alpine Dr Lake Hopatcong, NJ 07849-1248 (973) 663-1645

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mrs Linda Sarat 131 Vineyard Dr Rochester, NY 14616-2007 (585) 663-5113

Linda Sexton

40877

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, Other Americans, along with Minnesotans want to protect clean water. PolyMet's plans to mine sulfide ore in northeastern Minnesota is too risky. Risking high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest makes no sense. PolyMet targets the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. People as well as wildlife depend on clean water; once ruined, we may spend decades getting it cleaned-if ever it happens at all in our children's lifetimes. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. Please reject PolyMet's plans to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mrs Linda Sexton 702 Morningside Dr Norman, OK 73071-4920 (405) 360-1067

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Stop this mine and the damage it will do to our environment. The state will have to spend taxpayers money to clean up the mess made by this mine. Sincerely, Ms Linda Spyhalski 11136 187th Ave NW Elk River, MN 55330-7805

Linda Stephan

I sent a form letter, but would like to add: It seems absurd to risk YOUR spectacular heritage, the Boundary Waters Area, in order to allow a private entity to exploit it for short term profit. The risk is just too great. The area in question attracts many tourists and sportsmen to your state. Birders too, and I am one. We spend alot of money there. This is a long-term benefit to you and it will cease if the area is defiled. Thank you. Linda Stephan, HYPERLINK "mailto:lstephan9942@gmail-com"lstephan9942@gmail-com. Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Linda Tauer 909 1st Ave S Sleepy Eye, MN 56085-1803

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Linda Unsworth Minneapolis, Minnesota

Dear DNR: No one seems to be emphasizing that in MN the environment IS also an industry .it's called tourism. Why risk this major industry, which affects thousands of small businesses and individuals, to aid a private, big business. Virtually all big businesses involved with the environment promise to protect it. Just like BP did in the Gulf. No matter how much BP pays back to those communities/individuals, BP will never make up for the damages their greed caused. Please, protect our environment AND THE TOURISM INDUSTRY. Say no to Polymet. Sincerely, Linda Uscola 15732 130th St Menahga, MN 56464

Mar 1, 2014 Ms Lisa Fay MN Dear Ms Fay, As a Minnesotan, I am very concerned about protecting our clean water. I am particularly concerned about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe this statement is inadequate at best and terribly flawed. It should not be approved because various environmental disasters have proven that trying to contain contaminated water and soil over the long term is impossible. It is only a matter of time before a failure occurs releasing toxins into the surrounding water and soil. Why our state would let PolyMet mine in high quality wetland habitat only proves that at little money and a few jobs is more important than our long term concern for the environment. This mine would be in the largest designated Important Bird Area in Minnesota. Why would you risk destroying this area. Also consider that all the chemicals and toxic metals such as mercury, copper and nickel that would be unleashed into our environment affecting the aquatic organisms and habitats downstream. The food chain would be disrupted, birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Just think 20 years of mining and (350 jobs over the short term) threaten hundreds of years of water pollution to sensitive birds and habitats. The trade-off of some copper and jobs IS NOT worth the risk. Sincerely, Ms LindaMay Patterson 1919 Cabernet Ln NW Rochester, MN 55901-1906 (507) 206-0209

Lindsay Sovil 4055

Hello, I am writing to state that I am completely opposed to the PolyMet project in northern Minnesota. Copper mining absolutely does not belong in this water-rich area. The pollution generated by the mine would cause damage for over 500 years, or forever. I live in Ely, MN and I value the clean water in our area. The few short term jobs created by this project in no way compensate the state of Minnesota for the loss of one of the most beautiful wilderness areas in the country. For centuries into the future, the people of this state will be regretting what this generation did in the name of a brief period of profits. Sincerely, Lindsay Sovil 1197 Kawishiwi Trail P.O. Box 757 Ely, MN 55731 (218) 365-2525

Lisa Fay, EIS Project Manager: I have reviewed information provided by a number of organizations concerning copper-nickel mining in northern Minnesota. I am concerned about the damage such mining has historically done to the landscape and to the health of area residents. In addition, I am concerned about the pollution that is left behind for hundreds of years after mining ceases, especially water pollution. Northern Minnesota is the site of 3 major watersheds. We and many states downstream from us need fresh clean water. In particular, I am concerned that the proposal under consideration from PolyMet for a facility in the Hoyt Lakes area will cause unmitigated damage, and that it will be followed by other such proposals from other corporations which will cause additional damage. Northern Minnesota is NOT the area in which to provide mining rights to an outside corporation that cannot possibly provide adequate stewardship for the water and environment in this area. Jobs are important. I support jobs in northern Minnesota that are sustainable to all life in the area, and I encourage the Minnesota Department of Natural Resources to take a leadership role in promoting sustainable industry. I request that the MDNR deny approval for all copper-nickel mining projects in northern Minnesota. Thank you for taking comments and for including my comments in your deliberations. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: My name is Linnea Mohn. After careful review it seems plain to me that the risks outweigh potential benefits of this proposal as it currently is. There are so few places left in MN (in the world for that matter) that even come close to pristine. The BWCA is it and we have to protect it for future generations to know what was and what could be again. This plan is dangerous and the potential long term damage is terrifying. We can do better. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to disclose, with objective data, how much water would go where, what pollution levels would be at each pond, sump, waste pile, waste facility or seep, and what actual field experience shows that its plan would meet water quality standards. Minnesota should not be an experiment for untested technologies. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Linnea Mohn MN Resident and lover of the north woods. Linnea Mohn 5648 21st Ave S Minneapolis, MN 55417

Dear Ms. Lisa Fay, EIS Project Manager, Hello Ms. Lisa! I am a student Southwest Junior High, in Forest Lake, Minnesota. I am in eighth grade. I wanted to give you my input on how this could effect Minnesota. I have done much research in order to write to you, and what your plans are for the mining that may begin to occur. You make the plans sound very "green" as one would say. I have also gathered the information that there will be a few (or more) rivers affected, and a good amount of forests. Please consider how each decision you make will affect the people not only just in your area, but also the entire state, nation, and potentially the entire world. I know it seems quite drastic, but always consider what could happen. I think that having the mining start will benefit Minnesota's economy, but will it benefit our wildlife? Who knows, maybe it will affect more things than you know. Some of the advantages would be that it will be a big moneymaker, it will supply many jobs, and it will help our economy. Some disadvantages will be the wildlife, pollution, and nature in general will be affected. The cultural resources in the area will be affected. Mostly the historic and cultural resources. There will also be a lot of noise, dust, visual obstructions, and access restrictions to certain areas. People may not like that who live near to the area. They may think you're invading their space, which will not be such a plus for you. Like I said before, please plan out every single detail before any harsh decisions are made. The Land Exchange offers that are being made seem quite drastic. Sounds like you need a whole lot of land. The land you all are using is going to take up a lot of space. Be careful, and consider the outcome. Like I said earlier, it will not only affect this one area, it will affect possibly all of Minnesota and all of the states around it. Please take notice of all of effects, and be wise. Sincerely, Eighth Grade Student

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Lisa Atkins 185 Hall St Brooklyn, NY 11205 US

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, We are in no hurry to get minerals out of the ground. Deny PolyMet permits till they prove that it can be done safely. The wetlands of Minnesota are no place for an experiment. The minerals in the ground will still be there 100's of years from now. So have PolyMet prove their operations before they are given a permit. I have not seen the estimate of how much money PolyMet would have to escrow to clean up the site. How do you estimate how much it would take to monitor for 500 years. I will not be around then but our future generations will. They deserve a safe place to live as I do. The health risks of the mine have not been adequately study. We need to know the cancer risks. I am not against jobs. It has not been shown that this will bring high numbers of long term jobs. The risk to the environment is not worth the few jobs it would provide " this is not your grandfather's iron mine ". I could keep going but I think you got my point. Please reject the PolyMet SDEIS. We all are here to protect our planet. You can do your part and protect Minnesota and all who live here by rejecting the PolyMet mine. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands. Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceable wetlands and fresh water resources in the Lake Superior Basin for generations to come. Respectfully, Lisa M Boulay Lisa Boulay 6214 Lavinia RD NE Bemidji, MN 56601 (218) 760-1502

Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lisa Coons 418 W. Pleasant St Manakto, MN 56001

50256

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. "PolyMet's own study says that the water from the mine site would need at least 500 years of treatment." Wisconsin has banned this type of mining until it can be proven safe. Proven safe, this is what needs to start happening before corporations, American, Canadian, and any others, are allowed to act. In the courts we know it's innocent until proven guilty; this does not work with choices like these that severely impact, our clean water, health, threatened wildlife, and our needed and declining wetlands. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Lisa Erickson 5651 Fremont Ave N Minneapolis, MN 55430-3163 (763) 486-9731

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Please increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is happening) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Lisa Fitzpatrick Lisa Fitzpatrick 5229 Peabody St Duluth, MN 55804

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Lisa Kucukdogerli 235 Westlake Ctr Daly City, CA 94015 US

Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to calculate whether PolyMet's seepage would violate water quality standards using the closest location where groundwater seeps would reach wetlands. Both the mine site and tailings site have high pollution levels in surficial groundwater seeps and have wetlands far closer to pollution sources than the "evaluation locations" used in the SDEIS.
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lisa Nebenzahl 7210 Dupont Avenue South Richfield, MN 55423

Good evening, I'm writing to state my opinion on the proposed copper mines in Northern Minnesota. I will be brief. Who I am: I am a 27 year old woman, originally from the Twin Cities area. I graduated from the U of MN with a degree in Fisheries and Wildlife. I've worked for several government agencies over the last 8 years and am currently working for a non-profit expeditionary learning school based in Ely, MN. I have been living and working just outside of Ely since 2011- My line of work: I lead wilderness expeditions from 4-50 days in length in the BWCAW and Superior National Forest. Our students range in age from 14-60- Teenagers, families, young adults, military veterans, educators, adults, struggling youth and anyone in between represent our student population. We travel by canoe, dogsled, nordic skis, snowshoes, sea kayaks, and on foot. The majority of our expeditions are run unsupported. Students come to our school for self-discovery, to reveal character, to challenge themselves, to see and appreciate the beauty and majesty of the wilderness, among other things. We have been here changing lives since the 1960's and plan to continue our good work well into the next century. What I ask: I need to know exactly what to expect from PolyMet. Even though the mines will not be located within the BWCAW, their proposed locations have the potential to cause irreversible harm to the surrounding watershed(s). I need to know, beyond a shadow of a doubt, that this company will not contaminate our water. I need a guarantee backed by conclusive, repeatable scientific analysis that what PolyMet is proposing will not contaminate our water. I am asking for the best possible collection and analysis of data from unbiased sources about how this mining operation could impact our environment and thus, our quality of life. I need to know that if it is deemed safe by our government that PolyMet has a plan to be financially responsible for the entire operation from start to well beyond the finish and that taxpayers would never be liable for cleaning up mine pollution. Bottom line: The BWCAW and community that surrounds it, is of tantamount importance to me, both personally and professionally. If the proposed mines risk contaminating the waters that flow where I live; where my community of friends and neighbors live; where my students come to learn their potential, then we cannot allow it. We, as Minnesotans, need to protect the resources that serve us. I am not saying "no" to economic opportunity, but I am taking a stand against potential groundwater contamination, waste-rock pollution, taxpayer liability, long-term water monitoring and treatment, unstable employment opportunities, and unpredictable outcomes. I do not believe it can be done safely and I am asking of my government to consider our long-term safety and the safety of our resources above all else. Thank you for your time, Lisa - Lisa Pugh 952-237-6714 [HYPERLINK "mailto:lisa.a.pugh@gmail-com"lisa.a.pugh@gmail-com](mailto:lisa.a.pugh@gmail-com)

Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lisa Umhoefer Thomas Circle Minneapolis, MN 55410

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Lisa Welch 118 Cashin Dr Fayetteville, NY 13066-1514 (315) 406-1610

Lisa Wersal 6147

Lisa: Please find below comments regarding the proposed Polymet mine in northern MN. We know that, by their own admission, Polymet's system will allow millions of gallons of untreated wastewater, with heavy metals and acid, into our surface and groundwaters. Eventually, this water may make its way even to Lake Superior. Are we prepared, not only for the cleanup costs, but for the inevitable lawsuits that we will face, from residents and businesses, and possibly other states surrounding Lake Superior. We just don't know how bad the damage will be, and that's worrisome. Better to let Polymet work out the kinks of their new, untried system, SOMEWHERE ELSE. Our nickel and copper deposits are not going anywhere. Mining companies will be back with more proposals. We don't need to rush. Lisa Wersal 4525 Birch Ridge Rd Vadnais Heights, MN 55127 651-407-6247 wersa007@umn.edu

Dear Lisa: I am amazed that the copper-nickel mining proposal has gotten this far. I can't imagine that any other industry would be allowed to suggest a project that will require 500 years of water cleanup. It's unfathomable. Computer models show that water from the mine and the processing plant will be contaminated with heavy metals and sulfates. PolyMet's own mine plan shows that millions of gallons of polluted water will seep off site, untreated. Additionally, millions of gallons of polluted water will be treated for hundreds of years. It's ludicrous to suggest that water can be contained well enough for over 500 years to make this project safe. Think of the recent floods of Duluth. Natural forces always surprise us with their capacity to overflow, wash out, or flood away the "failsafe" structures we have built. There's no precedent anywhere of a mining company being able to capture all the contaminated water and treat it properly, least of all a company like PolyMet that has never operated a mine before. Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Ellen Thrasher 100 Hinkle Ct Lipan, TX 76462-2222 (682) 552-3027

Lise Abazs 47929

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I am an organic farmer and a wild rice harvester and I live in the Lake Superior watershed. My occupation, my recreation and my sustenance depend on a healthy environment. The proposed PolyMet sulfide mine would irrevocably change the character and health of this region. When I received my Environmental Science degree many years ago, I learned that ecosystems are interdependent in ways that we are still trying to completely understand. PolyMet's SDEIS attempts to model and predict how its mine pits and waste rock piles will effect the environment but they are woefully inadequate. They greatly underestimate the actual rate of groundwater base flow and therefore cannot possibly realistically predict the consequences to ecosystems downstream. This error could have drastic and irreversible consequences to water quality and wild rice beds. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lise Abazs Lise Abazs 5879 Nikolai Road Finland, MN 55603

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Feb 13, 2014 Ms Lisa Fay MN Dear Ms Fay, As a born and raised Minnesotan (now residing in Florida, earning my PhD in Ecology), I want to say that I hope the potential long-term ramifications of this action are truly being taken into account. My entire family still resides in Minneapolis, and I speak on behalf of them. There is money to be made and some people will get jobs, but in the long run, what are the real costs and benefits. Clean water and natural lands are not something that can be replaced, and every loss needs to be viewed as cumulative (a thousand cuts). Clean water is something that we all absolutely need, and that everyone benefits from. Who ultimately will get the greatest benefit from this mining. It's not Minnesotans or our wildlife. Everything is connected, and as we continue to degrade the natural world, each tradeoff between exploitation and conservation becomes more important. Please consider the long term effects, and weigh these relatively short-term benefits against the permanent losses that will occur. Once something is gone, you can't get it back. Sincerely, Liz White 101 NE 9th St Gainesville, FL 32601-5526 (203) 691-8755

We are writing to state our opposition to the PolyMet proposal. While we might all want to assume that Minnesota is water-rich and that our state has no issues with water-quality or quantity, that is simply not true. The threats to our water that are part and parcel of the PolyMet proposal are real. We ask that this proposal be denied and that further investigation be ordered. Respectfully, Curtis A. and Elizabeth Levang 4010 Bayside Road Maple Plain, Minnesota 55359 952/476-4123 clevang@aol-com

Dear Mr Westlake, Ms Fay, Mr Bruner and MrJimenez:: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. It would thereby adversely affect the health of people, plants and animals in the area. I'll first address the duration of the threat from toxic waste with several (lengthy) quotes from scientific journals. The first is from www.geographical.co.uk, the website created to complement Geographical, the official magazine of the Royal Geographical Society: "Wadi Faynan, Jordan - An ancient copper-mining center around 50 kilometres south of the Dead Sea. Mining at the site started in the third millennium BC but expanded greatly under the Romans. The remains of the town, the mines themselves, agricultural terracing and a vast, 30-metre high, 200,000-cubic-metre slag heap still survives. The Roman Empire's industrial revolution continues to pose a threat today. Analysis of modern plants and animals in and around Wadi Faynan has revealed that the 2,000-year-old pollution is just as harmful in the 21st century as it was in the first. The growth of plants is stunted and their reproductive systems are severely damaged with very low seed production. Sheep grazing in the area had high concentrations of copper in their feces (up to 25 parts per million) as well as in their urine and milk." The second quote concerns the same site and comes from the international journal *Toxicology and Industrial Health* 2002: "toxicological implications of ancient copper mining and smelting in Wadi Faynan, southwestern Jordan: the pollution legacy of ancient metal extraction activities remains considerable (Gee et al., 1997; Maskall and Thornton, 1998). Pyatt and Grattan (2002) noted that traditional foods prepared by the Bedouin of the area may be contaminated with high concentrations of lead and copper; while Grattan et al. (2003a) have reported significant enhancements of heavy metals within the floor sediments of Bedouin tents pitched within a kilometre of Khirbet Faynan; copper concentrations reached 2849 mg/kg soil, with the highest values measured around the hearths where food is prepared. The exceptional enhancement around the cooking hearths probably resulted from the combustion of plants as fuel, which contain high levels of absorbed metals; copper in the stem of *Ephedra alta*, frequently burned in these fires, was measured at 603 mg/kg dried plant (Pyatt et al., 2000). Ingestion of plants containing metal burdens also appears to be contaminating the modern invertebrate food chain (Pyatt et al., 2002); the accumulation of metals by modern vertebrates is discussed in Pyatt et al. (1999), where modern goat skeletons were shown to contain lead and copper in excess of 100 µg/g bone. These studies suggest that in the present day several pathways operate by which organisms may accumulate body burdens of heavy metals emitted by ancient industrial activities (Pyatt and Grattan, 2001). These include the direct ingestion/inhalation of airborne metalliferous dusts; the ingestion of food contaminated during preparation by metal-rich dusts in the air, on the ground and via the release of absorbed metals during the combustion of plant material during cooking; the ingestion of food, both animal and plant derived, containing metals absorbed during growth (Leita et al., 1991; Ylaranta, 1996; Moustakas et al., 1997). It is clear that modern exposure to metals derived from ancient industrial activities is considerable. Analysis of buried palaeosols, sediments which have accumulated in archaeological features and mines and smelting waste suggest that during ancient times the region was highly polluted; copper and lead concentrations ranged as high as 11961 µg/g soil and 15205 µg/g soil, respectively (Pyatt et al., 2000). In the developed world, contaminant values at these levels

My name is Frank Ongaro and I'm giving my time to Lloyd Hoeft. Thank you, Frank. There are no simple solutions, only intelligent choices. My name is Lloyd Hoeft, L-L-O-Y-D, H-O-E-F-T, and I'm honored to have the opportunity to speak tonight as a Minnesotan in full support of PolyMet. I'm also speaking as someone who is part of the local mining industry as an employee of Cat. Caterpillar has a strong commitment to the mining industry and has a long history of developing environmentally-efficient equipment and solutions. In today's global economy, copper and nickel have become common elements in nearly everything we use, from cell phones, wind turbines to hybrid cars. The mining of these metals will help support key uses such as green technology, healthcare and manufacturing. The economic opportunities that copper-nickel mining brings is exactly what our state needs to both jobs and mine the minerals we use in our daily lives. Minnesota has some of the nation's strongest environmental laws and financial assurance regulations. Combining these strict standards with the lengthy and thorough environmental review process will ensure the copper-nickel mining will be done right. PolyMet's a resourceful project. The reuse of (inaudible) infrastructure greatly reduces the environmental impact. Many third-world countries mine the same minerals with little or no regard to the impact it has on the environment or its people. We are fortunate to have regulations in place and a company whose first concern is the environment and the citizens. The Polymet team is made up of Minnesotans with strong values and character who not only have faith in this project but also are members of the local community. They're the last people who would jeopardize environment, especially in their own backyard. Let's be good stewards of the natural resources we have. Many other countries and states wish for an opportunity to mine one of the largest copper deposits in the world. This project will employ 360 people, create 600 more spinoff jobs and over the next 20 years, generate 721 in wages and benefits, in addition, there will be \$10.3 billion in economic benefits to St. Louis County, as well as \$300 million in local and state tax revenue, and \$900 million in the federal tax revenue. That's a lot money that we can reinvest into our state. Let's use this opportunity to build a stronger sustainable industry that will allow future generations to grow and prosper in the Iron Range for generations to come. I've been to every hearing and continue to appreciate this project more and more each time. The support of the local community is admirable. There are local residents whose businesses are reliant on the clean water and they support this project. There's a lot of misinformation being thrown around, but look into the facts for yourself and you will find that most heated topics have already been addressed. We're all united here tonight because we care, so let's trust the professionals and unite the plan to mine these resources safely and responsibly. I want to conclude with a simple comment that CEO of PolyMet, John Cherry, said, "The debate isn't whether we should mine but how we mine." Thank you and have a good night.

