Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Madeline Seveland 14418 Wildcrest Rd Minnetonka, MN 55345

43378

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Madeline Seveland Wildcrest Minnetonka, MN 55345

The Boundary Waters of Minnesota is a treasured part of our state. Part of its value lies in the beauty of its untouched nature. I will not stand for the destruction of an environment that means so much to me, my family, and many other Minnesotans. This land has been the backdrop of countless family vacations and memories for me. Its degradation is not worth the benefits this project proposes.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Madi Malone Maple Grove, Minnesota

Maggie Nelson 47988

Hello, My name is Margaret Nelson and I am a senior at Prior Lake High School. I think the mining so close to the boundary water is a bad idea because the amount of money that would need to go into clean up is unfathomable. If the estimated clean up and regulation could be 500 years, going back that far would be Columbus's time. Can you name a company that is still around from that time. Further more after inflation of 500 years, the money put aside would not be enough to cover the cost of the regulation and clean up for that period of time. Because of this, I fear our beloved boundary will be damaged and not restored to the current beauty. Thank you for reading my concerns, Margaret Nelson

Maggie Rozycki 45851

What can be more important than preserving clean water. This resource will soon be even more scarce than oil. In a [HYPERLINK "http://www.dnr.state.mn.us/input/environmentalreview/polymet/index.html"](http://www.dnr.state.mn.us/input/environmentalreview/polymet/index.html) Supplemental Draft Environmental Impact Statement (SDEIS) the PolyMet NorthMet project is predicted to contaminate this watershed for anywhere from 250 to 500 years. To knowingly pollute the Lake Superior Basin watershed, seems very short-sighted. Maggie Rozycki Sent from my iPad

I submitted the following to the Reader Weekly of Duluth (HYPERLINK "http://duluthreader-com/articles/2014/02/06/2872_what_do_you_think_of_the_twins_who_had_twins"<http://duluthreader-com>) for the Feb. 13 issue and posted it on my blog as <http://magree.blogspot-com/2014/02/does-environmentally-friendly-copper.html>. Does "environmentally friendly copper mining" exist? I did a Google search on the phrase "environmentally friendly copper mining". I received a large variety of references, some of them enthusiastic about the process, some very skeptical of its "environmentally friendly" results. "In-Situ Recovery", Excelsior Mining <http://www.excelsiormining-com/index.php/in-situ-recovery> This process consists of drilling sets of holes to push an acidic solution down a central hole and then pulling it back up with four nearby holes. The acidic solution dissolves the minerals. This process requires fracturing and must be below the water table. It supposedly can be permitted in 18 months and built in a year. At the end, wells are flushed and then filled with cement. This article enthusiastically states, "The San Manuel copper mine, owned by BHP Billiton, was a successful operation" However, BHP Billiton admits, "The water quality of the future lake is expected to be affected by spent process solutions that remain in the former open pit mine as a result of in situ mining on the benches. . . . the pit lake pH is expected to approach 5-0, and dissolved metals will still be present in the water." <http://protectourwaterourfuture-com/index.php/2011/03/18/report-isl-operations-comparable-to-curis-project/> "Copper and Sustainability", Copper Development Association <http://www.copperinfo.co.uk/environment/sustainability.shtml> Mostly about the usefulness of copper. Small nod to recycling. "Copper Mining In A Cotton Field. The Florence In-Situ Mine" by John Kline, the environmental project manager at BHP Copper's Florence site <http://www.copper-org/environment/impact/casestudies/cottonfield.html> Reprinted from "On CU", January - March, 1997, Vol. 1, No. 2- "On CU" is the quarterly publication of BHP Copper, a business group of The Broken Hill Proprietary Corp., Ltd. This article is very positive about in-situ mining. For example, "Its hard to imagine putting a sulfuric acid solution into the ground, and protecting the environment. But the permitting process makes sure the environment is protected." On the other hand, we have "Proposed Florence In-Situ copper Mine a Bad Idea", Arizona Mining Reform Coalition, "Working to ensure mining is done responsibly to protect communities and the environment in Arizona." <http://www.azminingreform-org/content/proposed-florence-situ-copper-mine-bad-idea> In 2011, fourteen years after it was proposed, this mine still had opposition, including changing the zoning of a residential area and complaints that the mine will contaminate groundwater. See also "Underground acid mining threatens Florence communities", <http://www.azcentral-com/arizonarepublic/opinions/articles/2011/08/28/20110828florence-con29-html> Dan Steuter, conservation chair of the Grand Canyon Chapter of the Sierra Club, Arizona Republic, 2011-08-28- As of January 2014, the project had not been fully started. See "Florence Copper Project". HYPERLINK "<http://www.florencecopperproject-com/s/Home.asp> What was that about 18 months to obtain all necessary permits. The Saskatchewan Eco Network offers several steps to reduce the need of mined products and to minimize the impact of mining. <http://econet.ca/issues/mining/whatyoucando.html> "Is green mining possible." <http://www.greenlivingonline-com/article/green-mining-possible> Max Mallet, Green Living. The article is undated but the page copyright is 2014- He wrote that a "good mining company" "is actually a recycling company". He stated that mining companies have too much "secrecy in reporting toxic mining waste". "[T]he industry has a long way to go before it can even be considered remote

Please stop sulfide mining in the Boundary Waters! As someone who has lived in Minnesota their entire life, and has been a frequent visitor to the BWCA, it pains me to see such a beautiful place destroyed by greed and pollution. Please help preserve this peaceful and captivating land of nature! Creating more jobs isn't worth destroying the land, please save it!

Mai Her

54187

I am writing you this letter in respond to debate about whether we should put a mining on the boundary [ILLEGIBLE] of the lake not not. I say that we shouldn't. Why? Well first, let's consider about our environment. If we put a mine there what will happen to the water and the wilderness in that area. The acid in the air will cause the lake water PH to drop and probably change their colors. Animals will died from drinking those polluted water. This will ruin the whole beauty of the wilderness. We've been protecting that place for 30 years and now we're just going to give that place up? Is the environment worth less than precious copper and metals? I don't believe so.

54188

I don't think sulfide mining is a good idea. Sulfide mining pollute H2O with sulfuric acid (PH). People fishing/tourism/\$ there. Since it was 1978 wilderness in MN. It affect lakes and rivers. People love that place so please don't do it in that place. Do it in some other place.

Maija Schaefer

14071

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I am writing to express my serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota. I feel that the Supplemental Draft Environmental Impact Statement (SDEIS) lacks vital information about long-term water treatment, and how this treatment will be funded. By the mining company's own admission, the mining operation would ooze toxins into the region's waterways for as long as 500 years. The mining site would require constant and expensive water treatment for that entire period. PolyMet's plan will directly destroy more than 900 acres of valuable wetland habitat, and an additional 10 square miles will likely be damaged by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. I urge you to deny the Section 404 wetlands permit, and ask the Minnesota Department of Natural Resources to reject this risky proposal. Thank you for your consideration. Sincerely, Ms Maija Schaefer 2 Adobe Ct Novato, CA 94945-1314

Maja Black

45921

Greetings, My name is Maja Black, and I wish to respectfully participate in the discussion regarding the projected impact of the PolyMet mine in Northern Minnesota. I am a college student, currently attending Carleton College, in Northfield, Minnesota. I feel strongly about this issue, as it is both close to my heart and close to my home. As a native of the rural Midwest, I recognize that the promise of jobs and a boosted economy in this time sounds like the promise of a lifetime. When there isn't much to offer in one's town, the promise of new jobs is often the difference between sending your kids to college or not. Having a permanent job means the potential for health care coverage, and better lives for the ones you love. In a time when towns that came from a historic relationship with mining are now struggling financially, there is no way to easily say that you really need this help. A passionate argument for the preservation of the Boundary Waters might not resonate with you, as a more practical relationship with the land might not bring the same connection to the place for you as it does for the thousands of tourists that paddle through every year. PolyMet is promising 360 permanent jobs, as well as thousands more hours of temporary labor. Jobs mean money, and money means opportunities. Additionally, the materials to be extracted from the land are resources that we very much depend on in the modern world. I could not be typing this comment on my computer without the mined materials used to build the hardware. We cannot deny the importance of these materials in today's society. I recognize all of these are very persuasive reasons for building the mine. However, I beg that this step not be taken too hastily. There is no worse way to be steered wrong than to enthusiastically support something while only looking at the benefits, while ignoring the potential pitfalls. When the intention is right, but the action is wrong, who can we blame but ourselves for the mess that has appeared. To accurately examine the pitfalls, we need to look at the arguments both for and against the mine. At the bottom of each side of the argument, we can find the same priorities. Those who support the mining do so with the belief in the "vast economic benefits the project will bring," as cited from the Jobs for Minnesotans statement on their webpage. They also cite a survey that says most Minnesotans trust the DNR to avoid the environmental pitfalls implied by the Environmental Impact Statement. Trusting the DNR and the statements of the SDEIS means a trust in our society, a trust in those who are supposed to know how to interpret this information. That trust is not illfounded, it means that we live in a society that functions as it is supposed to. However, if we look back to the SDEIS, we can find beyond a reasonable doubt cause to postpone the mine. It is one thing to trust the DNR to identify the potential impacts of the mine, it is another thing to trust the DNR to interpret this information adequately, in a way that keeps us, as the residents and caretakers of this land, safe. On the other side of the argument, it seems overcautious to condemn the proposed mine on the basis of the past impacts of mining and environmental concerns. It is true that the technology has improved in recent times, and that there are benefits to having industrial labor providing jobs for the community. However, the concerns raised by the environmentalists have a legitimacy to them, and we cannot deny them just because we might not agree with the sentiments of those who voiced them. Dividing the discussion into distinct sides hinders us from discussing what is truly important. Those who are speaking in defense of the Boundary Waters are not only concerned about the aesthetic beauty of a wilderness area. If the toxic water projected to be treated for upwards of 500 years were to be released in an accident, it not only would destroy the Boundary Waters, but it would

I have several concerns that I wish to express concerning the Polymet mining proposal in northern Minnesota. 1- Even if Polymet meets all the DNR requirements for mining sulfide ore in MN, including a bond to cover 500 years of contamination management, will other companies also eager to mine be held to the same requirements. The more companies involved in mining the greater the chance of a contamination accident. 2- Drought is a serious problem in the world, including the USA. Chancing a long term contamination of Lake Superior, the largest fresh water source in the country for a 20 year mining project seems illogical. Because of its size and volume the Lake cannot cleanse itself of contamination the way shallower Great Lakes can. Please protect this precious resource. Malcolm McCutcheon. MD 3121 MN Ave Duluth MN 55802 218-393-2282

Mar 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Malerie Wirey 13 Allison Ave Ellsworth, ME 04605 US

According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Manel Dias Mt.McKenzie Drive Calgary, AB T2Z3C CA

Mao Vang 54232

Dear Ms. Fay,Hello. My name is Mao Vang and I'm a sophomore at Humboldt High School. I'm writing to talk about the environmental Impact statement and the mining that PolyMet wants to start at the 100 mile swamp. I want to talk about this because the map that was done that shoes the drainage at the mining not affecting other lakes and streams in the marsh. From this view, people would mine in okay. But it actually not because the map is wrong which can fool more who don't know the natural lakes.The environmental Impact Statement also should that there are high levels of toxic in the water after the mining. That'll stay for about 500 years and will cost billions of dollars to clean up and which is impossible because when sulfuric acid gest into the water it can't be removed. So it'll just keep flowing down the streams and lakes. Which will kill off many species of plants and animals.The mining will destroy our resources that we have in Minnesota. It will also take away part of our waters at Minnesota. The drainage will forever permanently cause us to suffer if we live on the land of environment that won't support us. Taking away what could be affected by generations to come.Sincerely,Mao Vang734 Chippewa AveSt. Paul, MN 55107

Mao Vue 54233

Dear Ms. Fay,My name is Mao Vue. I am a student from Humboldt High School. The map in the environmental impact statement is wrong. PolyMet people drew maps of the one hundred mile swamp; their map compared with the U.S. National Atlas shows that the PolyMet has left out half of the swamp. They are immorally lying just to get jobs and it is affecting the BWCA in a very negative way. The BWCA is left unprotected from acid mine drainage. A place with water so pure like the BWCA being polluted would be very sad and I don't want that to happen because once it is polluted it'll be impossible to recover. In order to protect the BWCA I'll need your help. Possible solutions to fix this issue are: correct the maps that PolyMet has created, test the water in Langley Creek to make sure there's no pollution seeping through the swamp.Sincerely,Mao Vue1569 Hyde Ave SoCottage Grove, MN 55016

Marc Fink

18321

I am Marc Fink. I am with the Center for Biological Diversity. I live here in Duluth. The first thing I would like to add is, Minnesota law requires that mines leave an area maintenance free at the time of closure. The PolyMet Mine, however, mechanical water treatment would be needed for more than 200 years at the mine site and over 500 years at the plant site, which would be in violation of state law. Funding for mitigation under (inaudible) is critical for ensuring informed decision making. Unfortunately the EIS is completely silent as to how PolyMet would fund the hundreds of years of mitigation repair and maintenance for the hundreds of years of pollution control. I believe it is unfair to impose on our grandchildren and future generations the responsibility to fund and maintain the water treatment plants that are going to be required at this site. I think it's also illogical to think that there is not going to be more pollution problems for hundreds of years at this site. The Clean Water Act does not allow permits to be issued where a discharge can cause or contribute to water quality violations. The areas downstream of the proposed site are already in violation of water quality standards; and, therefore, no more pollution can be allowed. The Clean Water Act sets forth a pretty straightforward program where you first clean up existing pollution before you can allow further pollution. And up there there is already mercury and sulfate pollution. Under the National Environmental Policy Act agencies are required to look at the cumulative impacts of the projects. As we all know, there's a lot of mining projects up there that have already had significant impacts on the area and downstream into the St. Louis River Watershed. I believe the limited impact analysis under NEPA needs to include the St. Louis Watershed to encompass all this pollution. The National Environmental Policy Act Limited Impact Analysis for Moose completely does not mention the species whatsoever. That's a glaring defect in the analysis. Research shows moose are declining dramatically across the state and yet they are not even mentioned. I believe both the EIS and the 404 permit need to be rejected by the agencies, go back to the drawing board, and come up with a better analysis or reject the permit outright. Thank you.

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Marc Olson PO Box 185 Barrett, MN 56531

Feb 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Lisa Fy, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 We are writing as residents of northeast Minnesota to express our significant concerns about the proposed PolyMet project. We believe that the PolyMet project could destroy or severely damage irreplaceable wetlands in the St Louis River watershed. We are very concerned that this project would be harmful to drinking water supplies and put human health at risk due to increased arsenic and other contaminants. The fish habitat, natural wild rice, and tribal resources are threatened by PolyMet. The pollution and need for pollution treatment are major concerns. We are aware of the fact that sulfide mines located in water-rich environments, like Minnesota, have polluted surface or groundwater with acid drainage and/or toxic metals. This makes us very fearful for future generations who will reside in northeast Minnesota. Therefore, we ask that the SDEIS be deemed inadequate and the PolyMet project as environmentally harmful. We ask that the exchange of Superior National Forest Land for the PolyMet project be rejected. We do not support allowing PolyMet a state permit to mine in Minnesota. Thank you for consideration of these significant concerns. Marcia Hoff and Paul Hoff 2122 Princeton Place Duluth, MN 55803

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Marcia Jacobs 1520 Koester Ct. #56 Northfield, MN 55057

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Marcia Mitcheltree 415 Cogan House RD Trout Run, PA 17771 US

Hello noble DNR representative, I have followed the Polymet story for the last couple years and still have concerns about the proposed project. I know the Iron range needs jobs, but this project will only provide jobs for around 20 years and will leave us with cleanup for centuries. Polymet has a decent plan for containing the acidic and heavy metal waste, but few things in life go perfectly to plan. That is my concern about the mitigation plan; if any little thing goes wrong, a lot of toxic water or slurry will be released into a nearly pristine watershed, which is irreversible. I believe the cleanup plan calls for 200-400 years of water treatment. I am extremely skeptical that everything will 'go to plan' over that period of time. Acts of god (the Duluth floods), unforeseen circumstances (cracks in the bedrock developing), or accidental oversights (circumstances like the ones that led to the 35w bridge collapse) are likely to create an environmental disaster in the next 200-400 years. Based on a reasonable expectation that something unforeseen and catastrophic will happen over the next 220+ years, I encourage the DNR to deny the permit, or get a very very substantial up front payment to ensure the future health of our environment (a larger payment than currently proposed). Thanks for listening, Marcus Imes

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Marcy Leussler 4456 5th Ave S Minneapolis, MN 55419-5124 (612) 824-3240

The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Maren Anderson

to Whom It May Concern, I wholeheartedly oppose the PolyMet mining location. There are not enough jobs that will be created to validate the absolute destruction of our natural resources. Please, DNR. Protect our water, our land, our fish, birds and mammals. Make a stand for the environment. We NEED it. I am sick of our environment losing to corporate greed. If we keep this up, there won't be any pristine wilderness left. Thank you, Maren Anderson - Maren Anderson | Photo Stylist [HYPERLINK "http://www.marenandersonstylist-com"](http://www.marenandersonstylist-com) www.marenandersonstylist-com 612-237-8147

Maren Hinderlie 18153

My name is Maren Hinderlie. And you can see it's spelled "Hinderlie." And what I stand for -- so I've invited Larry Long -- I'm deferring to Larry Long to sing a song for us. LARRY LONG: I'm so honored to be here. Today we lost a very great American, Pete Seeger. And I stand before you in the spirit of Pete and I speak this in song. This is a song that I wrote for this gathering. (Sings a song).

Margarate A. Gillen 39916

DNR, I am highly against the proposal to allow PolyMet to operate mines in Minnesota. I have lived in the Twin Cities for 23 years and I love the beautiful lakes, trees, wildlife, and clean air. My family has camped in the Boundary Waters and experienced its beauty and peacefulness. We cannot afford to have this resource polluted by mining companies who lamely promote job growth but are really counting profits. I, and many others, are counting on you to represent the best interests of Minnesota families in the face pressure from these big companies and their slick staff. Please say NO to Polymet and preserve Minnesota's beauty for generations to come. Thank you, Molly Gillen

Margaret 18125

My name is Margaret (inaudible). I am a native of Aurora. I work for Minnesota Power as vice president of regulatory and legislative affairs. Minnesota Power strongly supports the PolyMet project and the SDEIS. (Inaudible) his job staples of middle class life, food closing, health care, college education. And because of mining strong schools and community and help us become educated, (inaudible) and able to stay in Northeastern Minnesota. Because of mining also blessed with endless opportunities to appreciate nature and recreate right out our front door. (Inaudible) while I grew up here I also lived in the metro area where the presence of quality jobs and the life that comes with them is a given the rest of the state doesn't have. Mining brings economic opportunity to places like the Arrowhead, Hoyt Lakes. The opportunities for a quality of life here that is too often only available in the largest cities. (Inaudible) tremendous opportunity to create high quality employment for people living a high quality of life here. (Inaudible) after the professional and public review of the PolyMet EIS through this process I am a confident state and federal agencies (inaudible) and confident because I know our agencies carry out regulatory responsibilities competently and thoroughly and with the highest integrity. (Inaudible) society clearly needs PolyMet (inaudible).

From: Margaret A. Redmond 1455 Rose Place, Roseville, MN 55113 March 10, 2014 Comments regarding PolyMet SDEIS Despite the huge economic and political pressures to develop a major Copper Nickel mining industry in Northeastern Minnesota, the flagship permit request by PolyMet—and the resulting SDEIS—are full of very troubling problems. These include issues which appear to be sloppy science, issues of modeling, and vital issues that are not addressed—or are addressed inadequately. The underlying science is supposed to be the basis for mitigation efforts for mining impacts and for contingency planning for a range of complicating (and foreseeable) situations that might arise. When the science, modeling, and serious degree of omitted factors is at the substandard level of this SDEIS report, a decision to allow mining to take place can become a very grim forecast for serious resultant environmental and/or health problems. Further analysis of several issues is essential to be able to avoid them or plan for realistic and effective solutions. Basing a major, environment-changing project on a foundation like this can be compared to house-building—those built on lousy foundations never quit causing problems and draining funds. They are not bargains. And they can be toxic to their residents. In addition, there are other issues which would indictate that ALL aspects of this second EIS and the proposed mitigation measures therein should be of absolute, stellar, impeccable quality. These are perhaps just as important as the science issues, and, are just as damaging to the increasingly marginal credibility of this SDEIS.

1- SOME SCIENCE ISSUES There are several issues in the SDEIS that leave me very concerned regarding its basic usefulness as a tool to even assess the CURRENT status of the areas to be mined and to be utilized for waste rock disposal and for treatment ponds. Those insufficiencies lead me to real disbelief about its valid use as a predictive instrument for future conditions once mining actually begins.

A. There are basic problems in the water modeling—in terms of assumptions and in terms of total failure to authenticate the model presented for the Partridge River.

B. The models handle the possibility of extreme weather events very poorly, and—in the brevity of their handling—very dismissively.

C. Although the DNR (in its other divisions, eg Forestry) does acknowledge the reality of climate change, this SDEIS and the models it is built on barely acknowledge any possible impacts. Clearly, there ARE some climate change impacts which would need advance contingency planning to avoid environmental contamination.

D. Previous mining in Minnesota—ie, taconite—has had to take measures to protect the population from harmful fibers released in mining and milling. Specifically, asbestiform minerals are found in some of the rock bodies. There is not much discussion of this potential hazard.

2- EXPANSION OF CONCERNS REGARDING SDEIS METHODS and CONTENT

A. Some basic problems in the water modeling:

(1). The Water Quality modeling for the mine area is NOT based on the actual MEASURED flows in the Partridge River. Flows measured by the DNR exist, but the model vastly understates (underestimates) the amount coming in as groundwater. This unexplained mismatch of data actual and data assumed casts doubt on other numbers used throughout the SDEIS.

(2). In addition to the mismatch in data sets, there has been a failure to collect the data which would be needed to validate a model in the real world. Often, to validate a model (that is, to check whether it has predictive value for the future), the researcher constructs the model, then runs it "backward" on data that's already been collected in past years. The model is "valid" if the model can actually "predict" the observations of the data in the past.

In the time between the first EIS in 2010 and this revised EIS of 2

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. Lisa Fay and the DNR in general, Just a quick word to add my voice to those calling for a refusal to let PolyMet establish mining activity in the state of Minnesota. This is way too dangerous, with way too many unknowns, for our state to risk the future health of our lands for relatively short-term gain. Many more jobs would eventually be lost as we lose the wilderness we are so fortunate to be the stewards of. I am strongly opposed to this project and request the greatest caution going forward. The promise of jobs should not occult the eventual risks involved. Thank You, Margaret Ann Nelson PO Box 1196 Grand Marais, MN 55604

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Margaret Beegle 550 Varner Circle North Golden Valley, MN 55427

Please protect the Boundary Waters--no sulfide mining! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr Margaret Farr 1929 valhallar Duluth, MN 55811

Margaret Haapoja 7767

As Rangers born and bred, my husband and I are very skeptical about the PolyMet project and its effect on the sensitive environment of northern Minnesota. It is our understanding that once the pollution has developed from a sulfide mining operation there has never been a successful way to get rid of the toxic waste. It is hard for us to believe that PolyMet will cover the cost of this clean up for 500 years or longer. What happens when this company disappears or goes bankrupt. Our precious northwoods and BWCA are too valuable to risk no matter how many jobs this company promises. When we see the water shortages in the southwest and California, we realize clean water is at a premium in many parts of the country. We don't want our pure water polluted. If the PolyMet process is safe, why can't they prove it by building a pilot plant that will show everyone they can safely mine these metals. Sincerely, Don and Margaret Haapoja 20043 County Road 70 Bovey, MN 55709 218-247-7830

I don't think this type of sulfide mining should be tried here until it has been successfully done somewhere without severe environmental damage. Given the track record of the mining industry, there is no reason to believe this mining will be accomplished without destroying water quality, even if the technology exists to do so. A several hundred year consistent clean-up is unrealistic.

40113

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Margaret Kirtley-Sternberg 320 E Buffalo St Duluth, MN 55811-2437 (218) 724-4328

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. The Great Lakes are the source of drinking water for millions of Americans and Canadians. Allowing PolyMet Mining to pollute Lake Superior, the upper lake in the Great Lakes flow, would mean severe degradation of water quality, with consequent threats to human health all along the watershed. There are other concerns about this project's potential impact on our region, including: loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and permanent ruin of the land stripped for the open pit. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Margaret Nelson 2206 Green Bay Rd Evanston, IL 60201-3027 (847) 425-9412

Margaret O'Loughlin

3472

Dear DNR representative, I'm writing to express my opposition to the Poly Met Mining Project. The project seems like a terrible choice for the North Shore location for the following reasons: - the toxic and lasting effects of water pollution - the absence of long range planning for inevitable accidents and system failures - the tax burden Please don't be complicit in degrading yet another tract of wilderness in our state. Thank you, Margaret O'Loughlin 2721 39th Avenue S. Mpls. 55406

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, I do not live in Minnesota but I have relatives that do. I care deeply about the condition of waters in every single state that our birds use; whether they live in or are migrating through, Minnesota. I feel that this project is just going to be a slow death for all birds. Please do all you can to stop it before it can harm anything. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mrs Margaret Sears 1648 Arbor Knoll Loop Trinity, FL 34655-7182 (727) 375-8795

PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Dear Ms Fay and MN DNR; I want to express my concern and opposition to the proposed PolyMet mine. My concerns center on the documented concentration of sulfur in the holding ponds which is a result of the mining process, as reviewed in the EIS. The likely leaching of this highly toxic sulfur into the surrounding lakes and streams would severely damage the ecology of our area. Elevated sulfur levels would decimate fish populations and reduce or eliminate other aquatic species. These waterways would change from the clear pristine watershed we all know and value. And rely upon. The company has argued that all of this highly toxic water borne sulfur can be contained. Similar mines in other parts of the world and not situated in a massive fresh water basin have been unsuccessful in this regard. The EIS states a need to monitor and repair the holding ponds for at least 500 years. Clearly, no current corporation will likely be around 500 years from now. Even the posting of bonds or setting up trust accounts would be unlikely to stop the dispersing of this very toxic pollutant. I'm reminded of the radioactive water, currently stored in a variety of containers throughout the US. In the last 60 years (about 11% of the 500 year projection) those storage vessels have been seriously deteriorating. We had a short term need for electric power and now we have a 10,000 year pollutant to warehouse for the foreseeable future of mankind. I see little reason to think that mining precious metals in a pristine watershed that connects to our Great Lakes is a necessity. The short term financial gains and some employment aren't remotely sufficient to risk the inevitable pollution of our watershed. Once introduced into the watershed these pollutants will rapidly disperse, and we have no foreseeable technology to remove sulfur from billions of cubic feet of water. I would urge you to deny this application and spare our region our country and the planet from this very unwise mining activity. Sincerely, Arno Kahn

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Margi Preus 1747 Columbus Ave Duluth, MN 55803-2517 (218) 728-4780

I am a life-long resident of Minnesota and much of my professional career was related to science and industry including environmental compliance. I have read the SDEIS for the proposed NorthMet Project and Land Exchange and want to complement you on the work done and the completeness of the project as outlined. This is a large important project for the region and it appears to me that most everything that one could imagine to look at and analyze has been done. I am in favor of this project because the State of Minnesota is one of the most stringent regulators in the nation and in the world. I believe that if we are to utilize precious metals in our everyday life and ask for greater technology and energy savings that use these metals, then we should also bear the cost of the mining that these metals will bring. To do anything less is hypocritical on the part of our society. We live on a world that is round and what happens in far-away lands does ultimately affect us. I believe that the EIS outlines that this project can be done safely .after all is a project that deals with inorganic agents which are easily removed by simple chemical means. Certainly, there will be unknowns, with a project of this size that is to be expected. However, I believe that with work on the part of the company and the regulators any problem can be solved with a good outcome. As I mother and perhaps one day, a grandmother, I am not afraid that this will ruin our land for future generations. Instead I see this as an opportunity to show the world that this substance can be safely mined, that it will be a world-class model for environmental compliance and will provide increased technological breakthroughs for the future generations. Thank you for your consideration. Margie Ritter 32 NW 4th Street Grand Rapids, MN

Dear Ms Fay, I am opposed to the proposed PolyMet metal mining project in northern Minnesota. I urge you to deny the permit needed to allow the proposed land swap and open pit sulfide mine. My reasons are numerous, and you have probably heard them from many other concerned Minnesotans. - The land exchange circumvents federal law that protects national forests and watersheds therein. - The impact of the mining operation on surface and ground waters, wildlife, air quality and sensitive habitats will be significant. PolyMet's proposal includes clean-up and monitoring for hundreds of years, which defies logic, financial responsibility and good stewardship. I understand that the DNR is scrutinizing only the environmental impact at this stage. But the huge costs and super-human time scale cannot be ignored, as they reflect the serious environmental consequences of mining in a water-rich environment. - While valuable metals are, indeed, among Minnesota's natural resources, their extraction must be weighed against other natural resources such as wetlands, groundwater, rivers, Lake Superior, the boreal forest and all the flora and fauna that supports, and the air quality throughout the area. A balance is in order here. Yes, we need more copper and other valuable metals. But Minnesota ranks quite low on a national scale of valuable metal reserves. Much larger copper mines elsewhere currently produce and will continue to produce much more product than this mine will ever yield in its 20-30 year life span. - Air emissions and water effluent from such a project would include sulfates and asbestos-like materials that will seep or stray far from the proposed project site and have long-lasting consequences. These byproducts will impact not only the flora and fauna of the entire area, but also the employees, their families and other residents and visitors to this precious part of our state. In short, the environmental review process has not fully or accurately addressed the impact of this proposal on the water, air, wildlife, land and other natural resources that you and all of us are responsible for now and into the future. I urge you to deny the permit. Sincerely, Margit Johnson 613 Union St Northfield MN 55057 Cc: Representative David Bly and Senator Kevin Dahle

Bjorn Monson, B-J-O-R-N, M-O-N-S-O-N, and I want to cede my time to my better half. MARGOT MONSON: Margot Monson, M-A-R-G-O-T, M-O-N-S-O-N. I have a master's degree in entomology with research experience in wetlands. As a biologist, I'm speaking to Section 404 of the Clean Water Act and the Wetland Conservation Act which states that, "There shall be no net loss in quality, quantity or biological diversity in Minnesota's existing wetlands." The supplemental EIS states that in addition to a 912 wetland acres destroyed directly at the PolyMet NorthMet site, there will be an additional 7,000-some acres destroyed indirectly from the effects of air and water pollution. Mining has been revealed that indirect effects of mines on wetlands are real. For none of these aquatic resources exist in isolation. They are all interconnected, and they are what make watersheds strong and functional. At the very least, any wetland compensation should occur within the same watershed and include the St. Louis River watershed at the Lake Superior Basin. According to Chapter 5 in the Supplemental EIS, 68 percent of the wetland replacement areas are outside the Lake Superior Basin, 72 percent of the credits are off. The Supplemental EIS only commits to replacement of 26.9 acres out of the over 7,000 acres. These losses will mean that the very serious destruction of peatlands found in this ecosystem, and these take hundreds, thousands of years, sometimes, to develop. The land suggested for the replacement value is from old sod farms. Surely, not in any way equal in quality or biodiversity. In order for an agency to determine wetlands to use for replacement, they must have data that documents the biodiversity of these lands, and having done wetlands research, I know that Minnesota does not have any comprehensive inventories of such diversity anywhere in Minnesota aquatics has this, let alone in our nearly pristine BWCA in Lake Superior watersheds. Some have been done on a spiritual task list. My work, and along with my colleagues, studied caddisflies. Caddisflies are important in water quality, but these important inventories document just a fraction of the millions of organisms that live there and take years to complete. Furthermore, the Army Core admits it has no experience in requiring wetland compensation after a project is built to mitigate indirect loss of wetlands. As scientists, you must know that all wetlands are not created equal in function and biodiversity, and wetlands in Northern Minnesota are far different than those that we can find in other regions of the state. This wilderness is unique in the entire US. We have one BWCA and one Lake Superior. So, my question for you, as scientists responsible for making these decisions to ask, to the future of our variable wetlands, how can you in good conscience allow the destruction of thousands of wetlands knowing they are truly irreplaceable? If this kind of destruction is permitted, it will be not based on real science, but wishful thinking, and our descendants will suffer.

Tim Dabney, Deputy Forest Supervisor U.S. Forest Service, Superior National Forest 8901 Grand Avenue Place Duluth, MN 55808
Dear Sir: March 9, 2014
I've written to you because we were originally advised that the U.S. Forest Service will weigh in on the decisions for permitting sulfide mining in MN, and the forests are ecologically integrated with the wetlands. I have lived in Minnesota all but three of my 68 years and do not own any land within the BWCA or Lake Superior watersheds. I have only visited there enjoying the as-pristine-as-we-have-in-MN wilderness, but my children and grandchildren have camped and hiked in this region and will be there again this summer. This part of our state is very special to us and visited by tourists from all over the U.S. and world, not only for its wild beauty but for the ecological health of the forests, wetlands, streams, rivers, and lakes. If the idea that perpetual treatment of water contaminated by the sulfuric acid produced by the mining processes may be necessary for centuries is not outrageous enough to stop you dead in your tracks and cause you to reject it, the very fact that the financial assurances will not be stated publicly until the permitting process begins is disingenuous and an insult to Minnesotans. The fact is that 80% of sulfide mining operations in the U.S. have closed with massive environmental degradation, all have left water pollution behind, and some filed for bankruptcy leaving taxpayers to foot the bill. For these reasons and that PolyMet has never operated a sulfide mine, is owned by foreign companies, and Glencore is a major investor with horrific environmental and financial track records in foreign countries, should be more than enough evidence for Minnesotans to reject this type of mining and this company at the outset. I am most disturbed by the inevitable loss of wetlands, so critical to the function of aquatic ecosystems. I studied in these amazing places as an aquatic biologist doing research in wetlands as a grad student in the UMN Dept of Entomology. I know that each wetland functions as it does because of its evolution over thousands of years involving millions of interactions between invertebrates, aquatic and terrestrial plants, and the particular soils, minerals, substrates, and water chemistries. This does not begin to adequately describe the immense complexity of an ecologically healthy wetland, and my professional experience working in them fuels my passion for these habitats so critically important in maintaining natural functions in these wild places. If sulfide mines are permitted in MN, this will mean the permanent destruction of thousands of acres of valuable and irreplaceable wetlands. These are not just any wetlands one casually drives by in the city or rural areas but places wild and undisturbed, primarily reached only by hiking, canoeing, portaging, and each unique in its watershed. The fact that the plan calls for the "replacement" of the destroyed wetlands with land far removed and in different counties, much apparently in previously drained and farmed land, is ludicrous from a scientific perspective. Even if the natural flowage eventually resumes, it will be hundreds of years before the hydrology is restored to its original function, nor will it be the same in quality and biodiversity as the destroyed wetlands once were. There may be a plan to increase the acreage of the "replaced" land to be greater than that destroyed, but increasing it does not justify it, because it is different land in a different habitat ecologically, and this is an insulting mollification. The Wetland Conservation Act, states that there be "no net loss in quantity, quality and biological diversity" for the land chosen to replace the destroyed wetlands. Where are the biological inventories of all the critical species of wetland plants, animals, fungi, etc. that would have to be used to determine equal biological diversity? There may be some for plant spe

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Margret Fox 3262 Wilder Rd Santa Rosa, CA 95407-7748 (707) 545-8961

Maria Antonescu 16228

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Maria dels Angels Beltran C/. de la Pineda, 32-34 Palau-solità i Plegamans, 08184 ES

Maria DOnofrio

15817

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Maria DOnofrio 9585 Pawnee Ave N Stillwater, MN 55082

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Dear DNR Committee for the Review of PolyMet Mining Project, Foreign mining interests and big money should not determine how we manage public land in Minnesota. There's no amount of compensation that would be enough for the kind of damage this kind of mining could cause. I know that many of you must share my conviction that the number of jobs temporarily created are not enough to justify ruining the watershed, one of our most vital and irreplaceable resources. The SDEIS report released to the public failed to report accurately on the inadequacy of collection pumps to catch all or most of surface and ground water waste,. The same report made no mention of the geologic fractures under the tailings basin itself. Many Minnesotans think that even this invitation for public commentary is a sham. What do you think. Please bear in mind that public works on this scale are now conducted in a climate of unprecedented transparency. Interest in what happens here is not about to go away, and it will take more than a few fudged reports to hide the potential for disastrous consequences for all Minnesotans. I urge you to turn PolyMet away. Please don't approve this project. Thank you, Maria May St Paul, MN

Dear Governor Dayton and Minnesota Department of Natural Resources: I am very concerned about the impact PolyMet's mining plans in northeastern Minnesota will have on environmental and socioeconomic resources and I urge you to reject the NorthMet project proposal in its current state. The Supplemental Draft Environmental Impact Statement clearly identifies the effects the plan will have on water, bio resources, and socioeconomic resources. I am not in favor of a plan that would: · Elevate aluminum and lead levels in our water. · "Directly affect 912-5 acres of wetlands located within the NorthMet Project area, mostly within the Mine Site, as a result of activities such as filling, excavation, and installation of a containment system within the wetland boundary, and, therefore, these wetlands would be permanently lost" (ES37). · "Directly affect up to 1,741-1 acres of Minnesota Biological Survey Sites of High Biodiversity Significance, 698-2 acres of "imperiled" or "vulnerable" native plant communities, and 2 acres of "widespread and secure" native plant communities" (ES38). · [Impact bio life] "There are 11 state-listed plant species, all at the Mine Site; nine species would be directly affected and two would be indirectly affected by the NorthMet Project Proposed Action" (ES38). · "Potentially affect aquatic physical habitat via changes in streamflow, affect riparian and aquatic connectivity via construction activities within the riparian zone, and affect water quality by increasing solute concentrations above Class 2B (aquatic life) standards" (ES38). · [Potentially impact/ Impact] "One federally listed wildlife species, the Canada lynx, may be affected by localized direct decrease and fragmentation of designated critical habitat Four additional state-listed species—including the gray wolf, eastern heather vole, wood turtle, and yellow rail—may be affected by the NorthMet Project Proposed Action" (ES39). · [Impact] "The territory ceded by the Chippewa of Lake Superior to the United States in 1854- The Chippewa reserve rights to hunt, fish, and gather on lands in the 1854 Ceded Territory. Natural resources and the lands on which they are gathered are important to the Bands for a number of reasons, including their cultural, spiritual, and/or historic meanings, and will be considered under federal agency tribal trust responsibilities as outlined above and also as cultural resources under NEPA" (ES39). I recognize that implementing the proposed plan would create jobs and positively impact the greater Minnesota economy; however, I believe that PolyMet can produce a better project plan for this mining initiative, one that involves less environmental damage/risk, does not threaten our state's defining clean fresh water characteristic, and does not require 500 years of water treatment post-mining operations. Please reject the PolyMet proposal and ask NorthMet to revise their project plan with greater consideration for environmental and socioeconomic and cultural impact. Sincerely, Maria Freund 2313 Barton Ave NW Buffalo, MN 55313 This e-mail is intended only for the addressee(s) and may contain confidential information. Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. From: Maria M. Pierz, 331 Coolidge St Anoka, MN 55303 March12, 2014 To All Concerned, Once the big machines come into the Babbitt and Hoyt Lakes area, all bets are off. There are no guarantees that PolyMet's new technology and water treatment facilities will not have an adverse affect on the surrounding environment. I find myself in the category of the "No Action Alternative'. Two major problems with the copper/nickel mining is that seepage into the water table will have major consequences for the pristine wilderness; and the mining will impact three watersheds with wetlands and forests, potentially even the BWCAW. My point is that with all the scientific studies there is no positive evidence that the mining will not have a negative impact on the areas. Minnesota is known as the "land of sky blue water", an area that offers recreation and serenity to all who come to the northwoods. 90% of the area mined will only bring 10% of the copper, and the rest is sulfide and other dangerous minerals (ie mercury). The impact will endanger the aquatic plants, fish, vegetation, and wildlife. Over the years there can be a cummulative effect on the surrounding waters and habitats. Reclaiming the area will be impossible even over the 500 year plan. Even climate change cannot be predicated with 100% accuracy. By 2040, the 350 jobs that are gained in the short run will be gone for future generations. Money matters, but the focus should be on the long term and not be part of short term gains. The Superfund clean-up is in the billions of dollars. We cannot let profits rule our decisions. Water Quality is certainly an issue for continuation of legal rights to the Native Americans in the area especially concerning hunting, fishing and wild ricing, in accordance with the Treaty of 1854- Wild rice is a tender crop that can be washed away with the pollution of waters. Habitat loss will impact the wildlife. Certainly, the negative effects of the copper/nickel mining will damage a beautiful area for camping, canoeing in the BWCAW. Everyone loses in this proposition. Please protect our our wild and scenic places and preserve it for future generations. Maria M. Pierz 763-427-0332

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, Please choose clean water and a healthy environment for all of us by denying PolyMet's proposal to mine sulfide ore at the headwaters of the St Louis River, which will damage the watershed all the way to Lake Superior. This operation will destroy wetlands directly and contaminate air, water, and soil over a large area. Think about the recent industrial "accidents" in West Virginia and North Carolina/Virginia. Don't let profits and greed override the health and standard of living for all Americans. Jobs are good, but NOT at any price. Please deny the Section 404 wetlands permit described in the Supplemental Draft Environmental Impact Statement (SDEIS) being considered by the Corps of Engineers and the Minnesota Department of Natural Resources. Birds, fish, forest and aquatic animals and plants, as well as children, grandparents, and communities will suffer incalculable short- and long-term problems if we (that is, our government agencies) continue to bow to corporate pressures for such projects. Thank you for considering my comments. Sincerely, Ms Marian Gordin 1654 Rainier Falls Dr NE Atlanta, GA 30329-4108

Marian Puglisi

The effects on human health haven't been adequately addressed in the PolyMet environmental review. It fails to define the human health oeffects of increased mercury emissions, exposure to asbesdos-like mineral fibers and arsenic. The World Health Organization lists 10 chemicals of major public health concern. Sulfide (copper) mining involves 5 of them including mercury, arsenic, lead, asbesdos, and air pollution. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Marilla MacGregor P.O. Box 226 Kasota, MN 56050

Marilyn Andersen

Thank you for this opportunity for input. Please prevent further mining destruction in our North Woods and Waters, and do not the PolyMet SDEIS. The mining itself is totally unacceptable. Accidents always happen, despite precautions and our best analysis and fat bank accounts waiting to take care of damages. Those facts are incontrovertible, without need of analysis. In regard to issues in the SDIE, I do not approve of: open pit operations that permanently scar the earth and destroy our forests and habitat. acid run-off-which can't be assured for 500 years, no matter what price. habitat destruction for native plants and animals pollution, such as sulfates in our wetlands, which become toxic to plants and animals, and production of mercury methylate, which further poisons aquatic life further infringement of Indian rights on legally ceded territories, including hunting and ricing activities "streamlining" public processes such as hearings, etc to make it easier for wealthy corporations to pull off huge projects such as this without having to deal with public opinion. In our current system we let big money rule everything and destroy the earth that was our legacy. Whose pockets will benefit from this project. The copper will be gone, the jobs will be gone, and so will the earth, deeply impoverishing our citizens and the environment. Minnesota will get a pittance of the money that mining companies make. When China runs out of copper for its production, someone will discover another product, perhaps an artificial synthetic, that works just as well. Corporations have the wealth and resources to figure that out-let them do that now. Protect our birthright now, before it is destroyed. Thank you for the opportunity for input. Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Marilyn Smith 4449 Toro N. LV, NV 89031 US

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Marilynn Torkelson 8956 Braxton Dr Eden Prairie, MN 55347-5344

Mar 9, 2014 Ms Lisa Fay MN Dear Ms Fay, There are serious problems with PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. This region's copper-nickel is locked in a sulfide-containing matrix. Once exposed to oxygen and water, sulfides oxidize to produce sulfuric acid and release metals in soluble forms, including mercury, copper, iron and nickel. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. It could also wipe out wild-rice beds in the watershed. The trade-off is not worth the risk. Sincerely, Mrs Marion Cartwright 205 N Sheridan Rd Lake Forest, IL 60045-2474 (847) 235-2803

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet DEIS does not consider a range of practicable alternatives to the proposed action. As the DEIS states: "NEPA requires that a 'range of alternatives' must be discussed in the environmental documents prepared for a proposed action (40 CFR 1502-14). This includes all practicable alternatives, which must be rigorously explored and objectively evaluated . . . The emphasis is on what is practicable rather than on whether a proponent or applicant prefers or is itself capable of carrying out a particular alternative" (1-13). But the SDEIS provides no meaningful consideration of alternative means to achieve the project Purpose and Need as required by law, it only looks at a No Action alternative and the same action with a smaller land exchange. The Underground Mine Alternative is discarded, mostly as a result of an InfoMine model used to determine economic feasibility, for which there is no detail provided in the SDEIS. The SDEIS states that the underground mining alternative "would not offer substantial environmental or socioeconomic benefits" and was therefore discarded. However, in Appendix B, the co-lead agencies found that "compared to the proposed open pit mine, the underground mining alternative would offer some significant environmental benefits. . ." and that underground mining is "technically feasible." The West Pit Backfill alternative is also discarded prematurely. Backfilling the East and Central Pit with Category 2 and 3 waste rock is considered both feasible and desirable and is part of the proposed action. The offered reason that backfilling the pit would "encumber" resources in violation of PolyMet's mineral leases is irrelevant, since these resources are currently encumbered by 696 feet of soil and rock. As the Tribal Cooperating Agencies note in Appendix C, the backfill alternative "meets the purpose and need, is available, is technically feasible and is economically feasible." Please take the following actions: 1) Revise the SDEIS to provide details of the economic models used to simulate the costs of underground mining and its economic feasibility 2) Revise the SDEIS to eliminate assertions that the Underground Mining Alternative does not offer environmental benefits, since the co-lead agencies found that it would offer significant environmental benefits 3) Revise the SDEIS to include the Underground Mining Alternative as an alternative to the proposed action 4) Revise the SDEIS to include the West Pit Backfill Alternative as an alternative to the proposed action Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Marion Scott 1691 Princeton Ave Saint Paul, MN 55105-1943 (651) 470-7923

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2- Putting a liner under the Category 1 waste rock stockpile; 3- Placing all tailings on a new completely lined facility; 4- Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5- Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceabl

I attended the St Paul open house, and reviewed the film, which was very helpful. Thank you. I don't believe that contractors have the skill to create a fully functioning sealed barrier beneath the storage pools of toxic waste-no matter what engineers might believe. For that reason, I oppose the PolyMet development, as the risk to water resources is too great. I hired contractors to create a pond system at IRRB's Ironworld USA, using a product we thought was fail-proof to line the bottoms of the ponds. It was fraught with so many unexpected problems, and leaked like a sieve. We had problems with: air temperatures being too low due to the short construction season (temps above 50 were required for the seam sealants) humidity being too high at the pond bottoms where soil was saturated (humidity made the curing process incomplete) water in the pond basins made them too mushy even after pumping out the water, so the basin was not compacted well wrinkles in the fabric created trapped areas that did not get sealed properly (it is impossible to avoid wrinkles) contractor was pushed to work outside the proper temperatures, due to the short season and impending deadlines contractors became high from working with toxic products, and their judgement suffered, leaving pin holes pin holes occurred in many places, but there were no more obvious leaks the ponds leaked so fast it caused damage to nearby buildings no one could trace where the water leaked to, as the mining dump material beneath the ponds allowed the water to escape deep below the surface immediately the contractor was pressed to re-do huge areas without reimbursement, and went bankrupt All in all, the concept of creating a sealed basin sounds appealing, but there will always be seams and wrinkles, improper applications, and weather struggles, and a perfect seal is not possible. Nor is a sealed basin's life span going to be long enough to deal with the toxin life above. Nature can erode any material we invent, with enough time. Marjorie Pitz Martin and Pitz Assoc., Inc. 1409 Willow St Minneapolis, MN 55403 651-778-9558

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Thank you for taking my comments: I do not believe that PolyMet is capitalized to the point that if groundwater contamination happened, they would be able to provide long term protection to the citizens of MN. If it's already too late to stop the project, any amount of money that is required to be set aside must be indexed for inflation, so \$100M determined to be sufficient today will grow as the costs for the eventual clean up grow. This amount must be revised on an annual basis with the State on MN holding the money in escrow. Fresh water is a valuable resource in and of itself, much more than nonferrous metals in MN. The risk of environmental damage is great, the likelihood that PolyMet will not be able to adequately address the issue is also great . . . just say NO to this mining project and continue to allow one of the world's great natural resources continue to be enjoyed by thousands of people each year. Mark Anderson 1620 N. 4th Street Mankato, MN 56001 (H) 507-345-1855 (c) 507-340-7677

Mark A. Kaprelian 47622

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Re: Polymet Mining, Inc. NorthMet Mining Project and Land Exchange (the "Project") Dear Ms Fay: I write to call attention to certain material facts about the financial condition of Polymet Mining, Inc. (Polymet) which are not addressed in the Supplemental Draft Environmental Impact Statement (SDEIS) dated November 2013 and issued for public comment on December 6, 2013- The failure to give these facts adequate consideration in the SDEIS undermines its quality and usefulness to permitting authorities, other policymakers and the public. I strongly urge the Co-lead Agencies to address these facts before proceeding any further with the Project. In its financial statements and related disclosures filed with the United States Securities Exchange Commission, Polymet states: While we were incorporated in 1981, we have no history of producing minerals. We have not developed or operated any mines, and we have no operating history upon which an evaluation of our future success or failure can be made. We currently have no mining operations of any kind. Our ability to achieve and maintain profitable mining operations is dependent upon a number of factors, including our ability to successfully build and operate mines, processing plants and related infrastructure ourselves. We may not successfully establish mining operations or profitably produce metals at any of our properties. (Polymet Mining Corp. January 31, 2013, Form 20-F at 9 (filed April xx, 2013)). In other words, Polymet has no demonstrable capacity to establish or sustain a viable mining operation. Furthermore, Polymet's financial resources are, to put it charitably, extremely limited. Polymet has an accumulated deficit of \$88-4 million, it has no operating revenue (Id. At 9, 13, 34, 35) and its "only source of liquidity consists primarily of cash from project debt, other debt and equity financing" (Id. At 35). It states "we currently do not have a source of revenue" (Id. At 11), and "we do not know if we will ever generate revenue" (Id. At 8). In its most recent interim financial statements, PolyMet disclosed that it will need to renegotiate a convertible debenture held by a Swiss investor, Glencore AG, or raise sufficient funds to meet its current obligations and to fund planned development, capital expenditures and administration expenses for the next year. (Polymet Mining Corp. October 31, 2013, Condensed Interim Consolidated Financial Statements Note 1 at 1 (filed April 22-, 2013)). Significantly, Polymet's development of the NorthMet Project and the nearby Erie Plant is Polymet's only business (Id. At 13-16). In other words, unlike, say, British Petroleum, Exxon Mobil or General Electric, Polymet has scant capital and no other resources to absorb financial losses or other adverse contingencies relating to the NorthMet Project, such as a prolonged collapse in prices or a catastrophic environmental accident. Polymet acknowledges that if the prices of metals in our ore body decrease below a specified level, it may no longer be profitable to develop our North Met Project for those metals and we will cease operations. Polymet Mining Corp., January 31, 2013 Form 20-F at 7- And Polymet acknowledges, as it must, that its business is subject to various risks and hazards, including environmental hazards, that could result in damage to, or destruction of, mineral properties, production facilities, transportation facilities, or equipment. They could also result in personal injury or death, environmental damage, waste of resources or intermediate products, delays or interruption in mining, production or transportation activities, monetary losses and possible legal liability. The insurance we maintain against risks that are typical in our business may not provide adequate coverage. Insurance against

I have confidence in the DNR and believe the SDEIS process for PolyMet Minings proposed NorthMet project has been thorough. The state and federal regulators will ensure that PolyMets project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'm very familiar with, and have faith in, the proposed reverse osmosis water treatment technology and believe that if any further water treatment would become necessary that simple ozonation of discharged water in holding ponds would complete the process to comply with even the strictest water quality standards. The same ozonation techniques hold true for air quality. Fact: OZONE oxidizes and decomposes organic and inorganic contaminants at a higher rate than other reagents. Also, OZONE is used for eliminating heavy metals from the effluent produced by many types of industry such as mineral extraction plants. And over 4000 cities worldwide use ozone to treat their municipal water and/or sewage. There are ways to clean up air and water discharge simply and effectively from most industry if only implemented. These techniques would also benefit Wild Rice growth. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. We cannot let the sins of past copper mining keep us from moving forward into a new safe way of doing business. My hopes would be to keep PolyMets mined resources in the United States and working here to keep us the "greatest country in the world." Thank you. Mark A. Snidarich 3912 Peary Rd Eveleth, MN.

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Mark Anderson 125 Century Trl Lino Lakes, MN 55014-7002 (651) 784-3205

Mar 12, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. The question here is whether clean water and sulfide mining can coexist The simple answer is no. The complicated answer is, "simply" no. Every sulfide mine ever operated has polluted the water around it. There will be pollution. This is acknowledged in the EIS. Polymet claims it can control the amount of contamination. It cannot, however, control nature for 500 years. The massive rain event of 2012 should teach us even greater respect for nature. Regulations can look good on paper, but they are no match for a force of nature. Also, they are no guarantee a catastrophe won't happen. They only provide for the cleanup, if possible. No amount of economic gain is worth the risk to perhaps Minnesota's greatest resource, clean water. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Mark Anderson 4501 Cambridge St Duluth, MN 55804-2314 (218) 724-6375

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." I currently work in Central America building water projects and providing treatment for drinking water. I have seen so many ways that problems can derail a project's planned expectation. While the plan to capture water run-off and treat it by membrane filtration may work well on paper and may work fairly well in practice (although the track record for sulfate rock mining is poor, in my research I have not found one example that did not pollute beyond intended levels). However, it is a remarkable position to consider a which tech solution for this newly created environmental problem. It is as if Christopher Columbus put this in place in 1492 when he sailed the ocean blue, and we Minnesotans are dutifully maintaining and operating the equipment today for the relatively small and short lived gain for those Spaniards. A crazy notion to consider. Proposing the creation of a new environmental problem that demands treatment for so very long can not rely on a high tech solution. There are too many things to go wrong, both things thought of and those not yet imagined. There needs to be a proven, effective low tech solution that will clean up the fallout of this mining operation. I admit that this may be hard to do, but the mining operation and the created environmental problem do not need to happen. An extraordinary request to create an environmental problem for Minnesota to deal with into perpetuity requires an extraordinary demand - the mining and exposure of this acid producing rock is permitted only if it can be treated in a proven, low tech, fail safe manner without continual human input. The SDEIS needs to include this fail safe treatment option. Sincerely, Dr Mark Arneson 2101 27th Ave S Minneapolis, MN 55406-1273

Mark B 47108

As a life long MN resident and frequent visitor to it's many recreational opportunities I am very much concerned with a possible Poly Met mining project. My greatest worries concern the long term harmful environment impacts that such mining will cause. These fears are due to the companies reported lack of experience in this type of mining and it's troublesome history of implementing adequate environment protections. Minnesota's north woods is truly unique and in my opinion worth immensely more than the mineral value or job creation that is purported to be produced. Now is not the time to move ahead with this project. These minerals aren't going anywhere. I'm suggesting waiting, hopefully until better pollution controls exist to ensure that these precious natural resources remain available for future generations. It is my desire that this project not presently be approved. Thank you. Mark Butala 10575 St Croix Tr. No. Stillwater, MN 55082

Mark Bakk 18210

My name is Mike Birkeland. I'll be giving my time to my friend and fellow Northern Minnesotan, Mark Bakk, who drove down here with me tonight. Thank you, Mike. My name is Mark Bakk, M-A-R-K, B-A-K-K. While I can't play guitar and I'm not an eagle scout, but I did just save a bunch of money on my car insurance. I'm here tonight representing the board of directors and the nearly 43,000 members of Lake Country Power, a rural electric distribution cooperative that serves eight counties in Northeastern Minnesota and most of the rural areas surrounding the project that we're talking about here. In 2010, our board took the position of supporting non-ferrous mining projects if they demonstrated appropriate environmental safeguards. We believe the PolyMet Supplemental EIS conforms to that standard. Our electric service territory doesn't include this project, so our cooperative and our members won't gain directly, financially, from approval of this project. But we support the science, the data and the outcomes. Lake Country Power also supports moving forward with the project because of the moral dilemmas that defy logic if we don't. Dilemma Number 1. Many in this room are supporters of renewable energy and the state's renewable energy mandate that requires 25 percent of Minnesota's energy be generated from renewable sources by 2025. This is a worthy goal, and like electric cooperatives, are well on our way to meeting this requirement. But there's a moral argument to consider because it's unjust to push this demand for renewable generation sources that drive up the price of electricity yet be against the extraction of the very minerals that go into what most of us in this room would call clean and green energy sources. Whether it's wind energy, solar energy or battery storage, it takes precious metals mined from the earth to capture renewable energy and make it work. If we're opposed to taking these resources out of the ground to meet renewable energy mandates and expand alternative options, is the outcome truly clean or green. Dilemma Number 2. It's contradictory to be for one form of environmental science that suits our ideals, yet opposed to the same science that doesn't. For example, climate scientists have tested and modeled data for years to validate predictions about the earth and our atmosphere. Some of the data's been adjusted, yet we continue to accept their findings as fact. The SDEIS uses the same methodology to predict outcomes for modeling data that has been tested, verified, and repeated, but in this case, to protect our environment. Science, if applied correctly, uses logic and recognized methodology to predict outcomes. Are we willing to accept and support the science in one case but not in the other just because one example aligns with our values and the other does not. Lastly, Dilemma Number 3. Is it morally acceptable to allow mining for precious metals elsewhere where we can't verify the environmental outcomes? How could we be more for the very products and technology that helped make the opposition to this project be so well heard, yet be against the most scrutinized venture of this type in the world. When we transfer this demand, it's like burying our heads in the sand. If you have a Smart Phone in your pocket right now --

Mark Baldwin 42147

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Mark Baldwin 1801 Hague Ave Saint Paul, MN 55104-7397 (651) 808-4350

Mark Bauerly 10752

I support the project 100%. I know that the mine be environmentally safe. It will have a huge positive economic impact on Minnesota and the US We need to mine our own minerals in the US for our balance of trade as well as our national security. Mark D Bauerly

I am pro-mining, pro-environment and pro-BWCAW. I believe that Polymet will provide immense economic benefits to the state of MN, especially the iron range region. I've sought expert opinion from parties who have read the EIS. These parties are not directly involved in the project or with any of the environmental groups opposed to it. To my knowledge the plan for the mine is smart, safe, financially viable and extremely unlikely to cause material harm to the environment during or after operations. I am 30 years old and have enjoyed time in the Wilderness for the last 22 years over approximately 35 trips. I am grateful for the financial position my family has been in over these decades as it has allowed me to enjoy these trips. As a "Twin Cities" resident I am an environmental stakeholder in this project because I want to continue to enjoy time in the BWCAW. However, do not stand to substantially benefit from an enhanced economy in the iron range. While I know that if this project go forward, my continual enjoyment of the BWCAW is ensured. However, Twin Cities residents have no right to impose unnecessary environmental restrictions to this project. Doing so only prevents financial benefits to families living on the iron range. This project is a fair compromise for all stakeholders and should move forward. Thank you for consideration of my comment. Mark Brice 5025 12th Ave S. Minneapolis, MN 55417

Mark Bridge 16749

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mark Bridge 610 Gilbert Avenue South Park Rapids, MN 56470

Mark C Wihriala 18319

My name is Mark Christopher Wihriala, W-I-H-R-I-A-L-A. I live at 710 12th Avenue, Two Harbors, Minnesota 55616. I am a fisherman, a canoeist and an outdoor enthusiast who loves Minnesota. I am here tonight because I'm concerned about the water quality of Minnesota's rivers, streams and lakes. I fish in these waters, I drink these waters, and I swim in these waters. I do not want them to be polluted, and I do not believe that the SDEIS is a sufficient cumulative analysis of water quality impact from PolyMet Mining. I am requesting that the State and Minnesota deny the wetlands destruction permit. The Section 404 permit should be denied because PolyMet's discharge would violate water quality standards, destroy animal and fish habitats and threaten natural resources for centuries to come.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. As one who values our state's natural resources and wants them preserved for our grandchildren I strongly urge you as decision-makers to reject the ill-conceived PolyMet proposal to mine in the Arrowhead. This is a shockingly bad idea: combining the exposure and deposition of sulfide rock, in a wet environment, located in a fragile watershed, to cause leaching of acids for generations to come, hoping that technology will somehow prevail. When in all of recorded history has a piece of technology, no matter how well conceived, withstood 200 to 500 years of daily challenge. In fact, with one environmental disaster after another, we continually prove how arrogantly short-sighted man can be. Precious metal mining always pollutes. It is currently the single most toxic endeavor we engage in. And our "partner" in this boondoggle, for the next several hundred years, is to be Glencore, one of the world's most notorious polluters ever. Why would we think this would end well. Please don't sacrifice the priceless legacy of a pristine North Country for a few million in taxes and twenty years of jobs. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Mark Catron 4731 Bouleau Rd Saint Paul, MN 55110-3371 (651) 483-1266

March 10, 2014 Mr. Tim Dabney Superior National Forest 8901 Grand Avenue Place Duluth, MN 55808 Dear Mr. Dabney, I am opposed to the proposed PolyMet large scale copper-nickel sulfide mining operations near Hoyt Lakes and Babbitt, Minnesota. Simply stated, I do not believe the "BENEFITS" outweigh the "COSTS". Mining companies engage in exploration and complete cost/benefit analyses of projects. Often they determine the costs are too great and do not justify a project- even though there are valuable raw materials. While there is copper/nickel, this is NOT the only valuable resource. As a citizen of Minnesota and user of the BWCA and other northern MN areas, I do not believe the "costs", to the environment and the tax payers for the 200 to 500 years after mine closure, are warranted. My objections to the project are summarized as: Short term benefits of relatively few jobs do not outweigh long term costs of pollutant monitoring and clean up. (Are we that optimistic to think a mining company will provide financial support for 200 to 500 years? That is not optimistic, it is "dumb"- no company is going to last that long nor provide the financial resources for that time period!) The copper-nickel is not needed, we can derive what is needed from recycling. The copper-nickel will not be used in MN, or the US, and therefore will not directly benefit MN. Mining companies have documented histories of pollution and significant impact to the land and environment. PolyMet has NO documented contingency plans for accidents/disasters. Again, from a "cost/benefit" perspective, this project does not make sense. I strongly urge you to reject the PolyMet proposal. Respectfully, Mark D. Dickinson 1674 Princeton Avenue St. Paul, MN 55105

To the Minnesota Department of Natural Resources: On page 569 of the SDEIS we find the following: “A Contingency Action Plan has been prepared as part of the Flotation Tailings Management Plan (PolyMet 2013m). The plan provides guidance to on-site personnel and emergency responders in the case of unplanned occurrences at the Tailings Basin. The plan defines 3- Level 3 is defined by either imminent failure of the Tailings Basin or a significant component thereof. The first actions in the event of any Level 3 condition are to check all persons who could potentially be affected are safe, initiate the appropriate chain of communications, and immediately undertake appropriate response actions.” What exactly does the phrase “appropriate response actions” mean. Why are the Flotation Tailings Management Plan’s disaster provisions not covered more fully in the SDEIS. This is grossly inadequate. As “100-“ and “500-year” floods begin to occur every few years in northern Minnesota, it is clear that extreme weather could cause failures in treatment systems that enable pollutant release from mine tailing pits far in excess of any rosy PolyMet projections. Will PolyMet, a mere shell company, be responsible for guarding against these inevitable events for the next 500 years. What financial assurance for disaster mitigation can PolyMet possibly provide that would cover such an immense period of time. What assurances has the DHR confirmed thus far to pay for mitigation of even the “normal” amount of acid and heavy-metal environmental damage in ensuing years that sulfide mining always produces. Until such time as proper financing for much more robust water safety measures can be guaranteed, permits for this project should be denied. Thank you. Mark E. Vesley 1598 Edmund Avenue Saint Paul, MN 55104-2234 [HYPERLINK "mailto:mvesley@minncle-org"mvesley@minncle-org](mailto:mvesley@minncle-org)

To: Minnesota DNR Human beings are bad at weighing the potential for a current gain against the potential for a future loss. This failing skews the analysis of environmental issues, all the way from overarching topics like climate change down to specific projects like mines. It is hard for us to compare effectively a clear near-term benefit (Jobs., usually), against a foggy long-term detriment, even, in the case of hard rock mining, with plenty of past examples of cases where the scales have been poorly calibrated. With this dynamic in mind, we urge the Department to go out of its way to lean on the scales in favor of future protection and recovery of the landscape that will hold this mine. There is a good Minnesota statute directing the Department to do that, and there is no requirement that the provisions and fundings for future protection and recovery leave room for a profit for the miner. These minerals are not going anywhere, and even if if extra-prudent and especially tough requirements discourage extraction now, there will certainly come a time when those requirements will fit a sensible and profitable mining outcome. We have tried to follow this mining proposal and the resultant environmental concerns, and are sorry that we have not seen a financial proposal for future protection and recovery from someone that we can refer to or endorse. We would rather our message be "please don't do that - do this" than "please worry about this somehow." But in this specific case that very lack of alternative proposals for the future seems to show how uncertain and underweighted the future is in the analysis so far. We hope that the Department can insist on a financial plan for future protection and recovery that escapes the usual human tendency to discount the future, and that sets an especially tough and thoughtful standard for this mine and the Twin Metals mine that will soon follow, and for other states as well. We thank the Department staff for its work on the huge task of dealing with this proposal. Mark and Carol Engebretson 153 Lakeview Ln. Wayzata, MN 55391

My name for the record is Mark Haider, M-A-R-K H-A-I-D-E-R. And the reason I'm commenting on this is I think it needs to be commented on because there are a lot of false premises that people are going on. Like PolyMet is a new company and they are bringing new things in. Well, actually, most of the people have been part of other things around the whole world. Just because they polluted around the whole world, they are going to come here and not pollute? Okay, I'm not believing that. The last thing they set up, and if you look and read the list of names that are involved in this PolyMet operation, they are the same people that set up the Eagle Mine in Michigan. Okay? To show what short-term commitment they have, they have already sold it, and it is not even up and operating yet. They sold it in January of 2013 and the plant isn't even up and operating yet, in Michigan. Okay? Their company is also involved along the Flambeau River in Wisconsin. They are reopening a mine over there so that they can get more minerals out of it. Okay? But because the mine was put in in 1980, pollution control standards, they only have to use the 1980 ones. Because if they had to do the same thing and apply now to get a permit, they couldn't get a permit. The mine over there is only 140 feet from the Flambeau River. Okay? Do these people really care about Minnesota or Wisconsin or Michigan? Or do they care about themselves? Okay. And there are a number of different corporations that they fall under; Rio Tinto (phonetic), PolyMet. And PolyMet had a previous name. Okay? They have already changed the name once in this thing in Minnesota. And they have a number of names. Okay? So, you know, can they be trusted? Well, if you look back to the last thing they did in Michigan, they sold it before it opened up. Okay? To me, when you are dealing with people like that, you know, who can deal with that? They can't be trusted. Okay? I said, you know, that's the first thing when I'm dealing with somebody, it is that I have to know that they can be trusted. Okay. Which we are talking 550 years here. You know, 500 years. How about one year? We are not even going to be sure that they are going to have it a year after it opens. Because they -- if you look at their past record, these people, the No. 1 guy for PolyMet, he worked on the Eagle Mine project in Michigan. Okay. He is working on this one. Okay. So, it is a corporation. So, they could sell it next week. They could sell it right after they got the approval. Okay. So, you know, you can't -- you can't trust them. Okay. It is, you know, that's all I got to say. Thanks.

Mar 4, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Minnesota is second largest user of underground water reserves used in mining of all states because of iron ore mining and now we have already started to pump well water to neutralize the acid derived from iron ore mining. Why would the state of Minnesota assume the full risk of cleaning up Poly Met mine site: Poly Met or another business entity which could own the mine site in the future would surely walk away from the massive undetermined liabilities. Poly Met isn't even committed to start cleaning up the mine site until after the mine site would be closed. What water would Minnesota be cleaning up with a reverse osmosis plant proposed for the site; polluted well water or/and polluted surface water . An undermined amount of jobs for an undetermined amount of years We would be better off to building a water bottling plant to produce water to ship to California for 500 years. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Mark Haider 3988 Woodview Dr Vadnais Heights, MN 55127-4115

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Multinational corporation, PolyMet, is seeking permission for an open pit sulfide mine on National Forest lands near the Boundary Waters Canoe Area Wilderness and Lake Superior. If approved the mine will pollute the largest of our Great Lakes, Lake Superior, threaten local clean water and wildlands, and endanger public health for generations to come. A decision in favor of PolyMet's proposal would open a floodgate for more sulfide mining in a large area near Lake Superior and surrounding the Boundary Waters Wilderness - considered by some as one of the most beautiful wilderness areas in the world. This is a dangerous proposal. Please protect the Lake Superior and the Boundary Waters Canoe Area Wilderness from dangerous sulfide mining pollution. Sincerely, Mark Harris 3855 Blair Mill Rd Apt 204d Horsham, PA 19044-2905

Lisa Fay MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement ("PolyMet SDEIS") fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provide evidence to justify its claims about collection and containment of mercury and sulfates. The PolyMet SDEIS also provides an insufficient analysis of the human health risks of other pollutants, such as neurologic morbidity resulting from manganese and lead release; and carcinogenic effects of air emissions of diesel, asbestos-like fibers, nickel and other particulates, and of arsenic releases to water. The PolyMet SDEIS fails to analyze health risks to workers who would work on-site at the PolyMet mine or plant and fails to assess impacts of tailings groundwater seepage on nearby residential. The PolyMet SDEIS does not discuss impacts of exposures to vulnerable populations, such as infants, children, the elderly and persons who rely for subsistence on fish, wild rice or game species where pollutants may bioaccumulate. For these reasons, we would first request that the PolyMet SDEIS be revised to provide more complete information on mercury and sulfate emissions, deposition, and seepage from various sources, and the potential conversion to and bioaccumulation of methylmercury resulting from releases to the environment and hydrological changes from the proposed PolyMet project. We would further request that the PolyMet SDEIS be determined inadequate pending supplementation to include a Health Impact Assessment, under the direction of t

Hello DNR My feelings about the proposed Polymet mine situation: First, unlike what some mine proponents speakers suggested last night, most of us "environmentalists" do not hate miners nor mines. I see it as their right to mine, but in this case, only under the condition that they have a 100% ironclad guarantee that no sulfuric acid can escape into the surrounding environment. During last night's meeting, the mining side of the debate constantly brought up the notion that they trust the process, that they trust the agencies involved do whatever is necessary to ensure that no disaster will occur, now or in the future. I sincerely believe that the miner's and Polymet are doing everything required to make this happen. No doubt, they don't want to pollute their "own backyards", nor see their plant shut down and jobs lost during the mining process. Regardless, history has proven that despite the best efforts of leading professionals, disasters happen. Case in point: 35W bridge collapse. Based on historical fact, their reasoning is flawed and their position is irresponsible. I have no faith in ANY proposed system that is required to monitor and safeguard the waste for 500+ years. A year of two maybe, but 500 years. Seriously. If indeed, that it what is required, that is ridiculous, and we all know it. Frankly, I'd like to know what incentives Polymet will have to maintain an abandoned mine 400 years after any person who benefitted from it or had anything to do with it is dead. I saw a sign last night that read "500 Years Ago, Martin Luther Was a Catholic". Sarcastic, but it makes another good point. I've read over and over that 100% of sulfur mining projects have polluted the surrounding environments. If I were on the panel of DNR personnel responsible for this decision, I would want to know what happens in a worst case scenario. What happens if some terrorist group comes into northern MN 200 years from now and bombs one of these containment facilities, for instance. Again, if what I've read is true, "100% failure rate", how in the world can this even be considered.. We're being asked to be guinea pigs. Please, do not let them mine until they have the technology to immediately, cleanly, and completely dispose of the waste products. That copper has been there for millions of years and is not going anyplace. Just wait. Be prudent. Be conservative. Be smart. We all know that copper is coming out of the ground sooner or later. It will only become more valuable as the years pass. This is your legacy. Sincerely, Mark Imsdah

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Mark Klausner 3854 gateway dr Greenbelt, MD 20770 US

Mar 9, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Mark Klugiewicz 32905 Sunrise Dr Magnolia, TX 77354-2628 (281) 259-6555

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mark Lauderbaugh 12501 Nicollet Ave Unit 414 Burnsville, MN 55337

The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mark Lauderbaugh 12501 Nicollet Ave Unit 414 Burnsville, MN 55337

To whom it may concern. I believe Polymet corporation's due diligence has been over and above. I believe their plans on keeping the mining and run-off areas environmentally safe are legitimate. Like the mines today, they are policed for possible harmful issues created by mining. There is no doubt that this is a good thing for our future. If the Polymet mining goes through, there should be aggressive measures created to police the air, water, and land issues. Measures that will shut down the mining operation, if there is evidence of any possible breaches in Polymet's assurances. I believe the State of Minnesota and the Polymet company will work together to make it work. I firmly believe that this opportunity should come to fruition. I could get into the jobs, the local and state taxes, the future of our children, Polymet's being a good custodian but this means nothing to me, if we are left with a bad environment to live in. I do believe Polymet is all in to providing safeguards to the environment. I also believe that Minnesota's checks and balances and Polymet's pro-activeness will make this venture work. I firmly believe in the Polymet plan, and hope for Northern Minnesota and it's people to grow with the mine. - Mark Lundberg Products Manager TerraMar Ingredients, LLC 4920 Queen Avenue South Minneapolis, MN 55410 218-750-7945

I wanted to note my opposition to the proposed copper-nickel mine in NE Minnesota based on the information from the SDEIS. 1) I don't believe there is adequate funding set aside to cover the 200 to 500 years of waste water cleaning, monitoring. This will eventually fall into the hands of the state when the cost overruns what is set aside and the mining companies have provided what they can afford to cover without going bankrupt. It looks like a planned superfund cleanup site is the result of this mine. 2) I was encouraged about the changes to the holding pond but realized they are only offering a partial solution. There isn't enough information about how it would hold up to huge rainfalls and sudden flooding conditions. Rains in Duluth last summer caused huge washouts, flooding, loss of property, etc that could not have been predicted/expected. There is no secondary capture in place and if a overflow or breach occurred, it would flow into the St Louis River watershed. 3) Not enough information on the reverse osmosis process to clean the water. The idea is great but it will require a huge amount of energy to run this type of system. Is this within the ability of the local power grid. Are they going to create electricity onsite to power this. Has this been tested on the scale that will allow them to profitably process the volume of ore that is planned. I know the jobs provided are a great boon to the range cities and this will also provide a great new resource for the state but we need to be able to do this where the mine can still profit and the environment is not tainted for the next couple of hundred years. Thanks for listening. Mark Alan Luttinen 40 Taylor Lane Grand Marais, MN 55604

Mark Lystig

18245

My name is Mark Lystig, L-Y-S-T-I-G. I live in Eagan, Minnesota. I have not recently been to the Range, but I lived in Virginia for two years, and I am familiar with the problems with employment, or lack thereof, on the range, but I think this is an opportunity that we can take a stand to protect a really unique environment and that if we don't do it now, we will not have the opportunity. It's not just a matter of there being minerals up there. There are minerals up there, true, but there are other aesthetic features of the area that do not occur anywhere else, and we need, as a community, as a country, as a world, to protect the earth, and this the time to do it. Thank you.

Mark Mansfield

40048

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Mark Mansfield 37 Madison St Geneva, NY 14456-2853 (315) 789-2829

Mark McKeehan

39534

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mark McKeehan 29827 Hardwood Road Chatfield, MN 55923

Dear Lisa Fay or Whom it May Concern: Please accept my comments on the Northmet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement. My comments are listed below and in the attached pdf document. Northmet Supplemental Draft Environmental Impact Statement Comments Mark C. Moehlenbrock 630 Orchid Lane North Plymouth, MN 55447 To Whom it May Concern: My primary area of concern regarding this project is its potential long-term effects to water quality. The plan to mitigate detrimental effects to water quality appears to have several shortcomings. Long Term Water Treatment “Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site). The duration of the simulations was determined based on capturing the highest predicted concentrations of the modeled NorthMet Project Proposed Action. It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modeled, NorthMet Project water quality performance, as determined through monitoring requirements. PolyMet would be held accountable for maintenance and monitoring required under any permit and would not be released until all conditions have been met.” (Page 5-7) “In this SDEIS, non-mechanical treatment systems are not described in detail because the NorthMet Project Proposed Action is based on mechanical treatment only. However, implementation of non-mechanical systems is considered a long-term goal for closure.” (Page 5-7) Comments: Minnesota laws governing mine permitting expressly forbid granting a permit to any project that requires perpetual water treatment. By Polymet’s own calculations, their waste water would require water treatment for at least 500 years; their models didn’t calculate what would happen after that. Surely this is in violation of Minnesota’s mine permitting laws. The SDEIS vaguely references non-mechanical treatment, but doesn’t explain what that treatment method might be or when it will be able to be employed. Polymet claims to be very concerned with post-reclamation water quality, but in 50 years, when there is no more money to be made, who is going to make them accountable. 500 years is longer than any of us can fathom, and the idea that Polymet will be on site for half a millennium, diligently maintaining their waste water treatment facility, is absurd Mercury in the Embarrass River “Several lakes downstream of the NorthMet Project area within the chain of lakes are on the 303(d) list for “mercury in fish tissue” impairment, including Sabin, Wynne, Embarrass, and Esquagama lakes” (Page 4-133) “The NorthMet Project Proposed Action is predicted to result in a net increase in mercury loadings to the Embarrass River of up to 0-6 grams per year (from 22-3 to 22-9 grams per year), about a 3 percent increase.” (Page 5-207) “Research suggests that total mercury concentrations in streams and methylmercury content in fish are roughly proportional within individual watersheds (USGS 2010), such that, for example, a 5 percent increase in total mercury in water would be expected to result in about a 5 percent increase in mercury content in fish within that watershed” (Page 5-21) Comments: Mercury loading in the Embarrass River is expected to increase. The Embarrass River watershed is already impaired by excess mercury in fish tissue. The SDEIS justifies this by saying that, because mercury loading to the Partridge River will decrease, the net effect is less mercury in the Saint Louis River. This is small comfort to people who live and recreate on the Embarrass River system. Because of the existing impairment for excess mercury in fish tissue, any project that anticipates adding further mercury to the Embarrass River should not be deemed acceptable. O

To Whom It May Concern My comments on the Polymet SEIS for public record are as follows: I have read several sections of the report and the lack of detail regarding financial assurance is troubling. It sounds like this information will not be given until the permitting phase, which is quite late in the game. The wastewater treatment may need to continue for hundreds of years, so the estimate of \$3-5-6 million annually is meaningless. How much will treatment cost in 100 years. 200 years. I cannot envision any scenario where Polymet could afford to set aside enough money to cover the cost of an open-ended treatment period. The document is remarkably vague about the length of time required for water treatment, so I must assume that no one knows with any certainty. My second concern is the complete lack of consideration for underground mining as an alternative. How many large, open pit mines do we want in the area. If we allow one, what right do we have to deny others. Taconite mining has already decimated part of the landscape in the area; must we now destroy the surface of more land. Underground mining may cost more, but without including it as an option, how will we know. I am not opposed to mineral extraction in NE Minnesota, but it must be done right, or not at all. The SEIS is based on the assumption that all will go according to plan. I don't see any room for errors, accidents, spills, etc, yet there will almost certainly be unplanned events during a project of this size and duration. The environmental risk seems much higher than the document admits to. I respectfully submit my opinion that the proposed project should not go forward in it's current design. The environmental risks are too high, the financial assurance is no more than wishful thinking at this point, and we should not set a precedent by allowing an open pit mine now, to be followed by an unknown number of other open pit projects. Thank you for considering my comments. Mark Pelham 400 Sigrid Drive, Buffalo MN 55313 mepelham@hotmail-com

Mark Peltan

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Mark Peltan 23334 Lakewood Clinton Township, MI 48035 US

My name is a Dave Lislgar, and I yield my time to Mark Phillips. Good evening. My name is Mark Phillips, M-A-R-K, P-H-I-L-L-I-P-S. They list that I'm from Oakdale, Minnesota, that's where I currently reside, but I'm a native of Eveleth, Minnesota, and spent the first 55 years of my life on the Iron Range, and actually plan to return to that area in my retirement in just the not-too-distant future. Both my grandfathers were hard-rock miners in the Iron Range and most of my family and extended family made a living off iron-ore mining for their whole lives. I spent most of my career, about 30 years, in the field of economic development. The majority of that time, trying to encourage job growth in Northeastern Minnesota, and to quote somebody that was up here earlier, that's not an easy task. I was privileged to serve nearly two years in the Dayton Administration cabinet as the Commissioner of the Department of Employment and Economic Development. During that period, I served on the governor's sub-cabinet on mining and also on the Environmental Quality Board, the EQB. This engagement provided me with many unique opportunities to receive firsthand high-level briefings from most of the DNR and MPCA and other agencies, as well as from PolyMet, on the proposed project. During this period, I developed a deep respect and confidence in the environmental review process in Minnesota and in the agencies involved in these processes. I also observed that PolyMet has worked diligently to respond to both the State Federal agencies to ensure a project meets all of Minnesota's and federal environmental standards. I was also comforted that PolyMet was proposing to use proven technology to remove any contaminants before returning collected and processed water to the environment. I also appreciated that PolyMet was willing to meet the state's somewhat arbitrary wild rice standards. Based on these and other firsthand obligations, I support the PolyMet project. I believe the agencies, both state and federal, should find the SDEIS adequate and move forward with permitting. Let's bring these needed jobs back to the Iron Range, as well as protect the environment we all love. Thank you for giving me this opportunity.

Mark R Brown

I have been following the progress that PolyMet Mining has made in anticipation of operation. I am impressed and confident that the preparations and precautions proposed by PolyMet through processes like reverse osmosis will protect the environment today and well into the future. Minnesota's Iron Range, my home has had continuous mining activity since this country was settled. Then as now the quality of life, the environment and the natural beauty of Northern Minnesota has been cherished and protected by the mines, their workers and those in the community that work and support this critical industry. This will not change with PolyMet Mining. I am confident that PolyMet's mining operation as outlined in the SDEIS will have minimal if any long term adverse effect on the water, air or land. I believe that PolyMet will provide real living wage jobs for residents of the area, support education, local charities and initiatives, youth activities and opportunities all the while safely and responsibly mining important metals that are essential to the local and global economy. I am in support of this project. With Kind Regards, Mark R. Brown 742 Ridgewood Road Duluth, MN 55804 218-591-9093 Mark R. Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I spent one of the best weeks of my life canoeing in the Boundary Waters and Quetico-Superior, and have done other outdoors activities along Lake Superior between Duluth and Thunder Bay: canoeing, rock climbing, biking and swimming in Lake Superior. Though I wouldn't really recommend that unless you like ice baths. I now live on another of the Great Lakes in Chicago. I greatly appreciate the ecological, economic, and recreational value of the lakes. Even from a strictly business perspective, when you put a proper value on these services that the lakes provide, keeping sulfide mining is the right thing to do. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Mark Raulston 2543 N Bernard St Chicago, IL 60647-1201

Mark Rieder

11341

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Lisa, Please note my opposition to the Poly Met mine. The short term economic benefits do not outweigh the long term environmental cost I have recently seen claims from Poly Met that the economic benefit surpasses that of the Mayo/DMC project. I do not dispute those figures, but I do know that in Mayo's 150 year history it has not been a polluter of the environment, and will be in business long after Poly met runs out of things to mine. Please express my opposition to those who will decide on the value of this mine to the citizens of Minnesota. Respectfully, Mark Rieder 1069 Golfers Ct SE Rochester, MN 55904

Mark Roalson 57340

Mark Roalson, R-O-A-L-S-O-N. My main concern is the existing Dunka Pit, D-U-N-K-A. It is near PolyMet lands, but it is owned by Cliffs Natural Resources. It is a pit that had sulfuric rock, copper-nickel ore in it in the 1960s. They dug it up in the sixties and it wasn't iron, like they thought it was, it was copper-nickel ore. So it has been sitting around the pit, on the outside, and it has been bermed and diked, and there is a water treatment plant there, but it still leaks sulfuric acid, sulfates and heavy metals. And Cleveland -- or Cliffs Natural Resources has been fined at least once for letting this seep into the watershed that goes into Birch Lake. The MPCA and the DNR are responsible for making Cliffs Natural Resources clean this up, but they haven't done so. It still keeps leaking. So my main concern is if the regulating agencies, like the MPCA and the Minnesota DNR cannot make Cliffs Natural Resources clean this up before PolyMet, how are they going to regulate PolyMet, that is going to be a lot bigger operation? I don't know if I made that clear. Let's see what else I have on here. Another thing that concerns me about the PolyMet mine is that there doesn't appear to be any emergency plans in case of catastrophic events, like heavy rainfall, heavy winds that might damage or cause leaking in tailings ponds or in any treatment plants. In case there is heavy rains or heavy winds, they need to have emergency plans in place to prevent leaking or spillage. Also, on the PolyMet mine lands, there is going to be large containers of chemicals stored, like sulfuric acid and other chemicals to process the mine ore. And these things need to be bermed and contained, and there needs to be emergency plans in case some of those break, from whatever cause it might be. That's pretty much it. Oh, can I add one more thing? Minnesota has a law on the books stating that when you sink a hole in the ground, like exploratory drilling, to take ore samples out in the form of a core, that these exploratory holes have to be grouted, cemented from the bottom to the top to prevent cross aquifer contamination. But the Minnesota Department of Health has issued a waiver to the exploratory drilling companies that they don't have to grout these holes for ten years. So, one of my concerns is if they are giving waivers now and making exceptions, what other exceptions are they going to make in the mining process if things don't go according to plan? Alright. That should do it. Thank you.