I work for and with the mndnr. I believe with their rules and regulations there is no reason not to permit this mine for northern Minnesota and polymet. Let's get this permitted and moving Lloyd Kongsjord

Lloyd Schallberg

47619

The gamble of maintaining a fresh water supply in Northeast Minnesota is too great to allow the mining of copper-nickel here. Purifying polluted water for hundreds of years is not part of a sustainable industry and does not make common sense. More effort should go to recycling, reusing copper and nickel and other metals that have already been refined and manufactured into products. Sincerely, Lloyd Schallberg 4901 Grand Ave #1004 Duluth, MN 55807

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Lobbies Luther Minneapolis, Minnesota

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Lobsang Dhondup 4820 Madison St NE Minneapolis, MN 55421-2332

Logan Olson

54349

Dear Ms. Lisa Fay, EIS Project Manager, I don't believe that the NorthMet project is the right choice for Minnesota. While researching the project, I found that the pros were heavily outweighed by the cons. I found that the environmental impact and the impact on Minnesota's many sites of cultural importance could be drastic. I know that the mining project would create jobs and a potentially stronger economy for Minnesota, but what will we be left with after the twenty years? We'll be left with people who no longer have jobs, and one of the state's treasured natural habitats left nearly destroyed. Even the current land exchange offers wouldn't be able to make up for this loss of land and habitat for Minnesota's beloved wildlife. Not only could wildlife on land be affected, but also the wildlife of surrounding lakes, rivers, and streams. The waterways of this state are important to all of its citizens and we all want to ensure that they are kept safe from pollution and harmful chemicals that could create potentially deadly chemical reactions. There are more things that would be affected by this mining project than just the environment. There are also many sites of cultural importance to Minnesotans that could be at risk by the mining project. The three identified sites are The Sugarbush, Beaver Bay to Lake Vermilion Trail, and Mesabe Widjiu which is sacred to the Ojibwe people. Losing these lands would be a huge loss for the people of the area. Also, there are several historical sites in the area. We should try to protect these important sites instead of putting them at risk. The project would have many effects on air and water quality. The air quality would decrease which could cause problems for wildlife as well as humans. Also, mercury that rubs off when the ore comes into contact can pollute water, killing fish and vegetation. These are huge risks that I don't think Minnesota is ready to take. I hope you consider my thoughts and the thoughts of all Minnesotans and make the right decision. Sincerely, Logan Olson

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. As a former member of the MPCA Board and an environmental consultant with 35 years of experience on water policy, I have been involved in a wide variety of development proposals and environmental reviews. I am convinced that this proposal is dangerous, and that the environmental review is seriously and legally deficient. In addition, as a citizen who treasures the Boundary Waters Canoe Area, Superior National Forest, and our extended family's land and cabin on Burntside Lake near Ely, I have a personal stake in protecting the waters of this region. My concerns are myriad, but I will focus on two: water quality related health impacts, and the deficiencies in the SDEIS. Mercury and sulfate emissions are a major threat from this mine. Minnesota has been trying to rein in mercury for decades, placing significant restrictions on power plants and incinerators to limit added airborne mercury. Nevertheless, ten percent of infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood, according to the MN Department of Health. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Specifically impacted by the PolyMet project are surface waters already legally impaired due to mercury in fish. These include the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes. Opening this mine in this location would add a terrible mercury burden to the waters and future health of Minnesota's residents and the ecosystem. The threat of sulfide water pollution, the unique and nearly everlasting concern of acid drainage from metal mining and the waste rock it leaves behind, will multiply in its impacts on the region's waters, beginning with how it increases mercury in the food chain. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. We need to know what mercury concentration levels will result from seepage from waste rock, peat overburden, tailings and liner leaks. Yet the SDEIS fails to provide this critical information. A promise to "control" or "capture" is meaningless. We need precise information on untreated versus treated levels, and detailed scientific information on how the capture takes place, and where residues end up. The SDEIS does not fully assess human health impacts of PolyMet's pollution. In addition to mercury in fish, manganese, lead and aluminum in water can affect the brain. Air emissions of asbestos-like fibers, nickel and other particulates can be carcinogenic. Arsenic can cause cancer. The SDEIS does not analyze harm to human beings, particularly for vulnerable populations. The SDEIS omits analysis of risks to workers on-site at the PolyMet mine or plant. The SDEIS omits analysis of risks to groundwater affecting nearby private wells coming from the tailings basin. The SDEIS apparently halved the normal 70-year "lifetime" used for cancer analyses to 30 or 40 years, and I urge you to investigate and correct that assumption. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved gaps on human health impacts. My second major concern with the SDEIS is that it fails to carry out a full analysis of a range of alternatives. This is the heart and soul of the environmental review process. Significant alterations in activity or scope or mitigation should be fully disclosed and analyzed as to their impact on all aspects of the project. The "Do Nothing" alternative, to not build a mine at all, is to always be included and compared to the impacts of the proposal. That is how decision makers can make decisions on whether to permit an operation. Is the social and economic benefit large enough to justify an acceptable amount of environment harm. M

Dear Ms Fay, Dear Federal and State Agency Leaders: I find it astounding that a copper sulfide mine of the type proposed by PolyMet is even being considered in a part of the country dominated by wetlands. Copper sulfide mining has never been carried out safely in wet ecosystems. After its first Environmental Impact Statement received a failing grade, its current SDEIS is hardly better. Good paperwork cannot cover up a flawed plan. The SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. That is more than twice the age of our country. Pollution seeping from mine pits into the Partridge River "would continue in perpetuity." Even if we could manage this seepage in the present, there is no way that any human being alive today can guarantee continued management that far in the future. Although I recognize the need for copper and other precious metals, especially because of their role in renewable energy technologies, the lake country of Northern Minnesota is not the place to mine for them. Arid areas of the Southwestern US would be far better. If not there, then we will simply have to learn to be more economical in our use of these substances, or find alternatives. They are simply not worth the perpetual pollution they would cause in northern Minnesota. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Lois Braun 1988 Brewster St #109 St Paul, MN 55108

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Lois Braun 1988 Brewster St #109 St Paul, MN 55108

Dear Federal and State Agency Leaders, Co: Lisa Fay, EIS Project Manager, I am asking for an extension to the comment period on the Polymet Northmet SDEIS. March is fast approaching and I find that reading 2000 + pages - and trying to understand all that this project means to Minnesotans, it time consuming. I feel that the citizens of this state have a large stake in the outcome of this process and could use more time to do a thorough and comprehensive look at the documents Polymet has provided. This is a note I found on a "comments" section to a recent Daily Planet article: SUBMITTED BY PAT BRADY ON FEBRUARY 15, 2014 - 1:49PM. Thanks for the links from both of you above. The more I read, the more questions I have about these mining permits process on so many levels. And I am just an average citizen. Aren't our elected officials watching them like a hawk. This is more than an economic issue of 300+ jobs, it is about the future of our state. And a full discussion should be had ,not just a 60 day comment period of three town hall meetings. I agree wholeheartedly with the author. This project has far-reaching implications for the future of Minnesota, our arrowhead region, and I need to understand better the economics of a short term and very destructive extraction process compared to sustainable resource uses in perpetuity – uses that would not impact the health of the land, waters, wildlife and people of our state. Please extend the timeframe for Minnesotans to understand this project. We really need at least double the time that has been given so far. Sincerely Lois Norrgard 952-881-7282

March 13, 2014 Lisa Fay EIS Project Manager Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 Saint Paul, Minnesota 55155-4025 RE: the PolyMet SDEIS for the Northmet Mining Project Dear Lisa Fay, Federal and State Agency Decision-makers, Comment additions: please include this “addendum” to my previous comments. I am insisting that the SDEIS address this problem. Lois Norrgard 10368 Columbus Circle Bloomington MN 55420 HYPERLINK "mailto:lnorrgard@lnmn10-com"lnorrgard@lnmn10-com COMMUNITY VOICES | It’s a whopper: PolyMet’s myth of 99-38% tailings seepage collection By HYPERLINK "http://www.tcdailyplanet-net/profiles/carla-arneson"Carla Arneson, HYPERLINK "http://www.tcdailyplanet-net/partners/community-voices"Community Voices March 12, 2014 HYPERLINK "http://www.tcdailyplanet-net/sites/tcdailyplanet-net/files/imagecache/HugeColorbox/14/12/fig_1_faulted_bedrock_and_surface_topography_-_northmet.jpg"http://www.tcdailyplanet-net/sites/tcdailyplanet-net/files/imagecache/NewArticlePic/14/12/fig_1_faulted_bedrock_and_surface_topography_-_northmet.jpg Map was prepared by Geologist J.D. Lehr In January, the Ely Timberjay broke the story that PolyMet’s Supplemental Draft Environmental Impact Statement (SDEIS) had a problem; its water flow modeling was flawed. Definitely a big problem when the Minnesota Department of Natural Resources (DNR) seriously underestimated the amount of water available to transport pollutants. Perhaps a show-stopping problem; the DNR is not talking. The Tribes have been saying for years that water flow numbers were wrong. The DNR’s troubles have just begun. PolyMet’s SDEIS has yet another flaw. This flaw could prove to be fatal, ending PolyMet’s Project. Symbolically, the Ides of March is coming up. Critical miscalculations PolyMet’s SDEIS has sprung a leak. The projected seepage from PolyMet’s tailings basin and the Mine Site Category 1 waste rock stockpile has been grossly underestimated. “PolyMet does not propose to line the Tailings Basin, nor is the existing LTVSMC Tailings Basin lined.” (SDEIS, p. 5-161) Just reading that a proposed tailings basin of approximately 2,900 acres in size, or four-and-a-half square miles, would be situated, unlined, on top of an existing, leaking, unstable tailings basin, also unlined, screams BIG TROUBLE. As WaterLegacy’s attorney, Paula Maccabee, summed it up, “The SDEIS assumption of nearly perfect seepage collection is the critical foundation upon which all claims that PolyMet might comply with water quality standards downstream of the tailings piles rely. This assumption is unreasonable, unfounded, inconsistent with site conditions and inconsistent with the Modeling Work Plan methodology adopted by PolyMet” Mind-boggling; the SDEIS for a proposed sulfide mining project – in water-rich Minnesota – now has two flawed key components: water flowage and water seepage. The Co-Lead Agencies have not only made incorrect assumptions for base water flow, they have made incorrect assumptions for seepage of contaminated water (uncaptured and untreated). Simply put, they do not know how much surface and groundwater flows through the area; how fast, far, and where it flows; or how much contaminated water is escaping. Major underpinnings of the PolyMet Project knocked flying by the numbers. PolyMet’s house of cards has collapsed. The numbers The claim that 99-38 percent of total seepage from the tailings piles will be collected and treated is reflected in, “Table 5-2-2-36 NorthMet Project Proposed Action Tailings Basin Seepage (gpm) During Operations,” on page 5-159 of the PolyMet SDEIS. This table states that, under existing conditions, there is a total of 2,020 gallons per minute (gpm) of seepage through the north, west and northwest flow paths, 1,811 gpm in surface seepage and 209 gpm in groundwater seepage. This Table and accompanying narrative then predicts that during operations, total seepage in these flow paths will incr

March 13, 2014 Lisa Fay EIS Project Manager Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 Saint Paul, Minnesota 55155-4025 RE: the PolyMet SDEIS for the Northmet Mining Project Dear Lisa Fay, Federal and State Agency Decision-makers, I am a resident of Bloomington Minnesota, a citizen of Minnesota. I care deeply about the natural environment, birds and other wildlife and human communities of this state. I believe that the SDEIS has shown that this project should not move forward, there are many instances of missing, inadequate, and even false information contained within this document, even with that what is included has proven that this project is too great a risk to our waters, wildlife, air, environment and local communities to move forward and must be denied. 1) I urge that the Minnesota Department of Natural Resources (DNR) find the Supplemental Draft Environmental Impact Statement (SDEIS) for the NorthMet Mining Project, incomplete and inadequate due to many shortcomings, detailed in following comments, and that it should be rejected; and 2) I urge the United States Forest Service (USFS) to reject the proposed land exchange as not in the public interest, with reasoning to follow in these comments; and 3) I urge the United States Army Corps of Engineers (Corps) to deny the Section 404 permit due to the unacceptable adverse impacts to thousands of acres of wetlands and inadequate replacement plans. Comments: I know much of what I include in my comments you've heard before, from the thousands of other very concerned citizens and those amazing non-profit organizations that have driven and passionate staff looking into this threat with great depth. I wonder and am incredulous that we even "need" to have to try to "convince" our state and federal agencies of the real threats and illogical direction that this and any following sulfide mining projects would be for our state, and all those people and states "down river" from us. You are deciding a future. Your legacy will be far-reaching, either a turn towards a more sane way of living with our natural world, or an irreversible pollution that will be impacting our waters and health "AT LEAST" 500 years into the future. Your legacy will be asking Minnesotans to commit future generations to a significant, persistent pollution risk – I say no. You will be remembered. I know that it might seem far-fetched, foreign thinking for us humans, or even "crazy" to say this, but we need a new future. Industry (and all of us thinking we are beholden to industry) needs to clean up its act. We no longer can accept the destruction of what is left of our natural world if we are to continue to live on a "livable" planet. We are stuck in a paradigm, but it is through our own negligence, possible laziness and lack of knowledge. Well, and the lack of Will from our elected and public leaders. You might think this is far too big of a scope to use for this one project - but it is not. We are now in a tipping point of over-consumption of resources that the 6th mass extinction (http://www.nytimes-com/2014/02/11/science/the-sixth-extinction-looks-at-human-impact-on-the-environment.html._r=0 or just google "The 6th Extinction") and climate change with its melting glaciers and rising water levels, catastrophic fires, droughts, and storms, and everything else that it entails, are really only just symptoms of - a far greater problem. We are using up the planet and cannot continue down this path. Projects, like this one, that bring far more costs, impacts, and destruction than they do value to us and future generations should be stopped. A new scope to use is using creativity and our human ingenuity to create good jobs that do not destroy the health of the people doing them. Period. Do not believe that we cannot do this – we can. And this project is a first step for the iron range and arrowhead region of Minnesota. Our Governor, Legislature, and public agen