57408

DNR: One factor that I couldn't find addressed in the latest PolyMet SDEIS is the issue of mitigating the results of natural disasters. While dealing with the acid water, heavy metals, waste rock and other concerns are listed, none take into account of what emergency efforts would take effect if there was a major flood. While the area to be mined is not located on a flood plain, neither is Duluth, MN. Only last year there was record summer rainfall in a short period of time and there was flooding to the extent never before recorded in Duluth's history. Whole paved streets were opened up and washed out. Sewers were overwhelmed. Cars floated away. A child was sucked into a sewer and miraculously came out an opening many blocks away, still alive, fortunately. I even experienced this in Brimson, MN, near the Iron Range where country roads were completely flooded and reamed out overnight to bedrock during the same time as the Duluth flooding. I am sure if you check the records at the MPCA, you will find that an already existing stockpile of copper-nickel ore stored within a berm (set aside by the former LTV mine on what is now Polymet) has several times had acid drainage wash over its walls and into tributaries going north to Birch Lake. Plankton, insects, and small fish life were the casualties. While earthquakes and tornadoes are very unlikely to happen in the northland, they are possibilities. Flooding, however, should definitely be considered in the emergency plans to contain waste and untreated water of all types. Thank you. Sincerely, Mark S. Roalson 218-225-8897 900 Dorchester Drive Hoyt Lakes, MN 55750

Mark S Jensen 54521

PolyMet has not proven that they can contain or dispose of the waste rock and other materials associated with the mining process.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Mark S. Roalson 900 Dorchester Drive Hoyt Lakes, MN 55750 Hoyt Lakes, MN 55750 218 255 8897

Mark Saastad

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Mark Saastad 12272 Jack Pine Trl Eden Prairie, MN 55347-4631 (952) 828-5054

Mark Sanstead

18301

I am Mark Sanstead, fourth generation of Swedish immigrants to Minnesota. I'm proud of our state in terms of its legacy, amendments, and how our citizens would be taxed to protect our natural resources. As we look at mining ahead in the Minnesota future, I think we are at an important decision point. We are kind of weighing our heritage of natural resources, the water, the air, versus a short-term perspective of 300 jobs for a 20-year period by a company looking to start their very first mining operation. I hope that we can take a long-term view of our heritage and our resources, in terms of our quality of life in Minnesota, and be wise stewards of these resources. That's it.

Mark Sanstead 43317

I am very concerned about denigrating our water resources for decades ahead for the short term benefit of mining. I fear the costs will far out way the benefits to our state and our natural resources . I see few examples of successful copper mine reclamation. Please make sure we will not be paying a cost for generations. Let's not damage our Minnesota legacy. Mark Santead Phd Director Mental Health Hazelden Betty Ford Foundation

I am for the mining so jobs can be created I think we have more than enough protections in place to protect the environment. Get more people working in this state to help take the burden of high taxes off the rest of us working people. You democrats promised to lower property taxes which seem's to have gone out the window another broken promise. I am hoping the mining takes place and that a bunch of government regulation's does not put a stop to another opportunity to move this state forwaRdWe need more private sector job's people need to work in this state it only makes sense to go through with letting them mine in northern Minnesota.I think every one cares about protecting the environment and it can be done if we put our minds to it.Mining and protecting the environment could work if you get the rite people making the decision's.If this fall's through God help us all I may have to leave this state I am getting sick and tired of paying higher than usual taxes in a state that can't seem to move forward in other places than just the twin cities area. May God Bless us all bye for now thanks Mark Sent from my iPad

Mark Skelton 18078

Good evening. I'm Mark Skelton. I'm the Mayor of Hoyt Lakes and I'd like to begin by thanking the co-lead agencies, and all the agencies that have gotten us to this point, today, after nine years of hard work. I can't stand before you today and speak on the expertise of mining precious metals, but I am glad I live in a state and a country that have the experts to do what they've done to get us to this point, today. I do feel that I have some expertise to talk about the socioeconomics of this project, and I can start with the town about five miles from here called White Lakes that was a town of the '50s, new technology in mining, and how they closed that plant in 2001. In 2001, they closed that plant. But what I'm here to talk about is not our city. I'm here to talk about the socioeconomic impact of this statement. They talked about us as a region. Nine communities, three counties. They talk about us as a region, which they should, and as a region, did you know that we have 23,000 less citizens than we had in 1980? We have lost 10 percent of our population in this region. Ten percent. When our state sports 30-percent increase in population. Thirty percent increase versus a 10 percent. It's time to move forward. The socioeconomic impacts. Imagine. It is my hope -- it is my hope that the powers to be will look at this and will weigh, proportionately, the socioeconomic impacts to the science of this project. It is so important to us. Imagine, if you will. Imagine, if you will, two million man hours of construction, \$82 million of new federal, state and local taxes, \$232 million of direct wages, and so forth. \$330-plus million a year in direct output or the value of the metals coming out of the ground. That doesn't count the indirect -- the \$99 million in indirect wages, or the \$182 million in indirect output. It's time to do this project right, it's time to do this project now, and it's time to do this project here. Thank you.

My name is Rory Lentsch. I represent the Local 512 Union Ironworkers Program. (Inaudible) apprenticeship program best program in the nation. I yield my time to Mark Skelton. Hi. My name is Mark Skelton. I'm the mayor of Hoyt Lakes, Minnesota. Skelton is S-K-E-L-T-O-N. I understand that this project a risk. I took a risk crossing that highway out there in the roads a little while ago. I have to tell you that as far as a risk goes the consequences of taking that risk I believe is a risk we have to take. We have nine years of science. We have nine years of technology. We've got nine years of work from all these people. And we have regulatory agencies that are going to keep an eye on making sure this project is done. We cannot take the risk. We can say we're not going to do it. Yep. We're all going to use our phones. We're all going to use our computers. We're all going to use the medical technology. It's a risk that I believe has to be taken. I also have heard that Hoyt Lakes or the Iron Range needs to diversify their economy. They have to think outside the box and diversify their economy. I understand that people don't live there making a comment like that. If you live there, I think you've been living with your head in a box. Because the fact is we have been trying to diversify our economy for years, for decades. We have an agency called the Iron Range Resource Rehabilitation Board that has worked tirelessly for years. We have economic development people that we pay from small-town budgets to diversify our economy. We even built industrial parks. And my industrial park in my community has every amenity that you can possibly think of. And we have a marketing team that is awesome. But, you know what? The old analogy, "build it and they will come," we built it, nobody came. I will give you a little comparison. A little comparison of what is going on on The Range. My wife and I came down to the Excel Energy Center a few weeks ago and went to the Wild game. It was awesome. They announced that there were 20,000 fans. That is 20,000 more people than we have living in the cities of Virginia, Gilbert, Biwabik, Aurora, Hoyt Lakes, Babbitt, Tower, and Ely combined. This is a project that is about diversifying our economy. It's about stabilizing the economy. It's a project we need to do. Thank you.

Mark Snyder

58067

I'm very concerned about the loss of wetlands that would resort from the PolyMet mine as well as the risk this places on nearby water resources. Wisconsin has a moratorium on sulfide mining due to its track record. How can we be sure PolyMet will do better? Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Mar 10, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, Are you guys nuts. There is very little in this mine proposal that even warrants discussion, let alone consideration. "Water, water everywhere, and not a drop to drink." I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Dr Mark Sorenson 2987 W Owasso Blvd Saint Paul, MN 55113-2160

Mark Stratman

Mark Sutich

18358

Hello. My name is Mark Sutich. S-U-T-I-C-H. I'm a third-generation Iron Range bulldog. I've been involved in the mining industry off and on for 50 some years since I was a little kid. Got involved in some projects. I'm currently on site. I have -- my company leases property adjoining the PolyMet sites. We do quite a few project. I came prepared to talk to everybody tonight, but as I listened to everybody talk and bring up points, they're valid points; however, I think a lot of them might be selfish. You know, we want jobs on the Iron Range. Of course we do. We want to protect our water. We want to protect our forests. I don't think there's anybody in this building that wants to see environmental issues. I started at a mining company in '73. I watched many, many environmental issues come up and be addressed. These companies are responsible. Just like the regulatory organizations that are scrutinizing every move they make. They are going to be under a microscope. One of the things that my company does -- I've been involved with mining and mining people from all over the world. I recently talked to a gentleman who was a mining consultant worldwide. I met him -- I've known him for years. I met him at the Northern Green Expo at the Minneapolis Convention Center. He brought a point up to me. And I've heard it before. The world looks at the Mesabi Iron Range in Minnesota, the mining world, looks at it as the mecca of mining. The Australian mining -- there is nobody big technology other than Minnesota mining. South America relies on Minnesota mining. We are technically advanced in mining. When we look at this project, I have 300 jobs for 20 years, that's not true. It could be thousands of jobs for centuries. There are standards being set here. And in the true fashion of Minnesota, we're setting 14 the mining standards. We're setting cutting-edge technology that is going to pass through the world. We look at environmental issues. Let's bring these issues to South America. Let's bring them to China. I hear somebody say foreign countries are polluting our air. We're the people that have the capabilities of doing this. And, you know, we look at our whole situation, 60 years ago taconite was a dream; but it was our technology that developed that kind of mining. It's done all over the world today by our standards. We set those standards. We developed them. And we can do the same with this. And this is very important. And I think Minnesota needs to keep setting the standards in mining for the rest of the world to follow.

I am a resident of Minnesota for the past 54 years..born here 1959 and never left I spend my summers and have a cabin in Ely MN I am 100% against this mining I am 100% sure the approval will go through no matter what we say or how many say it Why. Because there is 1 trillion dollars worth of Cu/Ni in the ground Mark Trainor 10540 Raven Loop Foley, MN. 56329 783 Kawishiwi Trail Ely, MN mgtrainor@gmail-com

Mark Trumper

45775

Dear DNR folks, One of the most important places in my life is the BWCA. It is a place of majestic beauty and clean clear waters. The polymet project is too close to this wilderness. It is too risky. The amount of time to treat the water is unreasonable, costly and unproven. The science has been called junk science by experts in environmental science. Importantly as well, the big promise, getting some to buy into this project, is the prospect of jobs in an economically depressed area. This is a short sighted advantage. The jobs are few and short lived. This is a bad project. When you decide if this goes through or not, the question is: is it the right thing to do. That's easy. No. It is wrong because the benefits are minimal and the long term costs are too high. It is risky and unproven. The foundation of the environmental protections are built on junk science. Don't approve Polymet. It is morally and economically wrong. Mark Trumper Sent from my iPad

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Ask a question of Polymet "how many mines have been mined/on-going with the Polymet name". What is their track record. Sincerely, Mr mark voorhees 7660 Heritage Rd Eden Prairie, MN 55346-4426 (952) 949-0276

Mark Walters

42044

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mark Walters Hibbing, Minnesota

Mark Weis

3385

With the PolyMet proposal that says we might be treating this water for up to 500 years, is 20 years of mining really worth it. There has never been a successful mine of this type that the mining company has not filed for bankruptcy prior to the mine being successfully closed. Why doesn't the State of Minnesota do what Wisconsin has done and put a ban on this type of mining until a mine can be run for at least ten years and then shut down for at least ten years with no problems. PLEASE, PLEASE, PLEASE do not allow this mine to open. We are only going to get one chance to do this right. Thank you, Mark Weis

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. In closing , I ask you to take a personal interest in protecting us from corporate interest in the short term and provide us long lasting water quality that we all can live with. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. In closing, I ask you to take a personal interest in protecting us from corporate interest in the short term and provide us long lasting water quality that we all can live with.

Sincerely yours, Mark C Wihriala 710 12 ave Two Harbors Mn 55616 Mark Wihriala 710 12th Avenue North Duluth, MN 55616

Mark Wihviala

19519

My name is Mark Wihviala. I'm a Finlander like most of you out here. So I'm an outdoorsman, a fisher, canoeist. I love Minnesota. I've been here all my life. But I am here tonight because I am concerned about the water quality of Minnesota's rivers, streams, and lakes. I fish these waters. I drink these waters. And I swim these waters. I do not want them to be polluted. But I do not believe that the SDEIS is a sufficient, cumulative assessment of the water quality impact from PolyMet Mining. I am requesting the state and Minnesota to deny the wetlands destruction permit, Section 404 Permit to be denied since PolyMet's discharge would violate water quality standards, destroy animal and fish habitat, and threaten national resources for centuries to come. Thank you.

Markus (Blom) Dandy

57255

75% of people oppose this process around the Grand Canyon area...Lake Superior and the BWCA are at least as important to Minnesotans (& humans as well as other animals – that require clean water to live) Short term employment is nothing compared to the long term loss(es).

marla kennedy

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs marla kennedy 2259 Summit Ave Saint Paul, MN 55105-1002 (651) 645-3303

I am totally against any of the proposed mining projects. It will damage the environment and not worth it. Stop it please!Marlene Lorraine Johnson1903 Old N. Shore RdDuluth, MN 55804

Marlene Voita 18234

Marlene Voita. I am a Sierra Club board member concerned about the environment and that for 300 jobs to have environmental effect for 300 to 500 years when we won't be here and the company won't be here and how long will the company last? Twenty years at most? I really think that this has to be rethought, especially with the state-of-the-art now where PolyMet has never had a facility like this before, and none of the plants that currently exist can show that they have no environmental effect. In fact, they have grave environmental effect on the land and water resources. Very concerned that this project would go forward, and I have experience working with environmental impact statements for the Pollution Control Agency, formerly, and I just don't think that it's appropriate to trade our future for 300 jobs and ruination of our land by the Boundary Waters or in the northern part of the state. The next project will be closer to the Boundary Waters. I know this is a different watershed but to ruin a watershed over a project like this. That's all I have to say. And we have a cabin in the Silver Bay area, so we're concerned about watershed.

Marlene Warkoczewski 43107

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Marlene Warkoczewski 126 Union Road Coatesville, PA 19320

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I am writing this to urge you NOT to allow this mining in the Arrowhead and Boundary Waters Canoe Area Wilderness. This beautiful area should be preserved for our grandchildren and great grandchildren and beyond. Did you know that the Boundary Waters area is one of 3 national high adventure camping trips that Boy Scouts can partake in. Let me tell you it is the experience of a lifetime. Please protect these areas for US, the taxpayers and the everyday people of this country to enjoy. Don't give away our God given wilderness to those who would exploit it for their own profit and leave the mess for the American people to clean up. Please do the right thing and protect this land. Sincerely, Marsha Bezold 100 Lantern Trl Midway, KY 40347-9030

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Martha Baxter 3709 Grand Way 218 St Louis Park, MN 55416

Martha Brummitt 18298

Martha Brummitt. At age 24, and as a graduate with a Bachelor's degree in geology, I understand the benefits of exploration mining. However, when I entered the poor job economy a few years ago, I thought about the far future and the state of the planet and what's important to me, exploring our natural environment. Instead of taking a job in geology with a high salary, I decided to explore. I chose to pursue an environmental education, using my geology background, the study of earth, to educate people. Using wilderness travel as an avenue for educating others, I earn a living by leading youth in the Boundary Waters, teaching watershed education and exposing people to the pristine resources we have left. If this goes negatively, it could negatively affect my job security. Let's not pollute it. Let's recycle what we have already stripped. On behalf of my generation, do not allow the PolyMet project to get passed. Because it will negatively impact the Boundary Water Canoe Area and our planet. Thanks.

Martha Cleveland 38449

The pollution concerns are monumental. The proposed solutions are ludicrous. This whole idea is a travesty. vote NO. Martha Cleveland Minnetonka MN

The historical record (real data) show that no sulfide mining has been done without destroying associated ground and surface waters for unknown 100's of years hence. The proposed mines will be viable for +/- 20 years. Why would we sacrifice our land, fresh waters (eventually including Lake Superior) for 100's (at least 500 years) with no proof (data) indicating this can be done without system pollution? Where is the proof that initiating companies can and will afford and carry out appropriate remediation and how do the people who live here (along with other life forms that are to be protected under EPA dictates) do for potable H2O in the meantime over our future 100's of years? Martha M. Ritter 3750 Huckleberry Lane Duluth, MN 55803

1172 Parkwood Lane Stillwater, MN 55082 March 13, 2014 To the staff at the Minnesota DNR, US Army Corp of Engineers, and the US Forest Service: Thank you for your hard work in preparing the SDEIS for the proposed NorthMet/PolyMet Mining Project and for this opportunity to provide input. I am opposed to the proposed NorthMet/PolyMet mine in northern Minnesota. The statistical model which was used to determine the mine's environmental impact is flawed in that it does not take into account the worst case scenario but only outcomes with the greatest probabilities. Consequently, the SDEIS underestimates the potential human, environmental, and remediation costs. Recent environmental disasters demonstrate that we need to consider the impact of the worst possible outcomes, such as the "not-in-a-thousand-years" seepage of pollutants into Athabasca River and groundwater from tailings ponds in Alberta, Canada (The Canadian Press, February 20, 2014), and the discharge of toxic chemicals into the Elk River in West Virginia in January 2014 (causing the governor to order the National Guard to truck bottled water to residents and restaurants for drinking and bathing). The probable scenarios in the NorthMet/PolyMet SDEIS do not account for less frequent but certainly occurring real events, such as Duluth's recent 500-year flood which could cause an overflow of the tailings ponds. The tailings ponds and mining and mitigation plans in the NorthMet/PolyMet proposal do not adequately protect the public or the environment against the effects of such infrequent but certainly occurring events. Research shows that risks and costs are often underestimated. According to an article in the Canadian Press ("Federal study confirms oilsands ponds leaking," February 20, 2014), "Industry has acknowledged that seepage can occur and previous studies using models have estimated it at 6-5 million litres a day from a single pond." According to an article in the New York Times ("Alberta's Tar Sands, the Dead Duck Trial," March 1, 2014), "RiskMetrics, a financial research firm, recently put out a report indicating that tailings ponds represent an unknown liability for investors because producers have tended to underestimate remediation costs." Please do not trade short-term gains for long-term costs. Thank you. Sincerely, Martha Morse (Ely/Burntside Lake property owner)

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
Ms Lisa Fay: I am providing comments regarding the proposed NorthMet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement. Reframing Minnesota's Priorities to Recognize and Support the Vital Role of Biodiversity, Wild Lands and Eco-systems in Maintaining Human Security and Health The people of Minnesota need to re-frame how they view economic development and how they balance economic growth with environmental protection priorities for the state. With the very real threat of climate change and human population pressures on our natural resources, it is past time for us to move to a much more sophisticated world view of how we protect and maintain the quality and health of our natural ecosystems and wild lands. We need to recognize that not only our economic well-being and sustainability, but also human survival, depends on protecting and restoring the natural environment and the biological systems that create and maintain life. Minnesota is part of a global ecosystem and climate, and we will not exist as a species without this ecosystem remaining in balance. PolyMet's Financial Assurance and Reclamation Plan Are a Shell Game (Con Job) PolyMet Mining cannot guarantee the protection of northern Minnesota's environment, bio-diversity, water quality and the health of people and animals exposed to the inevitable resulting toxic pollution from mining. The proposed mine will ultimately destroy a significant amount of wetland and forest habitat in the middle of northern Minnesota, in the Superior National Forest, and Minnesota tax payers will end up covering the cost of the LONG TERM environmental damage incurred. Minnesota needs to move away from accommodating multi-international extraction industry financial interests and sacrificing the natural environment, public health, well-being and long term economic interest of Minnesotans. There is no level of "financial assurance" that PolyMet can give Minnesota that will assure the ongoing LONG TERM protection of northern Minnesota's wetlands, Superior Forest land, surface water and ground water quality, and the protection of threatened wildlife that depend on these natural habitats. Humans exposed to mining ground water pollutants face serious long-term health risks, and we have already seen (and should have learned from) the increased Mesothelioma Cancer risk for miners exposed to toxic air quality in mining work sites in northern Minnesota. Multi-international mining corporations are notorious for leaving environmental messes and toxic waste behind, after they have used up natural resources and moved on. The state of Minnesota is kidding itself (and is highly irresponsible) if it thinks it will have any legal standing to hold a multi-international mining company accountable for continuing to pay for and implement pollution mitigation after they are done extracting a projected 533 million tons of ore and waste rock over a 20-year period. It is ridiculous to think PolyMet would be responsible for what realistically would require hundreds of years, if not longer, of polluted water treatment to "assure" that watershed streams (Saint Louis River, Lake Superior, and other tributaries) and ground water are not contaminated. In addition, the proposed plan for water treatment of surface waters does not address the very high risk of polluting ground water, especially when you consider what the plan is for "reclamation." The DNR's description of PolyMet supposedly "reclaiming" its buried waste by covering it with a plastic membrane, filling up the mining pits with back water and then topping them off with a "reclaimed wetland" is science fiction. This is a ground water disaster waiting to happen. The state can't seriously claim that Minnesota will have any realistic legal standing to hold Po

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Martha Vest 63 Fairview Avenue S. St Paul, MN 55105

43460

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Martha Vest 63 Fairview Avenue S. St Paul, MN 55105

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. PolyMet has not shown that they can protect the environment adequately. They continually try to cloud the topic of environmental protection with talks of new jobs. That is irrelevant. When the mines are long gone, tourism will be the industry that keeps Ely and other small range towns alive. I will not support sulfide mining in MN until the techniques have proven safe in other states. Martin Theobald

Martin Anderson

Martin Cooney

45167

Dear Ms Fay- My name is Martin Cooney. I live at 2912 Cherokee Place in Golden Valley, Minnesota. My zip code is 55422- I am a 35-year resident of Minnesota. I moved here in my early 20's because I wanted to raise a family and pursue a career in a state that valued and protected its natural resources and provided me and my family with a place to paddle and camp in the wilderness and the state's rivers, lakes and forests. I also wanted to settle here because I felt that the government would represent the interests of the people of this state would be represented with firmness and strength against the concentrated financial and political power of large corporations which, in too many cases, overwhelm the divided voices of individuals and community groups that don't have the money or the expertise to muster slick, expensive publicity campaigns or to pay local well-connected lawyers. Polymet is proposing to create jobs in Minnesota for a maximum of twenty years, at beSt When Polymet is gone, by their own admission, they will have left an environmental mess that will cost millions to clean up. There is no mention of where the clean-up money will come from. The technology that Polymet claims will insulate Minnesota's waters for the inevitable pollution produced by their mining venture is experimental and unproven. Most of the money coming out of the earth will have gone to Switzerland and parts unknown after passing through Canada. The water that has been poisoned by Polymet will have to be filtered for two hundred years - or more. The local economy will be more or less where it is now, suffering once again from unemployment because of the departure of a short-term mining venture. Only this time it will be Polymet that played out the mines. But what will be different from the down-sizing of the iron ore mining operations will be the risk that the State's most vulnerable waters will be polluted beyond recovery, the State's recreation and tourist industry crippled, and the local communities hurting once again from boom and bust mining. Require a very conservative level of financial assurance escrowed up-front I am writing to urge you to deny a permit to Polymet, a corporation that is owned by who-knows-what other mining interests that have insulated themselves from financial risk of this mining venture, unless Polymet's investors produce an amount of money equal to the the present value of the conservatively estimated costs of decommissioning the mine once Polymet is done with it. This amount must be conservatively estimated by impartial financial advisors retained by the State, and not by Polymet or its affiliated, associated, hired, or otherwise related or interested parties. This financial assurance amount must be put under the control of the state, invested in US Treasury bonds and completely insulated from any and all risks. I understand that the laws of the State of Minnesota require that Polymet or any comparable venture fully insulate Minnesota's tax-payers from the costs of cleaning up Polymet's mess once the venture has exhausted the mineral deposits, dividended the profits of the mining venture to their shareholders, and run out of cash. The only way to do this is to require that Polymet escrow the full amount of the financial assurance up front, before the operation begins. If, as Polymet maintains, there are "billions of dollars" of minerals on the Range, there can be little risk of recouping the carrying cost of the financial assurance. They are committed to spend the principal in decommissioning the mine and cleaning the environment for God-knows-how long after they've left. If there is a risk of recouping the carrying costs, then it should be Polymet that bears that risk and not Minnesota's taxpayers. Experimental and innovative techniques to control pollution The abundance of Minnesota's waters: rivers, lakes, streams, and groundwater, make it especially vulnerable to the kind of mining proposed by Pol

Feb 22, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. And while I'd rather not see the mine built in my backyard at all I wouldn't be able to oppose it if there was a clear case the our public institutions will be left holding the bag of pollution when the corporate interests are done collecting profits. Sincerely, martin dahlke 813 12th St Hudson, WI 54016-1803 (715) 690-1090

Martin Rigney 45420

To Whom It May Concern: First of all, I understand that name and legal mailing address are required for my comments to be valid. Martin P. Rigney, Phd 1027 Sherren Street W Roseville, MN 55113 I am writing to comment on PolyMet's request for a permit to discharge mining runoff into a wetland called the One Hundred Mile Swamp. By way of context, I am a transplanted Minnesotan born in Iowa who has, at various times in the last 58 years, called Iowa, Georgia, Illinois, Germany, Switzerland and Minnesota home. From my perspective, the single most remarkable feature of Minnesota as a place to call home is the Boundary Waters Canoe Area. When I have been in state I have been at least an annual visitor to the BWCA and look forward all year to my birthday trip to the BWCA. I am a chemist by training and an RandD executive at a major Minnesota company with significant business in the mining industry. I am neither anti-mining nor what I would call an avowed environmentalist Each year I watch the Forest Service video encouraging me to "leave no trace" and take pride in always leaving a campsite in better repair than I find it. Having reviewed the pertinent facts, I am not convinced that PolyMet is being held to the same standard as an individual visitor to the BWCA despite the obviously potential for more significant and long term damage from their mining operation. I have been following the PolyMet controversy as reported in the mainstream media without forming an opinion one way or another but rather viewing it as the classic debate between local economic benefit and inevitable – and fiercely debated – environmental impact. I have recently dug a bit deeper and my position is a simple one – the burden should be – but has not been - placed on PolyMet to prove not that there will be no impact but that the future impact has been carefully and completely modeled in a scientifically rigorous manner such that a decision is made with a full understanding of the balance between positive economic impact and measurable but well understood negative environmental impact. In this regard, I am guided by the adage drilled into me in graduate school – theory guides but experiment decides. Given the value of this natural wonder I can imagine no justifiable reason not to require specific testing to confirm that water discharged from the mine site does not and indeed cannot enter the BWCA and I see no indication of this plan in the SDEIS. I admit that I have not read the SDEIP statement word for word but visual and electronic searches have failed to locate any data in the document to confirm that the mine site is geologically and hydrologically isolated from the Rainy Lake/BWCA watershed. I am sure you are aware of the concern about the accuracy of the maps contained within the SDEIS as referenced to the National Atlas and this only further compels that an experimental study of mine drainage be conducted. Before permitting can move forward, I encourage that experimental data are generated that are a more reliable predictor of the impact of the mine on the BWCA than the at best incomplete and at worst intentionally misleading information currently contained in the SDEIS. Best regards, Martin Rigney CONFIDENTIALITY NOTICE: This e-mail communication and any attachments may contain proprietary and privileged information for the use of the designated recipients named above. Any unauthorized review, use, disclosure or distribution is prohibited. If you are not the intended recipient, please contact the sender by reply e-mail and destroy all copies of the original message.

Martin Running 18325

My name is Martin Running. I live in Duluth. I want to thank Army Corps of Engineers and the DNR to let us have this public input here. I wasn't planning on speaking tonight, but I was looking at all the stickers on everybody and I was noticing several of these people had "clean water" stickers on. These are the same people I saw at a previous meeting that were against a cell tower that was going to be put up outside the Boundary Waters Canoe Area. They didn't want to be able to see the tower (inaudible). This is a tremendous opportunity for the state of Minnesota and local people. I don't think we should let this go. And I don't think that we should have that much land tied up just so a few people can paddle canoes around. Thank you.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Marty Kauls St Paul, Minnesota

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described and should not be built anywhere that would impact any wildlife in the state of minnesota or any other state . the wildlife has sufferd greatly just from home builders ,not to mention other businesses that are built in wildlife areas . the declining moose population should speak for itself in this matter without any input from the public ,unless your goul is to make the moose and other animals extinct in minnesota .i know the pollititions dont care because they get paid under the table to make this and other projects go thru no matter what the publics vote says they lie cheat and steal from us tax payers for there own gain .i think that the public should be in on all the helping decide where and what happens with our country wildlife or not .i vote to protect the land from being robbed of the minerals and destroying the moose and other wildlife popultion in this or any other area im strongly against the mining of any thing in the area describe here . Sincerely, Mr marv schuety 6817 Barrows Ave Brainerd, MN 56401-1776

Mar 13, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I also have other concerns about pollution. Once land, water, air and wildlife are destroyed, they never are completely be pristine any more and the dangers from the pollution go on for a long, long time. Also, corporations promise to clean up the messes that they create and often it is done partially or not at all because they don't have the knowledge to do the job correctly; sometimes there is no good way to clean up the problem created. Sometimes tax payers bear the cost of whatever cleanup must be done. Also, there is the issue of health related problems from pollution which can be permanent and sometimes fatal. None of the benefits from this mining can ever offset the detriments to health or pollution of the environment, locally or globally, and the effects on wildlife. Our planet is already in serious trouble from pollution; we do not need to contribute to it with more pollution. We need to be caretakers of this precious land. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mrs Mary Amundson 10012 Drew Ave S Bloomington, MN 55431-2728

Northern Minnesota is an irreplaceable gem with its pristine lakes, forests, and wetlands. Though a few hundred jobs for up to twenty years would be important in the short term it makes no sense to risk the disastrous pollution for up to 500 years. I cannot get over the admitted fact that there has NEVER been a copper nickel sulfide mine that has not leaked. We need to protect our land and water. I strongly urge our law makers to look at developing jobs in the clean energy area. It is sad that the new battery plant that will manufacture batteries for the Tesla car will be in Arizona. The plant alone will employ over 1,000 people. In Connecticut, Fuel Cell Energy Power is building hydrogen power plants to generate electricity and heat to power homes and industry. We need long lasting jobs here in Minnesota in industries that are forward looking and do not destroy our land and water. Mary Ann Lundquist

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, MARY ANN RANDALL North Oaks, Minnesota

Mar 12, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Please have the courage to say NO to sulfide ore mining. Who do you believe. An industry with a terrible, costly, environmental record. They always say "It will be different this time, we have NEW technology." But do we want to be the experiment, risking our precious waters. Managing the state's natural resources does not mean they have to be taken. Sometimes the best management is leaving resources where they are. Especially when removing them means damaging an even more valuable resource, our clean water. When we can't drink the water, it is too late. Economics what will be the cost of cleanup and who will pay. A shell corporation with no real assets. And why do we want another industry to lead us down the road of boom and bust again. Please have the courage to say NO to sulfide ore mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Mary Arps Thompson 1370 White Lake Dr Duluth, MN 55803-9712

I have reviewed the EIS ,and would like this project to go forward. The regulating agencies need to base their decision on science and facts. I feel I am a very strong environmentalist and I am all for clean water. The citizens of Minnesota have to trust in our government regulating agencies to do a good job of overseeing, monitoring, and regulating. We can only look at all the industries in Minnesota that do a of good job of minimizing their impact on the environment to see that this mine could do the same. My hope would be that the "not in my backyard" mentality rules over facts and good science. Vernon Becker 39679 592 ave Eden Valley MN 55329 320-282-5227

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit I disagree with the way the current (Supplemental) Draft EIS disregards the concerns of the Fond du Lac and Grand Portage Tribal Governments, the 1854 Treaty Authority, and the Great Lakes Indian Fish and Wildlife Commission. Furthermore, the PolyMet review process used incorrect maps in the environmental impact statement that give the impression that mine waste is geographically isolated from the BWCA watershed when it is not. The maps used include incorrect outlines of the One Hundred Mile Swamp which is downhill from the mine site and will collect acid and heavy metal laced run off from the mine. I believe the environmental impact statement is inadequate, and I ask you to suspend any decision about the Draft EIS until these problems have been corrected. Sincerely, Mary Cunningham 1764 Lindig St Falcon Heights, MN 55113

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mary Davis 6674 Boyd Avenue Eden Prairie, MN 55346

Dear Sirs: I am voicing my opposition to the Poly Met operation. I do not think it is well thought out and think we should wait until the operation is safer. They cannot guarantee that they will be around for the next 500 years. Our water, our wildlife is our most valuable resource and we cannot put it in further danger. I cannot believe you are even considering this operation. Mary Dickson

Mary Disch

18266

My name is Mary Disch, D-I-S-C-H. I have some concerns about the Mining Project. At this point I am not in favor because my concern primarily is pollution affecting the watershed for Lake Superior and especially the wild rice area in that sense. And I'm concerned about whether the assurance will be enough to clean up, because the pollution is inevitable. That I'm not sure how the amount is determined and whether that will be a sufficient amount, given that the project is only 20 years, but the pollution may occur for quite a bit after that, and will. I think that's probably the environmental effects. I'm concerned whether PolyMet is -- I know it is a new company, but it is funded by other companies' money, and what their track record has been. My concern, too, is that opening this area to copper sulfide mining might open it up to more of that, and what the cumulative effects might be, and my concerns of the cumulative effects on the people that live nearby and the water quality of the Hoyt Lakes, which I think is pretty close. I would just like to see more concern and overseeing what -- my question is when PolyMet says they are going to do this, how often does that happen? And is there a way of assuring that that happens? What they say -- I know in reality what people say and then nature has its own ways of eroding things, and who oversees that, I'm not quite sure that I have gotten that question answered, as to who monitors and how well is the monitoring done in order to provide that we have clean water, especially how it is affecting Lake Superior and affecting the wild rice in the area. And my concern, too, that wild rice, when I talk to people, it moves around, so it is not like you can say this specific area has wild rice. So it is essential that the area has clean water so that wild rice can move to where it needs to move. And I heard that the mercury is more up, and fish, with the higher sulfate levels, and so that's part of my concern, whether those levels will be safe enough for fish. Thank you.

Mary Dosch

19508

My name is Mary Dosch, address 5523 London Road, Duluth, Minnesota 55804, D-O-S-C-H. So these are my PolyMet NorthMet comments regarding moose. Like most Minnesotans, I'm proud of our outstanding natural heritage including our iconic moose populations. However, the PolyMet SDEIS acknowledges that overall moose population in Minnesota declined 35 percent from 2012 to 2013, and now moose are a state species of concern. The PolyMet project would harm moose due to habitat fragmentation and loss. The key habitat types considered moose habitat include mature forest, grassland and brushland and aquatic environment. A total of 2,775.2 acres of these habitat types would be directly affected by the NorthMet Project -- by the NorthMet Project proposed action, and thus, would affect individual moose in the vicinity through habitat loss and fragmentation. Moose are important to the Indian bands under treaties and for subsistence. The SDEIS says that impacts on moose will be discussed in the Cultural Resources Section 5.2.9. However, neither that Cultural Resources Section nor the Cumulative Impact Section mention one word about moose. The PolyMet SDEIS is inadequate in that it needs to be redone to study cultural effects of loss of moose habitat at the PolyMet mine site and the cumulative adverse impact on moose. I'm sure we all want moose in Minnesota to survive so that our descendants will not have to learn that moose have gone the way of the passenger pigeon.

37853

Greetings: I am opposed to the proposed PolyMet mine for many reasons, including the fact that I'm an animal lover who wants to know that our precious wildlife will be here for future generations. For example, moose are already in substantial decline and the habitat loss that would inevitably occur if PolyMet were to mine would expedite further losses for our priceless moose population. In addition, many species of birds whose homes would be in harm's way, eg, birds in the St Louis River Estuary like Common Loons, Hooded Mergansers and Belted Kingfishers, need to be considered when weighing the pros and cons of this proposed mining project. Given the potential for great harm to wildlife, including moose, birds and fish, due to loss of habitat and/or pollution of habitat, I respectfully ask that ALTERNATIVES to the open pit mine, specifically an UNDERGROUND MINE, be studied. Since PolyMet has acknowledged that an underground mine could access copper and nickel, and since an underground mine would be far less destructive to the habitats of wildlife species in impacted areas, I further ask that PolyMet's SDEIS be rejected as INADEQUATE since it did not adequately address the possibility of an underground mine. Sincerely, Mary E. Dosch 5523 London Road Duluth, MN 55804 - "The eyes of the future are looking back at us and they are praying for us to see beyond our own time." - By Terry Tempest Williams

37857

Greetings: Among the numerous concerns I have about the proposed PolyMet project and its SDEIS and the Section 404 Permit is the impact that it would have on wetlands. Also, two areas that are downstream from the proposed PolyMet mine that would be adversely impacted by it are the Sax-Zim Bog and the St Louis River with its priceless estuary. PolyMet's plan for an open pit mine would directly destroy more than 900 acres of wetlands and could indirectly destroy more than 7,351 additional acres of wetlands in the Partridge and Embarrass River watersheds due to pollution and changes in hydrology. The proposed wetland mitigation only covers the 912-5 acres of direct wetland impacts. Therefore, the more than ten miles of additional wetlands projected to be "indirectly" impacted by water drawdowns and toxic materials will likely be permanently harmed as the bogs and coniferous swamps in harm's way are extremely difficult to restore. Thus the SDEIS, by not addressing the impacts on these "indirectly" impacted wetlands, is INADEQUATE in that respect. Also, where pollution from the mine pits, mine wastes and tailings piles seeps up from surface ground water flow to wetlands, it is virtually certain that PolyMet's discharge would violate water quality standards. Furthermore, PolyMet's excavation and thus changing hydrology in wetlands would increase mercury loading to wetlands and streams and increase mercury bioaccumulation in fish, thus putting human health at risk. Given the harmful outcomes discussed above, I respectfully ask that you a) REJECT PolyMet's SDEIS as INADEQUATE and the PolyMet project as ENVIRONMENTALLY HARMFUL; b) DENY the wetlands destruction permit (Section 404 permit); and c) DENY PolyMet a state permit to mine. Sincerely, Mary E. Dosch 5523 London Road Duluth, MN 55804 - "The eyes of the future are looking back at us and they are praying for us to see beyond our own time." - By Terry Tempest Williams

Mary Dosch 37864

Greetings: I am extremely concerned about what will occur if PolyMet is given permission to mine for copper and nickel in the priceless region between the Boundary Waters and Lake Superior. Given that PolyMet's own mine plan admits that millions of gallons of polluted water will seep off site, uncaptured and untreated, and that this will continue for hundreds of years, I have to ask how we can even consider giving PolyMet the green light. PolyMet's water pollution from the permanent mine's waste rock pile would need treatment for at least 200 years and pollution from the tailings piles would require treatment for at least 500 years and the pollution seeping out of the mine pits would continue in perpetuity = FOREVER. In other words, by giving PolyMet the go-ahead, we would be getting 20 years worth of mining jobs (SHORT-TERM GAIN) while incurring at least 500 years of pollution and perpetual water treatment (LONG-TERM LOSS). Furthermore, perpetual water treatment is not maintenance free. Currently the region that would be impacted by the PolyMet mine is a haven for tourists, fishermen, and outdoor enthusiasts like me, people who appreciate our beautiful region and who value its environmental integrity, its unique attributes, and its ability to restore their spirits on an increasingly polluted and beleaguered planet. By giving PolyMet the green light and thus setting a precedent for numerous other mining companies to follow suit, the seeds of our own destruction as a place of retreat and purity and sanity will be sown. I therefore respectfully ask that you REJECT the PolyMet project as environmentally harmful and I ask that you DENY PolyMet a state permit to mine given that in addition to the at least 200 and 500 years of pollution that PolyMet admits, their assumptions about the percentage of seepage collection at the tailings basin is unsubstantiated and thus the SDEIS must be rejected as INADEQUATE. Furthermore, the SDEIS should be rejected as it gives no detailed information as to how 500 years of water treatment will be paid for. Sincerely, Mary E. Dosch 5523 London Road Duluth, MN 55804 - "The eyes of the future are looking back at us and they are praying for us to see beyond our own time." - By Terry Tempest Williams

Mary E. Dosch 10336

Dear Ms Fay, Dear Federal and State Agency Leaders: I am alarmed at PolyMet's SDEIS as it's essentially an experiment which, if allowed to proceed, would be a disaster waiting to happen and would put Minnesota's clean water at risk forever. The SDEIS doesn't provide even the most basic information to support its predictions. How much polluted wastewater would be going back and forth through nine miles of pipes. What is the total volume of wastewater in tailings and processing residue. Just how polluted is the wastewater in waste rock piles, pits, sump ponds, the tailings basin and the hydrometallic waste dump. Without this basic information, we can't estimate what would happen if PolyMet's almost perfect assumptions - not based on anything in the real world - don't come true. The SDEIS admits that it is an experiment. On page after page it says that in the event that modeling shows violations of water quality, PolyMet will "adaptively manage" the problem. BP "adaptively managed" that oil spill in the Gulf of Mexico with catastrophic results to the Gulf's ecosystem. This SDEIS is completely inadequate. The SDEIS must reveal wastewater volumes and pollutant levels at every step. Also, the SDEIS must have facilities from day one to meet standards. Once pollution is in groundwater it is TOO LATE to fix. I therefore ask that the PolyMet SDEIS be rejected as woefully inadequate and the PolyMet project as environmentally harmful due to the experimental nature of their proposed plan. Therefore I also ask that PolyMet not be granted a state permit to mine at this time given that their proposed "adaptive management" of any violations of water quality would put our priceless watersheds at risk of permanent contamination. Access to clean water should be the birthright of all - humans and non-humans alike. We have no right to jeopardize that birthright. Sincerely, Mary Elizabeth Dosch 5523 London Road Duluth, MN 55804 Mary E. Dosch 5523 London Road 4365 Kingston Road Duluth, MN 55804 218 269 4632

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Mary E. Dosch 5523 London Road 4365 Kingston Road Duluth, MN 55804 218 269 4632

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mary E. Dosch 5523 London Road 4365 Kingston Road Duluth, MN 55804

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Also, Lake Superior retains water for about 200 years. Any mining waste inputs would last for centuries. Also, as shown by the severe drought in California, fresh water for agriculture, human and wildlife usage is imperiled. The largest fresh water lake in the world should be protected at our own society's peril. Just say no to this mine. Also, tourism is a big source of income and should be protected not damaged by mining operations. Sincerely, Mary Ellen Kremposky 419 N Gainsborough Ave Royal Oak, MI 48067-4220 (248) 565-8100

Mary Elling

39897

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Mary Engen 3136 38th Ave S Minneapolis, MN 55406-2143 (612) 721-7181

Mary Everest

44551

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: The PolyMet mine would violate the 1854 Treaty between the United States and Minnesota Ojibwe bands. This treaty guarantees the right to hunt, fish, and gather in the location of the proposed mine. However, the proposed mine would destroy wetlands and habitat for animals and plants fundamental to Ojibwe life. In addition to habitat destruction and removal, the proposed mine would generate unacceptable levels of mercury and sulfuric acid contamination in the watershed, subsequently turning food into poison. The treaty is a legally binding agreement between the United States and a sovereign nation. In short, it is your duty to protect this land. The land must remain intact, including the animals and plants that the Ojibwe hunt, fish, and gather. The PolyMet mine project and proposed exchange of 6,650 acres of Superior National Forest lands MUST be rejected in order to comply with federal law and fiduciary responsibilities to tribes. •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. The SDEIS is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to provide a cumulative analysis of impacts to clean water, plants and mammals that are significant to tribes and protected under treaties, throughout the tribal Ceded Territories in the Lake Superior Basin. In summary, please reject the PolyMet SDEIS as inadequate and reject the proposed PolyMet mine and Land Exchange as destructive to the public interest and harmful to tribal rights, clean water, vital habitats and the health of future generations. Sincerely Mary Everest 4015 STANDISH AVENUE MINNEAPOLIS, MN 55407

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mary Gallet 100 Elizabeth St Duluth, MN 55803

I understand (from the program on MPR) that large piles of tailings remain from past PolyMet mining, and that the effluent from these tailings fails to meet MN water standards. Accordingly, I urge the DNR to require that PolyMet clean up the existing tailings before it is allowed to generate any more. The SDEIS for this project is inadequate. It fails to give appropriate weight to the fact that every copper/nickel sulfide mine located in a watery environment has resulted in contamination of surface and/or ground water. We should not subject Minnesota's waters to a known source of contamination. Thank you for your attention. Mary Gover 6711 Lake Shore Dr S, Apt 1007, Richfield, MN 55423

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Mary Green 628 N. 18th Avenue Sturgeon Bay, WI 54235 US

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to express my concern about the proposed PolyMet project in northeastern Minnesota. I am originally from the area and still own property there so it is an issue which greatly worries me. In addition, members of my family live in the Embarrass River watershed. I believe that PolyMet's plan for sulfide mining does not sufficiently address its potential to do irreversible damage to the environment and the health of the people who live and work in the communities that would be affected. My first concern refers to the permitting required by Section 404 of the Clean Water Act. The wetlands proposed for destruction are priceless and form part of a broader biotic system. The 913 acres to be destroyed and the additional over 7000 acres at risk of being degraded by subsequent air and water pollution from the mining operations represent an unprecedented loss of wetlands for Minnesota. On paper the plan to replace these precious wetlands might look like a fair "exchange" if one is just counting acreage and size, but what is lost is an aquatic ecosystem of rivers, creeks, streams, ponds, swamps, land and vegetation that provide habitat for wildlife and maintain the quality of the watershed. Can the lands offered in the land exchange proposal really compensate for a lost ecosystem, especially if those lands are outside the affected watershed. The SDEIS does not factor the real value of the lost ecosystem into its calculations. Land has value but so do nature and natural processes. The science of economics rarely makes this kind of calculation. The SDEIS has not made it either. But it does not mean that such value does not exist. It just hasn't been calculated. I ask that you deny any permit to destroy or degrade the wetlands since we really do not know the value of what we are being asked to give up. In addition, I ask that you reject the Land Exchange Proposed Action. Also of concern are the opportunities for pollution that the proposed mining site offers. This area is rich in water but unfortunately many of the bodies of water in the area are already identified by the MPCA as "impaired waters" due to elevated levels of mercury. This, therefore, is a proposal to mine in an already compromised area that mining will put at further risk. The water quality models used by PolyMet are guesses and assumptions about how mining might affect the water, but they are unsubstantiated and without evidence. The historical record, on the other hand, shows that sulfide mining in a water-rich environment has historically resulted in surface and ground water pollution with toxins that are harmful to human life. In short, no one on the planet has been able to do this type of mining without degrading water quality. I don't believe the SDEIS sufficiently addresses the risks of this kind of mining in a water-rich environment. What happens if and when the water is polluted, a very distinct possibility since the proposal is for unlined storage of waste rock. Then what. I urge you to not recommend a permit to mine for PolyMet. Our waters are precious. What I have written is sincere and reflect my best attempt to understand the proposal. Please give it your closest attention. Thank you. Mary Haltvick 713 Heather Drive Shoreview, MN 55126

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. I am concerned about the long range affects this proposal will have on our environment for future generations. I am not at all convinced in plans for clean up and oversight. This is an endeavor fraught with too many problems Please reject this proposal and choose health for our entire ecosystem Sincerely, Ms Mary Halvorson 324 Harvard St SE Minneapolis, MN 55414-2920

Dear Lisa Fay, I have serious concerns and doubt that adequate funding will be available to address any accidents or incidents that occur during mine operations and especially after the mine closes. Secured funding also needs to be available for the lengthy water treatment process after mine closure. How is the funding guaranteed to be there even hundreds of years after mine operations cease. It is important to have all of the necessary funds readily available throughout the entire water treatment period of 500+ years so that clean-up costs do not become a burden on Minnesotan residents. How is inflation and any unforeseen complications of treatment being calculated into Polymet's closure costs. How can a person predict the value of the dollar that far in the future. In addition, I also believe the SDEIS is inadequate in the following areas: It does not adequately look at reducing impacts to wetlands by considering underground mining vs. open pit mining. Economic feasibility is not supposed to be the primary factor for alternative methods in an EIS. What evidence is there that the proposed treatment of contaminated water by reverse osmosis actually works on projects of this scale. The water treatment process is not specific enough. What are the plans for the toxic sludge generated by reverse osmosis. How is the reverse osmosis system guaranteed to keep up with the quantity and continuous supply of contaminated water. The proposed wetland reclamation and regeneration would not equal the high quality wetlands that the mine will destroy. What are the effects on human health, especially in the unborn and very young, of exposure to the pollutants emitted into the air and water, especially as these pollutants accumulate to higher levels. What insurance is there against underground drinking water contamination and what procedures will be followed to clean up any contamination that occurs. As abundant clean water becomes more scarce world-wide and thus more valuable, this resource should be weighted higher for impact considerations the farther the timeline of impacts goes into the future. For example, clean water is likely to be more economically and environmentally valuable 100 years from now than it is today, therefore, any long term negative impacts done now should be assessed as more harmful than is currently considered. What are the health risks to employees who are exposed to sulfide mining conditions. What is the potential for soil contamination away from the mine site and what health risks are present for people who come into contact with this soil, especially for those growing their own food. The Superior National Forest is a national asset and the proposed land exchange is not adequate compensation for US citizens. How will the survival and reintroduction of rare species found in the disturbed wetlands be assured after mine closure. Thank you for addressing these concerns, Mary Heise 2105 E. Superior St Apt 3 Duluth MN, 55812

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Since we know that water continues to flow downstream forever till it reaches oceans, how can we protect those, especially children who live downstream from this proposed mine from the Mercury that will follow the waterways out of Minn. There must be some way to collect the chemical before it leaves the mine site, forever, not in a land based ground storage pit. DNR has a big job ahead of them. So many protections to human health, wildlife protections, environmental health protections, taxpayer protections, CleanWater Act Protections, Wild rice protections, etc Don't think a few jobs are worth it. Stop the PolyMet mine before it causes damage to Minnesota. Listen to independent, unbiased science. Sincerely, Mrs Mary Helen Stephens PO Box 1272 Valdez, AK 99686-1272

38936

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The financial assurance section of the SDEIS is inadequate and needs to be changed to reflect details about how much money would be required to pay for cleanup and in what form it would be held. In 2010, the US Environmental Protection Agency called PolyMet's first draft Environmental Impact Statement "inadequate." One significant reason was that the 2010 DEIS did not show that financial assurance would be enough to cover the cost of long-term water treatment at the site. "EPA believes that the adequacy of financial assurance for these activities could make the difference between a project adequately managed over the long-term by the site operator, or an unfunded or underfunded contaminated site that becomes a liability for the federal government and the public " As your revise the SDEIS, please take the following actions: 1) Provide details of the calculations used to arrive at the estimated closure and long-term treatment costs in the current draft 2) Provide details of the forms that would be used to ensure that financial assurance is both bankruptcy-proof and would provide adequate income for hundreds of years of water treatment 3) Identify other responsible parties (eg major investors like Glencore) that will be held responsible for long-term cleanup should PolyMet go bankrupt or be unable to meet their obligations 4) Account for reasonably foreseeable challenges that might increase the costs of cleanup and long-term site maintenance, and factor that into the calculation for the what would constitute adequate treatment Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. The DNR needs to give absolute assurance to Minnesota taxpayers that they will not be responsible for any problems in the future with the PolyMet SDEIS Mine. Without that given, the plan for the mine should not be allowed. Sincerely, Mrs Mary Helen Stephens PO Box 1272 Valdez, AK 99686-1272

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I am an Alaskan resident but still revisit Minnesota at least once a year. I am concerned about the water studies necessary for your DNR to approve this mine. Water studies science can lead to different results. We have found that they are inaccurate in our proposed Pebble Mine up here in Alaska. We have found erroneous water science being pushed through our DEC to accept for the mine proposal. I want your DNR to be very careful with the science "proving" how this mine will be able to protect your northern waters with GUARANTEED assurance before moving forward There is a lot at stake here - water carrying pollutants into the Boundary Waters to Lake Superior is not to be allowed at any possibility. Clean-ups are always impossible. Water carries everything along the routes, leaving deposits everywhere. I know you are aware of this, but the extractive folks are good only at extraction. They really do not have any, so far, capability of recovering product pollutants once lost into water. No way at all. It is common knowledge that Exxon recovered only about 1/10th of the 11,2 million gallons of crude oil they released into Prince William Sound. The rest is still showing up every year. Lake Superior doesn't just belong to Minnesota - it is a National Treasure. It needs to be protected for ALL of us - FOREVER. THANK YOU FOR LETTING A CARING ALASKAN EXPRESS HER CONCERNS. Sincerely, Mrs Mary Helen Stephens PO Box 1272 Valdez, AK 99686-1272

39011

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I certainly do not assume to be at all informed about the Glencore Company's Management history, but I see the name Tony Hayward listed as one sitting at the head of it. I only know him through the press at the time of the BP disaster in the Gulf of Mexico a few years back. I was totally not impressed with his skills at being a spokesman for BP nor of his ability to react under pressure. I recall his putting his loss of not being able to do what he wanted instead of taking care of his job ahead of taking care of the mess his company caused. I certainly do not have any confidence he would be any better if any accidents would occur in the beautiful Northern Minnesota country I remember enjoying. . The extractive industries - coal, gas, oil, mining - are pretty good at means of getting the desired substances out of the ground but have NO capability of doing anything when an accident occurs. We had our Exxon Valdez Oil Spill in Alaska-(I live in Valdez), the BP=Horizon disaster in off shore of our South's waters, the coal ash disruptions into the rivers of our country, storage tanks of chemicals leaking into waters used for human consumption. In no case were the companies able to recover the contaminating products. They really never include that aspect of contingency planning. But accidents happen because of poor planning and in every situation and people's health suffers, the environment suffers and they always say "We are sorry". Until we see GUARANTEES that NONE of the above WILL HAPPEN, I cannot see allowing this mine plan moving forwaRd Thank you Sincerely, Mrs Mary Helen Stephens PO Box 1272 Valdez, AK 99686-1272

39132

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I would look more favorably toward the project of the proposed PolyMet if I could see a plan which considers the wildlife of Northern Minnesota. So far I do not see a reasonable plan to offer protection to the Moose population in Northern Minnesota. The moose are finally increasing their numbers up there and that is one issue I would like to see considered in their plans. Sincerely, Mrs Mary Helen Stephens PO Box 1272 Valdez, AK 99686-1272

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. I live in Alaska but return to MN to visit my sister and her family every year. We have our problems with the proposed Pebble Mine and their plans. I am a bit involved with MN's proposed PolyMed Mine for a number of reasons. Up here water resources is a big issue = the possibility of the mining efforts to contaminate our waters and using an inordinate amount of available water. This mine in Northern Minnesota will use an inordinate amount of coal for powering the high use of electricity needed for their operations. In this day and age when we are striving for clean, renewable sources for energy and working toward cutting back on the use of more dirty coal for power, it appears to me to be off to a bad start in that given area. Our planet does not need a vast increased output of CO2- Please ask DNR to require PolyMet to find a better source of power and leave the coal industry out of the picture. Thank you I cannot get this to change the salutation at the bottom. I will sign off here.' Sincerely, Mary Helen Stephens PO Box 1272 Valdez, AK 99686 Sincerely, Mrs Mary Helen Stephens PO Box 1272 Valdez, AK 99686-1272

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to stop the PolyMet NorthMet sulfide mine. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1- Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands. Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to protect irreplaceable wetlands and fresh water resources in the Lake Superior Basin for generations to come. Respectfully yours, mary hoffman 12522 parkwood drive burnsville, MN 55337

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Mary Hogan 3076 S. Rodehaver Rd Guysville, OH 45735 US

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. This is madness. Protect the Earth, don't rape it for the profit of a corporation and its shareholders. This kind of violence to our source, ripping it apart for materials to make objects which will in short order, relatively speaking, become obsolete, will only bring our own destruction. This mine will break forever the beauty of our North Woods, one of our most valuable industries in tourism and forestry products. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Mary Holm 5240 Kimberly Rd Minnetonka, MN 55345-4429

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. With the history of desecration of our clean forests, lakes and rivers perpetrated by mining companies, it is not unreasonable to wonder what the hurry is in opening this mine. A delay of 10 or 20 years before undertaking this project would allow development and proof that they have indeed found ways to mine these elements safely and without damage to the environment. Let them demonstrate on other sites just how safe it is and how the environment can be protected as they assert. We will only have one chance to get this right so tell them to go practice somewhere else and come back with evidence that the processes they are proposing actually work. There will be no opportunity for a do-over if they make a mistake. Sincerely, Mary Jo Kingston 7774 Lochmere Ter Edina, MN 55439-2618 (952) 944-9022

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Those who live in the horrible drought conditions of the west know how extremely valuable water is, especially clean pristine water such as ours. Why on earth would we want to sully and poison our water gem. It's total insanity. No amount of jobs are worth ruining, or even risking the ruin of, our precious natural resource. The Boundary Waters--one of the wonders of the world. Invaluable. Lake Superior--an even greater possession. Why risk it. If people need jobs give them jobs through rebuilding our infrastructure and installing renewable energy. That could happen easily and quickly if the political will exists. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms mary Jo straub 4520 Andover Rd Edina, MN 55435-4032 (952) 922-2403

Mar 2, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Many aspects of the impact of the mining have been swept under the rug. Enough covering up has happened in various "schemes" for pushing through projects that hurt people, the earth, environment, and air that people are not so easily scammed as before. What the mining company says will not happen and what actually will happen are two different outcomes. Northern Minnesota is an unspoiled area of this world that is becoming a "novelty" not a common occurrence across the countries of this world. The pureness of this area will be destroyed, the waters will be polluted, the animals will be affected in the worst way possible, the flora and fauna will change, people will become ill. Studies on the factors affecting humans needs to be studied. More studies by environmental protectors need to be done and provided to the public without the results being altered. The people who are trying to push this project through are being paid off by the very companies who are wanting to destroy our state.. It is a dishonest and criminal act that needs to be stopped. Please let's be sensible about this ..the ore that is going to be mined is going to China What is that all about Please give the honest answers.. Sincerely, Miss Mary Judd 207 5th St SW Braham, MN 55006-3058

Mary Kanuit 15923

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mary Kanuit 711 Stonebridge Circle St Paul, MN 55123

Mary Kanut 11250

To whom it may concern: this proposed site or any site for that matter for mining is basically game over for our climate, for our Boundary Waters, our drinking water, air quality and the list goes on and on.. Oh did I say tourism. And for what? More dirty energy, a few more jobs. When will the madness end? Do you have any idea the impact to habitat, water quality, air quality, our tourism? The last three we will never be able to get back once compromised. I will fight against this to the bitter end. PLEASE DO THE RIGHT THING-DO NOT LET THIS GO THROUGH. Oh and I love how the report purposely leaves out pages. What do these pages contain that the DNR doesn't want people to see. Respectively, Mary Kanut Sent from my iPad

Mar 1, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Dirty energy is not the answer to our energy problems Wind and solar would create as many or more jobs for Americans and keep our air and water clean while keeping us in clean energy for the long haul - longer than 20 - 30 years AND no clean up to worry about saving billions of dollars in clean up and future health care costs to Minnesotans and the fish and wildlife (some of us eat fish and venison). Can't we just be smart and reasonable for once instead of getting yanked around by the promise of campaign funding or a trip to wherever Come on, it's time to get real and listen to the science. THERE IS NO CORRECT, GREEN, CLEAN, GOOD WAY TO SULFIDE MINE. PERIOD. THAT GOES FOR TAR SANDS OIL TOO. None of it will ever come to any good whatsoever and will only to serve to kill off tourism in Northern MN, one of the last pristine places on earth where man hasn't mucked it up yet. It's just the most unbelievable, ridiculous - can't even fathom it's actually being remotely considered idea I've ever imagined taking place in our watershed backyaRd Idiocy is too kind a word in this insane debacle. The cost to the environment will never be able to be recovered. EVER. Are we so self important that we can just wipe out what took millions of years to get that way for some freakin' copper, so we can build more shit to text more bullshit to each other while driving.. I can only hope reason will prevail before it's too late. The science has already been known since ancient times. You don't shit in your clean glass of water and then drink it. Sincerely, Mary Klausen Two Harbors MN Sincerely, Mary Klausen 404 Valley Rd Two Harbors, MN 55616-1480 (218) 834-2483

For 20 years my family has been spending some days between Christmas and New Years in the Boundary Waters Wilderness. We stay close to the hundred mile swamp which has been purported to be a filter for the run off from the holding ponds.This fragile ecosystem will be compromised by even low levels of uranium, radium, and radon. Additionally ground water supplies may be polluted by the listed materials. Minnesota's identity has been clean water. We loose not only an ecosystem, but a way of hunting, fishing, skiing, sledding, skating, kayaking which is part of our culture. Why can we not challenge ourselves to find a way to mine copper without water. - Mary Wotzka Lagaard, RN, CNP, DNP Assistant Professor 435 Whitby Hall Department of Nursing St Catherine University 2004 Randolph Street St Paul, Minnesota (651) 690-6126

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Mary Lein 81 Grande Isle Ave SW 2612 Rochester, MN 55902 US

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

To the staff taking comments on the Polymet Copper sulfide mine: For the last two weeks at work I have toiled in front of a copy of the EIS for the Northmet copper sulfide mine. I've looked at it of course, but I still come to the same conclusion. The mine should not be permitted in Northern Minnesota. Much of the water in northern Minnesota eventually flows toward Lake Superior. People obtain their drinking water from Lake Superior. It is one of the largest bodies of fresh water in the world. Fresh, clean water is infinitely precious in our overcrowded world. According to Mark Seeley, the state climatologist, Minnesota will face more of an impact from climate change than states at more southern latitudes. That could mean a disruption in our normal temperature and rainfall ranges. Is this a time to permit a Canadian company to come in to our state and endanger our water resources. I don't think so. The company says they will have a long wall to contain waste water down to the bedrock. Walls develop cracks over time. It has always happened and will happen again. I don't think the wall they build will last long enough to contain all the polluted water that is created. The company says they will force the polluted water through a filtration sheet, but these filters get gummed up, they clog, they can tear, they need constant maintenance. Who will maintain the filters and the wall after the company takes our minerals, makes their profit and leaves the state. To build such a mine near the Boundary Waters Canoe Area will bring additional development to the doorstep of an important Wilderness Area, degrading its pristine nature. Throughout the history of the United States, profiteers big and small have argued for and obtained the ability and the opportunity to exploit nature for their own benefit, leaving our natural heritage greatly diminished. This has to stop before we deplete the natural diversity that sustains us. The Polymet/ Northmet mining project is an excellent place for this exploitation to be stopped before it starts. In addition, the Native American people who rightly claim the authority to harvest wild rice, should not find lakes and waters that sustain them now, polluted by increased sulfides due to copper mining. Early in the debate about the mine the company reported that they would create new wetlands to make up for the ones they destroy during their project. To me it seems unlikely that a man-made wetland will ever truly replicate a natural wetland. Each place has its own unique mix of substrate, water chemistry, micro-organisms, plant and animal life. For example salamanders are thought to follow the same chemical trails to the same wetlands to breed every year. A man-made wetland somewhere else doesn't really accommodate them does it. While copper is used in industry and even in the plumbing of many homes in Minnesota, how much copper from the Northmet mine will be needed or used by Minnesotans. Polymet is a Canadian company with big contracts with China. Both countries have terrible pollution records: For Canada think of the Tar Sands project, or the clubbing of fur seal pups or the fact that when a Beluga Whale dies in the St Lawrence Seaway it's body is considered a hazardous waste because the water it lived in is so polluted. In China the air pollution is terrible, fragile lands are overgrazed, wildlife is exploited etc What do we want for Minnesota. Some people want mining jobs. I can understand wanting a job, especially one in the area where you are a resident. I would like to live surrounded by the beauty of Northern Minnesota, but I don't because I could never find a job up there. If there are no jobs in a certain region, the people there can make the choice to move to where there are more jobs. It sounds harsh, but people all over the globe are in motion looking for better opportunities, just as our immigrant ancestors did. Also people naturally see things with reference t

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Mary Lou Hoff 17844 Townline Rd Minnetonka, MN 55345-6147

Mary Lou Salawater

45115

Please do not allow Polymet to mine in Minnesota. Lots of money has recently been spent in efforts to clean up the St Louis river, why would we now allow a mining company to pollute it some more CRAZY we can do better things with our money if we would just try. Only a few will profit and we will all lose our natural resources. Our children deserve a world with less pollution. Sincerely, Mary Lou Salawater 70325 Caville Road Ashland, WI 54806

Please Please Please do not allow toxic mining of copper-nickel sulfide! I am gravely concerned about irreversible damage to our amazing water RICH environment. Let's not make a mistake under Birch Lake! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Mary Manns

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, MARY MCGILLIGAN 814 5TH AVE TWO HARBORS, MN 55616

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: This is a very serious decision about to be made. I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, MARY MCGILLIGAN 814 5TH AVE TWO HARBORS, MN 55616 218-834-4891

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions:

- 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation.
- 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project.
- 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project.

Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Mary Megan 17180 Gannon Way W Rosemount, MN 55068-5136

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. **WE SIMPLY CAN'T TRUST BIG BUSINESS TO PROTECT THE ENVIRONMENT SO WE MUST ALWAYS BE VIGILANT.** Sincerely,
MARY MOCHINSKI 1829 10th Ave S Apt 9a Minneapolis, MN 55404-2005

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. I have concerns about the pollution of waters where wild rice grows. Since wild rice moves around and does not stay in one area, it is crucial to protect the waters in areas beyond where wild rice is presently growing. Who will monitor these waters. I am concern about the present pollution in the former taconite mine area where Poly Met plans to mine. Will there be clean up of the site before Poly Met would be allowed to startup. Who pays for the cleanup. There seemed to be data that says there is already pollution into neighboring streams from the former taconite site at the planned Poly Met site. Are holding ponds for tailings and debris of Poly Met's mining lined underneath to prevent leaching into the groundwater. I saw plans for covering the mine debris and catching the runoff to filter, but I am unsure of what is under the tailings and the holding ponds to prevent leaching of toxins into the groundwater. How often are covers replaced as they deteriorate over time. Is there plans for replacement of covers. Is the present plan to use reverse osmosis to clean the runoff a viable process. Has it been used and shown to prevent toxins and pollutants from entering water from the mining area. If the reverse osmosis process is put in place and fails to keep runoff within water quality standards, are there alternative methods to clean the runoff. Will enough money be collected from Poly Met to pay for the continuing cleanup of pollution of the water in the area and for how long. Who will pay these costs if Poly Met fails to. Will taxpayers pay for poor planning of cleanup costs. How accurate are models that project cleanup processes. Is there an ongoing monitoring that corrects the models to represent the reality of the pollution being created. Is there accurate monitoring of runoff and water in the area to check pollution levels. Who monitors. Self monitoring by some companies has not always been up to standards. Will Poly Met self monitor or is there monitoring by outside reliable sources. How thorough is the regulatory process in Minnesota. Is this type of monitoring water quality in regards to mining already in place in Minnesota and has it been able to prevent water pollution from exceeding standards and reduce pollution that exceeds standards. Will the surrounding residents be exposed to air pollution from the dust created by the mining and extraction process. Can there be more aggressive ways to recycle the many minerals that are thrown into landfills every day in Minnesota, before mining for more minerals. I have huge concerns about creating more pollution from Poly Met's planned mine. The St Louis watershed affects Lake Superior's water quality. We cannot afford to pollute the largest fresh water in the world. I am afraid allowing Poly Met's planned mining operation will open new mines closer to the Boundary Waters area, a very sensitive area needing high water quality. I am not in favor of mining in the Boundary Waters watershed. Minnesota needs clean water to protect our health and our lives and our fishing, birding, and tourism industries. Sincerely, Ms Mary P Disch 8308 York Ave N Brooklyn Park, MN 55443-2747 (763) 560-6793

mary q mccallum

44958

Hello. I am a concerned Minnesotan writing to voice my opposition to the Polymet mine. While I understand the economic boon it could create, I feel that this is very short sighted. There is simply not enough evidence to support this type of serious endeavor. The land, the water, the people, all need to be taken into account for the long term. We won't get a second chance. With any sulfide mine there is risk of [HYPERLINK "http://savethewildup-org/2007/01/acid-mines-are-never-safe/"](http://savethewildup-org/2007/01/acid-mines-are-never-safe/)acid mine drainage. Sulfide mining in water-intensive areas has never been done without contaminating surrounding waters. The proposed "NorthMet" mine site (near Hoyt Lakes) is part of the St Louis River watershed, which flows into Lake Superior. Groundwater would be contaminated in the mining process, the question is how badly and for how long. Pollution from acid mine drainage can persist indefinitely ([HYPERLINK "http://savethewildup-org/issues/sulfide-mining-101/"](http://savethewildup-org/issues/sulfide-mining-101/)2500-10,000 years). One of the best things about living in this state is it's natural beauty, our access to natural resources for living, for recreation. YOU are the Department of Natural Resources. Once they are gone, they're gone. I urge you for myself, for my children, and for the communities across this great state, to NOT proceed with any sulfide mining. Be heroes to all, not just to some. If you listen to the voice of the people, not the voice of the money, you will do the right thing. I say this as a MN resident, parent, small business owner, MN state tourist, voter, and fan of the great state of Minnesota in all it's glory. Sincerely, Mary Quinn McCallum 1520 Fairmount Ave St Paul, MN 55105 tel: 612-968-0558

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Please carefully consider the world you are gifting to future generations. I tremendously enjoy seeing wildlife and the opportunity to get out into nature. With 500 years of toxic runoff, how would that be possible. The earth and its creatures are a gift, we are duty-bound to do our very best to protect it. The heading states "protect our water". I may not live in Minnesota, but those pristine places belong to all of us. They were set aside to remain pristine places so they would be there for future generations. I don't see why you believe you have the right to destroy that with your name scrawled with a pen. Even if you have no offspring to gift this legacy to, we your fellow Americans, intend on fighting for these pristine places. Last year, I received the greatest blessing in my life and took a five day Eco-journey to Ely, MN. During one of hikes I set my feet in the Boundary Waters; that experience gave me the drive to fight for those incredibly beautiful wild places. Please join me in the fight to keep these places pristine and do not fall under the spell of big mining business. If the people of MN need jobs, I propose Eco-tourism to bring others to see the magnificent wild places within in the boundaries of your great state. Blessings, Mary Rose Phillip Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mary Rose Phillip 7704 Creek Bnd Rockford, IL 61114-6668 (815) 520-2082

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the EPA gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." I am very concerned about mining where spills and runoff can flow into Lake Superior or its tributaries. The recent water contamination from coal in West Virginia truly demonstrates how widespread pollution of waterways can be. Please ensure that the environmental impact studies are truly adequate and based on reasonable and truthful information. Sincerely Mary Ruch 1124 Nightingale Blvd Stillwater, MN 55082 651-253-4131

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Mary Scheibel 5305 Elliot Ave Minneapolis, MN 55417-1741

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Mary Schoos 21503 Arcadian Hill Rd Hancock, MI 49930-9696 (906) 370-0264

39375

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on Alces Americanus, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Mary Schoos 21503 Arcadian Hill Rd Hancock, MI 49930-9696 (906) 370-0264

At the St Paul public hearing I heard some very troubling facts about the SDEIS. It seems that some very basic requirements are missing. In addition there is a complete lack of backup plans if there are accidents polluting the environment with these heavy metals. Polymet has a history of polluting through mining. Our water resources are the most precious of natural resources. 100% of sulfide mining around the world pollutes massively. Why would we even think of doing this type of mining at the heart of our fresh water that's unparalleled in the world? The wars of the not too distant future will be over fresh water. We must protect ours allowing this mine will not do that. It's an unsound and far too distinctive to Minnesota.

Mary Sitko

18149

My name is Mary Sitko, M-A-R-Y, S-I-T-K-O. Thanks for the opportunity speak tonight. I work as regional sales manager for Pace Analytical. Pace is a nationwide network with certified environmental laboratories headquartered in Minneapolis, Minnesota. I also live in Minneapolis, Minnesota. We have two locations in Northern Minnesota in Virginia, Minnesota, as well. Pace supports the PolyMet project. We have worked with PolyMet for a number of years providing quality data in support of their environmental testing needs. Work from PolyMet has allowed us to expand operations in our Northern Minnesota laboratories as well as several high-quality, high-paying jobs to the area. We will continue to support PolyMet and other mining companies in Northern Minnesota. As they continue to grow, we plan to grow with them adding jobs to the area. Thank you.

Ms Llisa FAy, EIS Project Manager , Environmental Review Unit. So much has been written and discussed on the problems of sulfide mining in water rich environments such as ours, that Polymet needs to do further work to convince you that their mine will be safe. Water will only become more precious as time goes by and populations grow. I suggest that PolyMet put in escrow the full amount of money it would take to do their 500 years of water clean up by reverse osmosis ,before they are able to get a permit to make the hugh profits they expect to make from the mine. The Durka mine pits are not cleaned up yet, and no agency is demanding it be done. 20 years of jobs are not more important than our water.. We need to put as much effort to come up with solutions, and more creative efforts than we have so far, to ending unemployment. We might find answers if we put as much effort into that, as Polymet is putting into pushing the mines without viable solutions. Please continue to demand they give better answers to the problems that will be created. THank you ,Mary Slattery ,2105 E. Superior St , Duluth, Mn. 55812

Mary Smith

19026

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Mary Smith 13998 165TH St 13998 165th St LITTLE FALLS, MN 56345

Mary Sorensen

42435

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Mary Sorensen 3801 Vincent Ave N Minneapolis, MN 55412-1816

49434

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. • Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: • Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. • Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. • Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. • Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1- Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2- Assessment of potential impacts on residential wells from tailings seepage. 3- Health risk assessment for on-site workers at both the PolyMet mine and plant. 4- Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury in fish.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: My daughter lives in northern Minnesota and my husband and I enjoy getting back to nature when we go to visit her. She also rices in the area. Once you eat hand harvested wild rice from Minnesota lakes, you will never be able to eat commercial rice again. It would be a shame to lose this natural and healthy food to mining. I am amazed that destroying this area is even being considered. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Sincerely yours, Mary Suelflow 508 Jewett Street Marshall, MN 56258

The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mary Suelflow Mary Suelflow 508 Jewett Street Marshall, MN 56258

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Mary Tacheny 200 Nolden Ln Jordan, MN 55352-1722 (952) 492-5964

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Mary Theresa Downing 47443

Dear Ms Fay, Dear Federal and State Agency Leaders: The PolyMet sulfide mine environmental study received a failing grade from the U.S Environmental Protection Agency in 2010 and nothing has changed. It is still inadequate. There is no analysis of effect of its pollution on workers or on nearby wells. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. How can a few hundred jobs lasting only 20 years be worth that price. Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Mary Theresa Downing 19522 Waterford Court Excelsior, MN 55331 952-470-1301

Mary Tripler 10359

My two major concerns are, first, the lack of real cost benefit analysis and, second, the lack of a definitive answer on who will pay the costs of clean up over the 500 years remediation will be necessary. The minerals are part of Minnesota's legacy, and it seems like Minnesota citizens should reap a benefit equal to the costs to our natural environment. But how many jobs will actually go to Minnesota's residents. What kind of jobs will they be. How long will the jobs last What kind of income do we earn from the leases. What kind of continuing income will come to the state from mining profits. It seems that the mining industry takes more than it gives in return to the detriment of the citizens of the state. As I understand it, remediation will be necessary for up to 500 years. What sums will be escrowed to cover those costs. What responsibilities will the mining companies have in perpetuity to care for the mess they leave behind. We who live here care about this state. What incentive does a foreign, for-profit corporation have in leaving the land and water safe and usable for those who come after us. Thank you. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: THE RISKS ARE TOO GREAT, just look at how many huge spills and leaks we have already experienced. Why continue to trust and hope "safe destruction" can be built. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Mary Voight 951 McKnight Road South St Paul, MN 55119

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Mary Vollmar 4945 3rd Ave S Minneapolis, MN 55419-5629

Dear Lisa Fay and NorthMetSDEIS, My comment is that the SDEIS does not require the absolutely essential step which is to make absolutely certain that the nonferrous mining companies pay the costs of ongoing and final cleanup up front, before any more steps authorizing their mining leases, facilities etc It's too easy for them to liquidate through bankruptcy after the fact after ruining our water, Lake Superior and the BWCA lakes and rivers among other things. I think this assurance needs to be created as a state water trust fund which will generate interest or which goes into something like our state's general fund. In reading Rebecca Otto's Nov. 21 oped in the Star Trib, it sounds like 31 recently granted nonferrous mineral exploration leases also lack this environmental protection (WHY..), but back to the SDEIS. Why doesn't it include essential environmental protections. It reeks of pandering to the international mining companies at the expense our precious resource, a basic human necessity, water. I find myself as always when writing to advocate for WATER, our most precious resource, a basic human necessity, WHY don't the authors of the SDEIS and all other water users get this. These proposed nonferrous mining practices will create sulfates and acid drainage, as well as open the door to a myriad of greedy land and water exploiters. They are far too risky to exchange for the estimated 350 jobs. Please, let's get this one right. Thank you for this open comment period. Mary Lou Wilm

Mary Wolszon

Thank you so much for your review of what is proposed by Polymet concerning Sulfite Mining. My name is Mary Wolszon. I live at 653 Lincoln Ave in St Paul, 55105- My husband's family owns a cabin in Northern Minnesota on the edge of the Boundary Waters. We go there every summer to enjoy life on Bear Island Lake and it's surroundings. My husband and I, when younger, went to the boundary waters every year with friends. I am opposed to the Polymet proposal for many reasons, primarily because it seems a poor trade off for a project with a 20 year life span verses a project that could harm a precious natural resource for possibly hundreds of years. It's not even primarily an American venture. This Canadian company, with Swiss backing, will be hard to go after if things go wrong. Company chair, Tolry Hayward, has a particularly bad history to be making proposals from. The proceeds from the waste tailings are to be placed in bins that I understand are already leaking. Even if not true, the potential for that in the future is very great. This project endangers many rivers as well, including Partridge and the Embarrass Rivers. The E.P.A. Identified hard rock mining as the largest toxic water processing industry in the country. The E.P.A. review of Polymet described it as inadequate and unacceptable. The history of sulfite mining in other areas is not good, associated with significant pollution. As a Minnesotan who goes to Ely often, I like what I see of how they are promoting eco-tourism. I believe many more jobs can be created in the long term if we have healthy forests and pure water ways. The Boundary Waters area is a national treasure. People come from all over to be in this environment which will become more of a treasure as the years go by, unless, by short sightedness, we fall for projects such as Polymet's, the Northmet Project and Twin Metals, LLC. I look for you all to be good stewards of our land and allow industry the opportunity to find more suitable sources of copper, nickel and other metals. Thank you.

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, MaryAnna Foscett 101 Brantwood Road Arlington, MA 02476 US

Hello DNR reps. We live in Houston County, too far south to be "directly" impacted by mining in northern Minnesota except that we use the north as our vacation, camping, hiking and biking getaways and we love the wild rice supplied to us by our Ojibwe neighbors to the north and we value clean water and healthy air in all parts of this state and scientists and geologists have noted that the PolyMet company can in no way guarantee the health and protection of the resources in northern Minnesota. Please deny this permit. The trade-offs are not worth it to us or our future generations. Thanks for hearing us out. Tim and Mary Crane Brownsville, MN 55919 tmcrane@acegroup.cc

MaryCarol Dart

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this DIRECT DESTRUCTION OF HABITAT, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms MaryCarol Dart 149 Western Ave Cambridge, MA 02139-3702 (517) 464-1111

Our northern Minnesota legislators and those supporting sulfide mining do not seem to seriously consider the implications of sulfide mining and its effects on the waters of Minnesota, a state that is known for its "10,000 Lakes." Our lakes, rivers, and streams define us. Will we show the rest of the world the protection of our waters comes first. Asking questions is not about being against mining or jobs. It is about being for the lakes and for the health of our citizens. Rep. Tom Rukavina was mistaken when he said, "This is a policy issue and not something for citizens to decide." Who has more right to decide than the citizens of Minnesota. Mining may provide some short-term jobs, but it can also drive away creative professionals and knowledge workers, destroy entrepreneurial culture, diminish quality of life and damage long-term economic vitality. Sulfide mining, as it exists today, is not safe. Minnesota could learn from the disasters that have occurred in other states and in other countries. Or are we required to have our own disaster. Why not wait until sulfide mining can be proven safe and done without damaging our waters. There would be 500 years of cleanup. Who will pay for that. Certainly not Polymet. Just imagine, in the year 2540, PolyMet is still standing by, guarding the water supply. It is far more likely, though, that after mine is no longer producing maximum profit, or maybe a little while after that, PolyMet, or its parent corporation, Glencore, will tire of pumping water and will just abandon the mine. We have a name for orphan mines like this — Superfund sites. Cynthia Peterson 518 N 23rd Ave W Duluth Let us put our minds together and see what kind of life we can make for our children. Sitting Bull

43255

Sulfide-ore mining would be seriously harmful to the North Woods, the Boundary Waters Canoe Area Wilderness, to our Northwoods economy, and to the quality of our lives. Since the last Ely mine closed in 1967 and mining employment in Minnesota dropped from 12-600 in 1980 to 5-600 today, Ely has seen an upswing in industries based on the natural beauty (Boundary Waters and Superior NF) including manufacturing, a large increase in summer home development with its associated construction jobs and ongoing service jobs and support of main street businesses, large upswing in retirees moving to the area and supporting main street businesses and local volunteer-run community groups, and new residents who telecommute and/or start new businesses. In fact, the 3-county Arrowhead area is above average in entrepreneurial and creative people. We have the necessary attributes to be successful and have a stable, sustainable, and diverse economy; this is happening organically now. By supporting our local businesses and encouraging people to move to the Northwoods because it is a great place to live, we can help the community to prosper. But the big problem is sulfide-ore mining. If current prospecting and mining holdings are developed, the Northwoods will be surrounded by a massive industrial mining district. The forests would be transformed and lost forever. No sulfide-ore mine has avoided extensive toxic pollution to waters, and the Northwoods is a high risk area for water pollution. At risk are more than numerous resorts, camps, and campgrounds downstream of sulfide-ore mining, as is the Boundary Waters. The path of pollution will flow into Basswood Lake, damaging a world-class fisheries and exposing humans to the toxic effects of methylmercury. What will the Northwoods lose. Its economy (summer/winter tourism is an important part but the Northwoods' economy is broader and based on being a great place to live and the entire economy will be harmed) its culture, and its healthy waters and forests. the Northwoods will displace its current economy and much of its new population with the boom and bust of sulfide mining, social upheaval, and man-camps. Is mining inevitable. I think not. These are low grade deposits and are dependent on high prices and low costs. If China slows down, the numbers won't work unless the costs drop dramatically. The trend is for recycling (at least 1/3 of every product). All of this is the reason I say our Northwoods area is too valuable to gamble on the most toxic form of mining with little return and a lot of cost to us. Cynthia Peterson 518 N 23rd Ave W Duluth

43257

Northern Minnesota has a strong mining heritage. Iron Rangers have a right to be proud of their contribution to our country. But that contribution came at a price. One effect of mining has been the corresponding removal of other employment options. When the minerals are gone, the mines close, and there is little reason for other businesses to locate in areas stripped of a landscape that draws people to a community. Mining is the only option, but without minerals that option no longer exists either. Sulfide mining will not bring stability. The minerals are finite. When they are gone the mining areas will again be left struggling to find viable options. And this time our lakes will need perpetual treatment for acid and toxic heavy metals. Is this what we want for future generations. Let us assume for a moment that PolyMet manages against the odds — and they are really long odds — to contain all the sulfuric acid that it produces during mine operation. What happens when the mine closes. If Freedom Industries, the Department of Homeland Security and other government entities can't keep track of one storage tank in West Virginia for less than a quarter century, how are we going to keep track of a toxic site on Lake Superior for five centuries. Cynthia Peterson 518 N 23rd Ave W Duluth - Let us put our minds together and see what kind of life we can make for our children. Sitting Bull

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Marylee Fithian 3735 Pillsbury Ave S Minneapolis, MN 55409-1220

AS A LONGTIME RESIDENT OF NORTHEASTERN MINNESOTA, I FIND IT IRONIC THAT WE ARE SPENDING MILLIONS OF DOLLARS IN RESTORING OUR POLLUTED WATERS, WHILE CONTEMPLATING A COPPER SULFATE MINE IN NORTHERN MINNESOTA. THE MINE HAS THE POTENTIAL TO DESTROY EFFORTS THAT ARE BEING UNDERTAKEN AT THIS TIME. THERE IS NO COPPER MINE IN EXISTENCE THAT HAS NOT HAD MAJOR EFFECTS IN DAMAGING THE ENVIRONMENT. WE WOULD BETTER OFF RECYCLING THE TONS OF PRECIOUS METALS THAT ARE BEING DUMPED IN LANDFILLS; AND IN THE PROCESS EMPLOYING PEOPLE IN AN INDUSTRY THAT RECLAIMS RATHER THAN ADDS TO THE DEVASTATION OF OUR ENVIRONMENT. THIS CORPORATION HAS NO ALLEGIANCE TO OUR STATE, AND AS A MULTINATIONAL WILL TAKE ITS PROFITS AND LEAVE US WITH THE RECLAMATION. PLEASE DENY THIS PERMIT.