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. In my view, the proposed mine plan would have unacceptable environmental impacts. The proposed site is in a peat bog which is an irreplaceable wetland and I'm concerned about the loss of this wetland and the potential damage to the water surrounding it. I know that Polymet is mandated to address water pollution concerns, but practically speaking how can massive pollution possibly be avoided. You can write anything on paper and state that you have all sorts of contingency plans, but the day to day operations themselves are already toxic enough - how can it be environmentally responsible to extract and grind 1000 pounds of rock for every 3 to 4 pounds of mineral that will be eventually sold (by this company to the highest bidder; the transaction itself taking place from China because that is where they are exporting the enriched material to be smelted). I heard the above information firsthand at the public comment session held in St Paul from a representative for Polymet. I asked him what was the largest percentage of mineral they expected to find and he answered .3 to .4% and then explained it will take 1000 pounds of rock to obtain 3 to 4 pounds of mineral. He also explained that Polymet would enrich the percentage of mineral to around 30% here in Minnesota and then would send the resulting enriched mineral to China (he thought) for smelting because (in his words) the smelting operations in the US were already operating at maximum capacity. Also, how can Polymet be certain that they will be able to protect the environment in the event of another "500 year" flood like the one that just occurred in this area. That type of event is more and more prevalent in these times of changing climate and as far as I can see could only lead to disaster at this mining site. A wetland is about the only natural habitat that could effectively mitigate the damage done by a torrential rain event - and that is exactly what is being put up for destruction with this mining proposal. Also, the Polymet proposal to protect the surrounding water is to place their waste in plastic lined pits and then put barriers to groundwater seepage (if I understand right, this means clay) around it. How is this going to protect anything in the event of torrential rains. There was a disastrous coal ash spill in Tennessee in 2008 that ended up destroying countless miles of rivers and killing entire lakes and another coal ash spill in North Carolina last month. I know that I am mixing the concept of coal ash with mine tailings, but these tailings are going to contain high sulfur content and everything else that has been sequestered in the earth of this peat bog for the last 8,000 years or so. Peat is the precursor to coal, so I believe that the concern of a toxic spill similar to what happened in Tennessee and North Carolina is valid. I have read about the land exchange that would need to occur for this mining to begin, and also about the replacement of wetlands that would be required of Polymet. However, if these proposed replacement wetlands are peatbogs, it's my understanding that they are already protected under state and federal law and should not be acceptable as replacements. If they are not peatbogs, they should not be acceptable as replacements, because bogs like this require thousands of years to form. The idea that anyone could create or restore a peat bog on some other site is laughable. According to Elanne Palcich, writing in MINNPOST on April 29, 2013, "the loss of wetlands for the proposed PolyMet mine (1,400 affected acres) would be the largest single loss in the history of the Army Corps of Engineers." According to the DNR factsheet this wetland provides habitat for the Canada lynx and the northern long-eared bat. I didn't see a mention of the moose in this factsheet, but they will also lose habitat if this land exchange g

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lonie Miesner 912 4th Street S.W. Apartment #11 Forest Lake, MN 55025

Lisa Fay MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement ("PolyMet SDEIS") fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates. The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate. For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project. We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of the

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Lore Frye Minneapolis, Minnesota

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Please reject the proposal to allow sulfide mining in northern Minnesota. The proximity to both the Boundary Waters and to Lake Superior mean that the risk benefit ratio needs to lean heavily to benefit over risk. The benefits: a relatively small # of jobs for a few decades, maximum, benefit to the mining company's profit. The risks: contamination of 10% of the world's fresh water, long term risk and need for active management (for longer than the US has been a nation), damage to a heritage site. This will not help the residents in the region and has unacceptable risk of harm. Please use common sense and say "no". Sincerely, Dr Loree Kalliainen 7920 Hill Trl N Lake Elmo, MN 55042-9533 (651) 777-2300

I don't trust the mining companies who are trying to further rape the mother earth, for monetary reasons. It sounds like the only thing is that the "mighty buck" prevails over sanity. I have used the BWCAW area for recreational reasons and do care about the area being preserved for our children and grand children and I don't want to leave a deadly legacy.

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Lori Andresen 3025 E Superior St Duluth, MN 55812

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Lori Johnson

3573

I urge you to carefully consider any and all mining projects in Minnesota. Our water quality must not be jeopardized for a few mining jobs. The BWCA and Lake Superior are more important than the mining and the jobs it will bring. I am a home owner in the west Metro and in Ely, MN. I have a vested interest in the economy and future of both areas. This interest leads me to object to mining that has even a chance of harming our environment and water quality. Please preserve our environment for the future.. Delores Johnson 4331 Highland Road, Minnetonka, MN 55345 lori@sandlor-com 952-935-3961

Regarding the PolyMet Mining Proposal As a home owner in both Ely and Minnetonka, I have evaluated the PolyMet proposed mining from both the Iron Range and Metropolitan prospective. From those positions I conclude that this mining would NOT be beneficial to Minnesota. I believe it would do more harm than good.. It would greatly benefit an international company, permanently scare the landscape, provide only a few jobs for a short time, and forever destroy Minnesota's water quality. There are just no proven and time tested methods to treat the amount of acid that needs to be processed over such a long period of time. Once the water quality is gone, no amount of money and "insurance" from PolyMet will bring it back. The few jobs that it would bring to the Ely area would be drastically over shadowed by the NEGATIVE impact the PolyMet Mining operation would have on Minnesota, Lake Superior, the Boundary Waters Canoe Area Wilderness and surrounding area lakes. Please do not jeopardize our water quality for a short 20-30 year gain. Once our water is polluted, it will never again be reclaimed. We will no longer be the "Land of Lakes" but only a range of polluted ponds. Please preserve and save our water quality at the highest level. Delores Johnson - HYPERLINK "mailto:lori@sandlor-com"lori@sandlor-com - 952-935-3961 4331 Highland Road, Minnetonka, MN 55345 9 West Harvey Street, Ely, MN 555731 Information from ESET Smart Security, version of virus signature database 9293 (20140115) The message was checked by ESET Smart Security. <http://www.eset-com>

Lori Olinger 25 Deer Hills Drive North Oaks, MN 55127 651-490-0769 I would like to submit the following comments regarding the SDEIS for the PolyMet Mining Project: Wild Rice: A wild rice-sulfate study was recently released that could result in a change in the state's current level of 10 parts per million sulfate in waters that hold wild rice stands. I think the permit should not be issued to PolyMet until the decision is made regarding current limits and whether or not they should be updated. If a permit is given to PolyMet, it should include a provision that PolyMet would have to meet the current standards, even if they are changed by the PCA after the PolyMet permit is issued. I am also concerned that 10 taconite mines currently do not meet the current standard The DNR Wild Rice Fact sheet stated that PolyMet would monitor both groundwater and surface water. An organization other than PolyMet should also have responsibility for monitoring groundwater and surface water so that any problems be identified and mitigated as soon possible. If PolyMet does a good job monitoring, that is great but a separate group should also verify since so much is at stake with this project. There are many examples of pollution problems that were not identified early and resulted in significant pollution problems The Wild Rice Fact sheet also stated that the PolyMet project would be expected to increase concentrations in the Partridge River but only by .1 percent over existing levels. The current level in the Partridge River is currently above the required limit. PolyMet should not be allowed to contribute to the problem with the Partridge River even if it is expected to be a small amount. The tribe has sovereign authority, under the Clean Water Act, to protect its wild rice from mining pollution. This project should not move forward if there is going to be any negative impact on wild rice. Flambeau: When I asked a DNR official if there were examples of copper mines that have not caused pollution problems, he replied that Flambeau is one example of a successful sulfide mining operation. All of the articles that I have read regarding Flambeau are similar to these comments from the Milwaukee Journal Sentinel. clip_image001 clip_image002 Here is another article from the Duluth News Tribune. clip_image003 When I hear that Flambeau is an example of a successful sulfide mining operation, I am very concerned that the DNR is not being realistic about the problems that can and will occur. Flambeau is a much smaller operation than PolyMet and was open for only 4 years. There are a lot of examples of sulfide mine operations that are now Superfund sites. \$80 million has been spent at the Butte – Silver Bow Creek site and work is not complete. At the Berkeley Pit in Butte , Montana, the mine was operated by Anaconda Copper and then by ARCO until it closed in 1982 and the water pumps shut down. Now the pit has become a tourist attraction as one of the largest Superfund sites in the country. The pit is a mile long and water level continues to rise and threatens the water table. Before approving the PolyMet permit, the DNR should take a field trip to Butte to see first-hand the result of copper mining. Talk to the residents of Butte. Ask about the long-term financial impact it has had. They certainly never expected anything like that to happen there. I would hate to have something similar happen in Minnesota. The PolyMet site is in a water rich part of the country that is subjected to freeze and thaw conditions. This will cause extreme challenges to be able to prevent pollution. What can go wrong, will go wrong. With so much at stake this project needs to ensure that every possibility is covered and the worst expected so that we can prevent the worst from actually happening. I am a concerned Minnesotan who wants to ensure that we don't overestimate the benefits of this project and underes

Mar 8, 2014 Ms Lisa Fay MN Dear Ms Fay, Not just Minnesotans, but people from all over the country are very concerned with protecting clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. No mining company exists with sufficient funding to cover the astronomical costs that this cleanup will entail. Mining companies are likely to claim bankruptcy rather than ensure responsible ongoing reclamation. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to REJECT this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. My husband and children have canoed this area with their Boy Scout troop, and desperately would like to see it preserved for future generations. Sincerely, Mrs Lori Petree 8308 S Alsab Trl Evergreen, CO 80439-6311 (303) 674-7353

Lori Rosenthal

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. And while Republicans believe that clean up responsibility is nothing to address it is of the utmost importance to have those discussions now rather than dump millions of dollars on to the tax payer. One crystal clear option to avoid all of this mess is to stop the project NOW. Not one job is worth the toxic environmental devastation that PolyMet and NorthMet will surely bring to our state. We depend on you to protect our waters and uphold the laws/regulations already in place to do so. Sincerely, Lori Rosenthal 3936 N Enchanted Dr NW Andover, MN 55304-2316