Marylyn Irrgang

48170

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Marylyn Irrgang 170 Good Counsel Drive Mankato, MN 56001

Mason C. Myers - 12009 Hilloway Road West - Minnetonka, MN 55305 Email: salmyers@ix-netcom-com March 12, 2014 Douglas Bruner, US Army Corps of Engineers Lisa Fay, MNDNR Division of Ecological and Water Resources Tim Dabney, US Forest Service RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Mr Bruner, Ms Fay, Mr Dabney, Thank you for the opportunity to comment on the Supplemental Draft Environmental Impact Statement for the proposed PolyMet NorthMet Mine. My comments are to the SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetland destruction in the Superior National Forest My Background: I am a retired mechanical engineer, P.E., with 37 years practice in design of heavy equipment, bulk material handling systems, piping, plumbing, heating, ventilating and air conditioning. My association with the Boundary Waters almost antedates my birth because my parents canoed the area while teaching in Proctor.. MN, before they married. I now look forward to my 51st season at the family cabin in the Superior National Forest Summer Home Group on Hungry Jack Lake The PolyMet mine is the poster boy for many similar mines waiting to follow approval of it and the SDEIS will be the model for EIS' to follow. It is important that the document set a high standARd The failure in EPA review of the original document and subsequent reports in the press and from reviews of environmental groups indicate that the SDEIS is a flawed document as follows: 1- Bedrock Fissures: Fissures in the bed rock that may open to the aquifer are incompletely and inaccurately mapped; better data is reported to be available from Canadian maps. I ASK that the SDEIS include accurate fissure mapping. 2- Reusing Storage Site: Sulfide process tailings will be stored on an existing taconite tailings site that is known already to be leaking to the environment. Sulfide leakage should be expected. 3- Storage Basins a: I attended the meeting in St Paul and saw the diagram of the proposed system of sealing the bottom of a storage basin. The diagram showed a subterranean geomembrane intended to prevent leakage down to the aquifer and another geomembrane covering the pile to prevent rain from entering it. Very little made by man has survived 200 years and I doubt these membranes have been so tested. The cover is available for replacement but the underground one is not. The protection intended seems inadequate. I ASK that the SDEIS include consideration of leakage control with a punctured underground membrane. 4- Storage Basins b: I understand the SDEIS does not address the possible failure of storage site containment methods, whereas the history of containing dangerous materials is a litany of failure. Note particularly boiler fly ash in Kentucky, coal treating chemicals in West Virginia, above ground nuclear waste in Hanford, OR and liquid manure in countless Confined Animal Feeding Operations. Failure should be expected at this site sometime in 200 years, if not during actual operations. I ASK that the SDEIS Consider modes of failure and demonstrate capability to respond so as to protect the environment. 5- Model Flaw: The design model makes assumptions that seem intended to deliver the desired result, for instance, that 90% of drainage from storage basins will be captured and delivered to a treatment facility. This would require that underground piping would be installed and maintained so as not to fail in 200 years. It seems an overoptimistic assumption. Recall that the Canadian company Enbridge's failure record for its underground piping is not enviable. I ASK that the SDEIS include the costs of repairing/replacing the system piping at 30 year intervals to account for breakage due to settlement of the piles. 6- Reverse Osmosis: I encountered the reverse osmosis process on an office building project where it was considered for pretreating humidification water. I learned that the product stream is about 10% of the input, the concentrated 9

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, mason burch Steen, Minnesota

Gwen Salisbury Myers 12009 Hilloway Road West Minnetonka, Minnesota 55305 March 4, 2014 Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, Minnesota 55155-4025 Re: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay: Thank you for the opportunity to comment on the Supplemental Draft Environmental Impact Statement on the PolyMet Project. I have many concerns about this project and find the SDEIS to be completely inadequate, leaving me with endless questions. To focus on one area of concern, the proposed project, located in the Lake Superior watershed, will destroy or degrade thousands of acres of high-quality wetlands and cause permanent water pollution with sulfuric acid and toxic wastes. To be specific, the PolyMet Project would completely destroy 912 acres of wetlands, 65% of which the DNR describes as high-quality. High quality wetlands, such as the coniferous bog wetlands that make up 56% of the wetlands impacted, have a rich diversity of plants and provide a range of services to the ecosystem. These include reducing the severity of floods, water filtration, carbon sequestration and animal habitat. In addition to the 912 acres, the SDEIS admits that an additional 7,351 acres of wetlands would be degraded due to air and water pollution, mine dewatering and diverting water from wetlands. This could be the largest single wetland loss ever proposed in Minnesota. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been unchanged for thousands of years and are important for water quality and for habitat for moose, lynx and other at-risk species. In addition, these wetlands bind up mercury, thus protecting the fish downstream and prevent further harm to the brain development of our children who eat fish from the St Louis River and Lake Superior. The wetlands that would be destroyed or harmed by the PolyMet mine are water resources of national and international importance. Though the environmental review process should propose alternatives, nothing is suggested to reduce impacts to wetlands in the SDEIS. The required wetland replacement for this loss is completely inadequate. There is no mitigation for the indirect wetland destruction and 2/3 of the replacement wetlands are outside the Lake Superior watershed. Under the circumstances, please: (1) Reject the PolyMet proposal due to unacceptable impacts on wetlands and water resources; (2) Reject the PolyMet SDEIS due to the fact that there are no alternatives proposed that would reduce this harm; (3) Deny the PolyMet Section 404 permit unless all replacement wetlands are in the Lake Superior watershed; and (4) Require the SDEIS to be redone to analyze alternatives that would avoid, minimize or mitigate impacts on the Partridge River watershed. In sum, please reject PolyMet's SDEIS as inadequate and reject PolyMet's copper/nickel "sulfide" mining plan. Very truly yours, Gwen S. Myers

The Polymet Mine Proposal threatens water purity of northeastern Minnesota and paves the way for additional mine proposals waiting off stage. Consider.1. Protective measures consists of products and equipment made by man which we are asked to believe will serve for hundreds of years. In face nothing man-made has lasted 500 years, most have crumbled in less than 2002. Review of the EIS shows that the supporting technology is based on incomplete mineral data and inaccurate water modeling data.3. No hard rock mine to date has failed to deliver and to the environment. Why has not this new technology been rushed to field testing on an existing mine to prove its worth?Is Minnesota's pure water supply to be the test medium for unproven technology? NO WAY. Technical preparation for protection is incomplete so we are not ready for full scale mining now. The project should be denied!

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Launching sulfuric acid into northern MN aquifers and watersheds is self-evidently stupid and immoral on any number of grounds that are being well-documented by qualified parties. A 500-year event horizon for sulfide waste might as well be nuclear. That's the level of arrogant idiocy we're contemplating. What's driving it of course is greed, not science or reality. Minnesota's tourism industry and general health apparently count for nothing against a few unions who know the mining jobs probably won't even be union jobs, and shell mining companies that have nothing else to do with MN. Humans can live without copper, but not without water. For those supporters who want me to "prove" my honesty by giving up my cell phone because it may contain copper I ask, do they wear cotton. I bet that in 1860, slavery supporters said there'd be no cotton without slavery. So, miners, if you wear cotton, you must support slavery, right. There will be no positive jobs, union or otherwise, in the giant superfund site this will become. The only work will be monitoring and vainly trying to make things appear as if the damages can be cleaned up. All the rest of us schmucks will have to show is our escalating tax bills and the far-off memory of a time when you could actually use the water in northern MN. Sincerely, Mathews Hollinshead 2114 Pinehurst Ave Saint Paul, MN 55116-1315 (651) 698-0260

I am writing to express concern about the Northmet Mining Project and Land Exchange. I attended the public informational meeting at the St Paul Rivercentre and heard comments both for and against the proposal. But it seems pretty clear that this deal is not worth the price. It just seems that 20 years of employment is not worth basically permanent damage to an important part of this state. Drier areas like Arizona may provide reasonable risk for similar projects. But recent accidents in North Dakota, West Virginia, and the Gulf of Mexico prove these operations are not reliable. Any contamination of the surface or groundwater in northern Minnesota has the potential to spread and include areas far from the mining site. Glencore has a history of lack of concern for human rights, as well as environmental protection. A little searching quickly turns up a number of disturbing articles about Glencore projects in places like Columbia, Bolivia, Zambia, Ecuador, and the Democratic Republic of the Congo. Here are a few quotes from these articles: In a remarkably robust comment, [The Times Business Editor, Ian King] damned Glencore as " a business with dubious morals. It trades grain amid food riots and has been accused of profiteering and environmental offences in numerous poor and war-torn countries". He went on: "Most of those signing up to buy shares in Glencore's flotation are major Middle Eastern and Far Eastern investors. Few of the traditional City institutions will touch the shares with a bargepole " <http://moneytometal-org/index.php/Glencore> The giant commodity company remained controversial even after Marc Rich left in 1994- The Daily Mail called Glencore "morally dubious" in an article [Zambia accused the powerful company for trying to manipulate the financial accounts to reduce the taxes and "deliberately depriving that poverty-stricken nation of much-needed income."](#) The article also pointed out that the company sold to African dictators, Cuban communists and South Africa during the apartheid. The controversy that Rich had brought to the company trailed on after he had left Glencore. <http://www.globaljournalist-org/stories/2013/11/22/profile-glencore-in-zambia/> In Australia, Glencore Xstrata has been facing accusations that its Mount Asa smelter in Queensland is responsible for elevated blood levels of lead in children living nearby. In one lawsuit brought on behalf of a six-year-old girl, the plaintiff's lawyers successfully pressured the company to hand over internal documents about the matter. The case is pending. <http://www.wri-irg-org/node/22681> It seems like Minnesota should not allow a company like this to damage any part of our state. Thank you for the opportunity to comment on this proposal. Sincerely, Matt Anderson 1875 Oxford St N Roseville, MN 55113

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

DNR I urge you not to accept the SEIS regarding PolyMet for the following reasons I do not think it is in the best interest for the citizens of Minnesota to be responsible for future tax burden as a result of cleanup costs for pollution that will result from poly mets project. The reason I am so concerned about this, in spite of poly met saying that they would be responsible, is that the financial assurances need to remain in place for an extreme amount of time. Financial assurances that need to be in place for 200 to 500 years have not ever been proven. Have there ever been any financial assurance vehicles that have been tested or proven effective for 500 years. I understand that the financial assurance part of this project is actually looked at in the permitting stage, but I strongly feel it is important that it is addressed here as well. The land swap between the forest service and poly met in my mind needs to have its own separate review. The proper amount of time needs to be allotted to this important piece of poly mets project. It cannot be lumped together and hurried through. The use of the national forest has restrictions put on it for a reason. We need to respect that and not put the needs of a corporation ahead of the rights of the citizens of the United States. We were personally involved in a land trade with the federal government. Our land trade took 12 years to go through and it was to trade lakeshore recreational property which was already in use and leased for that purpose. I feel it is a mistake for us to make this trade which would allow non ferrous mining to be done in our national Forrest without a longer period of time for public comment and education on this important change of use. It just does not make logical sense, unless a for profit corporations project does not need to have the same scrutiny as an individual. There is some discrepancy as to the amount of water being released from the project. I would believe the tolerances were put into the model for a good reason therefore it would make sense that the correct numbers be put in and the model be rerun. This is an important part of the EIS. In order to protect our citizens it is only responsible to redo the calculations and do a revision of the model. I am a concerned citizen, who loves this part of Minnesota, and is very troubled by the potential harm this type of mining could bring to northern Minnesota. I believe this harm will not only come to the earth but also would be damaging to the already established tourism environment of that area. This includes businesses as well as cabin owners. The related jobs, as well as construction jobs, taxes and other benefits this tourism economy and vacation home industry brings to the state is sustainable and can be grown. I do not believe that the current tourism economy and vacation home industry could flourish side by side with the nonferrous mining economy which brings pollution and greater industrialization to this unique part of our country. The following are items I would like the DNR to fix in PolyMets mine plan Plan to account for the destruction of moose habitat as well as other natural habitat for the Canadian lynx Plan should call for a detailed plan for financial assurances that protect current and future taxpayers Plan should accurately assess health risks to the public Address the risks of mercury pollution for our children as well as future generations Plan should improve wetland protection and replacements Provide Minnesotans with accurate information about how long polluted waters will require treatment Glencore must be recognized as a responsible party for permitting because of its ties with PolyMet Fix the inaccurate water data used in the model and redo the water model In conclusion it is my opinion that the few hundred jobs and monetary gain for a corporation is not worth the perpetual damage and pollution nonferrous mining will cause to Minnesota's environment. Ou

Dear Minnesota Department of Natural Resources, I would like to express my dissatisfaction with the SDEIS, the proposed PolyMet/NorthMet mine actions, as well as the proposed USFS land exchange. I believe that the costs far outweigh the benefits. The aesthetic toll cannot be measured and the economic benefits are negligible. Please, take another look at the online aerial imagery of the current/former mining sites on the Iron Range. Zoom out to see the entire state and then zoom back in to the Iron Range. This is what we have done to our land, for better or for worse. Next, imagine a drive through one of these towns. The impression one gets is that something big happened here, and whatever it was, it left a lot of destruction in its wake. Not only is the land permanently scarred - especially aesthetically - but the economy is so depressed. In fact, the only thing that seems to be able to inject a little life back into these Iron Range cities is another shot of mining, which only starts the vicious cycle over again. The only real benefit being touted by this proposed mining operation is economic and the anticipated impact is impressively feeble, especially in consideration of the scars that will be left behind. Won't this operation simply create another false/temporary economy. So what if 500 people have decent paying jobs for 20 years. When the jig is up, they'll find themselves jobless in a economically depressed wasteland. Minnesota has to stop sacrificing its land for a few meager (and essentially temporary) jobs. If these truly are our natural resources (the state tax-payers), then my vote is to please leave them where they are, in the ground. I appreciate your consideration, Matt Goodman 321 Minneapolis Ave Duluth, MN 55803

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Matt Johnson 3243 Grand Ave S Apt #1 Minneapolis, MN 55408 6122985509

41833

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Matt Johnson 3243 Grand Ave S # 1 Minneapolis, MN 55408-3708 (612) 298-5509

43447

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Matt Johnson 3243 Grand Ave S Apt #1 Minneapolis, MN 55408

Matt Jones

21

To whom it may concern, I wanted to express my concerns for the future of the Boundary Waters Canoe Area. The Boundary Waters is one of Minnesota's greatest treasure. It is one of the hallmarks of our state. It is a far more valuable resource than the sulfides that it contains. This is in both an economic and sentimental sense. The preservation of the beauty of the Boundary Waters guarantees tourism revenue for as long as we can preserve it, which is undoubtedly significantly longer than the mining will last. What's more, I have many personal memories in the boundary waters and I want my children to have the same experiences that I had. I do not want to see Minnesota turn into a state that permanently destroys its beautiful wilderness for short lived economic benefit; we are better than that. Thanks, -Matt Jones

Matt Lauseng

40236

Hi, I would like to take a minute to voice my support in the Polymet mine project. I have read the summary SDEIS report. I find no reason to hold this project up further. From what I see in the report the homework has been done and all effects to the environment have been looked at. I attended two of the three hearings and did not hear anything that would give me concern with this mine. I can see this being a good thing for the people and businesses in the area. Some sacrifices will be made yes, but they are minimal when the size of the payoff for the area are taken into account. I live, hunt, fish, and raise a family in the area and would be one of the first people to stand up against this if it appeared to be a bad thing for the area. I wouldn't want my home destroyed in any way. Please don't allow influence from groups outside the area or ones in areas that this will not affect to put a stop to a greatly needed expansion of mining on the iron range. Thank You. Matt Lauseng 100 4th Ave N #358 Biwabik, MN 55708

Matt Miller

22128

Good day, My name is Matt Miller. I work for B. Miller Products in Hibbing, MN, and reside here as well. We are a 3rd generation family run company that supplies building maintenance and industrial supplies to businesses in the Northland. Northern Minnesota is rich in natural resources, and mining has been a way of life here for many generations. With the combination of today's strict state and federal regulations, I think this is the best place to pursue the Polymet project and this new era of mining in general. I trust and have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. The positive effects from a project of this magnitude have on our region and state, far outweigh any negative. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Let's make this project a reality. Thank you for your time and support of this project. - Matt Miller cid:644412017@02102013-1EE2 ESt 1960 Janitorial – Paper – Cleaning Equipment and Repair – Safety 218-263-8958 Hibbing Office 218-263-8583 Fax 218-969-5563 mobile phone HYPERLINK "mailto:mrmiller@bmillerproducts-com"mrmiller@bmillerproducts-com HYPERLINK "http://www.bmillerproducts-com/"www.bmillerproducts-com cid:644412017@02102013-1EE9

Matt Mlinar

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I believe that the PolyMet mining project can be done in an environmentally sound manner. One of the safest sulfide mining operations in the world is being constructed in Upper Michigan and I believe that will also result in an environmentally sound mining operation. I urge you to please look at facts, not fear. The excuse "it's never been done before" draws upon horrible examples of past operations that are not a true indicator of mining today. I've worked at mining operations in Minnesota and copper-nickel-sulfide research and I believe mining this reserve is in Minnesota's best interest. Sincerely, Mr Matt Mlinar 19337 N Gama Beach Rd Grand Rapids, MN 55744-4966 (906) 361-5432

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, matt pearsom minneapolis, Minnesota

Matt Schmitt

58147

I feel this is a bad idea for many reasons and should not be allowed. The following are just a few of my reasons. 1) Production of Sulfide Acid. 2) Never has there been a copper/nickel mine anywhere in the world that has not polluted water. 3) Polymet has never operated a mining operation. 4) The mine would be located 20 miles upstream from the largest fresh water lake in the world. 5) 20 years of mining with 500 years of monitoring is an unrealistic thought. 6) Threat to thousands of jobs in the recreational and tourist industry over the next 200 years, for a handful of 20 year mining jobs.

Matt Slawson

Dec 21, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Mining companies: NEVER hire as many people as they say they will, and the jobs are impermanent, creating a future unemployment problem. NEVER clean up after themselves, leaving a toxic, deadly mess for taxpayers to deal with for decades-sometimes centuries. NEVER aid tourism in the states or local areas where they are allowed to mine. NEVER end up having a positive effect on any economies, local or otherwise, in the long run. NEVER find less invasive or less toxic methods to mine, always opting for larger equipment, fewer employees, faster methods, and a much wider impact in terms of carbon footprints and environmental destruction-that's what they call "progress." Five hundred years ago, there was no United States. America had just been discovered. Most Europeans thought the world was flat. Expecting Minnesota to keep those chemicals from poisoning an entire region for 500 years is nothing short of absurd Nothing short of pure, stupid greed. You should be forcing mining companies to develop less invasive methods for smaller profits doled out over much, much longer periods of time, rather than allowing that tiny tail to wag an entire state. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Matt Straw 315 Bluff Ave Brainerd, MN 56401-2648 (218) 828-8136

I do not believe the potential for 500 years of poisoned water, ruined tourism, destroyed habitat, and ravaged state and local economies is a good trade for any benefits from any mine. Water is life. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

matt tuccitto

47428

My name is Matt Tuccitto, age 35, and I have lived in Minnesota my entire life including 4 years of college at Gustavus Adolphus College in St Peter, MN. I've done my best over the last few years to gather all information available on this project and the answer seems simple: issue Polymet a permit. I love the outdoors and have visited the BWCA 30+ times this mine plan will NOT harm the water in northern MN. The management of Polymet is capable of making this project great for MN. Northern MN is struggling and there are almost 0 jobs available for college educated people. This is tearing children and grandchildren away from grandparents who live in Northern MN. Our state has a valuable resource located beneath the surface (copper, nickel, platinum, etc) and its our job to extract it as environmentally friendly and responsible as possible. Polymet mining will ensure that is done. Its time to make MN great again and attract tax paying families and corporations from other states similar to what North Dakota has accomplished in the last 10 years. GRANT POLYMET A PERMIT, they will not disappoint. Regards, Matt Tuccitto

Matt Tyler

18084

Hello. I'm Matt Tyler, T-Y-L-E-R, and I live in Finland, Minnesota, and I want to thank all my union brothers and sisters for coming out tonight. I see a lot of folks in the audience. Although I'm not currently in a union, I grew up in a union family and I know that union wages helped pay for my college, and I got a degree in natural resources and forestry and so I'm reasonably scientifically literate, and I agree with a lot of what's been said here, David Dill and others, that we really should be paying attention to the data, and we have to make decisions based on data, not on emotion. I think -- I think that's sound. But having read through this, I've seen a lot of things that are pretty questionable, and I have friends that are professional hydrogeologists that clean up EPA superfund sites and I've looked at it with them and they've said, "Well, you know, there's not enough wells here, there's -- they didn't do this right, they didn't do" -- there's a number of things they pointed out, and one thing I'd want to focus on is that something that's not been talked about is that this SDEIS, if you actually work through it, didn't have any analysis of worker safety in there. Now, in a lot of other SDEISes for other projects, like when they redid the nuclear plant down in Monticello, they had that in there. When they've done environmental cleanup cases from Chevron, they've looked at worker safety. Now, they looked at, you know, what might happen with residents of Hoyt Lakes, but they haven't actually looked at worker safety in here and I think that's pretty grossly inadequate. I think, also, we know that that study came from out from of U of M recently about, you know, mesothelioma and so forth, and we know that a lot of folks on the Range who worked in the mines got mesothelioma about three times more often than average folks and I lived near Silver Bay, and I've had a lot of friends that have worked in the mines over the years and I've seen some people die of that. They were from strokes and heart attacks, and so I think we have to look at this critically and one of the reasons they might not have put worker safety in there is because their own data in the SDEIS, page 5 -- 439 -- to 4 -- 438 to 439, points out that about nine percent of the ore tailing and process water have those asbestos-like fibers in them, and you know, they didn't really look at what's that going to go to folks in the plant. They didn't really look at what the air treatment mechanisms are going to be. So I think before we sign up on this, we should really think critically about that and we should with be skeptical, because, you know, the companies aren't always right. They don't always honor your pensions. They don't always admit to stuff. Thank you.

18354

My name is Matt Tyler and I live in Finland, Minnesota and I am a professional enforcer by trade, so I am involved in resource extractions. And I do believe that we should use our resources. Having said that, we have to use them responsibly. The enforcer's credo is, you know, "The greatest good for the greatest number for the long-term." If I look at this proposal from that perspective, I don't really see it meeting that test. I think if you looked at the EISes before, very, very rarely do you see an EIS that has its own chapter where the agencies say, "We disagree with this, we disagree with this, we disagree with this." If you look at Appendix C, it is about 250 or 200 pages of the tribe saying all of the things that are wrong with the EIS, based on science and citations with their own models. Now, if we are going to say that that is adequate, and we have that much dissent, then that is purely illogical and ridiculous. The other thing that I want to say is I live right next to the taconite, you know, I live next to Silver Bay. And a lot of my friends and neighbors work in the plant over there. And, you know, it's been good to us and it's been bad for us, you know. And I think one thing that doesn't get talked about a lot, you know, is the mesothelioma and the increased risk of heart attack and stroke, you know, that a lot of people have experienced. And that is not really reflected in here very well. Someone earlier said that the risks are basically left out on purpose to detract (phonetic) from telling other people or from pointing this out on what they used to base those models. No other EIS has this little mention in it to workers' safety. Now, I would like to thank all of my union brothers and sisters for coming down here, but to be fair, I don't think the union movement existed to call for a project that is not safe for workers. I would encourage the folks to say, you know, "Until we fix these worker safety issues and until we get a project labor agreement for the adequate operation of this land," we shouldn't be endorsing it. So, you know, I just want to put that out there and say I'm not against mining, but this mine, this mine is a bad deal for the workers, it's a bad deal for our community, it's a bad deal for the taxpayers. And since I am also supposed to say something also substantial about the wetlands, I will just point out, the way they analyzed the wetlands impact on this thing is kind of ridiculous. I am friends with a professional hydrologist and he has told me time and time again, if you want to look at a wetlands study, you have to do a hydrological study, do a pump test, you have to do a laser test. They didn't do that. Why? Because they were lazy. They wanted to rush to get this done, and now it is still incomplete. The reason it takes such a long time is because it is a good project, it's a regular study (phonetic), it's because it is a bad mine. And thank you.

Ms Fey, Mr Jimenez, and Mr Brunner, Attached, please find a technical memo I developed to comment on Financial Assurance in the PolyMet NorthMet SDEIS. My key findings include: * The annual long-term operating and maintenance post-closure cost estimates in the PolyMet SDEIS are significantly lower than the lowest estimates calculated from published estimates for similar reverse osmosis plants on the LTV property. This is a significant problem. Independent estimates of long-term annual OandM post-closure costs range from \$6-1 to \$10-6 million. * Lacking specific, detailed treatment water treatment plant plans specific to the NorthMet Project, there is still considerable uncertainty about annual long-term treatment costs. * Stochastic simulation of volatile investment returns and inflation rates show that the minimum beginning balance for the Long Term Treatment Fund required to ensure water treatment for 500 years after closure is between \$333 and \$694 million. * The Long Term Treatment Fund set aside is above and beyond the estimated \$50-\$200 million mine closure and reclamation cost estimates in the SDEIS (SDEIS, pg. 3-138). The SDEIS also fails to include an estimate of a financial assurance funds for accidents, natural disasters, and other unforeseen events. Not including additional contingency funds, the total financial assurance package should be at least \$383-\$700 million. Please acknowledge receipt of this email and technical Memo. Thank you, Matt Tyler Professional Consulting Forester PO BOX 511, Finland, MN 55603

Matt Zimmerman

54361

Dear Ms. Lisa Fay, EIS Project Manager,I think that PolyMet Mining has a great plan for the reduction of environmental side effects and the output of ore. They appear to be trying to limit cultural and environmental damage through engineering.This mining would greatly benefit our state. It would create numerous jobs and help boost our economy. It would offer a lot of potential for future copper mines and would be one of the most productive.The apparent lack of disadvantages is a point that proves that PolyMet has a lot of experience in Inining and limiting damage. The advantages of such a plan would be more jobs, money, copper production and mining in the state.This will have a 1nimal impact on cultural resources in the area. It might affect a segment of the Mesabi Widjiu. Other than that it wouldn't affect important cultural resources that are valuable to America.The land exchange offers seem fair. They appear to trade the same amount of land between both groups. The offers would add to the Superior Forest. They would also add to PolyMet's mines.PolyMet Mining's plans seem to be fair and have as little impact on the environment and cultural resources in the area.Thank you for your• time,Matt Zimmerman

Matthew Davidson

6011

To whom it may concern, I live in the twin cities. I don't struggle to find a job like the neighbors to the north. It is a retreat and as someone who has worked in the outdoor retail and boat manufacturing industry, I've had the pleasure of meeting people from all over the country who have shared stories of their trips up north. We already have a valuable resources up north. I believe allowing a mining company in will destroy a part of our state and kill an industry that runs indefinitely. Trading a generations worth of jobs for 5 generations of clean up and monitoring seems foolish to me. Please don't allow polymet to ruin our home. Matthew Davidson

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Matthew Hennen

44007

There appears several key components to this project that are not adequately addressed in the Supplemental Draft EIS. My primary concern is that there is a severe lack of fisheries and aquatic organism related information and data collected in the document. Without this information I am not sure how this project would be allowed to move forward given the massive implications on a highly connected aquatic system. From what I can gather, the information that is provided is extremely topical (and in some cases outdated and unconfirmed [eg, assessing aquatic vegetation using aerial photographs] and does little to address potential impacts on aquatic organisms. From what I can gather, essentially just species presence and mercury accumulation information is provided which barely scratches the surface of the data that needs to be collected. Sensitive aquatic indicator species should be identified and monitored on much more frequent basis in order to make inferences about potential impacts. Massive amounts of research including fish behavior, recruitment, growth, mortality, etc needs to be done on waters potentially affected by this project. Until this information is collected and provided in the document, then the document is incomplete. Matthew J. Hennen 5430 Mineral Avenue Mountain Iron, MN 55768

Matthew J Eckman

54524

1. Have a balanced SCIENCE (i.e., geology, chemistry, hydrology, ENGINEERS) group travel to several active copper/nickel mining sites of PolyMet (or their "parent" company) to review for current or residual problems with sulfides/pollution. 2. If PolyMet is a subsidiary and declares bankruptcy, then who pays cleanup?

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Matthew Johnson 3244 44th Ave S Minneapolis, MN 55406-4317 (612) 703-8686

Matthew Kilibarda

44121

To whom it may concern, I'm against this proposal to mine copper and nickel in Northern MN based on this proposal for a number of reasons. 1- Water quality, especially fresh water, is a hot topic these days. Our usage of it continues to increase at an alarming rate, beyond what is available in many areas. There are shortages all across the US and the world. I don't understand why we would take such a big risk polluting a resource that is going to be even more valuable and hard to come by in the future. 2- I keep hearing how we should do this mining here because we will do it right. Even if that were the case, and I'm not confident it is, to do it right will cost more, meaning the copper/nickel will cost more leading to issues we have had with other mining industries. We won't be competitive with these other countries. When we are not able to compete PolyMet and other companies will ask for concessions or worse cut corners in hopes they won't be caught. Many times the fines are more cost effective to pay than to invest in proper equipment to keep our environment safe. 3- I grew up in the Northland and still frequent this beautiful land to hunt, fish, camp and enjoy the peace and quiet. The long term effects of this type of mining are of major concern. Not only to the beauty of this land, but to the impact on game hunting and again water quality which will likely impact fishing, swimming and other water activities. 4- With the amount of jobs this project is promising to create (Depends on who you talk to, but around 200-300) it just does not make sense that for such few jobs we would take such a big risk with a much more important recreational industry and a fresh water system that will be a valuable resource in the near future. Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Minnesota greatest natural resource, and source of tourism revenue is the clean and pristine waters of the BWCA, and lake Superior. Any propose minning that slightly poses a danger to that is not worth doing. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Matthew McDonough 3109 Columbus Ave Minneapolis, MN 55407-1534

Matthew Ott

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and stream. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Matthew Schaut 3720 27th Ave S Minneapolis, MN 55406

42274

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Matthew Schaut 3720 27th Ave S Minneapolis, MN 55406-2512

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come.

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

As an avid backpacker on the North Shore and as someone who has cherished memories of many canoeing trips in the Boundary Waters, I write to voice my concern with the PolyMet mine proposal. Namely, I believe the positive short-term fiscal impact from a 20-year operation is significantly outweighed by what I understand to be the exponentially longer period of remediation and environmental impact. I am concerned that, even with the best intentions, PolyMet may not be available to continue monitoring and funding these remediations in 50 years or 100 years, and that therefore the cost of this would fall either on Minnesota taxpayers or on this fragile yet beautiful environment itself. While I understand and support the quest for quality, long-term jobs for individuals on the North Shore and the Iron Range, I do not believe that the short-term commitment of PolyMet meets that criteria, and it comes with a significant and as yet unknown price tag. Respectfully, Matthew - Matthew Webster 982 Laurel Avenue St Paul, MN 55104 612-716-3503

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Minnesota's identity, heritage and future is water. Growing up in Norther MN, my family's drinking water came directly from a pump in the lake. The proposed PolyMet mine means that never again will members of my family have the same connection to Nature. That is prospect is devastating and unacceptable to me. This path is ignoble. There is a better way. We should swim, fish and admire our spectacular water systems, not live in horrible fear of their toxic finger print. Sincerely, Ms Maura Dilley 7300 Rolling Acres Rd Excelsior, MN 55331-7722

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is 2,169 pages long and contains a great deal of technical details that need to be carefully read. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they are not available to the public. These should be made available so that we can conduct the proper review. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) seems designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about the ability to conduct this mining in a environmentally safe way that will not do substantial harm to one of the most valuable resources on the planet: clean water. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just foreign corporations, will matter when the government makes its decisions. Sincerely yours, Maureen Jensen 1120 Schooner Way Woodbury, MN 55125 Maureen Jensen 1120 Schooner Way Woodbury, MN 55125 651-261-9007

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. As you are no doubt aware, there has been much media coverage lately regarding polluted ground water in North Dakota as well as in other states and how it is affecting the human population which is fearful to use its tap water. It would be a shame to add Minnesota to the list of states that is unable to provide potable tap water to its residents due to a decision to allow a private mining company to mine federal lands. It gives the impression that the government cares more about profit rather than its residents and future generations. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. As a resident of Florida, I know of the dangers of man interfering with the environment. Thanks to Big Sugar and other commercial enterprises, the Florida Everglades which is a huge wetland is a fraction of its original size and much of it is polluted due to the run off from agriculture concerns. The Florida legislature now realizes that something has to be done to restore the Everglades and is trying to buy back land, but it is an extremely expensive and time consuming process and there are doubts whether this course of action will even be successful because of the extent of the damage. I sincerely hope that Minnesota learns from Florida's mistake and decides against allowing federal lands to be mined by PolyMet. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Maureen Keogh 5225 Versailles Ct Cape Coral, FL 33904-5666

Maureen Lahiff 13569

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I used to live in Minnesota and still have strong connections to the people and the land. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Maureen Lahiff 3800 Maybelle Ave Apt 9 Oakland, CA 94619-2152

---Original Message--- From: maureenmccarter@charter-net [mailto:maureenmccarter@charter-net] Sent: Monday, March 10, 2014 7:34 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Maureen McCarter 1931 17th St S Saint Cloud, MN 56301-4949

To Whom it May Concern: I am 65 years old, a resident of Ely, and lived my entire life in that area with the exception of military duty and pursuing an education. I worked for the tourist industry at a canoe trip outfitter while in high school and worked at a couple of mines as a young adult. One mine was a taconite venture and the other was a COPPER/NICKEL exploration mine (AMAX Exploration) at the exact site that Polymet is proposing to mine. Your records will show that we sunk a 1700' shaft and developed approximately a mile network of underground drifts. This was from 1977 to 1981 - 37 years ago. We did encounter, and dealt with, the problems associated with sulphides. Water pumped to the surface had a chemical (Alum) injected to the flow which settled out the sulphur particles in a retaining pond. The extracted ore, that was kept on site, was placed on sand and hypalon fabric to monitor the runoff. This was closely monitored by our environmental group as well as a group of your folks (Bruce Johnson, Steve Lampman, and Ann Wier) that shared office/lab space with AMAX. This was successfully done 40 years ago. Considering the tremendous improvement in technology since then, I am 100% confident that this area can be safely mined with NO ADVERSE AFFECTS to the area that we choose to live in. We are miners, That is how we have chose to EARN our living for generations. That is what we do. The mines provide us with an opportunity to make an acceptable living in a quiet, slower paced part of Minnesota that WE take care of. Thank you for your consideration and your time, Larry Polyner Larry Polyner 1560 North 20th Ave E Ely, MN 55731 218-365-3668

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Maureen Rooney North Branch, Minnesota

Maureen Skelly

18258

My name is Maureen Skelly. I am a native Minnesota. For years I have watched the exodus of half of the cities of Minneapolis and St. Paul go up to the Northwoods on Memorial Day and Labor Day Weekend. I wanted to just suggest that there may be some alternatives to another mine in northern Minnesota. I know that a lot of the small towns are having a hard time. There was a successful granola company in Ely with some creative marketing. So, I wanted to suggest that perhaps we come up with a plan where some of the 350 or 500 people that might apply for the jobs the mine is offering would consider creating some other jobs for themselves connected to the tourism industry; the fishing, the hunting, the canoeing, where people that go up there could commit to supporting them. Someone suggested green bucks that would be used only for hunting, fishing, canoeing. There are so many of us that love and use the north country. I would commit to going up once or twice a year to a specific bed and breakfast, if that would help to create a livable wage for somebody up there in lieu of such a destructive proposal as the mine. So, I just wanted to put forth the idea of the people sticking together, getting creative, using the mine proposal as an excuse to get serious about this, to help support the people in northern Minnesota that need jobs so badly. It would be much more destructive to our economy if the water becomes all polluted and the tourist industry all goes down and all of the other aspects of the tourism industry falls because of everything is polluted. That would be much more of an economic loss than whatever is being offered as a gain economically by this mine. I am a grandmother. I have the brightest grandchildren. I believe that the impact on future generations should be one of the primary concerns in debating whether or not to accept this proposal. I worked a summer at Isle Royale, I-S-L-E R-O-Y-A-L-E, Isle Royale National Park, which is an international biosphere preserve. The Aisle Royale is in Lake Superior, which I believe would receive pollution from the St. Louis River. We in Minnesota have a responsibility to protect the water, the land of 10,000 lakes, the source of the largest river in the North American continent and home to the largest freshwater lake in the world. It is a time period in history where water is becoming more -- fresh water is becoming more and more of an issue. Wars have been fought about it already. We need to protect our fresh water. We can't afford a proposal as dangerous as this, where there is a moratorium on this type of a mine in Wisconsin. And it has not been proven that this mine will be safe or non-destructive to the environment. That's all. I'm longwinded here.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, mauricio carvajal viento norte 4018 santiago, ot 9291583 CL

I would like to hear three conversations that I have not heard discussed much. 1). I would like to hear from those who are against the mine. I would like to hear what arguments they have heard from the pro-mining faction that they consider valid, and how they would address those legitimate points that are being made. 2). I would also like to hear from those who are for the mine. I would like to hear what arguments they have listened to from those who are against this mine that they consider valid, and how they would address these legitimate points. 3). Thirdly, I would like to hear people talk about solutions that take into account the economic need of the people in the region who stand to benefit from the mine while protecting against environmental damage and long term costs that many in the state object to. One idea that I suggest is to examine the viability of opening a precious metal recycling plant that would preserve the environment, provide needed metals, and provide jobs and industry. According to a recent publication by the Smithsonian Institute, there is an estimated 40 million tons of electronic waste generated annually that contain the metals we could use for these purposes. Consider what other solutions we could come up with if we work together instead of becoming polarized. Maury Aaseng Duluth, MN

My name is Maury Aaseng. I am from Duluth. And I guess my concern is that there is a lot of talk about jumping to mining for the metals, which we all use, but I don't hear a lot about using the metals that have already been in existence. All of our electronics already have all these metals in them. And I recently read that 40 million tons of electronic waste is generated annually. And that's just tossed. All of which contain these metals. So before we go to having a problem where we pit jobs versus the environment, I don't know why we aren't opening a recycling plant that takes these millions of tons of precious metals in electronics and using them that way. In the same way we don't cut down a forest every time we want to have paper, we have recycling for paper. And then what we can't make up from the recycling then look into mining for that. But it seems that we're kind of putting the cart before the horse. Anyway that's one big concern I got. I just don't see it being addressed where the recycling plays into all this. It seems we've got twin ports or an international port. And waste is generated worldwide. So we have access to that material. And I have not heard myself about other people doing it. So it's an untapped resource. And unlike a mine, which has a lifespan of 20 years, a recycling plant that continues to generate electronic waste, because cell phones and computers aren't going anywhere, could operate potentially in a much longer term. So I see it as a win for the environment, a win for longer term jobs. And I'm failing to see a down side. But yet I'm failing to hear anybody talk about it. That's I think my comment.

Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. FIVE HUNDRED YEARS recovery. Please, please do not allow this.. It would be fine with me if tthree things happened: (1) new technology that would allow recovery within two years, when any mining stops and (2) DOUBLY sufficient money is deposited in an account controlled by the State of Minnesota DNR (for example) to ENSURE that the technology works and that recovery is essentially complete after two years, whereupon some of the deposit would be returned to the miners; half the original deposit if recovery is ACTUALLY complete, and an appropriate amount kept back temporarily to check the last steps. Otherwise, the whole amount would be used to complete the recovery work. (3) Penalties large enough to make the mining company think their project through for the long term should be agreed to by the company. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Max Jodeit 6025 Medicine Lake Rd Crystal, MN 55422-3329

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. Minnesota's interconnected water table, lakes, rivers, streams and watersheds (including Lake Superior) are too precious to the future of Minnesota to allow feckless exploitation. Sulfide producing mines are better managed in dry regions. Please listen to all the scientists who are alarmed by Polymet's proposal and faulty research. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Sincerely yours, Maxene Linehan Hovland, Cook County, MN Maxene Linehan P.O. Box 278 Hovland, MN 55606

Maxine Hughes

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Maxine Hughes 1950 Selby Ave Saint Paul, MN 55104-5821

Maxwell Helmberger

57259

Polymet's promises are suspect at best. This project threatens to destroy wetlands, pollute our waters, and kill our wild rice stands. The loss of these ecological and cultural resources is not worth the metal from the ground, especially if the pollution remains here in the state long after the last speck of ore is carted away. Maxwell Helmberger 181 Vermilion Hall 1105 Kirby Dr Duluth, MN 55812

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, McKenzie Schultz Minneapolis, Minnesota

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Megan Locklear Minneapolis, Minnesota

Megan McGuire

44862

I have commented once already, but I would like to add more detail to my previous comment. This comment is regarding the lack of risk analysis in the document. While the standard processes may call for detailed risk analysis during a later stage of permitting, that would provide inadequate opportunity for the public to review and comment on the risk analysis. I would implore the agencies to conduct a thorough, detailed, and complete risk analysis to be included in the EIS to allow the public to comment on the analysis. A risk analysis is needed for many areas of the EIS and should be added. Potential impacts to water quality, habitat, and human health are discussed, but there is no risk analysis for these and other subject areas. I suggest that the risk assessment should follow the principles used by the Corps of Engineers for risk analysis. The analysis should include all potential avenues for harm to public health, environmental resources, and workers. These risks should include many forms of risk, such as events (eg extreme storms or mechanical failure), incomplete information (the risk of incorrect analysis), and human behavior (eg human error in operating systems, or the risk of political institutions changing before the contaminated water is mediated). These risks should then be described based on the likelihood of each risk occurring, the consequences, and the response. Event-based risks to be analyzed include, for example: the risk of leaching, the risk of mechanical failure in the system (eg pumps), the risk of a large rain event overtopping the basins, the risk of human error in system operation, etc These risks should then be analyzed with the following: 1) quantify the likelihood of each event happening over the first 50 years, the first 100 years, and the first 500 years, 2) determine the effects of each risk, both quantitatively and qualitatively, and 3) describe how this event would be addressed if it should occur. To summarize, there are many potential effects to human health, the environment, workers, endangered species, recreation, etc These effects should be analyzed with a risk framework that includes the LIKELIHOOD of each risk occurring, the CONSEQUENCES of each risk occurring, and the RESPONSE that would occur to minimize the effects of the event. This analysis is extremely important. While some worst-case-scenario events may be very unlikely, their consequences could be severe. The likelihood must be compared to the consequences. As a member of the public, I cannot have an informed understanding of this project if I don't understand the probability and consequences of various risks. Thank you, Megan McGuire Biologist

Dear Ms. Lisa Fay, EIS Project Manager, From reading about PGE mining I would agree that it is a hard choice to make. If I were you, I would do the project. I would do the project because not only is it going to benefit us it is also going to give us some disadvantages. If we do this project, we will be getting rid of some waste that is found in our earth. I think that the plan that they have right now would work out perfectly fine. I think it will also help Minnesota by, getting rid of our wastes and also earning more money for the copper-sulfate. Some disadvantages are how long this process is going to take, but at least we get something good out of it right? This project probably will not effect me but it will affect others. It will affect others by how close they are doing this project to their home town. It will also affect some others because if they do not agree with the project then they will want to make it difficult for the project to carry on. Afterall, I say get the project going as soon as possible and hope for the best of it. My final opinion is to do the project and make any changes if its needed. I have a feeling that if we do not do the project then we will regret not doing it because it will benefit us in many more was than disadvantage us. I would love to hear what the decision ends up being. Thanks, Meghan Ihfe (8th grade student)

Dear Mr Bruner, I would like to voice a few concerns I have with PolyMets 's Environmental Impact Statement While this is a large document it is still missing a lot of crucial information. Levels of contamination, acidity and corrosion that will result from the waste which would go into the HRF (hydrometallurgical residue facility) are not revealed in this report. We know that the waste will be hazardous though and therefore the site should be regulated as a hazardous waste landfill. Storage and disposal of such waste requires a separate permit in Minnesota. (Minn. Stat. 116-06, subd. 11) Minnesota rules protect water quality and human health by requiring that wastes must be solidified and stabilized after closure so they won't leak but PolyMet is proposing to use various types of liners including Geomembrane (which is known to degrade over time) and leave the waste in a toxic pond. PolyMet must be required to specify all HRF wastes and plan to treat their wastes as hazardous. The EIS states, "adaptive management would be implemented , if necessary, to protect the environment for the long term." What is "adaptive management." What if something happens in 40 years. Or 100 years. It is unlikely PolyMet still be around to practice this adaptive management. Other industries with similar risks, such as offshore drilling and nuclear industries, must include a Safety Emergency Management System (SEMS). PolyMet should also be required to layout safety precautions for possible scenarios instead of just saying we will use "adaptive management" when the time comes. Thank you for your time. Melanie Lahr 420 E. 9th Street Duluth, MN 55805

I am not in support of this mining project. The risk to ruining this precious area and even more precious water out weighs the benefits by far. Water will likely be a very precious resource in the future. Our technology is not yet advanced enough to extract the resources. The mining resources will wait and not disappear. The damage to water my be devastating and last for hundreds of years. Thank you. Melanie Erickson Little falls. Mn. 56345

Hi, I am Melanie Lahr. I am from Duluth. I want to voice concerns I have with the environmental impact statement. It's a very large document. But if you look at some of the criticisms of it that there's holes, that there's discrepancies, you can actually find those in the EIS. Even a layperson can. Levels of contamination, acidity, that will result from the waste which would go into the HRF are not revealed in this report. We know that the waste will be hazardous though; and, therefore, the site should be regulated as a hazardous waste landfill. Storage and disposal of such waste requires a separate permit from Minnesota. Minnesota rules protect water quality and human health by requiring that waste must be solidified and stabilized after closure. So they won't be. But PolyMet is proposing to use various types of liners, including the geomembrane, which is known to degrade over time and leave the waste in a toxic pond. PolyMet must be required to specify all HRF waste and plan to treat their waste as hazardous. The EIS states, "Adaptive management would be implemented if necessary to protect the environment for the long term." What is "adaptive management"? What if something happens in 40 or 100 years? It is unlikely PolyMet will still be around to practice this adaptive management. Other industries with similar -- such as off-shore drilling and nuclear industry must include a safety and emergency management system. PolyMet should also be required to layout safety precautions for possible scenarios instead of just saying, "We will use adaptive management when it happens." Thank you for your time.

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Melanie McPherson 3227 Halifax Ave N Robbinsdale, MN 55422-3102 (612) 245-3590

Melanie Peterson-Nafziger

40559

Dear DNR, EPA, and other associated decision makers, I am contacting you because I am very concerned about the impact of the proposed PolyMet mines in northern Minnesota. In particular, the exchange of protected wilderness lands in tracts 3, 4 and 5 increase the risk of pollution in the Boundary Waters Wilderness Area, the most pristine waters we have in Minnesota. Of course, the proposed PolyMet sites also endanger Lake Superior and the rivers that flow into it in that region of Minnesota. The trade off to create short-term jobs and tax revenue in Minnesota by permanently damaging our land; endangering our most precious wilderness areas; potentially endangering our human health and our resources due to acid mine drainage, sulfates pollution, and mercury and other heavy metals release; and exposing our region to unforeseen but somewhat predictable long-term impacts of the mine is not worth it. I am opposed to the development of the PolyMet mines in northern Minnesota as well as the land exchanges for the NorthMet project. Thanks for gathering and considering my feedback. Warmly, Melanie Peterson-Nafziger 1386 Saint Clair Ave Saint Paul, MN 55105

Melanie Tauring

38752

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Melanie Tauring 3843 Upton Ave N Minneapolis, MN 55412-1810 (612) 670-6751

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Melinda Suelflow

41053

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health and the environment. I work for the Organic Consumers Association and I live in Finland, MN, not too many miles away from the proposed mine site. I also harvest wild rice, it is a staple of my diet. The Organic Consumers Association has over 10,000 supporters in Minnesota who care about access to clean drinking water and safe, healthy and sustainable food. Wild rice and fish are common dietary staples in northern Minnesota. Fractures and Seepage The PolyMet tailings basin is proposed to be unlined, yet the SDEIS doesn't include the possibility that fractures beneath the tailings site would transport pollutants. This is an astonishing omission. Here in Finland we are finding out that pollutants from an old Air Base are being transported through fractures in the bedrock downhill from the Base site and into our community. It is also well known that fractures beneath tailings basins can transport pollutants. For example, in the Chevron MolyCorp Superfund remediation, the EPA concluded, "the pathway for contaminant migration is the leaching of tailings seepage downward from the tailing facility to ground water that migrates through fractures to surface water." It is wrong to assume that the PolyMet tailings site has no potential to transport pollution through fractures. Existing tailings seepage already exceeds groundwater standards. In addition, on the LTV site, adjacent to the tailings, the SDEIS has documented that Area of Concern #8 has a plume of pollution propagating through fractures. (SDEIS, p. 4-12). Another problem is the lack of analysis of tailings seepage to residential wells. The SDEIS reports that there are 27 residential wells downstream of the tailings basin, before the Embarrass River. Some of these drinking water wells already have high levels of toxic metals (SDEIS chapter 4, page 403-411). PolyMet's tailings pile would seep high levels of manganese and lead into groundwater. At its northern edge, lead in PolyMet tailings basin seeps would be more than 5 times as high as existing conditions. Manganese, already far above MN's health risk limit at the LTV tailings basin would increase by 45 percent. This is in the SDEIS at page 169 of Chapter 5- We all know that lead in drinking water causes brain damage. The MN Department of Health set a limit on manganese in drinking water because it causes neurological damage and reduces IQ in children. The SDEIS must anticipate that tailings contaminants will propagate through fractures and clearly disclose the impacts of leaching through fractures on surface and groundwater quality. The SDEIS must also be redone to analyze potential impacts of tailings basin seeps to groundwater on residential wells. Mercury Mercury is a big concern for me. I am also concerned about sulfates being released from the mine site and impacting the already impaired wild rice waters and fish in the St Louis River. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS doesn't include the information it should on how much mercury would be released into surface waters from mine pits, waste rock, draining piles of peat and polluted swamps. See for yourself at pages 5-107, 5-109 and 5-129- Mercury isn't even listed. PolyMet also doesn't tell us how much mercury pollution will be seeping out of the PolyMet tailings into surficial waters flowpaths right next to the huge n

---Original Message--- From: melcathcart@hotmail-com [mailto:melcathcart@hotmail-com] Sent: Monday, March 10, 2014 6:34 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Melissa Cathcart 3018 38 Ave S Minneapolis, MN 55406-2141

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Melissa Cleaver 13115 Walnut Lake Road Houston, TX 77065 US

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Hello, I just realized I missed the end of the comment period. I am a very busy PhD student in Boston who is originally from Northern Minnesota and is returning home to live in Duluth over the summer. I also hope to return permanently once I finish my PhD. My primary concern with the PolyMet sulfide mining is the lack of 100% surety over the longterm environmental and water quality repercussions. What if another historic flood hits the area like what happened to Duluth in 2012- What would happen to water quality then. How do we know what the world will even be like in 100 or 200 years. Sure a few hundred jobs for a few decades would come from this mining, perhaps more if other projects are approved, but the bulk of the money won't go to northern Minnesota. It will go to companies like PolyMet. As far as I can tell, the cost of swapping land with the Superior Natural Forest should take into account the value of the minerals and other resources PolyMet expects to extract. Minnesota truly will be getting the short end of the deal if this project goes through. I am sure my comments will be ignored as I missed the deadline due to my hectic schedule. But if something horrible happens because of sort of mining, the first sulfide mining in Minnesota, and our comments are not considered (including those that made the deadline), I can only imagine the scale of the massive class action lawsuits that could hit not only PolyMet, but the DNR as well. Of course, if that happens it means the worst case scenario and our state's environment will be damaged. Will it be worth it. I don't think so. Find some other way to revive the state's economy. Dump this idea of sulfide mining. Thank you, Melissa Harry, MSW, LCSW Doctoral Student Boston College Graduate School of Social Work 617-393-0229

My name is Kevin Grotheim, and I'm going cede my time to Melissa Hodnik. My name is Melissa Hodnik, H-O-D-N-I-K, and I currently reside in Minneapolis, but I was born and raised in Aurora, one of the greatest towns on the Iron Range. I'm an environmentalist because I care about sustaining natural beauty and resources of the area and believe that mining can co-exist in that world. I also support the PolyMet project. For 18 years, I was able to grow up in a town filled with those who relish the outdoor opportunities that Northern Minnesota has to offer. From the biking trails to the picturesque lakes, the choices were endless. An area full of many different types of resources that we could share with one another. Right alongside those wonders of nature beats the heart of the Iron Range and another human resource, mining. Drive into any one of the small towns that dot the landscape and can see its footprints. From the skyline in Virginia to the railroad tracks running down to Lake Superior, our region is proud to have depended on the resources in the ground to sustain the area. Over time, the landscape has changed. This is because of the progress we've made working together to use the minerals we've been blessed with. But also to give back to an area that has been our way of life for over 100 years. For example, right next to Minntac, a premiere producer of pellets used for steel, are windmills dotting the horizon. It strikes a chord with me that the two can share the same plot of land and serve as just one piece of proof that we are in the business of sustaining, a reminder of our past and the telltale signs of our future. This is just one small example of the high standards the Iron Range sets for itself, not wanting to sacrifice its beauty for industry. A lot has been said about PolyMet over the course of eight years, some good and some bad. But what I feel makes this project different than other mining projects of the past is the disclosure piece. We live in state that requires the in-depth review of environmental impact. While it may be true that our ancestry did not have the technology to fully understand the impact of what they were doing, in contrast, we do. Everything written in the SDEIS statement that we are viewing today is based off of true science and longitudinal studies by respected government regulators, alongside of the PolyMet team. In short, they have collaborated with experts to ensure that every angle is tested and can be bumped up alongside any governmental standard of today. Even better, this is not a new site proposed for use. This will be a recycling of a piece of our past rebuilt to a higher standard. The idea has always been to do the right thing and to bring jobs to an area which desperately needs them. In closing, I want to stress that I am in full support of the PolyMet project. This means jobs for the many communities that are starved for work, done the right way, and an opportunity for the Iron Range to share the legacy that the Twin Cities offers so many of us today. I'm a firm believer that we can balance the good intentions of both sides and make this a reality and do so now. To say that those of us in support of this project do not care about what happens in our backyards is not only false but insulting. I support PolyMet, not an all-or-nothing proposition but the best chance for sustainable future here in Minnesota. Thank you.

Ms Lisa Fay, I am concerned that the DNR role in this process seems to be one of promoting mining, and that promoting environmental protection is secondary. Somehow this seems backwards. At the very least, the DNR (especially the Division of Ecological and Water Resources) should take a neutral stance. Comments by those in charge of the EIS to the effect of 'it is our role to work with PolyMet to help them through the process' leave one with the notion that DNR has already decided that this mining project is a good thing and that it is in the best interest of the state to see that it happens. Whether one is for or against this project, they should question how the DNR has defined its role. I am concerned with the lack of a defined and dedicated funding source (one that is set up by the mining company, and not affected by future financial hardships the company may experience) for the treatment of sulfate- and other pollutant-laden wastewater / runoff from the mining operation. Leaving this major detail for the permitting process seems like a young couple deciding to have children but waiting until a few months after their child is born to figure out how/if they can financially afford to raise a family. The welfare analogy comes to mind here- will the public be left to pick up the tab for a decision made without proper planning and financial preparation. I am also concerned about wetland loss and other destruction of natural habitat. These seem to be viewed as expendable when it comes to mining. The natural forests and wetlands that will be destroyed are not replaceable. We can try to plant something that looks like what we destroyed, but it is always a poor substitute at best, at worst a sterile biological desert or weed-infested barrens. (Nonnative and potentially invasive plants are already turning up at many of the drill core test sites that are increasingly scattered through the forests of this part of the state.) I understand that if the decision is made to go forward with this mining project that natural habitats will have to be destroyed. I could better accept this fact if their true value was represented in the cost side of the mining equation. Finally, I am concerned that we too easily buy into assurances from the mining industry that things like this can be done in an environmentally friendly manner. There has never been a mine that has not polluted, nor a oil field that has not polluted despite the same sort of environmental assurances. If we weigh all the options and still decide to move ahead with this project, we owe it to our children to put the proper safeguards in place so that environmental accidents do not happen, or more likely, can be quickly and safely dealt with when they inevitably do occur. Regulation and oversight will be key here, and again not something that should be left to the permitting process. I think we need to step back and ask ourselves- is this really the right project at the right time. Is this as good a proposal as the people of Minnesota can expect, or more aptly- as we deserve. Is leaving the minerals in the ground at this time a better option, one that assures a better environmental outcome. Leaving the minerals in the ground now is not a defacto moratorium on this type of mining; it may actually be the best way to keep our future options open, both environmentally, and economically. Thank you for your consideration. M. D. Jansen-Lee 1026 Sunset Ridge Rd St Cloud, MN 56303

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Melissa Orr Minneapolis, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. . Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. Sincerely yours, Melissa Roach 1544 hwy 5 Cook, MN 55723

Lisa, We are the property owners just south of the current mine sit off of 117- We were not notified so we didn't get to attend any of the meetings. We bought this property about a year ago Corey a Exsted and Melody j Exsted. We have many concerns, we bought 165 acres for hunting, fishing, recreational use and our retirement. From what we can tell our land is in or very close to the new mine site. Our one whole side runs along the partridge river. We don't know what we need to do. Our concerns are about the wild life and water quality of the river and ground water if and when something goes wrong our land will be useless and not worth anything. We are one of the first properties down river if something goes wrong. When this mine starts up, their will be no one who will want to buy this land, no one will want to take the risk. I bought this land because I have seen moose, wolves, deer, grouse, bobcats and lots of other animals that cant be fixed if some of the toxins get out. They are just dead. Not to many of us would take the chance and drink the water that is coming off the mine site, but these animals will be forced to. I realize this would be great for the community and the state, but with all the protection around the nuclear plants their are still accidents. I don't think its worth the potential cost for just 20 years of gain. What happens when oops we were wrong and the toxins do leach out of these tailings even under water it just takes 50 or 100 years. If this mine starts I will be forced to move because i can't take that risk. It also will be very hard to get fair price for land. Please let us know what we can do, if anything. Thank you Corey and Melody Exsted

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Melody Tilton 7916 64th Ave N Brooklyn Park, MN 55428

No mines - I prefer the clean BWCA and rivers! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Melvin Giles 42021

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms mercy myers 1880 grand ave 206 206 St paul, MN 55105 (612) 363-5346

42434

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, WE DON'T NEED PROFITS FROM POLLUTERS LIKE YOU SLIME OFF I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms mercy myers 1880 grand ave 206 206 St paul, MN 55105 (612) 363-5346

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have spent time studying the wildlife and habitats of the Boundary Waters Canoe Area Wilderness, and it is one of the few true wilderness areas of its type left. Its natural resources are crucial to the balance of the entire region, a natural balance which affects us humans, too. This precious wilderness area especially means so much to those of us who have spent time in it and observed its natural riches. I would be devastated to see any of this area be poisoned and destroyed by corporate interests. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Meredith Kolar 20450 Crooked Rd Butler, OH 44822-9488

Meredith Lorig

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It is putting many Minnesotans at risk for years to come. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. As a fisher who frequently catches and eats walleye the PolyMet sulfide mine plan is of concern. The proposed waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. All of these are a concern especially the toxic metals and the effect bioaccumulation could have in people. One of my concerns is that the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." I don't know how it would be feasible to keep water clean from seeping for that long. I ask that you investigate further the PolyMet SDEIS and look closely at permits for the waste water discharge. I ask that written into the permit is that water quality is held to Minnesota standards. That if the water quality does not meet standards that the mining has to stop until the water quality meets state standards. I ask that penalties for permit violations are not just financial but are mandated to be fixed. I am proud to come from the land of 10,000 lakes and hope the lakes can be used for centuries for fishing walleye. Thank you for listening, Meredith Lorig 5613 Interlachen circle Edina, MN 55436

Meredith Sommers

February 19, 2014 In the 1960s, I was involved in a study of Taconite mining in the Arrowhead region of Minnesota. The resulting report believed that this mining could be done without extensive harm to the land and water. We believed that the company, Minntac, and the DNR would oversee water quality standards. We believed that hundreds of people would be employed for decades and their quality of life would improve. We were wrong. Open pits remain; tailings have leached toxic heavy metals and sulfuric acid that eventually have reached Lake Superior; drinking water in the area is unsafe; unemployment in the area is still high. Why should we believe that the proposal presented by PolyMet Mining and its financier, Glencore, will be different. Glencore has a record of environmental disasters, plus irresponsible safety standards. PolyMet has no track record of operating mines like the ones proposed in Minnesota. I strongly oppose the proposal for these, and many other reasons. And I have a suggestion to address the need for employment in the Arrowhead region. Instead of mining for copper, nickel and other metals, the state of Minnesota could jump-start a facility for reclaiming and recycling metals from existing electronic devices, rather than sending them to China and Winnipeg. The Arrowhead is a treasure for millions of folks who live and travel there. The pristine nature would be destroyed by the noise, the truck traffic, the dynamite, polluted waters and disrupted land. Tourism, which is a sustainable industry, would be drastically impacted. Please make your decision based upon what is best for all of Minnesota in decades to come. Meredith Sommers 921 Bayless Ave C St Paul, MN 55114

Merv & Suzanne- Joy Curran 39298

Lisa Fay, EIS Project Manager: After listening to debate on this issue on TPT, reading and discussing this in our faith-based community, and listening to many of those who live in that area of the state, we wish to send a comment which we hope will be seriously considered. Northern Minnesota is the site of 3 major watersheds. We and many states below us need fresh clean water. Northern Minnesota is NOT the area in which to provide mining rights to an outside corporation that cannot possibly provide adequate stewardship for the water and environment in this area. We do think jobs are important and we will support jobs in Northern Minnesota that are sustainable to all life in that area. We urge Minnesota to take leadership in promoting sustainable industry. This should not include copper-nickel mining in Northern Minnesota. Thank you for taking comments. Mervyn and Joy Curran 5146 Lonsdale Blvd. Webster, MN 55088

Mettameyer 44533

I am opposed to Polymet's plan for pollution management. The very idea that they can be responsible and held accountable for centuries into the future is crazy. Minnesotans will bear the practical and ongoing financial costs of this venture, and it's a bad deal for the environment and the taxpayers. Sincerely, Margaret Etta Meyer 225 E 9th St Unit 106 St Paul, MN. 55101 651-222-7859

MGK612 . 41647

To whoever is destroying Minnesota's future, Do not, DO NOT, allow PolyMet to mine. You KNOW it will destroy the environment for many, MANY years to come. I am completely against it. Archibald Kelley Benham IV Minneapolis, MN Full of disgust, Archie

To whom it may concern, which in my opinion is the entire state of Minnesota and its future citizens. I have carefully examined the available evidence both for and against the Polymet proposal for a copper sulfide mine in Northeastern Minnesota. It is my opinion that at this time this project should absolutely not go forward. We as a state are not in a good position to trust that Polymet and its associates will be able to provide us with the environmental and financial assurances that we absolutely need to have before a permit to Mine is granted. One question that has been asked over and over and has gone unanswered is "Please give us an example of this type of mining that has not contaminated the watershed." No one has been able to show an example. Saying that this will be the first copper sulfide mine that won't contaminate the watershed and pollute the air is unacceptable. We have never mined copper in Minnesota and based on the fact that there is currently a global surplus of copper and nickel right now tells me that the risk isn't worth the reward. Particularly when it comes to who will actually capitalize the most on this project if it were to go forward. There is little in this for the state of Minnesota or its workforce. I know people on the range need jobs but this will not change the economy on the range based on the number of jobs it would create. This is also not a typical range project so it is very likely that many of the jobs created wouldn't be filled by locals. It is well known that Polymet has never operated a mine before but their largest shareholder Glencore has with a very bad history of contaminating the communities that it has mined. I think that they will not be able to guarantee 200-500 years of financing for monitoring and treating the water at both the plant and mine sites. The only thing I would consider guaranteed by them is that they will maximize profits for their shareholders, which is the primary mission of any for profit corporation. Jobs will be kept at an absolute minimum. I have yet to see an economic impact statement that wasn't created by the company itself in a best case scenario sensibility. There seem to be a great number of questions that have to be answered before a permit to mine is granted. These questions remain unanswered up to this point and therefore a permit should not be issued. If you can expect technology to change significantly in the years to come than let's wait until technology is advanced enough to do this safely. Copper will undoubtedly be worth more in the future and perhaps we can get a US company to do this so it's better for all of us in terms of economics as well as environmental and public health. These are the most obvious problems within the current SDEIS. "The PolyMet mine plan is riddled with problems that must be fixed: PolyMet would require hundreds of years of expensive treatment of polluted water. PolyMet would destroy thousands of acres of habitat used by threatened moose and lynx. PolyMet's mine plan lacks analysis of human health impacts from mercury and asbestos-like fibers. PolyMet's studies contain inaccurate water data that need to be corrected. There are many more problems with PolyMet's mine plan. All we want is to make sure that any sulfide mines opened in Northern Minnesota are safe, clean, and don't leave taxpayers with a bill. If we don't get this right the first time, the next 17 generations of Minnesotans will have to live with the consequences." The world keeps getting smaller and I think most of us Minnesotans feel that this is in our backyard. I'll ask again to find an example of this type of mining that hasn't contaminated the watershed. It's a simple question that no one has been able to provide an answer to. The risk must not outweigh the reward. Right now it's not worth it. We need absolute guarantees that they will finance and clean up the mess that this WILL create. In the not too distant future good, clean water will

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. At some point, we as a people (Americans) have to stop thinking about the short term and start thinking long term, ie, what type of future environment are we leaving for our children and their children. Profit has got to take a back seat some time, and those who argue only for profit are (of course) arguing for their own profit and no one else's. Therefore, we should be suspicious of their statements. As such, I urge you to protect the environment. I have spent some time in Lake Superior and I have always wanted to go to the Boundary Waters. But not if the water is poisoned. Micah Sincerely, Micah Elder 3716 Latimore Rd Shaker Heights, OH 44122-5025 (216) 371-3846

Michael

46936

I am for this project. The state has mined extensively in this area for a hundred years. We have learned lots about mitigation and it seems, in this case there is a good plan for control of pollution. The country needs these metals. A woman compared this to dumping tailings in lake superior. That is absurd. I live in Grand Rapids and have hunting land north of Orr. If I thought this project would ruin the area I'd be against it. Michael N. Felix 38664 Co Rd 19, PO 642 Grand Rapids MN 55744

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Working as an environmental scientist for over 40 years, I have first-hand experience on the creation and effects of acid mine drainage. Therefore, I anticipate the environmental impacts created by the proposed PolyMet Mining project will be similar and, therefore, unacceptable. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. The hydrology of this region is a complex and interconnected system of surface and groundwater that cannot help but be impacted by the proposed mine. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sincerely, Michael Ander 218 Sharon Dr Sleepy Hollow, IL 60118-1719 (847) 428-1647

Michael Anderson

Dear Ms Fay, I came here from Alaska in 1975- Recently, the Environmental Protection Agency release a very critical assessment of the proposed Pebble mine, a copper sulphide mine, in the pristine Bristol Bay watershed area. It found that such mining was incompatible with the watershed and posed unacceptable risks for contamination of water and destruction of watershed habitat for fish, especially salmon. I am very familiar with Bristol Bay and it's lands and, other than the salmon, I see little difference between the pristine beauty of the area and the Minnesota BWCA and the Canadian Quetico. In addition, the hydrology of the watershed in the Minnesota Iron Range is remarkably vulnerable to the same kind of perpetual pollution described in the Pebble Mine EPA report. Please review the Pebble Mine study and consider it and it's findings as you look at sulphide mining in Minnesota. Michael Anderson 2554 Deer Path Red Wing, MN 55066

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change.org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Michael Anderson Shoreview, Minnesota

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. My entire life I've enjoyed the pristine wilderness of the BWCA. Please do not allow the PolyMet mine to proceed. It is not worth the risk. Sincerely, Mr Michael Berglund 18410 Kirk Ave N Marine ON Saint Croix, MN 55047-9618 (651) 295-4607

Michael Booth 38754

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Michael Booth 4413 Nokomis Ave Minneapolis, MN 55406-3719 (612) 483-9669

I have reviewed and entirely agree with the concerns and sentiments of the letter from Dr Youmans. I would reiterate the point that consumption of fish is already to be limited, especially to pregnant women and children. For many people in the state including our most low income populations, this can be a healthy supplement to the diet. Vascular diseases are still the number one preventable cause of chronic disease and death in the state and fish are our native low saturated fat nutrient source of meat. Thank you for your work on the matter. Sincerely, Michael Broton, MD, Caq Sports Medicine 569 36 1/2 ave Minneapolis, MN 55418

Begin forwarded message: From: william youmans <[HYPERLINK "mailto:youma001@umn.edu"youma001@umn.edu](mailto:youma001@umn.edu)> Subject: Concerns about the PolyMet NorthMet Statement Date: March 12, 2014 at 3:30:13 PM CDT To: [HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us](mailto:NorthMetSDEIS.dnr@state.mn.us) Dear Ms Fay and Mr Westlake: MDNR Division of Ecological and Water Resources Kenneth Westlake US Environmental Protection Agency RE: PolyMet NorthMet Sulfide Mining SDEIS Dear Ms Fay, Mr Westlake: This comment letter is submitted on behalf of the undersigned doctors, nurses and other health professionals. We are concerned that the proposed PolyMet NorthMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We also believe that the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (“PolyMet SDEIS”) fails to adequately assess important risks to human health from the pollutants that would be released from this project. The absence of any professionals from the Minnesota Department of Health from the List of Preparers of the PolyMet SDEIS is particularly troubling. We would respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Impact Assessment (HIA) be prepared under the guidance of the Minnesota Department of Health. In this letter, we summarize some issues and concerns leading to these requests. Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. The Minnesota Health Department found 1 out of 10 infants in Minnesota’s Lake Superior Region are born with unsafe levels of mercury in their blood. The percentage of infants thus at risk for neurologic impairment was higher than in the Lake Superior Region of Wisconsin or Michigan. We are aware that many of the bodies of water downstream of the proposed PolyMet mine and plant are legally impaired due to mercury in fish tissue. The lower reaches of the St Louis River, where the estuary for Lake Superior fish is located, contains a particularly high level of mercury. We also know that other mine facilities release both mercury and the sulfates that increase bioaccumulation of methylmercury. Reviewing the PolyMet SDEIS, we believe that the information on mercury releases and the potential for mercury bioaccumulation is insufficient. The SDEIS does not disclose releases of mercury from seepage and does not analyze the effects of local deposition of pollutants or of hydrologic changes on mercury bioaccumulation. The SDEIS does not provi

39962

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. Please forward his to the Commissioner and anyone working on the issue at DNR. Thank you. Sent from my iPad Begin forwarded message: From: "Michael D. Anderson" Date: March 1, 2014 at 8:28:57 AM CST To: "HYPERLINK "mailto:dnr.updates@updates.mndnr.gov"dnr.updates@updates.mndnr.gov" Subject: Re: PolyMet Supplemental Draft EIS comment period deadline To be very candid, this neither surprises me nor does it show respect for the citizens of Minnesota. The issue was never about the need for the DNR to meet it's prescribed timeline. It was always about citizens, citizens who want to provide more information and even if the information appears to to be what you have heard before, you would have heard more citizens views. Would 60 more days have disrupted your timeline. No. Your unresponsiveness is poor environmental science and even worse government. But it doesn't really matter. Truly. And do you know why. Because most of us opposed to sulfide mining believe that the DNR Commissioner operates on the basis of serving constituencies and the constituency he wants to serve in this case is mining interests. Period. We've never had much faith in our own DNR on this matter and have always assumed the decision to allow mining had already been made. We all just going through the motions. The recourse for those who oppose this disastrous form of mining in our northern watershed is the EPA and the Federal Courts. What a disgrace for the State of Minnesota. What a disgrace for the DNR. Please forward this to the Commissioner. Thank you. Sent from my iPad On Feb 27, 2014, at 2:41 PM, "MN Department of Natural Resources" wrote: HYPERLINK "http://links-govdelivery-com:80/track.type=clickandenid=ZWFzPTEmbWFpbGluZ2lkPTIwMTQwMjI3LjI5NDUwMDAxJm1lc3NhZ2VpZD1NREItUFJELUJVTTC0yMDE0MDIyNy4yOTQ1MDAwMSZkYXRhYmFzZWlkPTEwMDEmc2VyaWFsPTE2OTA2NjQ5JmVtYWlsaWQ9bWRhcmFuZ2VyOEBnbWFpbC5jb20mdXNlcmkPW1kYXJhbmdlcljhaZ21haWwuY29tJmZsPSZleHRyYT1NdWx0aXZhcmlhdGVJZD0mJiY=andandand100andandandhttp://www.mndnr.gov"Minnesota Department of Natural Resources header DNR NEWS – FOR IMMEDIATE RELEASE Feb. 27, 2014 Comment period for copper-nickel mine Supplemental Draft EIS closes March 13 The 90-day public comment period for the NorthMet Mining Project and Land Exchange Supplemental Draft Environmental Impact Statement (SDEIS) will end March 13, according to the Minnesota Department of Natural Resources. So far, the agency has received more than 19,000 comments. While the co-lead agencies – the DNR, the US Army Corps of Engineers and the US Forest Service – received and carefully considered requests to extend the comment period, the deadline will not be extended. The requests received did not include any substantive arguments or rationales that were not already fully considered in the design of the original public comment period. The co-lead agencies appreciate the high level of public interest in the SDEIS and have made efforts to ensure the public has had ample opportunity to review and comment on the document. Those measures include a comment period that is twice as long as required, three public meetings and supplemental materials such as videos and fact sheets. The SDEIS provides an analysis of the environmental effects of PolyMet Mining Inc.'s proposed NorthMet project. The copper-nickel mine would be located in northeastern Minnesota, near Hoyt Lakes and Babbitt. Public input on the SDEIS is a critical component to informing governmental decision makers about potential environmental consequences of the proposed mining project and associated land exchange. The co-lead agencies encourage the public to continue to provide comments until the deadline on March 13- Email comments can be submitted to HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us. Email submissions should include a full name and legal mailing address. Written comments may also be submitted to: Lisa Fay, EIS project manager, DNR Ecological and Water Resources Division, Environment

(Spoke foreign language.) I will speak English. My name is Michael Dahl, spelled D-A-H-L. I come from (inaudible). I am not Slovenian. My relatives have been here by far longer than anybody in this room. I'm standing up here on behalf of my people as a whole because of a number of things. Okay. Our family and our people have rights to these lands for thousands of years, not for generations. Thousands. These same lakes, these same rivers, these same streams, the same strains of rice we have raised here. My brother and I rice this area. As a people on average our families will finish upwards of 300 pounds of finished rice a year with an annual income to each household of upwards of anywhere to 2 to \$10,000. There are still people that make a living off of wild rice. As a people we came to this area and have been here for thousands of years. The same rice. The Sturgeon have already left this area once due to contamination and over fishing by non-native people. The moose are also becoming more and more rare. We do not want to see history repeat itself. The risk is unmeasurable. Science cannot prove the risk. Science does not know what we know. Our teachings and our legends told us for thousands of years any time we eat fish to eat it with a serving of wild rice and/or a serving of berries. Science comes along and proves the nutritional factors of rice and berries cancels the mercury in fish. Thus science has caught up to us and proven us right. We do not want to see that happen again. I have to refer to my notes. This is good. We are asking science not to wait to catch up to us again and prove us right again. For the first time in history pay respect and listen to the knowledge of this land and its qualities by its original indigenous inhabitants. This is ours. We managed it for thousands of years. The potential profits of mining to be made by few and enjoyed by few will never outweigh the proven risks to unmeasurable amounts of people, water, plants, and animals. Thank you.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Michael Doyle Bagley, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Michael Dunn 7330 Butterscotch Rd Eden Prairie, MN 55346

We own property in St Louis County at 8709 S. Strand Lake Road, Cotton, MN. We are completely and utterly opposed to the proposed mining operation. It is too close to the Cloquet valley and huge tracts of wetlands. We think the project would eventually pollute the entire region. Perhaps not in our lifetime but eventually when the tailings containment systems fail and the company responsible is long gone. Mining operations in general never clean up the mess that they leave in their wake. It is not economically feasible to do so. The iron range itself is an unsightly mess and we don't need another environmental catastrophe for hundreds of years in the future for the sake of a few jobs. The BWCA area is a jewel that should be preserved for future generations - not exploited for the gains of a few. We are completely opposed to the project. Sincerely, Michael and Kerrill Kaszynski 13533 6th Street N. West Lakeland Twp, MN, 55082

Feb 15, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS does not account for or even mention Glencore, the largest shareholder in PolyMet. Glencore is a global commodities and mining company, with a long record of environmental pollution and anti-labor practices. The discussion of financial assurance in the SDEIS is inadequate in several ways, but one is the lack of any mention of Glencore - the largest shareholder, largest funder, and owner of the first five years of minerals from the proposed NorthMet mine. Since PolyMet is a junior mining company that has never operated a mine before, and since their assets are limited, the best guarantor of bankruptcy-proof financial assurance is the inclusion of Glencore in any potential liability from pollution at the site. Taxpayers have incurred billion in cleanup costs, at times due to an inability to pursue the parent companies that bankroll junior mining companies. The PolyMet SDEIS should establish that the owner of the mine's proceeds and largest investor is responsible if pollution occurs. Please take the following actions: 1)Require that the PolyMet EIS include mentions of Glencore as the largest shareholder of PolyMet stock, the largest investor in the PolyMet NorthMet project, and as the owner of the first five years of NorthMet's minerals due to an off-take agreement with PolyMet. 2)Include Glencore in the financial assurance section of the document as a potentially responsible party, in case the financial assurance required of PolyMet proves to be inadequate. 3)Require that any permit to mine for PolyMet include Glencore, due to their status as largest investor and owner of the minerals produced by the mine. The revelations about Polymet just keep getting worse. Please do not open up the territory to mining for Polymet or any other company. There is no such thing as technology without accidents. Where there are cars, there are car accidents, where there are planes, there are plane accidents and so on. This is not to say that we should refuse technology. In fact, I've devoted my career to developing sustainable technology. Rather, it is to say that we can't be so naive anymore so as to think that there can be mining without environmental damage. So I ask you, is it worth it. Are a few years of jobs and profits worth hundreds of years of pollution that translates into generations of children who will never know what its like to have a big trout or walleye on their fishing line and who will never know what its like to taste one of those fish or to drink directly from the lakes of the BWCA. Is it worth it. Sincerely Michael Fisch Assistant Professor, Anthropology University of Chicago Haskell M-134 1126 E. 59th St Chicago, Il 60637 Tel: 773 702 2128 mail: mfisch@uchicago-edu Sincerely, Dr Michael Fisch 1126 E 59th St Chicago, IL 60637-1580 (773) 702-2128

I want to voice my opposition to the mine. I think it is a terrible idea. We all can look at what happens to mines eventually, they contaminate the area around it. Our forefathers were smart enough to protect this area from ourselves lets not undo the good they have done for our children's sake. I hope that my great great grand kids can enjoy the same BWCA that I am able to. Do the right thing. Vote this mine down. Thank you

Michael Gallagher

We know you must be receiving thousands of comments on this controversial issue, so we will make this short. It is unbelievable to us that anyone would want to risk our precious north woods, including the BWCA, and the greatest lake in the world, Lake Superior, to the incredible dangers this mining operation would present. A mining operation that would require centuries of water clean up should be enough of a deterrent by itself without even mentioning the open pit mine scar that would be left behind for millennia. This is another Superfund site just waiting to happen. What happens when PolyMet goes bankrupt and leaves behind a unfathomable mess which can NEVER be cleaned-up. How would you go about cleaning Lake Superior, or "fixing" the BWCA. It cannot be done. Ever. Impossible. Conclusion: No Mine. Mike Gallagher Linda Cullen 530 Deer Ridge Lane S, Maplewood MN 55119

No way! 20 years of jobs for 200 years of on-going monitoring and remediation? This is crazy. [Text of original "I support PolyMet Mining" card crossed out, altered, or clearly disagreed with.]