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Loriann Wright Gumm 6451 w bell road apt 1112 glendale, AZ 85308

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Lorraine Blaszcak 20 Potash Road Oakland, NJ 07436 US

During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

LORRAINE Stofa

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mrs LORRAINE Stofa 4464 Rue Elgin Pierrefonds, QC H9H 1V2 (514) 555-1212

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Lorrie Ogren 300 w main c6 Northboro, MA 01532

Lory Fedo

18182

My name is Lory Fedo. Lory, L-O-R-Y. Fedo, F-E-D-O. I am the president of the Hibbing Area Chamber of Commerce. I was not paid to be here. And I live 30 miles south of the PolyMet mining site. I want to thank all the chambers that are here this evening. Shout out to the trades. Thank you for being here in support of this project. I grew up in a small mining town. All the mines closed when I was in grade school, and I saw my community dwindle to one-third of its population. City leaders struggled to bring in tourism and wood products jobs; but wages and investments of those businesses could not replace the mining and industry jobs. As we now know, it takes all types of businesses to build a healthy economy. Growing up there was hard and I have spent much of my life praying for the day we can safely mine while protecting our environment so that we can rebuild our communities. That day has come. Like many others here, I trust the science behind the SDEIS and many thousands of hours of research that have gone into it. I believe in our DNR and I trust my friends and neighbors who work in multiple government agencies and are a part of the SDEIS work team. Gosh I'm nervous. My personal message is more direct. The word "jobs" has become political jargon. A word that's on a candidate's brochure. It no longer has a face. I would like to talk about the faces behind the jobs that will be created and the faces of those who will benefit. Like the face of an ironworker who has been struggling and is collecting unemployment and trying to pay his heating bill. He does not want to move to the Dakotas and may not have to if PolyMet is a go. Or the face of a grandmother who lives alone because her children have moved to other parts of the country for work. Mine. If this job goes, her oldest grandchild hopes to move back home to get a job at the mine and help out. Or the face of children on the Iron Range who love where they live and want mom and dad to live here forever so they can fish, swim, and ski. Most of them will likely need to move out of the area for work without more jobs on the horizon. Or the thoughtful faces of scientists, geologists, and engineers who want to move their families here so they can work on this very exciting project. Or the face of a main-street clothier who fears he will need to close his store because of dwindling sales. The possibility of this project brings him hope. And finally, the hundreds of faces of people across the state of Minnesota who could be destined for poverty. With the jobs that this project could provide many would learn a trade, would work and feed their families, and contribute to a community. Sometimes we forget the faces in the midst of all the media hype and drama. I'm just asking that we remember them as we move forward and that we move on with this project so they can get to work. Thank you.

To: Lisa Fay, EIS Project Manager From: Louis Ferreri [HYPERLINK "x-apple-data-detectors://2"1245 Fairmount Ave](#) [HYPERLINK "x-apple-data-detectors://2"St Paul, MN 55105](#) What current jobs could be lost as a result of environmental changes. For instance, will tourism be disrupted by changes in land use and traffic in the region. What is the potential economic impact of a percentage decrease in tourism. What other livelihoods could decline as a result of changes in lands and waters. For instance, could fisheries decline. Could wild rice stands decrease. If so, to what extent. What is the estimated cost of building and maintaining the public infrastructure to support this project. For example, who builds roads and pays for maintenance. Who pays for public services to support workers and families moving to the area. What, if any, portion of this expense has PolyMet been asked to cover. If not, why not. What, if any, guarantee has PolyMet made to ensure that Minnesotans will be hired for mining work. Will they be union workers. What will be the wage differential between the highest paid executives and the lowest paid workers. Before granting any permits will the State of Minnesota make its own estimate of financial reassurance. And if so, will it be more in line with the Grand Portage Band of Ojibwe's estimate of \$90-5 billion set aside at the outset. If not, why not. Why would the State of Minnesota assume the risk of permitting a hard-rock mine when not a single one has ever operated without gross pollution. What is the specific cost/benefit analysis. Because PolyMet says water pollution will last at least 500 years and millions of gallons of polluted seepage will enter groundwater each year, the State of Minnesota will be accepting risks for at least seven generations of Minnesotans if it permits this mining operation. What is the specific cost/benefit analysis that justifies this long-term risk. PolyMet calls for at least 500 years of treatment of polluted water. Minnesota Rules require the site to be maintenance-free at closure. Does this mean PolyMet will be keeping the mine open for at least 500 years. What company—national or international—has been around for at least 500 years. How can financial assurance exist if a company no longer exists. What laws, international and national, might prevent PolyMet from going bankrupt, closing its doors, or otherwise failing to meet the terms of this agreement. Sent from my iPad

My name is Louis Asher, Vadnais Heights, Minnesota. What I want to say is that it is absolutely insanity to assume that we can trade a few hundred jobs over twenty years for an eternity of pollution, and that's what it is going to be. I worked at 3M for 39 years and there is a few things that I learned there as a statistician and researcher. And one of the biggest things that I learned was that you can't make up facts. You take the data and then you take the information and you create real facts. That's how a company stays in business and that's why 3M is such a great company. PolyMet is lying through their teeth and I'm just disgusted by the whole thing. Thank you very much for listening. Thank you.

Across the country, there is no example where a sulfide mine has been operated and closed without polluting surface or groundwater with acid mine drainage, sulfuric acid and/or toxic metals. The risk of pollution is greatest in a water-rich environment like Northern Minnesota, which contains watersheds for the Boundary Waters Wilderness, Lake Superior and the Mississippi River basin. The PolyMet open-pit sulfide mine is the first sulfide mine proposed in Minnesota. Pollution from this project would impact the Lake Superior watershed. Based on PolyMet's recent technical documents: •PolyMet's open-pit sulfide mine would impact as much as 8,000 acres of high quality wetlands. These wetlands ensure clean water and protect fishing in the St Louis River and Lake Superior. This would be the largest permitted destruction of wetlands in Minnesota history. •The ore is very lean, so more than 99% of the rock that is dug out of PolyMet's open pit mine will end up as waste. •PolyMet's sulfide mine would create a permanent waste rock heap of 168,000,000 tons and dump 228,000,000 tons of tailings on top of a tailings basin that is already leaking and violating water quality standards. •Pollutants from PolyMet's waste rock heaps, mine pits and tailings dump are likely to seep, leak and propagate through fractures in rock. These pollutants include arsenic, lead, manganese and mercury, which harm human health, as well as sulfates and metals that are toxic to wild rice or aquatic species. •Pollutants at the PolyMet mine site and tailings dump would exceed water quality standards for 500 hundred years if not eternity. •PolyMet is suggesting that it will treat some of its mining pollution essentially forever – using untested technology. •Glencore, a global commodities giant with a record of environmental, financial, and human and worker rights violations, now owns about 34-9% of PolyMet and is likely to own more. In its merger with Xstrata, Glencore committed to provide copper concentrate to China for the next 8 years. Metals and profits would go abroad, leaving pollution for local communities. Benefits to the community. PolyMet claims it would hire a few hundred local residents at the mine. The mine is currently proposed to operate for 20 years. This will be followed by an eternity of pollution. Sincerely yours, Louis Asher 4525 Birch Ridge Road Vadnais Heights, MN 55127

The history of sulfide mining is one of toxic environmental degradation. There is no evidence that sulfide mining can be done without great environmental damage – especially in a water-rich area such as NE Minnesota. Louis B. Asher 4525 Birch Ridge Rd Vadnais Heights, MN 55127

Louis Hilgemann

27340

Dear project manager, I have some serious concerns with with Polymet Supplemental Draft Environmental Impact Statement. First, the SDEIS doesn't take into account the cumulative effects of all the sulfide ore mining proposals and expansions of mines in the area. This cumulative effect will have a much large impact than this one specific project, and needs to be addressed in the final EIS. Also, the model used for analyzing the impact on water quality is completely erroneous. This model doesn't use the actual hydrology of the area. it is based on a much lower water quantity than truly exists, and does not account for major rain events which are sure to continue into the future (recent Duluth flood). These issues need to be addressed in the final Polymet EIS statement. Sincerely, Louis Hilgemann 3006 Woodland St Ames, IA 50014

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Louis Hilgemann Louis Hilgemann 3006 Woodland St Ames, IA 50010

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. I think it important to inform you that the reason my wife and I moved here from Missouri is in fact due to the BWCAWA. We drove many hours, that first time 30 years ago to spend a week enjoying the unspoiled pristine wilderness. We decided after that trip to live in Mpls. She asked for and received a transfer by Ralsto Purina Corp. and here we are in 2014 with no plans of moving to any other place in no small part due to our state's historically unique strong environmental positions. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Louis Hoerr 5906 W 39th St St Louis Park, MN 55416-2840 (612) 710-2278

Louis Kirkbride

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Louis Lelchuk 3943 Bryant Ave S. Apt. 9 Minneapolis, MN 55409 6128248240

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Lowell Harp

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely,
Lowell Harp 209 S 7th St Oregon, IL 61061-1701 (815) 732-3953

39559

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

To Lisa Fay, I'm writing to submit a comment on the Supplemental Draft Environmental Impact Statement (SDEIS) for PolyMet Mining's proposed NorthMet project. First, I want to express my confidence in your agency to thoroughly evaluate the project and its ability to mitigate potential environmental impacts. I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. Additionally, I'd like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out – all the more reason to support it. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws – some of the strictest environmental regulations in the country. Minnesota is home to a world-class deposit of copper, nickel, platinum, palladium and gold. This is an economic opportunity right below our feet that will benefit the state's economy for future generations. PolyMet will produce these metals in an environmentally sound way and generate significant economic activity, expanding and diversifying our economy and creating hundreds of jobs that can support families and sustain communities. We cannot afford to miss this job opportunity. This project would mean 2 million construction hours, 360 full-time mining jobs and more than 600 related jobs – jobs that our state needs. Companies like PolyMet that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Based on my review and the level of detail included in the draft EIS it appears that a thorough evaluation of the project and potential impacts has been completed. Although I am from a neighboring state I do work in Minnesota and have been following this project. I see the value of adding these jobs into our region. Luann LaValley 1501 N 76th Street Superior, WI 54880

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Luca Rossetto Casel via Torino, 286 – 10050 Sant'Antonino di Susa (Torino) Sant'Antonino di Susa, ot 10050 IT

Lucas Lundgren 43732

I have worked as a geologist for the past 4 years, and I was fortunate enough to start my career working for PolyMet. At the end of 2009 I graduated from UMD and was hired by PolyMet to work on a drilling program for the exploration of the ore body. The experience was invaluable to me. Since the completion of that project I have been on the road working from the mines in Nevada to the oil fields of North Dakota, all the while waiting for the chance to go back to work for PolyMet. There is no company in the world that will be held to such strict environmental standards. Let PolyMet be the model for the rest of the world. Let other students have the opportunity to actually get a job when they graduate, just as I did. Please grant this great company the permit to mine. Thank you, Lucas Lundgren

Lucas Runquist 54353

Dear Ms. Lisa Fay, EIS Project Manager My name is Lucas Runquist. I am a student at Southwest Jr. High, Forest Lake, MN. I am writing this letter to you for a project we are doing in class. I will inform you on my opinion on the PolyMet Mining Inc. project. I hope you can find it useful! First off, I would like to clarify that this company has an excellent plan in place. It would benefit our state of Minnesota in several ways. It would be the first one in our state as well. This project could help our economy, and Northern Minnesota's water supply. However, many things would be affected in the process in the making of this project. If we went on through with this project, many natural resources, such as forests, lakes, etc. This would include the land that the Ojibwe people consider sacred. Also, the natural habitats of some species of animals, fish, insects, etc could be damaged. I am aware of the plans that could potentially minimize the effects of these risks. If the DNR is willing to go through with this idea, then I will support them. If they decide not to, I'm all for it! Either way could help shape the future of our beloved state. I hope you found my information useful! Thank you for your time! Sincerely, Lucas Runquist

Lucia Reid 44638

I sincerely hope this project will NOT be allowed. Our environment is being rapidly destroyed by projects similar to this. There are very, very few jobs created and possibly 200+ years of cleanup. EVERYONE who visits Minnesota as well as residents will be exposed to the contamination created. If passed, this will be a serious environmental disaster to land, water and wildlife (who are already in danger). Thank you, Lucia Reid Creativecrystal-com 73 South Palm Avenue #222 Sarasota, FL 34236 941-388-7770 FAX 941-388-7774

Lucinda West 57201

Water's precious, we shouldn't hurt it. That's all. There's many, many details in that, but that's the basis of it. Lucinda West 1507 Chelsea St. St. Paul, MN 55108

Lucy Duroche 42154

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Lucy Duroche 3542 4th Ave S Minneapolis, MN 55408-4511

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I send this to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. It is crucial that PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. The wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important water

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down.
- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lucy Knoll 2580 Kenzie Terr. Minneapolis, MN 55418

Lucy Sedgwick

Lucy Sedgwick

19529

So my name is Lucy Sedgwick, L-U-C-Y, S-E-D-G-W-I-C-K, and I recently moved to 1722 Princeton Avenue in St. Paul. And I would like to make a statement that this SDEIS is insufficient and should not be approved. I'm speaking not only for myself, but also as a staff member of Audubon Minnesota, so I'm also speaking on behalf of our 12,000 members across the State. The reasons that I think it shouldn't be approved is it doesn't provide important information. A lot of the comments that I've heard earlier tonight are talking about how they believe in the science that's being put forward and they trust in the agencies that are putting this forward, and I definitely believe in science, and I definitely believe in the agencies that are doing this, but the proposal as it currently stands is not enough. For instance, PolyMet claims to have made minimized -- claims to have minimized destruction of wetlands in their mining plan. They basically say, "This is the best thing we've got." However, an underground mine would actually disturb far fewer acres to access the ore in the headwaters of the St. Louis River. So in my opinion, the ore should probably sit in the ground until the value rises sufficiently to allow less destructive mining techniques to access the reason PolyMet isn't saying, "Hey, we could go underground and do less damage to our environment" is because, for them, it doesn't make economic sense. Well, in that case, they've clearly not minimized the destruction. If they were actually going to do that, they would go after it in another direction. And this is actually in reference to Section 8, pages 7 through 8, Appendix B and Casco another area that I think is a problem, especially representing Audubon Minnesota, we care deeply about our birds. It's, in fact, in our mission statement. Our mission is to conserve and restore natural ecosystems, focusing on birds, other wildlife and their habitats for the benefits of humanity and the earth's biological diversity. I mention our mission statement because we do have 12,000 members across the State, many of whom have been members for decades and who are literally all over the beautiful State of Minnesota. And right now, I do not think that this SDEIS is sufficient. I don't think that it fully protects and replaces loss of significant habitats and species. For instance, the entire 3,013-acre mine site had been classified by the Minnesota Biological Survey as of high biodiversity significance. So basically, there are two state-endangered, two state-threatened and seven state-special concern plant species that are actually found on the mine site. So six regional forester-sensitive species -- and what that basically means is they're a federal forest plant species of concern. So these are plants that have been identified by the federal government, by the state government to be in trouble -- are found on the mine site, the mine site that PolyMet proposes to completely destroy, and you can find this in SDEIS Section 4, pages 173 through 188. The SDEIS generally describes the impact as too small to be considered significant. Well, if the species were not significant, what the heck are they doing on all of those lists? They're important to people, they're important to our government, to our federal government, to our state government and to the people of Minnesota, and you can see this in Section SDEIS Section 5, pages 339 through 354. The last thing that I want to say, this is coming from me personally. I'm going to have my 25th birthday in a little under a week, and I noticed that a lot of people that were getting up and testifying today were quite a lot older than that. I have a lot of time -- fingers crossed -- left on this planet, and I intend to have kids, and I do not want to bring them into a world where they do not have access to clean drinking water and cannot go out and enjoy the species that I've been able to go out and enjoy through my childhood. So I urge all parties to reject this EIS as it stands. It is insufficient and should be rejected. Thank you.

Lucy Soderstrom

44629

Thank you for accepting my comments on the PolyMet NorthMet SDEIS. Although I do support a lot of the iron mining currently in Minnesota, copper mining has a much greater environmental impact, and due to the EIS' lapses in addressing serious concerns, I do not support the NorthMet mine. One of the biggest issues is the necessary ongoing treatment of contaminated water after the mine is closed. The model used by the SDEIS measured 200-500 years into the future with no decrease in contamination. Although PolyMet states that it will cover the costs for water treatment, it does not give any explanation as to how the treatment mechanisms will be maintained for hundreds of years. The EIS does not state how long the geomembrane covers and membranes will last, how they will be replaced and what replacement will cost. Neither does it state how long the equipment doing the treatment will last or how that will be replaced. There is no information as to how PolyMet will maintain the physical plant after operations. In general, it doesn't provide adequate information for the public, voters, and regulating agencies to evaluate whether PolyMet will be able to treat contaminated water as projected. In the 2013 Annual Report, Polymet stated it has no experience with mining or treating contaminated, thus the EIS should be required to inform the public in more detail as to how they will maintain water treatment for 500 or more years. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability. Furthermore, not all polluted water can be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. Mitigation plans for these seepages must be accounted for. Because PolyMet has no mining experience or financial capacity to develop and maintain a copper mine, it is likely that control of their decisions and operations will fall to the established mining entities that will ultimately fund the operations. So why isn't Minnesota requiring that the controlling company to make the commitments needed for such a massive mining operation. Why Glencore Xstrata and other mining giants set up their quasi-affiliates as they do is fully understandable, but that doesn't mean the DNR cannot require clear accountability from named funding entities. It's irresponsible to do otherwise. Glencore Xstrata will be among the primary beneficiaries of permits granted and as such should be the applicant and be subject to legal recourse by the state of MN for any failures to comply with the permits or other violations of law. Not all potential consequences can be anticipated at this point, however, in these circumstances with technology and processes largely untested on this scale, considerably more contingency planning is warranted. For an entity with no mining experience, asking for the immense responsibility of protecting the water rich environment they seek to mine requires greater and more confident planning and demonstrated ability to address inevitable, unexpected breaches in the mitigation mechanisms outlined in the EIS. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseen

Luis Ortega

43987

I would just like to say that I am strongly opposed to the idea of establishing another mine in Minnesota, for a number of reasons. The short-term benefit to the few entities with economic interests in this issue should hold no weight over the right for Minnesotans to keep their environment sustainable and clean. If Polymet has any right to establish this mine, they should be obligated to establish a trust fund (handled by an independent third party and mediated by the state government) to assure that Polymet will act with the highest integrity in their part of stewardship for the environment. Regards, Luis Ortega University of St Thomas | Class of 2014 | Neuroscience Major w/Justice and Peace Studies Minor Hana - Vice President of Operations Maysha - Education Program Director; Research and Evaluation Chair Minneapolis Heart Institute Foundation - Clinical Research Intern Minnesota's Future Doctors Scholar Cell: (612)-382-8358 "The task of leadership is not to put greatness into humanity, but to elicit it, for the greatness is already there." ~John Buchan

Luke Borkenhagen

Dear Ms Fay, Dear Federal and State Agency Leaders: Please don't take a risk at permanently damaging our beautiful natural resoruces in Minnesota - it is an advantage we have in the state that will increase in value over time. It wil reamain a powerful tourism draw int he years ahead. It is why I am proud to be a Minnesota tax payer. All you have to do is travel around the world and look at remanents of the messes they have left behind. It is like the invasive species - once here no going back - but at a more massive and dangerous scale. I love our lakes - fishing and incredible beauty of the north woods - as a proud taxpayer I am counting on you to protect them for our next generations. Sincerely Luke Christenson Luke Christenson 12309 Fiona Ave N. White Bear Lake, MN 55110 651-260-4760

Luke Jacobs

38716

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Luke Jacobs 411 S. 9th St Bird Island, MN 55310 (218) 393-0276

Luke Johnson

18299

My name is Luke Johnson. I am from Minneapolis, Minnesota. My stance on this issue is pro jobs. I am a 26-year-old, unemployed, and I represent some of the 44 percent of young Americans between the age of 18 and 28 who are under employed. This includes any job that is not directly related or requires their degree or qualifications of study. 360 jobs is not an adequate amount for any project, for me to consider it beneficial for my age group. A small fraction of the 360 will be Minnesotan jobs. I recently worked in Nicaragua for four months on a fisheries project and a freshwater lake system. I am very familiar with the concept of exporting environmental externalities. However, I feel it is our responsibility to utilize the full effect of our Environmental Impact Statement to reciprocate for the externalities that we are exporting. And one of the full force aspects of the Environmental Impact Statement should be exercising 23 the full 180-day review process. I think those are two good points. Cool. Thanks.

---Original Message--- From: luke.warrenjohnson@gmail-com [mailto:luke.warrenjohnson@gmail-com] Sent: Monday, March 10, 2014 9:30 PM To: Fay, Lisa (DNR)
Subject: PolyMet / NorthMet Comments Dear Ms Fay: Before I am able to adequately assess the full potential of this proposed mining project, and the many others soon to follow if this project is approved, I and every other Minnesotan need to see an adequate environmental review. A) The DNR has not allowed sufficient time for third parties, other than those hired through Polymet and/or DNR, to model and measure the projected water quality impacts. A 200 year hydrologic model should be vetted by numerous experts from a number of different parties and interests. No other agency, person, or organization has had the time to check whether or not the 200 year model is accurate and sufficient. A 90 day public comment period is too short. The public, including other experts, need more time to fully process these proposed benefits and impacts. B) The GIS maps used in the 100 mile swamp are wrong. The shapefiles in the SDEIS used to delineate the supposed USGS 100 mile swamp are not correctly georeferenced nor do the UTM's of the waypoints match those any other literature on this 100 mile swamp area. Thus DNR should correct its swamp delineation in order to more precisely predict the potential swamp impacts. C) Minnesota is dramatically changing because of climate change and this project will contribute to the root of the problem: greenhouse gas emissions. D) At age 26, I am unemployed and living in my Mom's basement. I encourage new job growth. As a fish biologist and GIS technician I may be eligible to gain employment from this Polymet project, though very unlikely due to the small number of projected jobs created. The type of boom bust development this project embodies is part of the reason my generation suffers a 26% unemployment rate. I would rather pay more taxes now, on the little income I make, to fund sustainable economic development in Northeast Minnesota. This is a much better alternative than me, my children, grandchildren, or great children paying for the inevitable restoration and cleanup efforts that will someday be required. This project is not sustainable growth and will do more harm than good. Sincerely, Luke Johnson 253 Washburn Ave N Minneapolis, MN 55405