Michael Gorman 29636

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I oppose the PolyMet Mining Corp. NorthMet mining project. This scheme endangers natural resources and public health in northern Minnesota and the Lake Superior region. My homeland. The risks it poses to water quality, habitat, and wildlife (including populations of lynx and Moose as well as spawning grounds for several species of fish) are simply too great. Everywhere sulfide ore mining has taken place has suffered from Acid Mine Drainage and heavy metal contamination. Sulfide mining, therefore, poses a grave threat to Lake Superior and the Boundary Water Canoe Area as well as the wetlands, rivers, lakes and streams surrounding (and feeding into) these natural wonders. The disastrous consequences of open pit sulfide mining outweigh all potential benefits. I vehemently oppose any Federal land exchange of protected Superior National Forest land for this future environmental catastrophe. The health of our citizens, our wildlife, and our water are too precious to jeopardize. Sincerely, Michael Gorman 121 E Bayfield St Washburn, WI 54891-1132

Dear Ms Fay, Dear Federal and State Agency Leaders: Minnesota is a state that prides itself on being healthy and environmentally conscious. We value our outdoor experiences and wish to preserve our excellent environment and water quality for future generations. Mining operations that are so destructive and have negative impacts for hundreds of years have no place here. Severe pollution and groundwater contamination along with environmental destruction should not be allowed to go forwaRd In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Michael Herman 2812 Devon LN NE Rochester, MN 55906

My name is Michael Hostetler. I live at 209 Fairview Avenue South in St Paul, MN 55105- I am a proponent of the mining projects in northern Minnesota. I believe this project will create much needed jobs in the region, provide tax revenues for the state, bring investment dollars into the state, and it will provide opportunities for educated young people to find fulfilling, challenging employment in MN - so they decide to stay and raise their families here rather than move away. This is the single, greatest economic opportunity we will see in our lifetime to help our children prepare for Minnesota's future. I was fortunate enough to benefit from a similar economic situation over the last 20 years working in the medical device industry, which has been a tremendous benefit for the state and its residents. The mining projects will have a similar economic effect for the people of this great state. However, if the investment is not made in the mining projects, many will be forced to leave and find work elsewhere (eg, North Dakota, Texas, Florida), and many more will follow when the state turns to them for new tax revenues. Am I concerned about the environmental impact. Absolutely. My wife, four children, and I spend every summer vacation in northern MN enjoying its beauty. It is where we plan to live when we retire. I also studied at the University of Minnesota's Biological Station while attending college at the "U" and can appreciate the concerns many have with mining. But this is 2014, not 1970- We now have significantly tighter environmental controls. We have government oversight and watchdog groups. We also have an extensive, detailed SDEIS and countless precautions proposed such as employing reverse osmosis technology and advanced emission-control devices on mining equipment. So based on the documentation in the SDEIS and the commitments made by PolyMet, I am confident that impacts to the air, water or land will be minimal, if any, so my family and their families will be able to enjoy Minnesota's beauty well into the future. I am very pleased, as others should be, to see such a competent team leading this project to ensure Minnesota's environmental future. I congratulate and thank all those involved in producing such a thorough and comprehensive report. Respectfully, Michael Hostetler

Michael Hughes

43502

Please do not move forward with the proposed PolyMet mine in northern Minnesota. It is a bad bet to think the state will win in this deal when weighing the short-term revenues against the big and most likely high, long-term costs to the state. The EIR statistical model used to determine its environmental impact admittedly (per its staff drafters) does not take into account the less-frequent but certainly occurring devastating scenarios. It is a sham. All of the draft EIR's models only contemplate the most likely environmental impacts and not the less frequently occurring events (but it should include the more remote events which will occur in the longer time periods during which the project's risks will still be present). I hope we have learned from recent environmental disasters that we need to consider the impact of the worst possible outcomes, such as industry's assurance that "never-in-a-million-years" could there be leaching of pollutants into the groundwater from the Alberta Sands tailings ponds in Canada, and the discharge of toxic chemicals into the River in West Virginia (requiring the National Guard to truck bottled water to residents and restaurants for drinking and bathing). The probable scenarios do not account for less frequent but certainly occurring events, such as Duluth's recent 500-year flood. The holding ponds and mining and mitigation plans in the PolyMet proposal do not adequately protect against the effects of infrequent but certainly occurring events. Please do not trade short-term gains for long-term costs. Do not exchange public land for damaged quality of life of life in the state's future. Thank you. Sincerely, Michael Hughes Burntside Lake and Stillwater, Minnesota resident

Michael J Husnik

3064

Sirs, This is a very important cross road for our economy in Minnesota. I am confident that by going through all of the rigorous testing and analyticals to protect our environment these kinds of new protections for water and air will be more than sufficient to protect the lands under proposed mining companies sites. Let the process proceed to the final stages and now pass the final permits to get the projects going. Michael J Husnik Stacy, Minnesota

DNR Personnel, I am a biologist from the University of California, Davis. My wife and I have lived on Birch Lake, between Ely and Babbitt, for the past 14 years. I am writing to express my concern regarding the PolyMet proposal. After reviewing the history of sulfide mining and the PolyMet proposal specifically, my question is this : can the DNR and the state of Minnesota state unequivocally that our lakes, rivers and wildlife will not be harmed by this short sighted business proposition. The answer is clearly no. Since taconite mining and its tailings involved relatively inert substances, the mining process represented virtually no risk to our environment. By contrast, with sulfide mining the chemical processes are not inert, they are very chemically reactive and very harmful to our watershed. The supporters of the sulfide mines are attempting to equate taconite and sulfide mining as a means of placating and fooling the public. The DNR must use rigorous scientific reviews to analyze this proposal. The DNR must, first and foremost, protect our environment. The benefit to risk ratio of this proposal, minimal jobs and deleterious environmental impact, does not justify approval of this mining process in Minnesota. We have an obligation to protect our lakes and not implement a plan which requires a 500 year clean up due to the polluting hazards involved with the Polymet proposal. Our arrogance in thinking current technology will prevent environmental damage is foolish. We have made that claim, historically, only to realize our inability to prevent certain hazards. We cannot risk our lakes by allowing sulfide mining in Minnesota. Sincerely, Michael Jordan 218-827-8193 "Chance favors the prepared mind" Louis Pasteur

Michael Kahn

Feb 13, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, This mine proposal is a shamefully shortsighted, terrible idea. Protecting our environment, as well as the massive tourism industry that thrives because of the boundary waters shouldn't be jeopardized. As someone who values clean water, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). The SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for-information that is necessary to evaluate the environmental effects of this proposal. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National ForeSt More than 900 acres of wetlands will be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge the US Army Corps of Engineers to deny the Section 404 wetlands permit, and the Minnesota Department of Natural Resources to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Michael Kahn 1747 Columbus Ave Duluth, MN 55803-2517

39015

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

The proposed copper-nickel mining and processing proposals by Polymet (to be followed by others) is a very bad idea and should be rejected completely for the safety of all Minnesota citizens and our descendants. I own a home in Minneapolis, and a cabin in Lutsen. I travel to the north woods with my family many times per year. We love to canoe in the BWCA and surrounding lakes and parks. We hike, fish, ski, and watch nature. I would not feel safe doing this if the Polymet proposal is approved in any form. I would blame the State of Minnesota for allowing such a catastrophe to occur. You might think I am just being overly concerned. I am not, I assure you. In my previous career, I was a construction lawyer for many many years. As part of my work, I represented contractors who performed work on these kinds of mines in Colorado. One such mine was the Climax Molybdenum Mine in Climax Colorado. Your staff should visit this site. I hAve Visit the leach ponds, where cocktails of arsenic, cyanide, acids and other disastrous chemicals still leak into the local watershed. Please do not pretend Polymet, or any of the other businesses that would temporarily benefit from this mine have any ANY intention (or capacity) to responsibly clean up the mess after they have created it. They won't. They probably can't. Our descendants will live for hundreds and yes, even thousands of years with this sickening, festering, leaching, ugly, dangerous mess in our most pristine lands. How many hundreds or thousands of lakes and streams are you willing to destroy in order to create a few hundred jobs for a decade or two. In 50 years, when Polymet and all the others are long gone, either bankrupt, merged, swallowed up, or just mining elsewhere, and we are left with the sinking leaching pools of filthy nasty chemicals, who will remember the small bump in economic activity. No one. They will remember though that you let this happen. They will. This is not New Mexico, Arizona, Nevada. This is northern Minnesota. The environment is far too fragile. Please reject this for all of us, and our children. Thanks, Michael Kinzer 4249 27th Avenue South Minneapolis, MN 55406 and 180 Caribou Trail Lutsen, MN 55612

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, MICHAEL KOHOUT 8205 Able St NE Spring Lake Park, MN 55432-2058

43077

Hello- My name is Michael William Kohout, and I live at 4360 Brookside Court #116 Edina, MN 55436- I'm writing to convince the DNR to deny Polymet's mining permit. Given the extremely long maintenance period to protect the area from runoff, as well as the lack of any positive track record by this company in this type of operation the risk seems to high and the reward of only 300 long-term jobs seems too low this operation should be denied or delayed. Until the long term effects of their techniques and technologies can be determined (hopefully elsewhere), any report that attempts to define it is based only on conjecture and should not be considered sufficient enough to be used as the basis of this activity. thanks, Michael W Kohout 4360 Brookside Court #116 Edina, MN 55436

Michael Koppey

18344

Michael Koppe, K-O-P-P-E-Y. I am here to voice my concern regarding the proposed copper-nickel mine in northern Minnesota. According to the SDEIS, the proposed mine data says it is approximately 700 feet. There has been two studies on the plant sites. There have been no studies on the plant sites' subterranean water migration and whether mining elements and contaminants would be carried through these frackings (phonetic) throughout our fresh water aquifers and our systems. This must be a concern because of the natural falls running through Minnesota. The EIS 36, paragraph two, it states, "Storm water runoff will include lead above the acceptable levels." Also in EIS 36, paragraph five, it states that, "The project will increase the (inaudible) time to the Embarrass River." Finally, the EIS 39, paragraph four, it states, "Species will not be affected by all of this infiltration." It is hard to imagine that adding deadly chemicals, like lead and mercury, into the St. Louis watershed will have no effect on our wildlife and our people. We already have a high level of mercury in the St. Louis River. Should we be adding more contaminants without a proper study? We live in Minnesota, the "Land of 10,000 Lakes," more like 13,000, and next to the freshest water, biggest freshwater lake in the world; Lake Superior. I do not want to risk doing damage to these valuable natural resources. EIS 24, paragraph three, it states that this facility will be capped and double-mined for 500 years for toxicity. This is longer than the State of Minnesota has existed. No known studies have shown that a manmade structure can stand for this duration of time, or especially 500 years, especially when we (inaudible) and biodegrade. EIS 24, paragraph three, also states that, "Adaptive measures will be implemented, if necessary, to protect the environment for the long term." This statement acknowledges that the system may fail as designed and is an uncontrolled experiment. That means that we, the taxpayers, will be responsible for the costs of any failure and that our fresh water and all that depend on it will be threatened. You, the members of the DNR, are charged with protecting the natural resources of Minnesota and the people that live here. This SDEIS by PolyMet is inaccurate, ignores many of the critical questions and fails to protect the public interest. Therefore, I ask that you reject this SDEIS. Thank you.

Based on the extensive documentation as outlined in the SDEIS, I am confident impacts to the air, water or land will be minimal, if any. Environmentalists vote every mining project down regardless. Half the time making baseless comments and publications in the newspapers and various other media without providing any real facts about the process. This project is being set up to do it right. Environmentalists want solar and wind energy and various other energy alternatives but don't take into account where the guts of these products come from or what minerals are used. If you are an environmentalist but you are ok with these minerals coming from China or elsewhere but don't care how they extract it they you are a hypocrite. America wasn't built without taking some risk and our advancement as a society will not come without risk. Let's get this project approved and show we know how to mine in this state in a way that is long term environmentally right. Michael L. Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

15800

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr MICHAEL LANDWEHR 541 4th Ave N Foley, MN 56329-8433 (320) 968-7434

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Our vacations over the last five years have moved from Lake Michigan due to poor water conditions to Lake Superior. Algae of different types, low water levels and Zebra Mussels have harmed Lake Michigan. It was hard giving up Lake Michigan because we have lake front property on Beaver Island. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Please do not harm Lake Superior and all the waters down flow from the lake. Sincerely, Michael Larmee 19670 Donna St Livonia, MI 48152-1504 (248) 477-1440

Michael Latvala

38422

The depth and breadth of study in relation to the NorthMet project has been well conducted and thorough. I believe that the NorthMet project can be permitted in a way that thoroughly addresses potential environmental impacts while putting a vast, untapped natural resource to greatly beneficial use. This project will provide minerals that are unquestionably necessary for the existence of modern humans, and of critical importance for the future of "green" economies. The project will set new benchmarks for safely extracting and processing these minerals, and should become the new benchmark for copper-nickel mining worldwide. Michael Charles Latvala, PE 311 7th St, Two Harbors, MN 55616

The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Michael Leeling 829 Route 113 Souderton, PA 18964 US

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Michael Lieberman 250 Jersey Ave S Golden Valley, MN 55426-1530 (612) 408-9430

Michael Line

Lets get people to work. Its a fact that these metals will be mined someplace in the world if we don't open this mine. It is almost assured that it will be done with less environmental regulation if that happens in another country. So lets have the mine here and benefit from the jobs and the economic impact for our state. The more than a decade review is enough.. Michael Line Barnum, MN 55707 218-389-0169

Dear Minnesota and Federal Agency Leaders: I am writing to express my strongest possible opposition to the proposed PolyMet mining project. Please reject the PolyMet SDEIS as inadequate and the PolyMet project as environmentally harmful. Please deny any permit to mine or a Section 404 wetlands permit. Please reject the proposed exchange of Superior National Forest land. PolyMet would be the wrong mine in the wrong place. The PolyMet mine would destroy thousands of acres of wetlands, create an immense and permanent industrial mining district in Minnesota's uniquely beautiful and most environmentally sensitive areas, and create a burden of environmental damage of mine dumps, pits, tailings ponds and acid runoff that would blight the landscape for generations and generations, and probably forever. I was drawn to move my family to Minnesota, and to raise my children as Minnesotans, by the promise of the unique natural beauty of the North. Since we moved here 25 years ago, several generations of our extended family have moved to Minnesota as well. Our experiences in the natural beauty of northern Minnesota are some of our most cherished experiences of our lives. We bring our friends and family from other parts of the US and the world to experience the unique beauty and solitude of northern Minnesota. We have seen many changes come to northern Minnesota in the last decades and have friends in those communities, and I am shocked by the existential threat posed now by the PolyMet mining proposal. I have read the various EIS documents and attended PolyMet events, including the open house in Hoyt Lakes in May 2013- I have talked with many people in northeastern Minnesota and farther afield about the proposals. I rode the bus to the LTV site with former LTV miners, who asked me if I was also a former miner, and who are now small investors in PolyMet hoping for their investment to bear fruit. I am worried about the economic opportunities for northern Minnesota. But the PolyMet mine is not the right thing to address that. Proponents of hard rock mining in northern Minnesota claim that opposition to mining equates with opposition to jobs for those communities. This is a fundamentally false and manipulative opposition. Local economies built on mining are boom and bust economies. First, the claimed short-term economic benefits of mining are dubious. PolyMet's claims of job creation deserve skepticism, as automation on the mines reduces the number of jobs, produces short-term low skill jobs, or requires workers with special skills from outside Minnesota. Then invariably the bust comes - relative to the lasting burden of damage, that bust comes in the very short term of 5 or 10 or 20 years. And the bust then endures in the form of impaired communities that people do not want to live in. Northern Minnesota is developing - and needs to continue to develop - a diverse and vibrant 21st century economy where tourism, retirees, telecommuters, service providers, artists, creative people, small businesses, and others can thrive in a way that is sustainable, and that is connected to Duluth, the Twin Cities and the wider world. That type of economy needs to be promoted, not an economy that will suffer the devastation of the other mining areas on the Range that are unlikely ever to thrive again. We are the custodians of what is already a damaged environment for our children and our children's children, and we cannot indulge short-term thinking for the dubious benefits of boom and bust industry. The "us versus them" arguments that pose the Range against "612ers" and others from outside northern Minnesota is also a false opposition. Many people on the Range oppose mining, many people actively go back and forth between these areas, the beautiful and important areas of northern Minnesota are the birthright of all Minnesotans and citizens of the world, and you are the guardians of all of those important places. I am alarmed at how PolyMet asks

Dear Ms Fay, Dear Mr Dabney, Mr Bruner and Ms Fay: I'm writing to ask you to reject the PolyMet sulfide mine project and proposed exchange of 6,650 acres of Superior National Forest lands. The PolyMet mine and the exchange of public lands to allow an open-pit sulfide mine and mine wastes on Superior National Forest lands are inconsistent with federal law, public interest and fiduciary responsibilities to tribes. The Land Exchange serves only the private interest of a foreign corporation, not the public interest. The Land Exchange won't unify ownership of federal lands. Nearly all of the lands in the exchange have split mineral rights and no legal barrier to surface mining. The Land Exchange results in an unacceptable net loss of high quality natural resources from federal public lands. This includes a net loss of 6,026 acres of areas with high biodiversity; 2,030 acres of mature forest – replaced by 2,000 acres of immature forest; 1,400 acres of floodplains and losses of 11 endangered or threatened species. The SDEIS does not assess the costs of replacing natural resources values lost when mature forests and pre-settlement wooded wetlands are destroyed. Despite the scandalous history of sweetheart appraisals that favor private interests, taxpayers have seen no appraisal information to show that the PolyMet Land Exchange would meet legal requirements for a fair trade. The PolyMet sulfide mine would reduce lynx habitat by two square miles, kill individual lynx, and impact 2 out of 13 remaining small corridors for wildlife to travel across the Arrowhead region. The PolyMet sulfide mine plan would also destroy 2,775 acres of habitat for moose, a species critical to tribes, the population of which dropped precipitously by 35% from 2012 to 2013- Yet, the SDEIS contains no analysis of impacts on moose from the PolyMet project. The SDEIS' analysis of harm to resources that are important for tribes relies on implausible assumptions. The SDEIS underestimates the hundreds of years of water pollution from the PolyMet sulfide mine and assumes away impacts on the St Louis River and tribal resources. Whether in discussing the PolyMet sulfide mine or the proposed exchange of lands ceded to the federal government by the tribes, the SDEIS disregards the federal government's fiduciary responsibility to protect tribal rights to hunt, fish and gather plants, including wild rice. Please take the following actions to protect clean water, ecological communities, public lands and tribal rights: •Reject PolyMet's proposed Land Exchange and any other land exchange where lands received by the public have split mineral rights and could be destroyed by future mines. •Reject the PolyMet Land Exchange as inconsistent with the requirements of federal laws requiring that exchange of public lands be in the public interest and for fair value. •Reject the PolyMet project and Land Exchange due to the cumulative and significant adverse impact on endangered plant and animal species and species of concern to tribes. •Reject the PolyMet project due to the cumulative and significant adverse impacts on clean water, wild rice, healthy aquatic systems and mercury contamination of fish. •Reject the PolyMet project and Land Exchange as inconsistent with fiduciary obligations owed by the United States government under treaties with Indian tribes. No more studies are needed to know that the PolyMet land exchange and sulfide mine should not be approved. The SDEIS plan is also inadequate and should be rejected: •The SDEIS fails to assess costs of replacing functions lost due to destruction of mature forests, floodplains and high value wetlands. •The SDEIS fails to disclose appraisal information for public comment so citizens can scrutinize whether PolyMet would get a sweetheart deal at taxpayer expense. •The SDEIS fails to analyze alternatives, including underground mining, that could reduce impacts on lynx, moose, and other species that are threatened, endangered or of

My name is Mike Mlinar. I've worked in the mining industry for nearly 40 years. I live in Duluth. I'm representing myself and will offer my personal opinion. Thank you for the opportunity to comment on the SDEIS for the Polymet Project. My comments are primarily targeted towards the language that relates to the modeling of compliance for an extended period after the operations are suspended. To frame my comments let me first state the obvious and undeniable need for a solid mining industry to support our US lifestyle. Everything we rely on every day of our lives has its source in mining, farming, timbering, or fishing. And it's important to recognize that all of these resource-based activities impact our environment. Specific to the Polymet project, valueless rock will be dug from the ground and processed to produce metals that can then be further transformed into products that we use everyday. So the real question to be answered before this project can proceed is "can it be done safely without significant harm to our environment." I believe the project can and will be successful in properly managing the environmental impacts for a couple of reasons. First, the people who make up the senior leadership of Polymet's Northmet project are all dedicated, credible, and proven mining professionals. I have worked directly with several and indirectly with most of the remainder. They are committed to complete this project in a safe manner with minimal impact to the environment. I trust them. However, even with the confidence that I have in the people who make up the Polymet organization, I was still concerned by the comments I heard by several speakers during the Duluth public hearing regarding the need for 100's of years of mechanical treatment of the waste water, post operation. In fact, my concerns led me to further investigate these claims. What I discovered through careful review of the SDEIS and through discussion with Polymet was that the SDEIS submittal included modeling of the all discharge water quality for an extended period beyond closure. And that modeling was done in an extremely conservative fashion including the highest possible predicted discharge concentrations, far in excess of what will reasonably be experienced. And the modeling included mechanical (active) rather than non-mechanical (passive) treatment as a worst-case scenario. And even given these extremely unlikely conditions the modeling did demonstrate compliance to all water quality parameter requirements. Therefore since the work done for the SDEIS demonstrates compliance even in the most extreme prediction of conditions, and that it further includes a commitment for treatment as long as necessary to meet regulatory compliance standards, I believe the project will minimally impact the environment and should proceed. Thank you for the opportunity to voice my opinion of strong support for the agencies' approval of the Polymet project. Mike Mlinar, PE

I am a Minneapolis resident and a regular visitor to NE Minnesota and the BWCAW area. My in-laws live in the Duluth area and my wife grew up in Two Harbors. Why do we have to mine this resource right now. Why don't we wait till they have the technology to leave no clean up. Not leave a mess for my children and the next generation to worry about for the next five hundred years. I think this mine is a bad idea in such a water rich environment. Where contamination could be so easy and potentially disastrous. Thank you for listening.

Michael Noble

16246

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Comments regarding the SDEIS for proposed NorthMet Mining Project from: Paula Okerstrom 2537 34th Ave So. Minneapolis, MN 55406 Hello, I am a resident of Minnesota, homeowner, and landowner in Northern Minnesota near Babbitt, MN. I am concerned about the proposed NorthMet Mining Project in Northern Minnesota. I question and wonder about the accuracy of the information in the SDEIS, and thus, its pollution affect on the land and water in that area. I question the sulfate, metals and mercury discharge containment and possible pollution to the land and waters in that area of our state. I questions the direct and indirect impact that sulfide mining will have on the nearby wetlands, lakes, water table, and ultimately water shed. As a cabin owner, on Birch Lake, near Babbitt, Minnesota, I question the effectiveness of the drainage of mercury into Birch lake, and that effect on the fish and wildlife, from the taconite mining in the past that has not been effectively dealt with over the years. If we are not doing it well, now, how do we trust another complex operation will be correctly watched and dealt with into the future. If copper mining has not ever been done successfully elsewhere without damaging lakes and streams in the past, we must be even more certain of the accuracy in the SDEIS now and it's possible negative affect on our resources. I question the financial commitment of International Corporations assurance to clean up the mess they will make in the future. These companies must be deeply invested to put up assurance monies to clean up the possible pollution on land and water. We must require them to put up greater sums of money to ensure their honesty and truth, so they don't walk away with the profits and leave the tax payers with the clean up. Thank you. Paula Okerstrom 2537 34th Ave So. Mpls., MN 55406 612-724-2729

46350

My name is Michael Okerstrom. I am a lifelong resident of Minnesota. I own land near Birch lake outside of Babbitt. Heavy Metal rock piles, rained on, make pollution. Heavy metal rock piles rained on create water pollution for many years. The Minnesota DNR has trouble getting the Bobs Bay problem on Birch lake taken care of. The mining company's leave with the profits but leave the pollution problem behind. They seem to become bankrupt or somehow untouchable and refuse responsibility. The Polymet proposal must provide details on financial assurance that the pollution they create they can take care of properly. Sulphide mining will create huge amounts of waste rock. Perhaps we are lucky as Minnesotans to have this valuable mineral deposit, - Perhaps not. As we all know, the track record for sulphide mining polluting surrounding surface waters is a fact that overshadows this whole proposal. This a water rich area of the earth. The border waters, Lake Superior, the many rivers. There is no rush to start such a high risk operation. The rocks have been there a long time. They are not going anywhere. The science and analysis of the Polymet proposal must be done correctly. Because the downside, the risk factor to the water, is too great. The time period of polluting too long. The methods and techniques are not proven. Polymet has never operated a mine before. The lead agencies must require any potential sulfide mining operators to demonstrate a successful sulphide mining facility. Based on the information, and lack of information provided by Polymet I do not believe Polymet can operate its proposed facility without damaging the surrounding water, nor take care of the waste rock and tailings for the hundred some years required. Another point no one is talking about is the amount of coal that will be burned in 20 years of operation. This should be calculated and be a consideration of this proposal. Polymet has little to lose and privatized profits to gain. The State of Minnesota and its water has much to lose. Let the minerals stay in the ground until they can be safely harvested. It appears they will only go up in value. The lead agencies should reject the Polymet project as environmentally harmful. The lead agencies should not allow Polymet a state permit to mine. The lead agencies should not allow any sulphide mining operations until the operator has a proven facility and provides proper financial assurance. Thank you for your valuable work. Michael Okerstrom 2537 34th Ave So. Minneapolis, Minnesota 55406

Dear Ms Fay, Dear Federal and State Agency Leaders: The PolyMet mine offers the lure of construction and jobs for people that are eager for this opportunity. The PolyMet mine also has the potential to create an environmental impact on 3 major watersheds, with no concrete certainty of the nature or degree of this impact. There is the potential benefit of many millions of dollars in construction and payroll over the next 20 years. In contrast, Lake Superior, the single largest body of fresh water on the face of the planet stands at potential risk of becoming adversely affected for generations of future citizens. If this body of water, or its neighboring watersheds, are damaged by this mining operation, the costs to reverse the damage will dwarf the potential economic benefits to the region. These potential environmental costs should be borne by the individuals that seek to profit from the mining. However, the mining industry has a history that does not inspire confidence in carrying out this responsibility. American taxpayers have shouldered the economic burden of dealing with EPA categorized Superfund sites as detailed below from companies that oftentimes denied their responsibility after causing environmental damages on an epic scale. As of November 29, 2010, there were 1280 Superfund sites on the National Priorities List in the United States.[2] Sixty-two additional sites have been proposed for entry on the liSt[2] As of November 29, 2010, 347 sites have been cleaned up and removed from the liSt. Due to the risk for centuries of potential work necessary to address the potential damage, there is no conceivable way that PolyMet can guarantee that they will address any and all damage that results from their mine. As a citizen of the region, my wife, children and I stand opposed to the PolyMet mine plan because of the risk to the priceless, and irreplaceable natural resources that it potentially jeopardizes. Sincerely, Dr Michael Overend 557 Scenic Drive Two Harbors, MN 55616 Michael Overend 557 Scenic Drive Two Harbors Minnesota, MN 55616 (218) 591-2514

Michael P. Carlin 19974

To Whom It May Concern; I am contacting in regards to the proposal of the PolyMet mine in northern Minnesota. I am in opposition of the mine due to copper cobalt mines history of pollution. I also think that past performance is a direct indication of future output. Currently the water monitoring in West Virginia has failed to adequately protect its citizens and with governmental programs starved for cash flow it would be a poor decision to jeopardize the water quality. I do not support the PolyMet mine. I want to thank you for taking my email and as well as my thoughts on this matter. Best regards, Michael Carlin (952) 221 4672

37574

To Whom It May Concern; My full name is Michael P. Carlin. My address is 6901 Hillcrest Lane, Edina, MN 55435- I do not support the copper cobalt mine in Northern Minnesota. Never has there been a copper cobalt mine in the history of our planet that has not polluted. The PolyMet mine proposal will be no different. The idea of testing the water quality for 500 years is quite daunting considering the benefit of jobs in the short-term. Please do not let this mine destroy our biggest asset in North America: fresh water. Currently we are using fresh water at a rate faster than aquifers can replenish, and to threaten the little amount of clean fresh water we have would be detrimental. We would be doing irrevocable damage to our ecosystems, threatening wildlife as well as industry centered around a healthy environment. Minnesota as a northern most state, needs to set a precedent on water and habitat management. Thanks, Michael Carlin (952) 221-4672

Michael P. Savage 18989

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Michael P. Savage P.O. Box 115 1209 Lincoln St Superior, WI 54880 218-391-3070

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Michael Paulson Wadena, Minnesota

michael PRIEST 38898

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to ALLOW the proposed PolyMet mine. The project presents acceptable environmental risks and should be allowed. This sulfide mining operation IS needed for the future of America. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines . For all these reasons, I urge you to accept the PolyMet mine. Sincerely, Mr michael PRIEST 4326 Miller Trunk Rd Eveleth, MN 55734-4044 (218) 744-5637

Michael R Boyd 57235

For the sake of argument, let's say the water can be treated to a standard of 100% clean and safe. Others can argue on that. I am all for mining (and logging) in the US if done correctly and enviro safe. We need mining jobs for at least 2 reasons: 1. Minerals needed for our industry coming from inside the US (national defense) 2. Jobs for Americans. However, how can any corp put aside money to treat water for the next 200-500 years for a mining operation that will last 30-40 years? How do you invest that money over that time period? In 1814 the "high" wage for a laborer was \$1.35/day or about \$450.00/year (Google in report on statistics of Labor – Mass Dept of Labor – 1885 – Labor Movement) They could have put \$45,000 in 1814 to reclaim a pit and water restoration for 200 years – do you think the money would have been invested wisely? In what form? Remember the countless "panics", recessing depression (1929 & 2008) in the last 200 years. What will the inflation rate be over 200 years? The US dollar has lost 95% of its value since 1913 to present! My prediction: PolyMet will mine, put away some money, go bankrupt, money (thru inflation and recession) will be used up 25 years after bankruptcy, all Minnesota residents will pay for the next 125 years, minimum. I say leave it in the ground until a tried and true method is found. It's not going anywhere. Michael R. Boyd 6689 Hwy 21 Embarrass, MN 55732

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Ms Fay: Thank you for the opportunity to comment on the PolyMet project. I find the SDEIS to be quite alarming. Major points of concern harvested from the document revolve around the centuries long period during which remediation will be required as a consequence of planned mining operations, and the speculative nature of the proposed remediation measures. The sustained pollution from proposed operations can, over a five century period, be expected to escape. To pursue such an operation at the headwaters of some of the largest freshwater reserves in North America strikes me as the height of folly. The ultimate costs in human terms alone will far exceed whatever employment/economic benefits might be realized in the next few decades. Add to that the reasonably anticipated damage to the state's natural resources, and you have an almost perfect picture of a losing proposition for the citizens of Minnesota and the Upper MidweSt Please count me as one Minnesota citizen emphatically opposed to having the PolyMet proposal move forwaRd Best regards, Michael R. Huber 3810 Vermilion Court South Eagan, MN 55122-3156

Michael Ramsey

6645

Dear Sirs, I have listened to a presentation by President, CEO and Director of PolyMet, Jon Cherry. Mr Cherry's presentation was well informed, thought provoking and insightful to this type of mining. As a previous supervisor from the paper industry, I can attest to the difficulties of running an operation while meeting the stringent requirements of a manufacturing process. The requirements include meeting air and water constraints while maintaining a safe operational environment for both the workers and the community that borders the plant. Without a doubt, this mining can be done safely and comply with the rulings placed upon it. No company would fail at its environmental stewardship while risking large amounts of capital. As a final testament, Mr Cherry did not push the doubters of the project aside, but answered to their concerns which show us the type of leadership we can expect from PolyMet. Let PolyMet proceed with the project. Thank you, Michael Ramsey Michael Ramsey 221 Bluffs Ridge Court Duluth, Minnesota 55811 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
Ms Fay et al.: I write to express my thoughts on the NorthMet SDEIS. Thank you for providing us this (legally mandated) opportunity. I have some concerns I will outline below
Minnesota Biological Survey: The SDEIS identifies that the mine site includes over 1,000 acres of habitat identified by the MBS as “Sites of High Biodiversity Significance” The SDEIS attempts to rationalize/minimize the acreage by arguing that the affected acres are a small fraction of all land identified as of “High Biodiversity Significance” and small fractions of the habitat types overall in the region. This represents a fundamental misunderstanding of what a site of “High Biodiversity Significance” means. These sites are identified as areas that are among the best examples of the habitat in the state. It is not meaningful to compare these habitats with others in other parts of the state, as they do not perform the same ecological function. Also, as units considered to be of “High Biodiversity Significance” they cannot simply be swapped out with less significant examples of the same habitat that are, by definition, of lesser ecological integrity.
Non-invasive plants: I applaud the stated intention to control erosion and potential invasion through re-vegetation, but have some concerns with the proposed species mix. Several of the proposed re-vegetation species are known to be invasive, and simply co-planting with native species and hoping the natives win out is unacceptable. The referenced mitigation measures to control for potential non-native invasives is vague, referencing a “monitoring and control program” with no details on how this would occur, nor any definitions of what would be considered an unacceptable level of non-native species in the reclamation, and at what date that target would need to be met to trigger the “monitoring and control program.” I would like to see a target date for the assessment of reclamation, and a level of non-native ground cover and species that would trigger control.
Lynx: The analysis of impact on this species does consider possible increased mortality as a result of increased vehicle traffic, a good example of deeper thinking. No mention is made, however, of the impact on this species of increased noise. If the animal is “spooked” by the mining noise, the effectively lost habitat could be greater than that which is simply within the direct footprint of the mine.
Noise: I was pleased to see the effect of noise on wildlife considered. However I would like to see this concern married with the noise level maps from previous sections to determine the total possible habitat loss, or lower use of habitat by mobile species such as the lynx, eagle, and other birds.
Moose: Little mention is made of moose in the wildlife section. What affect would the increased noise have on moose in the surrounding Forest. I have directly observed moose in the Skibo/Seven Beavers area, which could potentially be within the noise footprint. Given the decline in moose in Minnesota, any action which impacts this species needs to be approached with caution. I would like to see some effort made to address noise and vehicle/rail impacts on this animal.
SGCN: The list of possible SGCN does include the heather vole, but does not include 3 other SGCN mammals that may inhabit the region: 1) *Microtus chrotorrhinus*, 2) *Mustela nivalis*, 3) *Sorex fumeus*. The DNR does sample small mammals in the area of the mine (John Erb) and while none of us have captured these species near the mine, an absence of proof is not proof of absence. The last surveys which directly searched for any of these species are many years in the past, including those referenced for the heather vole (Christian 1993; Jannett 1998).
Thank you for your time and consideration. M

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Sirs/Ma'ams, Please accept these comments concerning the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Not just some, but ALL places where sulfide ore mining has occurred. Being that sulfide mining has never been done in Minnesota, based on its history it therefore poses a real and direct threat to wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. If it poses a threat to Lake Superior, would this not pose a threat to the other Great Lakes as well. How many citizens, industries, farms and how much wildlife, water sources and acres of soil would this adversely affect, not just in Minnesota but neighboring states as well. Remember, our fresh water is finite, not infinite. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Please place the health and well-being of citizens over those of corporate profits. Thank you very much. Sincerely, Michael Ripberger 1977 Cerro Crest Ct NW Los Lunas, NM 87031-8318 (505) 565-0379

Feb 11, 2014 Ms Lisa Fay MN Dear Ms Fay, I urge decision-makers to reject the PolyMet proposal to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Let's not sacrifice the long-term well-being of our state for some short-term economic gain, which only benefit a few. Sincerely, Dr Michael Rota 2143 Eleanor Ave Saint Paul, MN 55116-1357

Michael Saima

9663

My name is Mike Saima, I live at 1380 Terrace Dr apt 302 Roseville, MN 55113, and I am e-mailing you because I saw on Channel 4 News the proposal being reviewed to mine in North East Minnesota's Iron Range for copper and nickel. I am strongly against this as well as my family and friends for this proposal. The damage it would do to the environment is not worth this endeavor. Too much has already been done to this planet to extract and ravish the environment for material and monetary gain, it comes across as greedy and inconsiderate. I would never vote for any politician that would support big business over the environment. Can't you people have the foresight to see that preserving the environment is the best for our future generations. Our children and grand children will be judging us on how we treat this planet and in what condition we leave this planet for them. I hope you make the right decision and decide against this project and the potential damage it would do to the water system, that should not be overlooked. There are more people in the state of Minnesota who oppose this measure than support it and their voices should not be disregarded. We'll be monitoring your decision and if you choose wrong the people won't forget and may not forgive. Thank You, Sincerely Mike Saima

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025
Dear Lisa Fay, As a property owner in Lake County, I certainly feel that I have a vested interest in PolyMet's proposed copper-nickel mining operation near Hoyt Lakes, Minnesota. I'm also a private business owner and resident of Hennepin County. I understand Senator David Tomassoni's position that, "New mining opportunities provide critical jobs for Iron Rangers " I will acknowledge there is an ever-increasing demand for metals like copper and the benefits of tax revenues can't be ignored. However, these are hardly justifications to move forward with a plan that says next to nothing about the financial assurance of this proposed mining operation. If the role of the DNR is to protect and manage our natural resources, then why hasn't the DNR requested a more detailed financial assurance analysis. How these amounts were determined for example. In addition to the proposed cost to shut down operations, contain the waste, monitor the water quality and treat the water that becomes polluted, I have concerns about the "reclamation process." If I understand the report correctly, the reclamation process would consist of a need to monitor and treat the water for a minimum of 200 years at the mining site and 500 years at the processing facility. Even if the high-end cost-estimate of \$200 million were adequate to complete the reclamation process, 500 years is unimaginable. It makes absolutely no sense for the state of Minnesota to even consider such a proposal. PolyMet's proposed mine is not Minnesota's typical mine, but a new toxic producing mine. The long term environmental impact for the state of Minnesota could be [HYPERLINK "https://www.google-com/search.client=firefox-aandhs=ddnandrls=org.mozilla:en-US:officialandq=define+catastrophicandsa=Xandei=PXKzUpyAGcqV2QXqkoDoBwandved=0CC0Q_SowAA"](https://www.google-com/search.client=firefox-aandhs=ddnandrls=org.mozilla:en-US:officialandq=define+catastrophicandsa=Xandei=PXKzUpyAGcqV2QXqkoDoBwandved=0CC0Q_SowAA)catastrophic, leading to the impairment of wetlands and aquatic ecosystems, toxic pollution of drinking water, ground and surface water. Mercury contamination of fish and threats to endangered species. I think it's a safe bet that PolyMet's open pit sulfide mine and tailings basin will leave behind a mess, whether the reclamation process is adequately funded or not. As a Minnesota tax payer I don't want to be a part of PolyMet's proposed mining operation and I urge the DNR to act in the best interest of the taxpayers of Minnesota not the PolyMet corporation. Sincerely, Michael Smith 4952 Newton Avenue South Mpls, MN 55419

I am very concerned about any plan that calls for 200 or 500 years of remediation/maintenance by a private or public corporation. This is unprecedented and goes beyond any realistic that any entity could fulfil this type of obligation. In addition, the EIS does not address the plan, or lack thereof, how you plan to secure a 500 year financial commitment that is irrevocable to Polymet.

Michael Vanderford 19802

Feb 28, 2014 Ms Lisa Fay MN Dear Ms Fay, I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. For 20 years PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream literally for hundreds of years. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Michael Willemsen

39061

---Original Message--- From: michael_willemsen@yahoo-com [mailto:michael_willemsen@yahoo-com] Sent: Tuesday, March 11, 2014 10:58 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025. The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies' thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. I hope this information is correct. I haven't read all of it - I just heard some bad things from a really nice guy who came to one of our Sierra Club North Star Chapter meetings a while ago. I have a "No Sulfide Mining" button. I trust his expertise. I hope you're having a good day. Be well. Sincerely, Michael Willemsen 208 9th Ave South Sauk Rapids, MN 56379-1846

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

---Original Message--- From: mbevis@fmr-org [mailto:mbevis@fmr-org] Sent: Wednesday, March 12, 2014 3:59 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: Long after the mining has stopped, PolyMet would pose an ongoing risk to fresh water. The Embarrass, the Partridge, and the St Louis Rivers, as well as Lake Superior, are far too precious to be put at risk for so long by PolyMet in its present form. PolyMet should not be permitted unless, when the proposed mining stops, the groundwater and surface water is left in a clean condition, and surrounding streams, rivers, and Lake Superior are safe from risk of sulfide mine pollution. Work for Minnesota's environmental long term health. Sincerely, Michele Bevis 3442 35th Ave S. Saint Paul, MN 55101

---Original Message--- From: mbevis@fmr-org [mailto:mbevis@fmr-org] Sent: Wednesday, March 12, 2014 9:03 AM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: Dear Decision-makers for the PolyMet Sulfide Mine; In January, 2014, I attended the StPaul hearing for the proposed PolyMet Mine in northern Minnesota. I was struck by the desperation of the citizens that want the mine for the sole purpose of providing themselves and their community with jobs for 20 years. As much as my heart goes out to them, I believe it is short-sighted and unsustainable to want jobs for a mere 20 years, then to have your children and grandchildren, and their children's children, deal with eternal water pollution that will affect them, even harm them, and possibly destroy or at least seriously alter, the environment that they profess to love. Not to mention the rest of the citizens of Minnesota who will be paying the taxes for eternal clean up. I do not believe that one of the purest watersheds IN THE WHOLE WORLD is a good place to take such a RISK.. of contamination. I do not believe that PolyMet will be the first, or one of the first, companies to operate a sulfide mine without creating dangerous pollution. They apparently have a questionable reputation in other parts of the world. What' in it for them to care about our community.. It is notable that within the last few days, a coalition of MN doctors and health care agents have expressed serious concerns about the potential chemical contamination and this health effect on Minnesotans. Please listen to these concerns. Please error on the safe side of this decision. If it's true that we only recycle 25% of available copper, why not create a copper recycling industry in northern Minnesota. Why not focus the best and brightest minds on creating sustainable, essential industries in this region, that will not harm the environment or our people. Thank you for holding public hearings on this serious, serious matter. Thank for all your efforts to listen to all concerns and be fair in your assessments as to what is the right thing to do. PLEASE, PLEASE, PLEASE, do not allow this sulfide mine to happen in northern Minnesota. Not to mention that this would open the door to the other sulfide mines waiting in the wings for this decision. Thank you. Michele Bevis Sincerely, Michele Bevis 3442 35th Ave S. Minneapolis, MN 55406-2741

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Michele Braley 2215 - 27th Avenue S. Minneapolis, MN 55406

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. My family and I have been camping in the BWCA for many years. I hate to think of the waters up there being destroyed and us not being able to enjoy the BWCA anymore. Please reject any possibility of mining in that area to help preserve the wonderful area that it is. Sincerely yours, Michele Gonyea

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, michelle coughlan north mankato, Minnesota

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: I grew up on the Iron Range during the days of orange drinking water, blasts that broke windows and open pit mines that seemed to go on forever. Looking back, the environmental impacts were minimal compared the concerns I have with this operation. I now live in Finland, MN and enjoy clean water, pristine rivers, a crop of wild rice that is safe and air that is sweet to breathe. This operation may compromise the water, as the tailing's basin seeps into the ground water and could go in every direction. We are already home to a Super Fund site because of the previous Federal Air Base that was here for over three decades. People's health has been compromised and many deaths have occurred because of lack of vision and and a blind eye turned to the toxic waste in wells, soil and the ground water. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Michelle Duhant Michelle Duhant P O Box 486 Finland, MN 55603

I now live in Finland, MN and enjoy clean water, pristine rivers, a crop of wild rice that is safe and air that is sweet to breathe. This operation may compromise the water, as the tailing's basin seeps into the ground water and could go in every direction. We are already home to a Super Fund site because of the previous Federal Air Base that was here for over three decades. People's health has been compromised and many deaths have occurred because of lack of vision and and a blind eye turned to the toxic waste in wells, soil and the ground water. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Michelle Duhant Michelle Duhant P O Box 486 Finland, MN 55603

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Michelle Finn 1273 Prospect Place Cincinnati, OH 45231 US

Feb 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, People all over the United States are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Michelle Guyett 4140 N 35th Pl Phoenix, AZ 85018-4708 (602) 522-1680

I want to register my objections to allowing this mine to proceed. From what I've read, the companies and people involved either have dismal records on safety or have no record at all as this is their first foray into this kind of mining. Clean water is more precious than any ore or gas or oil - we won't truly realize this until we lose it, but then it will be too late. Respectfully, Michelle Loseke 2701 E Thomas Circle Sioux Falls, SD 57103

Michelle Raskovich

19526

My name is Michelle, M-I-C-H-E-L-L-E, Raskovich, R-A-S-K-O-V-I-C-H. I live at 1539 North 9th Avenue East, Duluth, Minnesota. I am greatly concerned about the water quality impact and what will happen over the years after PolyMet leaves. I feel that over 20 years of mining and we have to spend over 500 years with contamination that will be leaking continuously into our water. It just doesn't impact a small part of Minnesota. The waters continue to flow and flow for generations, spewing toxic waste. And there is no guarantee of containment, there is no follow-up on how they're going to pay for all of that, and when we're talking about our environment and our children and the generations to come, the 20 years of mining is a small -- small, ridiculous suggestion. That's it.

America was founded on the idea of stealing lands, cheating hard working people, making quick profits, and being corrupt. It is a long standing tradition. Your company follows perfectly with this idea. Keep up the good work. Way to destroy our natural lands in order to make a quick buck. I'm happy for you as a large controlling company. I love swimming in arsenic polluted lakes and destroying the the lively hoods of hard working Americans in the tourism industry. In conclusion your mine will only hurt people, the economy, and most importantly the land and water surrounding our beautiful state. -Mick Lundquist

Miguel Bordayo 54176

The reason why you shouldn't drill for copper and nickel is because all the rocks and dirt has sulfuric acid and you are going to wash that into a river, and all that water will turn yellow and kill so much water life. And the TNT you are going to use, to make a 20 story building and a length of 5 football field you are going to kill everything. We all have been protecting that site for 30+ years and your [ILLEGIBLE] stay there for 20. All that damage is going to hurt the environment. It's never gonna come too life, its gonna stay dead forever.