Luke Laaveg 6334

Dear Ms Fay, Look, this obviously isn't going to work. I can certainly see the immediate benefits of this plan. Since when, though, has Minnesota ever been one to act on immediate financial impulse by way of throwing the health of it's people, environment, and pride by the wayside. This is an awful decision. Please understand the depth of disaster this permit can create for centuries to come. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Thank you for your time. Sincerely, Luke Laaveg Luke Laaveg 612 16th St Apt 1 Des Moines, IA 50309

Luke Peterson 6076

A responsible approach to mining should be followed in the State of Minnesota. This approach balances responsibility to the environment we all enjoy and job creation and economic growth. I applaud the DNR for following this balanced approach and leaving emotional, political, and unsubstantiated rhetoric outside of the approval of the EIS. Congratulations on a leading the state in a collaborative process that will continue to move our State forward in responsible mining. The right results, the right way. Sincerely, Luke J. Dear Lisa, I'm writing in hopes that the PolyMet NorthMet sulfide mine project gets denied. If this project goes through it will destroy this beautiful wilderness that we enjoy and need, including jobs. This area depends highly on tourism. My husband and I run a small lodging business and a Bed and Breakfast where people come from all over the world to enjoy. If Polymet is allowed to mine it will destroy our business and many others. Tourism in this area will last a life time where the mining project, if allowed, will only provide temporary jobs and potentially ruin the landscape FOREVER. I have heard the plans for clean up but that will cost our children and grandchild dearly and realistically there is no guarantee that the destruction caused by mining can be cleaned up. I personal believe we will lose the beauty for ever along with many jobs if this project comes to fruition. SDEIS admits that PolyMet would directly destroy thousands of acres of wetlands in the Superior National forest not to mention our drinking water, wildlife, including moose whose population is already at risk, birds, fish, and eventually even our big Lake Superior That is incredibly sad. PLEASE reject the PolyMet's Open Pit sulfide mine project due to its unacceptable negative impacts that will permanently destroy this beautiful area. Sincerely, Lura Wilson 6125 Highway 1 Silver Bay, Mn. 55614 218-353-0346 Lura Wilson

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Lydia Holsten 6400 Smithtown Rd Excelsior, MN 55331-8211 (952) 474-5780

Feb 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuri

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lydia Morken 2313 141ST LN NE ANDOVER, MN 55304

I will not write this letter with the message that I do not understand the reasons for which you chose to let the mining commence in the Boundary Waters. I get it, but the future possibilities of what may come from this new reality is both shocking and fear inducing. Though this may bring jobs to the area (for a time) and may increase the amount of metals, at what cost is this happening to my world? The Boundary Waters are an escape for many. A safe haven where the land is untouched by the damaging hand of man and where the beauty of nature is purely exposed. As a person unable to visit it is daunting that adults can make decisions like this that may begin a domino affect changing the lives of many, possibly my own, as well as those of my offspring. Think not only if solving an issue, think of how this may hurt the children of tomorrow. The beginning of this sulfuric mining will degrade not only the water supply, but also the tourism that the area often depends on. If this area is changed astronomically and the jobs produced may not last. There is not a long term solution, their "solution" will only lead to more problems. The water in the Boundary Waters is one of our state's purest watersheds and the world only has .024% of the total water supply that is easily drinkable. Are you really willing to risk the purity of this resource and necessity to human life? I only ask that you think of how this decision will change the lives of so many down the road. One day people will be wondering what in the world possessed you to make this decision. It will go down in history though for its hurt and not its aid.

Lyle Bradley

18168

Good evening. I was wrong when I came down here. I told the guys there would be a very small crowd tonight because of the cold weather. In Minnesota weather doesn't seem to bother us. I worked for the Smithsonian Institute several years ago when they came to Minnesota. And I remember one of the saying, "I can't believe it. You have more people out for this program than in Los Angeles." People in Minnesota are concerned about history and the environment. So I want to congratulate everyone that came tonight. I'm a half-lifer. I spent half of my life in Iowa and half of my life in Minnesota. Don't hold that against me. But in Iowa if you don't deal with agriculture, you don't get very far. In Minnesota we have such a tremendous diversity of jobs and so on that we cover the whole gamut. And that I think is a real congratulatory thing for Minnesota. Let's keep it up. Half of my half life I spent in the Marine Corps. And half of my life I spent teaching kids in high school. And I look at that past history that I've had and I feel that I spent part of my life protecting this country and part of my life protecting the future with good generations. And we have a lot of good scientists coming up. I've been involved with science all the way through my college and work schedule. And I've been very concerned because this particular project is going to load us with things that are not very good. Sulfide mining brings sulfuric acid. Have you ever tried swimming in sulfuric acid? Now not only sulfuric acid but also from sulfide mining we get a lot of other good ones, like a little mercury and a little so on. So this is something that is of great concern to me, because when I'm thinking about future generations -- I have five of my own kids plus the thousands of kids that I taught -- we should give them as good an environment as is possible to have; and we cannot do it when we are going to pollute our area with some of these very powerful chemicals. We have to take care of people's jobs. And I lived through the 1930's when we had the interesting job markets, the people standing in food lines, and so on. I know what that is about. But we can handle this thing. Jobs are short lived. Water is long lived.

---Original Message--- From: Lbrandt@uspsioig-gov [mailto:Lbrandt@uspsioig-gov] Sent: Tuesday, March 11, 2014 8:02 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Lyle Brandt 5820 Amy Ln Maple Plain, MN 55359-9303

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Lyle Brandt 5820 Amy Lane Maple Plain, MN 55359

To Whom it may Concern: This project is way too risky for the potential to pollute our cherished lakes and streams To consider trading 20 years of jobs for 500 years or more of pollution is not acceptable, nor does it make good sense. The so-called assurances from the DNR for the parent company to provide .what specifically are they. In most instances, the parent company pillages the resources, then leaves. Holding them responsible for long term cleanup is impossible, since after they make their profits, they will file for bankruptcy protection. So who then pays. Us the taxpayers, to clean up the mess, if it can even be restored. The companies go off in search of another area of the world to exploit. Enough is Enough. P.S. I own a cabin on Bear Island Lake that has been in my family since 1962- I do not wish to see this area become a corporate wasteland. Sincerely, Lyle J. Salmi 11 Lincoln Place Decatur IL 62522

To whom it may concern, Please do not authorize PolyMet's draft mine plan. There is too much at stake to accept a plan that does not take into account, and will damage the health of Minnesotan citizens, will cause damage to already stressed Lynx and Moose populations as well as other wildlife, and will poison and destroy wetlands, forest and our water table. We don't want more air and water pollution, and even if PolyMet does manage to provide so called "safeguards" against large scale mercury or asbestos disasters, no mine is able to cause no pollution. Every water source, table, creek, lake, pond, and wetland in the area of the mine will be affected, with wide reaching effects to the aquifer. Whether from direct pollution and chemical runoff or spills, or poisoned by the chemicals in the air from the machines and mining extraction processes, Minnesota's water will be harmed, and the people, animals and plants that depend on it as well. PolyMet will make a great deal of money, share a comparatively small amount with their "new employees," and leave Minnesota scarred, dirty, with centuries of cleanup, especially water treatment, untold health issues, and with all the bills. We've seen this happen in the south, in the Smoky Mountains, in the west, in Canada and the northeast The mining companies take, and leave devastation behind, and the money leaves with the business. This is unacceptable. Please direct our new jobs, corporate business developments, and state monetary development programs toward renewable, sustainable, environmentally healthy, green businesses. Thank you, Lyn Yount CTS (Certified Technology Specialist) Technical Support/Customer Service Milestone AV Technologies HYPERLINK "mailto:lyn.yount@milestone-com"lyn.yount@milestone-com P +1-952-225-6879 http://www.milestone-com/ cid:image002-jpg@01CAABF1-05A83C20please consider our environmental responsibility before printing this email

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Lynda Dahl White Bear Township, Minnesota

Mar 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Lynda Fedeler 5977 Eagle Lake Rd Duluth, MN 55803-9744

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

39771

Dear state evaluator, I am not a scientist, but I have read enough about the potential damage the PolyMet mine could do to Minnesota's water and wetland resources that I urge you not to approve this project and related ones that could follow. Sulfide mining releases acid and heavy metals that harm aquatic plants, fish and waterfowl. And there's a great risk that the damage and cost of clean-up could far exceed the value of several dozen jobs for 20 years. I recognize that northeastern Minnesota badly needs good jobs for its people and communities. But increased spending for high-speed internet service and other strategic investments seems far wiser and more productive than authorizing a mining project that could endanger our water, forests, animals and people. Sincerely, Lynda McDonnell 3916 Pleasant Av. S. Minneapolis, Mn. 55409

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a big concern. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. The PolyMet SDEIS is an inadequate assessment of human health impacts and the PolyMet sulfide mine and mine wastes proposal poses an unacceptable risk to the health of fetuses, infants, children and adults in Minnesota. Please reject both the PolyMet SDEIS and the PolyMet mine. Very truly yours, Lynda Pauling 5812 Olene Ave N Oak Park Heights, MN 55082

Lynda Withbroe 43040

Lynda and George Withbroe 6943 Newbury Road Woodbury, MN 55125 March 9, 2014 Dear Ms. Fey, I am writing to ask you to reject the PolyMet mine's proposal / mine in one of our state's greatest natural resources, the BWCA. As fairly new residents of Minnesota, my husband and I have visited the BWCA. We have read and researched the dreadful consequences of permitting this company to damage our land and water. Only 360 jobs will be created while hundreds of years of damage will result. Sincerely, Lynda Withbroe

The long term health effects of allowing the mining proposed by Polymet are substantial. More research is needed as well as more answers. As a health care professional and a resident of Minnesota, I ask that another look be taken at the short and long term effects of PolyMet being allowed to mine in Minnesota.

Lynn Bishop 38803

Dear Readers: In addition to the jobs it will create and the boost to the overall economy, this project will demonstrate a cleaner way of mining nickel for mines all over the world to follow. Lynette Bishop 4945 Jamilee Dr Hermantown, MN 55811

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Lynn C. Lang 1721 Polaris Ct Saint Cloud, MN 56303-1375 (320) 202-0341

Lynn Evenson 3524

Dear Folk, As a resident of Ely, please accept my comments of profound concern regarding PolyMet's most recent attempt at an Environmental Impact Statement. My father's apt observation, "Figures don't lie, but liars figure" continues to echo in my head. PolyMet plays fast and loose with established, verifiable facts, including the biggest drawback to their proposal: nowhere in the world, at no time, in no way, has acid mine drainage been successfully contained long term. It cannot be done; this has been proven beyond any doubt. PolyMet's constant attempts to distract us from this glaringly obvious hazard do nothing to enhance their credibility. I have long since dismissed their promises to do better this time as so much hot air. This type of mine waste cannot be contained. It is that simple and that black-and-white. The companies involved in sulfide mining know this; that's why they dissolve, go bankrupt (they say) or otherwise disappear when things look like they're about to go wrong. That way, they can never be held accountable (read, made to pay to clean up their mess) for the widely documented disasters they leave behind when they close their mines. Take the money and run, indeed. No, PolyMet is not to be trusted. Yes, we need jobs, but not these jobs, which may or may not even be offered to my friends and neighbors. If one mine is drilled, and its waste problems spring one leak, the Boundary Waters and our drinking water are ruined. This too-long-standing conflict is having an impact on Ely, as well. Hostility is common, an ugly fact of life in a small town. As bad if not worse, rumors abound in the outside world that we're an armed camp up here; that mines are already operating and fouling the Boundary Waters; and it's shrinking our tourist business. At the moment, that's what's keeping us alive, and it's beginning to wheeze and stumble thanks to bad, inaccurate publicity. I blame the mining companies for this state of affairs. A local organization sells yard signs saying, " We support mining and clean water. We can have both." All the evidence, all of it, says otherwise. Please stand with the EPA and force PolyMet to do the right thing: go away. Thank you for your time. Sincerely, Ms Lynn Evenson 206 E. James St Ely, MN 55731

2014 February 6, 2014 Attention: Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 RE: Public / Written Comment re the PolyMet Project Supplemental Draft Environmental Impact Statement Dear Ms Fay, Please submit / include the herein comments to the public record regarding PolyMet's proposed copper-nickel mining project and the Supplemental Draft Environmental Impact Statement ("SDEIS"). If one wants to quickly grasp the inherent absurdity of the proposed project, all that's required is to ask a simple question, namely-'what financial assurance instruments in operation in the year 1514 still function today.' Answer, none. Take a little 500-year trip down history's memory lane: Columbus has only recently landed in San Salvador; Ferdinand Magellan is meandering the Pacific in his wooden boat for the Portuguese; King Henry VIII is dispatching wives while Thomas More is writing "Utopia"; Luther hasn't started the Reformation yet, and another 65 years must transpire before William Shakespeare could start writing sonnets. More to the point, neither the United States dollar, nor any other present currency, exists. There is no United States Treasury to issue bonds, or Munich Re, AIG, or Lloyds of London to provide surety, project insurance bonds, or any other type of 'financial assurance'. And yet the proposed PolyMet project assumes a level of "financial assurance" stability going forward over the next 500 years that has never existed in history, or for even much shorter durations of time. Need anyone be reminded, within just the past 5 years, one of the largest providers of such "financial assurances" products, the American International Group ("AIG"), only staved off bankrupt ruin and closure because the federal government bailed the corporation out in excess of \$100 billion dollars. But for that bailout, all the prior issued AIG insurance policies, surety bonds, and/or other financial instruments (the very same type that PolyMet will presumably rely upon to meet their 'financial assurance' obligation to the State) would likely be worthless. Given that the SDEIS concludes that it is possible that mechanical water treatment might well be needed "for the duration of 200 years at the mine site and 500 years at the plant site" what possible "financial assurance" as required by Minnesota State law could, in fact, actually provide real assurance that the environmental mess this project may well create will be effectively dealt with. The answer is obvious. No such extremely long-term financial assurance exists today. It has never existed in the past and it will never exist in the future. If one wants real life confirmation of the inherent ridiculous nature of PolyMet providing "financial assurance" that will indeed last until 2514, try getting your State Farm agent to write a car or homeowner's insurance policy for the period 2014 to 2514 or call your Senator and ask them why the US Treasury doesn't issue 500-year T-bills in addition to their 10 and 30 year government bonds. Their respective chuckling responses will tell you all you need to know about the ludicrous nature of extremely long-term financial instruments / assurances. Moreover, rather than address this issue, the SDEIS offers only a pathetic punt of the problem: The level of engineering design and planning required to calculate detailed financial assurance amounts is typically made available during the permitting process and was not available at the time this SDEIS was prepared. (SDEIS, at 3-2-2-4) How, pray tell, is an informed citizenry expected to reasonably evaluate the proposed project's potential impacts if they are not provided with any meaningful ability to assess how PolyMet might possibly cover potential liabilities arising over the course of some five hundred years in the future, apart from being offered some banal recitation within the SDEIS to PolyMet possibly c

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Living along lake Erie I am very concerned with the constant assault on our valuable fresh water "Great Lakes", from farm runoff, factories, the asian carp threat, mercury levels in the fish, etc, etc How can we justify this mine., especially when we consider it should be protected, since it is a National forest . Thank you for considering my comments. Sincerely, Mrs Lynn Moyer 399 Riverside Dr Fremont, OH 43420-9495

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

I just left public comment session in Duluth. Was disappointed that there was no one speaking that actually lived near Polymet/Hoyt Lakes. I live in Hoyt Lakes, I work in Aurora. I have full confidence in the DNR's ability to do the research and monitor, We are an area that needs mining. The jobs are necessary, our economy needs it, Too long have we seen our children leave our area because they can't find jobs. Too long have we bought other countries resources, and improved their economies. Now, is the time. Safe mining. My husband and I live 5 blks. From the Partridge River. We fish and boat there, We don't take our beautiful environment lightly. Our vote is YES. WE SUPPORT MINING. Larry and Lynn Voss Hoyt Lakes, MN

Resending with contact information: LynnAnne Vesper 14038 Fall Lake Rd Ely, MN 55731 HYPERLINK "mailto:lavesper@gmail-com"lavesper@gmail-com I am submitting comments regarding the Supplemental Draft Environmental Impact Statement for the NorthMet project. I own land and reside year-round near Ely, Minnesota. I believe the Supplemental Draft Environmental Impact Statement is inadequate in the following areas: 1- Economic Impacts 2- Land Exchange, wetland quality, and water pollution 3- Environmental impacts to be addressed at a later date 4- Financial assurance requires additional analysis My primary concern is in the area of economic impacts, mainly in the area of financial assurance. Polymet routinely cites figures indicating how much they have spent so far on the permitting process, as if this number should justify the issuance of a permit. The DNR and other agencies have a responsibility to see to it that issues are addressed during the planning phase; otherwise no permit should be issued, regardless of the amount Polymet has spent on analysis. Further, regarding the proposed land exchange, the Forest Supervisor bears the responsibility for determining if the proposed land exchange benefits the public. The Forest Supervisor must make the determination that the land exchange is for the express purpose of directly furthering the financial interests of private and foreign economic interests and is clearly NOT in the public interest The land exchange should not be permitted to proceed. Wetlands exchanged are not of the same quality as wetlands destroyed. I have a friend in Southern Minnesota who has created a wetland "bank" from some reclaimed farmland. These wetlands created for the purpose of the wetland crediting system are by far inferior to those created over many hundreds if not thousands of years by natural processes. The artificiality of the wetland crediting system must be taken into consideration when determining the quality and quantity of wetlands to be exchanged for wetlands permanently destroyed or disabled by mining processes. 1) Economic Impacts -The SDEIS contains no cost/benefit analysis of the PolyMet mine. - The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. - The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. - What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. 2) Permanent Water Pollution -PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. -Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. -The SDEIS

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Lynne Christensen` 221 River Ridge Circle Burnsville, MN 55337

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Lynne Lokken 3900 Sunnyside Rd Apt 3 Edina, MN 55424-1264

Lynne Markus 54810

M Argaret Mousley 16097

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I am a professional Fisheries Biologist and am opposed to further development of the Poly-met mine. I have read the EIS and find it does not go into the detail necessary to answer critical questions of sulfide run-off and potential long term effects on the aquatic environment (wild rice, invertebrate, fish and wildlife). In addition, any project that takes 500 years to abate its pollution is not something rational Minnesotan's want to pass on to their children and grand children. At the very least this company under the supervision of the MNDNR needs answer the critical and unanswered questions on sulfide mining and potential for sulfide runoff posed by the chemical and ecological experts (of which I am not one). They also need to expand on the contingency plans which are vague in the EIS, should an unforeseen event such as a train derailment, extreme precipitation event, or explosion occurs. In addition, details need to be shared with the public on what process and how much funding will be set aside to address the long term clean up after this main development occurs and the mine is no longer operating and the company has either been sold, dismantled or gone into bankruptcy. Remember this is an extraction industry and the natural resources the mine is based on will run out. I am tired of spending taxpayer money to clean up after businesses rape our land, pocket the monetary profits and then leave the area or dissolve as mentioned previously. A prime example is the massive amount of money being spent to clean up the pollution that took place by logging, timber and steel companies over 100 years ago in the St Louis River. Ironically the watershed the Poly-met mine will be developed in is the St Louis River/Lake Superior watershed and after spending millions, we plan to risk polluting this system yet again. Will we ever learn. Allowing the Poly-met mine with only the information provided in the EIS appears to be another example of short sighted gains vs long term detrimental consequences. Thank you for the opportunity to comment and I hope you look out for future generations, not just the short term job gains that will only last 15-20 years at the moSt

To DNR of Minnesota, Relevant to the Polymet copper/nickel mining economic impact, new media information indicates there is no shortage of either mineral that requires urgent demand for mining in Minnesota: A Wall Street Journal 3/11/14 article reveals demand for copper in China is based on its warehousing for collateral in a shadow-banking system rather than for actual manufacturing. As well, Indonesia has recently banned export of nickel raw metal to China due to ecological and resource-nationalism reasons; shortened supply has not caused market havoc. Since this mineral market is unpredictable, without demand driving the mining schedule, Minnesota has leverage to demand upfront economic concessions from Polymet (rather than looking like the proverbial hayseed in an international mining conglomerate). A reasonable alternative would be For Minnesota to copy Indonesia and employ "resource-nationalism" by keeping the operation owned and operated by our own State. What is the advantage in using a foreign corporation such as Glencore Xstrata (with suspect ecological track record), where we would get all the pollution but none of the wealth. We should not trade the unpredictable economic viability of copper/nickel mining for our current tourism trade which is based on Minnesota's water-economy. Thank you for your stewardship, M.T. Mason

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I am opposed to the Polymet mining operation for many reasons, all of which I am sure have been stated numerous times by others. So I am only going to list one here. This is not the last time we are going to have the opportunity to capitalize on this significant resource. The value of the metals will only continue to increase. There will be plenty of "suitors" willing to mine for as long as that resources is there. As protectors of all Minnesota resources, we should wait until we are as close to 100% sure as we can be that the operation will cause no environmental harm. Technology will catch up to this, and there will be cost-effective mining techniques that will provide proven safeguards. If we demand absolute proof, the value of the resource and potential for profit will drive the research and technology until absolute proof is achieved. Please do not take this gamble with such an amazing environmental treasure. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mac Meade 388 McCarrons Blvd S Saint Paul, MN 55113-6912 (651) 488-7958

Feb 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

I really think you should do this to the boundrie waters. Your killing the fish because of the pollutes H2O with sulfuric acid (PH). Your taking away fishing and tourism when will make it lose money. This has been around and protected sense 1978. Your taking away to many beautiful things away! Your going to build this mine then get what you want in 200um years then leave a huge environmental problem.

Water quality in MN is too important to take a risk. Environmentally Unsatisfactory (EU) indicates that our review has identified adverse environmental impacts that are of sufficient magnitude that the EPA believes the proposed action must not proceed. Why ask for a study to just ignore it. Does Polymet know more than an impartial organization whose interest is protecting the public. Madeline Baird 26175 160th Ave Way Welch, MN 55089

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Madeline Buck 6104 Wilryan Ave Edina, MN 55436-2647

This project will pollute our valuable water resources & cause hundreds of yrs of cleanup. The risk is not worth it. I enjoy the BWCA several times a yr & used to work as a wilderness guide there for teens. Pollution of the water would take this experience away. Its not worth the risk. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Madeline Seveland 14418 Wildcrest Rd Minnetonka, MN 55345