Miia Suuronen 40357

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Mikayla Rue 54352

Dear Ms. Lisa Fay, I have read your website on the mining project in Northern Minnesota and I agree with this project's idea. I think this would benefit Minnesota in many ways. Some advantages are that it would upgrade utilities, roads, and railroads. It could also benefit the economy! The project could make 18,000 tons of nickel/copper hydroxide, 113,000 tons of copper concentrate, 32,000 tons of ore, and 500 tons of PGE precipitate each year. In some ways this can be bad, but for our growing economy we need to collect this stuff for manufacturing. Now there are some disadvantages with this project. There is land-clearing, which can be hard on the environment. We need to protect the land, it helps us in several ways. If the land is cleared this could allow erosion to happen without the trees there to protect the earth. This project could also affect cultural resources. The land is important to the Indian people for hunting, fishing, and planting. People also, don't like the noise, dust, earth-moving, vibration, visual obstruction, and excavation. The land exchanges would make sense. It would involve the transfer of 6,650.2 acres of federal lands from public to private ownership, and up to 6,722.5 acres of land to private to public ownership. But this would depend upon the results of the environmental analysis and federal real estate appraisals. This project would not affect me much. Mostly because I'm at a young age and I'm not part of the work force yet. I don't see this stuff happening. But I do think this project is a good idea! It will hopefully help our state in many ways. Sincerely, Mikayla Rue

Mike 4268

Public Comment for PolyMet's SDEIS I would like to submit my public comments in support of PolyMet Mining. In order to support my standing on granting a permit to the PolyMet Corporation, a few items are listed below: First and foremost, science is a wonderful profession. My background is medical which I have been practicing since 1989- I see first-hand new technologies that at the start of my career were mind blowing and so "unknown" that people would say that would never happen. Today however, many of those things are now in mainstream practice and we look back thinking WOW . An example of this is genetics and our ability to actually change our chemistry (genetics) to cure a disease. Another is stem cell research where we can take the base cell of human existence and turn it into any organ we want. Another is the invention of 3-D printing where we are actually printing organs and tissue – you can read about the ear transplant that was created by a 3-D printer. In an era of great advances in science and engineering, we should never go in with blinders and say something is a bad thing. As a society, we should be open minded and say "how can we improve the current situation with current and / or experimental technologies and make it a viable operation that could potentially leave the environment in a better place than when we started." PolyMet has done their research. They have systems in place that not only will meet or exceed standards for environmental protection, but they may actually set the bar higher for other mining companies to keep our natural resources intact. Reverse osmosis is clearly a winning technology that will win the hearts of all living creatures in the area, including humans. I have reviewed the SDEIS, visited with company leaders and toured the mine and property, I am confident that PolyMet is a conscientious partner to have in the mining industry. Next of course is the economic impact that this mine will have on the communities involved. It is no secret the mine itself will be great asset to both the local area as well as the state of Minnesota. But the impact this project will have in the country will also be established as we see industries moving back to the United States from overseas. Our energy landscape has dramatically improved in the last couple years and because of that, interest in investing in America is returning. Resources found at the PolyMet site are required for America to rebuild and grow. The local job creation is directly obvious. The indirect job creation this country will see by having the combination of cheaper energy alternatives, as well as the domestic resources mined by PolyMet for building and retooling American companies will be impressive. PolyMet is a key player that holds the resources needed for innovation, rebuilding and science advancement. Having companies like PolyMet in areas like Minnesota are a great benefit for all, especially those of us in this country. Not only will we benefit from the economic boost that this mine will bring, but we will be reassured that quality measures are in place to keep the entire planet cleaner and greener. Having been able to see firsthand, the potential of this mine as well as the safeguards in place to keep Minnesota's natural resources protected, I have given my support by investing in PolyMet by becoming a shareholder. I believe the approval of this mine will be a game changing event in many ways for Locals, Minnesotans as well as Americans as a whole. With the permit approval, we will see; improved job markets and decreased unemployment, increased tax revenues, more conscientious partners in the mining sector, better advances in water purification, and understanding of the mining resource requirements needed in all industries. Respectfully submitted, Mike Tonne 7749 Meadow Lane Minocqua, WI 54548

Mike & Mary Anderson 3854

This is the 21st Century, not 1900- The greatly improved techniques for mining and our concern for the future of this planet go hand in hand. We can enjoy the benefits that our planet provides without destroying it. We just had our 1st great grandchild. We would support nothing in the name of greed that would not assure her of a future of fresh air and fresh drinking water. There is a new term that we have come to use frequently. "CAVE" People "Citizens Against Virtually Everything." We have become a nation of bitches, not doers. Move forward with this project. Create jobs. Create resources for our factories. And protect the Environment. Are we a great nation or does China now rule the world. Mike and Mary Anderson 484 N 600 E Angola, IN 46702 260-665-9376

One part I noticed that was not mentioned often enough, was that when they bury the waste ore, they can add limestone to neutralize the sulfate acid if there is a problem. Maybe this should be standard practice to help insure limiting potential pollution run off. Thank you. Mike Bergh 424 E. 9th Street Duluth, MN 55805

I am sending my comment and recommendation to not allow PolyMet to risk the future by mining copper and nickel. I think the following quote sums up my opinion as well: "Trading 500 years worth of mining pollution for 20 years worth of jobs is irresponsible," argued Hillary Peterson of Sturgeon Lake, during the hearing in Duluth earlier this month. This is a place where I think government plays a very important role to protect the future of this state. Access to clean water is already a world wide problem, so I can't conceive why projects like this PolyMet proposal would gain consideration. Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. DO NOT BUILD. MN DOES NOT WANT POLYMET. Sincerely, Mr Mike Dahlheimer 2760 Lancaster Ln N Minneapolis, MN 55441-3282

Mike Ferguson 42431

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Mike Ferguson 418 W Pleasant St Mankato, MN 56001-2509

Thank you, Mari. She's probably do a better job than I will, but I'm going to try anyway. I'm a lifelong four-generation ranger. I'm now in any 32nd year as the local elected official, the 20th year as the 4th District County Commissioner. I say that because I've represented the people of this area for many years, now. In fact, I can't remember not representing them. First of all, thank you all for putting this on. I mean, one of the things that I -- that I wanted to say is that I also spent 34 years as a United States steel worker. I retired, actually kicked out of the Reserve Mining Company when they closed the -- the doors there and then ultimately retired from a Minorca. I worked for five mining companies. Still kept the same locker as they kept changing names there, but at any rate, I've reviewed the EIS, read most of it, and I've attended most, if not all, of every informational meeting that has been held on the Range, in Duluth, and St. Paul. I have been to nearly every one of them, and as I've been to them, I've certainly become -- I'm not a scientist, so I rely a lot on the scientific knowledge that we get from NRI, from all of those people that have taken -- taken the time out to take and try to find out is this a good project. And among the scientists, and I don't mean among the people that are against this project and do not have the scientific background, maybe there are some that do, but to the scientists that have really looked into it, I think that I've developed a trust that this supplemental EIS and the people that have worked on it, Commissioner, Supervisor Halter and Colonel, we appreciate you being here, but I think that your offices have really worked to try to make this supplemental EIS and, as I read it, it says that this project is ready for permitting. That's what I saw out of it. I hear detractors that tell me about 500 years of monitoring, et cetera, et cetera, and you know, I was offered -- I did want the clean water thing because I believe in clean water, but I was offered the 500-plus years, you know, and the 20-some years that this mine's going to be on and I looked at myself and I thought to myself, you know, we started mining in Ely, Minnesota, over 100 years ago and that mine was going to -- they -- if they had environmentalists back then, I don't know if they did or not, not but it they did, they probably told them at that time that was going to be a five-year plan in Ely. Thank you.

Mike Garramone, G-A-R-R-A-M-O-N-E, 4225 West Fifth Street, Duluth, Minnesota 55807. Phone Number 218-624-1280. My concern over the permit issue is I feel that this reverse osmosis creates a pretty toxic sludge or byproduct from the filtration of the water, and they're going to bury it, and three years later, they're going to rebury it in an on-site double-lined area. My concern is, I think in this permit they should have a shutdown clause, and the reason why I'm saying this is because a lot of these companies, it's easier to pay a fine than it is to fix a problem, so if the permit has a shutdown clause, like three violations and you're done until they fix it, that's what I believe should be instilled here somewhere. And I brought this up when they had an open public forum at the Concordia Lutheran Church in Duluth here, and they addressed my comments, but they didn't give me an answer as to whether or not that could be done. And what this instilled in the permit, it's a no-brainer.

To the residents of the State of Minnesota, In the past 40 years, I have seen the promise of numerous “big” projects come and go with the potential of hundreds or even thousands of jobs come and go right with them. Sometimes it was prospects for new technologies; Endotronics, Excelsior Energy. Other times it’s a new economic development entirely; a new Army National Guard base, NW Airline Maintenance Base in Hibbing, Paulucci projects X, Y and Z. ect ect. Besides the wood products industry, the only reliable economic development in Northern Minnesota was in the mining industry. They would come, plan, study and then build, with hundreds or thousands of jobs that came directly from the project. But today, the boom of the 1960s seems a distant memory supplanted by contraction, closure and crisis. Once thriving communities’ now just sign-posts along a highway, have become small bedroom communities with barely a local convenience store and a post office. Their schools and playgrounds closed, torn down and grown over as residents left to look for work elsewhere. The roads are a patchwork of torn up streets and alleys with asphalt patches and potholes the rule not the exception. The water and sewer systems in many cases are WPA products of 1930’s and 40’s but are now substandard in the best cases and essentially antiquated in the worSt The overflowing schools of the 60’s and 70’s are unrecognizable in name as district after district have consolidated with the loss of enrollment and the funding that comes with it. Lastly the churches of our communities, the pillars of the town, have withered away right with the rest of the town. The Polymet “Northmet” project represents a change in the fortunes of the Iron Range and Northern Minnesota. With the recent release of the SDEIS, the issues once troubling both residents and environmentalist alike have been addressed. The studies and engineering completed by the US Army Corps of Engineers, Minnesota Pollution Control Agency, Minnesota DNR, Barr Engineering, ERM and others have finally addressed the numerous water effluent issues of the active mine site. The studies completed by Polymet Mining with the reverse osmosis systems answers the water quality problems with a system that’s quite simple. The money Polymet will be setting aside address’s the legacy water issues for generations to come. This project and the resulting economic boom that comes with it, represents far more than just a few hundred jobs, it represents vibrant thriving communities with local business districts bustling. It represents modern environmentally friendly sewer systems and potable water treatment systems in our towns on par with the best in the state. It represents residents and travelers driving on clean new intact streets with modern storm sewer systems that direct heavy rains and runoff into proper drainage systems that don’t overflow our sewage plants. It represents school systems with modern amenities’ of fiber optics, high tech computer systems and modern science departments. But most important, our kids have hope. They have hope that remaining in our area will not lead to poverty on their part to remain up north, their home. They have hope that they will be able to raise families on incomes that will afford them a decent standard of living. That having a large family won’t penalize them allowing them to remain around parents and grand parents. That our schools will again become revitalized with children of people who have chose to stay up north for the clean air and water. We, the residents of Northern Minnesota, outdoorsmen, hunters and fishermen love our land, waters and the air we breathe. Nobody wants to see the unchecked environmental devastation of Sudbury Ontario. But this isn’t Sudbury, and Polymet is not INCO/VALE, Xstrada or their predecessors. We have demanded that this not be and Polymet has stepped up and answered our concerns. I and my wife finally believe in Poly

Mike Geisdorf 18093

My name is Mike Geisdorf and I'm from Aurora. I fully support the science behind the SDEIS, and I believe that it does address the environmental concerns of the people. Civilized societies advance because the needs of subsistence living was the mother of invention, the outcome of which are today's modern conveniences. My question to you antis are these: When to mine? Modern medicine -- and we heard the doctor speak -- modern medicine has revolutionized human life allowing us, in just 100 years, to move from subsistence life expectancy of some 40 years to soon approaching a hundred years, having mapped the human genome because someone said when was now, by utilizing our natural resources like copper-nickel, platinum, and palladium. Modern transportation has allowed mankind in that same hundred years to go from horse and carriage to now leave Aurora, Minnesota and be in Beijing, China and put our head down on a pillow that night and go to bed, all because of someone saying when was now by utilizing our natural resources copper-nickel, platinum and palladium. Modern communication, which we all have right here, and I see a lot of you guys out – the antis having this, modern communication has advanced in the last 100 hundred years from hearing news from weeks ago in the newsprint to now receiving instantaneous communications from around the world, in Beijing, China, of unchecked pollution because someone said when was now, utilizing our natural resources like copper-nickel, platinum, and palladium. Modern electrical systems have made, in that same 100 years, the life of the common man equal to the wealthiest man amongst us, giving us all the same modern necessities, due to all of the things I've already mentioned, but also due to central heat, air-conditioning, modern water systems, modern sewer systems, which we need, because someone said when was now, by utilizing our natural resources like copper-nickel, platinum, and palladium. Modern scientific advances of 100 years ago began having discovered began mastering entropy, electromagnetism, X-rays, radioactivity, special relativity, quantum physics, to now, we're actually sending probes out of our solar system, doing scientific experiments on Mars, discovering the Higgs boson and utilizing super conductivity because someone said now was the time by using our natural resources like copper-nickel, platinum, and palladium. We talk about sustainability but forget about responsibility. Let me ask you antis this. Where to mine? You who all utilize the same modern inventions the rest of us do. Which third-world mine and where do you want your copper-nickel coming from? The Norilsk mines in Russia? The South African mines? The Chilean mines? The Chinese mines? There's limited choices. Sustainability comes with responsibility and here in Minnesota, in our time, with the best pollution control agency in the world, we can do this right.

Mike Harrington 38843

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Mike Harrington 1392 Pine Tree Dr Maplewood, MN 55119-7115 (651) 214-5309

My name is Mike Johnson. I'm the current president of the Engineer's Club of Northern Minnesota. The Engineer's Club of Northern Minnesota is in support of the PolyMet Mine. (Inaudible). PolyMet has provided a positive economic impact to the region (inaudible). The engineering club members have been involved in every step of this process and consider the project as described to be economically viable and environmentally sound. The Engineer's Club of Northern Minnesota is in its 100th year of organization. We are dedicated to the advancement (inaudible) economical return, societal growth, and environmental protection. We believe the PolyMet project is respectful in the great tradition of mining in Northern Minnesota while at the same time continuing to improve the various mining processes and results. Minnesota and the United States of America have a process for approving projects such as this. PolyMet has gone to incredible lengths to satisfy the regulations and the law. It is time for the DNR and other agencies to create a positive decision (inaudible) will allow the benefits of the project to be one step closer to reality for the individual businesses and communities for Minnesota and the United States. Thank you.

mike kaufman

40209

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr mike kaufman 1 Winona St W Saint Paul, MN 55107-3354

Mike Klein

39444

Please accept these comments into the public record on the Supplemental Draft Environmental Impact Statement on the NorthMet Mining Project and Land Exchange. Having reviewed the SDEIS, and the significant environmental impacts of the proposed project, I am concerned that the potential environmental risks and economic, environmental, and social costs associated with the project outweigh the potential economic benefit. To encourage careful accounting of costs internal and external, short- and long-term, I propose that a trust fund be established by the mining interest, in an amount determined by a third party assessor, and to be administered by the state, to set aside adequate funds to cover potential environmental impacts over the entire span of project - and subsequent impact - upon the land and waters of the project area. Calculations for the fund are certain to be contentious, but the calculation process would allow all parties to fully assess the predictable environmental impact and unintended consequences of the project, and to internalize those costs that might otherwise be externalized; ie: to other landholders, to water treatment facilities, or to future generations who will not benefit economically, but will be impacted by the long-term timeline established in the SDEIS. Thank you for the opportunity to comment on this significant and long-term project. Sincerely, Dr Mike Klein 1790 Jefferson Avenue Saint Paul, MN 55105

Dear Ms Fay, Dear Ms Fay, My name is Mike Kuitu, I live at 1114 w 6th St in Duluth 55806- I ask that you reject the Polymet SDEIS and deny permits to Polymet to proceed with their Northmet Mine. I have worked all over the State of Minnesota on construction sites, My very first construction job was at The Minntac Mine in 1974, my last was at the Mesaba Nugget mine in 2011, shortly before I retired. Throughout my career, and particularly at the taconite mines, we workers were informed of the environmental hazards at the Jobsite. Mitigation methods for these hazards were presented to us and their use made mandatory and non-compliance often resulted in termination. There is no identification of the specific environmental hazards present to the workers working at the Northmet Minesite, let alone the levels of toxicity. There is no mention of asbestos or asbestos like fibers becoming airborne. If this is present all over the Mesaba Range, one should conclude that, they will exist at the Northmet mine. There is no mention of how Polymet will protect these workers from that plus arsenic, mercury, and sulfuric acid. There is no mention of the cumulative effects of these hazards on workers health. Because of these omissions, one must conclude that Polymet does not respect workers and their health. We must deny any permits to Polymet. Sincerely Mike Kuitu Mike Kuitu 1114 W.6th St Duluth, MN 55806 (218)391-6367

18387

Hello, everybody. It's sure been a long night. My name is Mike Kuitu. I was raised in Cloquet and I live in Duluth right now. I've been -- I'm a retired operating engineer, which is I was a building trades member while I was working. And you all heard the president of the building trades, Craig Olson, talk about the good paying jobs. And honest to God the construction workers that work at PolyMet will have good paying jobs. But that's where it ends. We don't know what PolyMet is going to pay their lowest paid workers. And that's what scares the heck out of me. Right next door to PolyMet is the Mesabi Nugget Mine. It's a taconite mine. It's a direct reduction facility. And at times those workers have been paid only \$11 an hour. And they disguise that by giving them a lot of overtime. And whatever happened to the 40-hour week? So you give people a 60-hour week and so now it seems like they are starting to get a halfway decent job. I really have a problem with that. The SDEIS does not recognize some of these environmental -- these economic environmental hazards that are going to drawdown the rest of The Range and Northeastern Minnesota. Let's consider this: You have the Nugget Mine that's already non-union. There are no agreements for PolyMet to be a union mine. There's no secret agreement with a union where that mine is going to be union right off the bat. And it's not likely that an organizing vote is going to go well there, because the Nugget Mine right next door just turned down an organizing drive two to one. So you got the PolyMet Mine, if that goes non-union -- and I don't know what the plan is at SR or when you get to Twin Metals. I don't know. But if you start getting all these mines together and they're paying \$11 an hour, what kind of impact is that going to be to the union mines, Minntac, and ArcelorMital, and United Taconite, and all those folks that are making \$20 an hour at a minimum. And those \$20-an-hour jobs, those are premium jobs. That's family sustaining. Those miners don't have to go back to moms and dads and say, "Can you buy me a cell phone?" Or "Can you make my car payment this month?" Or something like that. So I would like to see -- I would like to ask this question of PolyMet: What is the lowest wage you're going to pay?

Mike Larson

58120

I am a life long Iron Ranger and have been involved in mining my entire life. I am fully supportive of the Polymet Project. I firmly believe that mining can be undertaken in a fashion that is not harmful to our environment. We need jobs that pay liveable wages.

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

I offer these comments on the NorthMet SDEIS as a degreed professional who has worked in the environmental protection field for 38 years. This experience includes water quality protection work with the US Forest Service, a private company, and two Minnesota counties. Along the way I have worked alongside of staff of all Minnesota environment and natural resources agencies and many private consultants. If I could state that only one lesson I have learned from all this private experience, it would be that things go wrong. Again, despite all the best laid plans, the latest technology, and stringent local, state, and federal permit conditions, things go wrong. And the second lesson would be that when things go wrong, there are not always easy ways to fix the wrongs. I have traveled in western states and seen miles of western state trout streams ruined by mining runoff and not yet "fixed" after more than a century. I have personally seen the Zotrman Mine in Montana and the impacts it's operation, closing, and pollution has had on the local environment and people. I have operated water treatment plants where equipment broke, concrete crumbled, and dikes were breached. I have dealt with major companies who were allowed to continue operating and polluting for years under outdated or expired permits due to lack of political will, lack of enforcement resources, and lack of funds to implement expensive changes that might shut a facility and kill jobs. So I am suspicious of this proposal that allow a mining technique that has a proven track record of failure and pollution to operate in Minnesota, to be operated by a company with no previous experience, and to be operated with no specific backup or contingency plans. Viewing the document presented on the SDEIS has brought little comfort. Even for a seasoned professional such as myself, there is too much to absorb and comment on during a 90 comment period. And at the same time, despite the hefty stack of documentation, there isn't enough data to make a determination even if the time allowed and I were an absolute expert on that particular chapter of the SDEIS. It's a classic case of "show your work". This hasn't been done. Where's the documentation of consideration of worst case scenarios. It can't be found – at least by me. The scale of the treatment technology when considered over 500 years and the sheer size of the project – even without planned expansions – is untested in the world – at least as far as I can determine. The complexity of the work and modeling has added to the confusion surrounding the project. One day we hear that the water quality model used incorrect flow data and needs to be corrected. The next week we hear that the correct data was used, but it was buried so deep in the model that it took the experts a week to find out is was correct. At a minimum, slow the project down - extend the comment period and offer details on financial assurance, even if not legally needed now. Once again, show us that State employees have done their homework on an immense project that has no proven track record other than failure, operated by a foreign company with no operational experience, that will need care and maintenance for 500 years or more. To the hearing officials and state and federal agencies reviewing the PolyMet permits I need to make sure there is no confusion about my position. I oppose the Polymet Mining projects in Minnesota unequivocally. The rationale for these mines has one basic flaw – and that is that they cannot help but harm the only planet I can live on. The location of these proposed mines raises the immediate concern for two of our regions greatest resources – the Boundary Waters Canoe Area – and Lake Superior. In January 2012 the Environmental Protection Agency released its annual survey of pollution discharges in the country. Mining operations similar to what PolyMet and Twin Metals propose were once again identified as the single biggest polluter in the country, responsible for 41 percent of all toxic releases. The EPA report for Mining Operations as Nonpoint Source Pollution in the Mid-Atlantic Region states that in the Eastern United States, “More than 5,150 stream miles have been contaminated, causing the loss of aquatic life and restricting stream use for recreation, public drinking water and industrial water supplies.” This acidification is caused by two sources – again according to the EPA “abandoned mine drainage - which results from water flowing over or through abandoned mines, and by acid air deposition - primarily from the burning of fossil fuel; this produces acid rain.” The source of this information is <http://www.epa.gov/reg3wapd/nps/mining.html>. The impact of the mine will have a positive economic impact for the community in the short run, however, let’s be clear – these are International companies and as we know the laborers do not get the majority of earnings. These companies have no concern, no commitment to our resources – they simply see profit. But profit for the mines actually means loss to the state and nation. Our resources will be diminished and our state and federal taxes will be required for the infinite treatment of their wastes. And I would like to emphasize – INFINITE. There is no expiration date for the wastes, no time when they convert to some innocuous compounds – this is a forever commitment that we should not make and one that we know the corporation cannot make. Should they decide to convert their company and sell off the assets they can declare bankruptcy and we will still have the problem. The fact that we have had Iron Ore mining in this region is not sufficient justification - when rain falls on the waste from iron mining, it makes rust; when rain falls on sulfide ore waste, sulfuric acid is produced. - See more at: <http://www.friends-bwca-org/issues/sulfide-mining/#sthash.U6R6aaYl.dpuf> The real economic engine of this state is the unspoiled landscape and waters of the canoe country and Lake Superior. In a time when we know there is a coming water shortage on this planet we cannot afford to compromise the quality of our water. We cannot afford to see degradation and diminishing fresh water resources. We cannot canoe in bottled water, we cannot sit beside bottled water and enjoy the fresh breezes and breaking waves, nor can we swim and fish in an aquarium. When my wife and I walked around Lake Superior we chose to emphasize the fragility and importance of Fresh Water. We saw how much effort and money is needed to clean up bays if they are polluted, but more than anything we saw that the people really cared about their lake and the same can be said for the Boundary Waters. These are not anonymous places, they are in our heart and they are places the state and nation are obligated to protect. Say NO to the mine. Mike Link 82119 Bennett Road Willow River, MN 55795

40026

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I never feel that my responses are adequate. Everyday we learn new lies. We find more coverups. Just say no to this unethical corporation. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Mike Link 82119 Bennett Rd Willow River, MN 55795-3079 (218) 372-3507

Dear Ms Fay, Mr Bruner and Mr Dabney, We have grave concerns about the SDEIS and the potential mine and wetland destruction permits for the NorthMet mine operation. Protection of the area's wetlands and water should be the number one concern when considering the permits. The US and the state of Minnesota have lost too many important wetlands already. PolyMet proposes to create 913 acres of destroyed wetlands, but manmade wetlands never have nearly the biodiversity of natural ones that have developed over hundreds of years. The bogs and peatlands in the area will be especially difficult to replace. In addition, there is no plan to repair damage from pollution and reduced water flow to several thousand acres of other wetlands. It is our understanding also that most of the mitigation will be outside the Lake Superior basin. Lake Superior is the most vulnerable of the great lake to pollution because of its cold temperature and lessened ability to clean itself. The Lake Superior Basin needs more wetlands, not less. This is an unacceptable environmental degradation and we request that you deny the wetland destruction section 404 permit. Minnesota Rule 6132-3200 states that a mine must be maintenance free when it is shut down. The timeframe for treating the water from the mining site and the tailings site is several centuries. How can this plan comply with state law and how can it be taken seriously. No one today can guarantee that the treatment will be continued that far into the future and that the company can put up enough money to ensure this. How can we know the current amount of money that will be sufficient to monitor and treat these sites for that long. We don't even know all of the details of the current treatment plans or how adequate they will be for keeping pollution out of our surface and ground water. Sulfide mining has never been done before in water abundant areas without causing pollution. What proof is there that the proposed treatments will be effective enough. Will there be backup equipment for immediate use in case of equipment failure. We think there should be stringent and frequent monitoring of the surface and ground water for pollutants and continuous monitoring of all discharges into the local rivers. What plans are in place to repair damage and stop the mining process if excess pollution is found. If the pollution control plans don't work as advertised, will a correction be possible. We don't believe that the cumulative effects analysis area was large enough. Along with the Partridge and Embarrass Rivers, the St Louis River should be studied for the cumulative effects from the proposed NorthMet mine. The city of Duluth has spent millions to clean up the St Louis River for recreation and plans to spend millions more in the future. With all of that effort, it would be a shame for PolyMet mine to add more pollution to the St Louis and Lake Superior. Our country has had a poor history of honoring the treaties with and rights of Native Americans. We are troubled that the local Minnesota Indian tribes disagree with many of the findings in the SDEIS. The rights of Native Americans should not be impeded to live off of their lands without serious concerns about the water quality for drinking, fishing and wild rice harvesting. Wild rice has been declining in the state and a safe sulfite standard has not yet been definitely determined. The state should err on the side of caution. Wild rice is part of our state heritage. PolyMet has never mined before. The major company hiding behind them, Glencor, has a bad track record for pollution, lack of clean up and poor working conditions. There has never been a sulfide mine that has not polluted the near by waters. Wetlands that protect other waters will be eliminated and impaired by the proposed mine. We don't believe that the alternative of an underground mine was fully studied. Native Americans and all area water users are afraid of the consequences of the mine and ta

PolyMet Project Comment In the dialogue about allowing the PolyMet copper mine project in Northern Minnesota, It is important that we turn down the volume of rhetorical extremism from both sides of the spectrum. The policy decision cannot be driven by those who believe that this process should be allowed without question or those who believe that any measure of risk should not be tolerated. To me it comes down to facts and truth. Lay people cannot begin to wrap ourselves around the research and data generated by the 2169 page EIS report required by regulators. I take solace in the fact that Minnesota has some of the most stringent policies in the nation regarding the permitting of mining. I also recognize that with any progress made in life, there is some inherent risk in moving forward. We cannot expect or guarantee absolutes in outcomes. We can, however, with the proper research and monitoring minimize potential negative consequences for the greater good of our society and for the quality of life in this region. We must trust in our process and in our governmental institutions to make wise policy decisions as a necessity to a functional society. From everything I have read and heard, the PolyMet project can and will be managed and scrutinized in a manner that will be of low risk for a high gain to the local and the national economy. Please permit this important project. Mike Lundstrom Executive Director Hermantown Area Chamber 218-729-6843 [HYPERLINK "http://www.hermantownchamber-com/"](http://www.hermantownchamber-com/) www.HermantownChamber-com Description: HERMANTOWN CHAMBER LOGO WITH BLUE BACKGROUND

Mike Maleska 19525

My name is Mike Maleska, M-A-L-E-S-K-A, and I'm from Hibbing. If this type of mining is allowed to proceed, these communities will fill up with families and churches and other industries and groups and interests, and that's an economy. What I want to know is what entity will have the authority, or more specifically, the courage to call a halt to this mine when a disaster occurs? Who will tell the workers in their communities that it's all over? What politician wants that responsibility? Is it going to be the Forest Service? Is it going to be the DNR? Is it going to be the U.S. Army Corps of Engineers? I stand up for whistle-blowers and any other entity that wants to make what is needed to be done on a disaster of any size. What magnitude of disaster will it take to -- to have this mining process stopped and halted and repaired forever? Is a little poison for a little while okay? Is a little poison for a long time okay? Is a lot of poison for a little while okay? And again, what magnitude of disaster does it take to make people realize that this is a permanent change to the ecology and the environment? That's all I have to say.

Mike Malling 52314

I'm concerned about the long term impacts of the project. Noise, water pollution, long term contingency plans if the project fails, the endangered lynx, and the fact that this type of mining has never been done without impacts to water are concerns. I'm a biologist and understand the project. I don't understand why the forest service would consider this project. By the way, your commercials are less than effective and poorly timed. Thank you Sent from my iPhone Mike Malling

Mike Markell 16202

Thank you for the opportunity to comment. I'm 69 years old and have been user of the BWCAW for 50 years. My father was a user and guide before me in the 1930's. Although not opposed to mining in Minnesota, I am opposed to this project. There is no scientific evidence that the waters of the BWCAW will be protected and preserved under this proposal. This is of utmost concern to me. I'm not convinced that the cleanup projected to take maybe 500 years (hard to comprehend) is even viable. Companies come and go and how can we ensure that there are enough funds to first, protect Minnesota's treasured lands and waters and second, if the proposed project is approved that there will be enough dollars to for protection in the short term and clean up longterm. If we need 300 jobs in Northern Minnesota let's have the Legislature approve a CCC type project (with corresponding funding) of good paying jobs rather than use that as an argument to approve this project. Give the IRRRB the funds and have conservation related jobs created. Mike Markell 17809 Covington Road Minnetonka, MN 55345

Mike McGill 39236

Please see the attached letter reflecting our opposition to the proposed PolyMet mining project and the inadequacy of the PolyMet SDEIS. Thank you. Mike McGill

Mike Mcparlan 18170

I'm Ed Borchardt. I and I yield my time Mike McParlan. Like he said, I'm Mike McParlan. That's M-C, capital P-A-R-L-A-N. I would like to start my time by telling you I guess a little bit about myself and what I do. I think it will add context to my remarks. I was born in Duluth, Minnesota. I've lived all my life in Duluth. My wife, Mary, and I have raised five children in Northern Minnesota. Like many of us here in Minnesota I care a lot about the outdoors. It's a major part of my life. We began with our children in Bear Head Lake State Park. And as they got old enough to carry the canoes and paddles and gear, we graduated to the Boundary Waters. And we've raised all of our children enjoying the outdoors of Minnesota. I also work in Northern Minnesota. I work in construction. My job is -- I'm a COO for API Group, which is a parent for numerous construction companies throughout North America and the UK. 15 of those companies are based in Minnesota. Four of them in Northern Minnesota. My whole career has been in construction. And I guess to add context to my remarks, I really feel the need and the benefit for the jobs and the economic and the input that we will get from a project like this. But having grown up in Northern Minnesota, I also highly value the environment and the quality of life that we have. And I wouldn't change that for anything. I wouldn't trade that away for anything. But thankfully in this process I feel that we have an opportunity to repurpose an existing mine site. And I think we have the technology and the capabilities to do this right. I put my faith in the process. And I look at the room here tonight and the push and pull between different points of view. I believe we in Minnesota can assure that this project is delivered safely; and that we have the capabilities to hold ourselves and the company accountable for a safe, long-lasting, positive project for our future. Thank you.

Mike Menzel

18273

Mike Menzel, Edina, Minnesota. I understand that this is a very difficult process, given the unemployment rate up in northern Minnesota. And that is being balanced against environmental concerns. However, I feel that we need to explore other job opportunities for the folks up north because this mine has great potential for being an environmental catastrophe. Many great points have already been submitted about why the mine should not go through. Most of them refer to water quality and toxic sulfides and other chemicals ending up in the watershed. And I understand that there has never been a sulfide mine in a water intensive area ever before that has not resulted in contamination or pollution to our waters. One point I have not seen brought up is, that I feel needs to be addressed in the EIS, is the high likelihood of catastrophic climate events. And I am referring to the fact that we have already had four one thousand year floods since 2004 in the State of Minnesota. We have seen massive winds, with terrific blow downs up in northern Minnesota, leaving the potential for epic fires. We also know from university scientists that our Boreal forest is dying off rapidly; massive dying of trees. That also will result in epic fires. And I don't see that there is any way to prepare for any of these climatic disasters. We will see. We have a great likelihood of massive flooding in the mine site, as well as epic fires that could cause the operation to shut down, with loss of electrical power. And who knows what will happen to the mines that we have during that period of time. Thank you.

Please see the attached comments. Thank You, M. Michael Menzel

Mike Miklas

41866

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mike Miklas Shakopee, Minnesota

Mike Neaton

Feb 16, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. The Supplementary Draft Environmental Impact Statement has many failures: 1)to address the correct flow of base water, 2)specify the under water crevices that will allow water to flow in pathways that are sited as clay, 3)show the correct flow to the 100 mile swamp feeding eventually to the WCA and 4)fails to address the health regarding the working conditions. If these and many other aspects are not failures to protect the public, the purposed operation is expecting a public monitoring for 500 years and counting.. No business enters a contract with liabilities that extend for a time period of this length. This suggestion is both ridiculous and irresponsible. The primary concern is the requirements and satisfaction to offer the public an environmental analysis to assure the public. It's many lacking and incorrect information should stop this now. Lastly the state of Minnesota will be in partnership with Glencore/Polymet with an environmental history and ruthless business profile that should make anyone realize this is dancing with the devil. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Mike Neaton 4433 Upton Ave S Minneapolis, MN 55410-1931 (612) 226-3801

Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resoures Environmental Review Unit 500 Lafayette Road, box25 St Paul MN 55155 Dear Ms Fay, I am writing the email in support of the Polymet Mineing Project. Minnesota has a long history of Mining. It has not been without probleMs The rise and fall of the employment at the iron Mines. the tailings piles of generations past, just to name a few. Though out all of this Minnesota has developed the models for the regulation of the industry. I am in the construction industry. The recession hit us haRd many of us lost our homes. Many more lost jobs, forcing them to move out of state. The financial impact will be here for generations. This project will generate over 800 million in wages and benifits to workers like me. Therre will be Billions in economic benefits over the life of the project. There will be tax revenues for the local cities and the state. I have a hard time with the premise that there is not a way to do this and deal with the impact in a manner that is environmentally sound. We are and always have been environmentally concious. We can find a way. Please help me support this Project - Mike Nies Nies Electric

Mike Nordin

47796

Mike Nordin [mailto:mnordin41@gmail-com] Sent: Wednesday, March 05, 2014 8:19 PM To: Periman, Richard -FS Subject: Polymet Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. • Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: • Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. • Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. • Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. • Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1- Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2- Assessment of potential impacts on residential wells from tailings seepage. 3- Health risk assessment for on-site workers at both the PolyMet mine and plan

Mike Perala

18105

Good evening everyone. My name is Mike Perala and I'm from Virginia. I have deep roots in both Ely, as well as the Twin Cities (inaudible). I speak to you tonight in support of the review process put forth here, as well as in support of one of the most extensive and expansive recycling projects in Minnesota history; the PolyMet project. I have a keen perspective and interest in the project area. As many in the audience know, I once wore an orange hard hat proudly as an employee of LTV. The final pellets produced in the area glomerator (phonetic) were done under my watch. And through my work experience there, I gained a deep and unique knowledge of the infrastructure and of the mine site. I've seen firsthand the devastating impacts that the LTV closure has had on the east range. You know, I was one of the lucky few, because I found a job in short order. In my role at Minnesota Power now, I'm able to do what I can to add value to the region and the PolyMet project. Excuse me. I speak tonight in support of the review process managed by the Minnesota DNR. Some people think it a long process. I think that the length of the process has been dictated appropriately by the complexity of the project and the robustness of the area mine site. Admittedly, it has also been partially driven by corrections along the way. As best said in last week's comments by former Ely mayor, Mayor Scraba (phonetic), and I paraphrase, "The process is being conducted by professionals, with input from experts, and if at the end of the day the project receives a determination of adequacy, then it certainly should go forward. On the other hand, if the process requires further review, then that review should take place. And that echoes my sentiments to the tee. Review of the process indicates that accepted study practices have been followed in all steps. You know, I'm really amused by the misrepresentation behind the 200-year and 500-year impact numbers being bandied about by the media and the project opponents. I see the only relevance of those numbers, of any significance, as to provide parameters beyond those of reasonable impact. Sound science and basic design of experiments both indicate that you want to extend a study period beyond that time frame of which you reasonably expect impacts to occur. I point to the treatment station at the Dunka Pit as a prime example of this. A facility originally intended to treat discharge based on threshold measurement, which hasn't needed to run for years based on those ongoing measurements and due diligence. I also speak tonight in support of the PolyMet project. I have been personally involved with the PolyMet project since 2005, and coupling my work experience, my background as an engineer and a project manager and my working relationship with PolyMet, altogether has lead me to conclude that the project is a strong one. There is a level of responsibility, ethics and competency with John, Joe and their team, and it is at least on par as that with our other mining companies. In closing, I look forward to the successful completion of the public process and the decision of adequacy. I want to stand on the Rod Mill (phonetic) deck and watch the mills go around in this area. Thank you.

Mike Schrage

45109

March 12, 2014, Dear Ms Fay, Mr Bruner, and Mr Jiminez: As a resident of northeast Minnesota I have many concerns about the proposed NorthMet project. The greatest natural resources we have are our abundant public lands, clean water and healthy populations of fish and wildlife. These resources have both economic and intrinsic value and properly cared for they are infinitely renewable. They should not be put at risk for comparatively short term profits. I don't feel the SDEIS adequately considered the costs and benefits of alternatives (including not doing the project at all) to open pit mining. The lead agencies should at least give full consideration to the costs and benefits of extracting this ore by other means including underground mining. Just because open pit mining is the most economically feasible way to get this ore does not mean it's the best way when all other concerns are considered. I don't believe the SDEIS has provided adequate financial assurances the residents of Minnesota won't be stuck with clean up and reclamation costs following the mine's closure. Whether the horizon is 50 or 500 years in the future, it's clear the consequences of this project will last a long time. I remain unconvinced PolyMet and its stakeholders can or will be held responsible for any unforeseen consequences or failures in cleanup strategies after the mine is closed, profits have gone elsewhere and no one alive today is still around. The proposed land exchange should not include 382 acres of Lake County land. This represents a net loss of public land opened for hunting, fishing, trapping and other forms of outdoor recreation. The Forest Service land is lost to mine development, and the County land simply changes government ownership. No part of this or future mining projects should result in a decrease of public lands. The Biological Assessment and the Biological Evaluation accompanying the SDEIS are limited to discussions of impacts to federally listed species and Regional Forester Sensitive Species. The SDEIS does not adequately discuss impacts to outdoor recreational pursuits such as hunting and trapping nor does it adequately discuss impacts to traditional game and furbearer populations. This is a major discrepancy in these documents as healthy wildlife populations of all species, not just rare or sensitive ones, is critical for many residents and visitors to northeast Minnesota. The existing wildlife corridors are inadequate to maintain connectivity across the Iron Range. As evidenced from aerial photographs, they're narrow and often heavily intruded upon by roads, utility corridors, mine pits and urban development. These features serve as barriers to many kinds of wildlife. While the existing corridors may function well enough for large, mobile species like deer or wolves, they are inadequate for smaller, less mobile species. The SDEIS admits increasing development of urban areas alongside the corridors will render some of the existing corridors less suitable for wildlife in the future. Increased urban development and associated transportation and utility infrastructure should be expected if the project provides the economic benefits stated in the SDEIS. This issue should be mitigated before NorthMet or additional mine development goes forward through the establishment of dedicated and protected wildlife corridors and the reclamation of existing mine land. It's clear NorthMet is only the first of these new mines to come. The SDEIS shows ore deposits that are increasingly distant from existing mines and on landscapes in more pristine condition. Future mines may seek to exploit these deposits and will use the environmental review process for this project as a template. While any individual mine may not have significant impacts on the landscape or natural resources by itself, the cumulative impacts of habitat loss will begin to add up for populations of fish and wildlife and our access to the

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mike Williams Moorhead, Minnesota

I have 3 questions. 1- If comments are sent by mail, is a postmark of March 13th OK. 2- If the comments are emailed, to whom should the email be sent. 3- Is there a list of reference citations someplace. I've searched all over and couldn't find any. I found some documentation that I think is questionable and I'd like to see the original source of the citation. Thanks

I am no longer a resident of Minnesota but I have close friends there. Please approve pPolymet. I don't want MN to end of looking like Detroit. Had industry in the past but no longer..thanks Michael Mardirossian 3001 lake east Dr apt 2118 Las Vegas NV 89117 Sent from my MetroPCS 4G Android device

miles holets 21979

I wish to add my voice of support to the PolyMet project. It seems that this company is aware of the environmental implications and is willing to comply with all standards required. I believe they will be excellent stewards of this land and water that I grew up with. I am a life long resident of northeastern Minnesota and love the area I call home. I support the development primarily for two reasons: 1- Our country is stronger when we do not need to rely on foreign countries for our infrastructure minerals and materials. 2- Economic strength jobs and taxes will provide. Thank you for your work on behalf of us all. Miles J. Holets 3777 Keene Creek Lane Hermantown , MN 55811

Miles Kramer 41807

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. We cannot, for our sake and the sake of our children, put short-term small-scale economic progress ahead of long-term, large-scale ecological devastation. Thank you for your time. Sincerely, Miles Kramer 44 Bates Ave Saint Paul, MN 55106-6339

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Miles Kramer 44 Bates Ave Saint Paul, MN 55106

Dear Ms Fay, I'm a longtime resident of Saint Paul, a mother and grandmother, a public school teacher, a union member who's walked picket lines twice. Everywhere I turn I find reasons against sulfide mining in northern Minnesota. I wish to draw your attention to one of many, many arguments against this proposal. I'll focus on its parent company. Most galling: while PolyMet has never operated a mine anywhere, it's owned primarily a known quantity with an abysmal environmental, ethical and labor record: the Swiss international commodities and mining giant (50% of all mines worldwide), GlencoreXstrata. Glencore was originally called the Marc Rich Company (charged with tax evasion, accused of doing business with Iran during the hostage crisis, pardoned by President Clinton right before he left office – that Marc Rich). Now Tony Hayward is chairman of Glencore's Board of Directors. He's the guy who was running BP at the time of the Deepwater Horizon oil spill. Remember that he botched the handling of the fire and then attended a yacht race while oil polluted the Gulf, announcing that he "wanted his life back." That Tony HaywaRd Some Glencore history: · BBC investigation accusing Glencore of dumping copper refinery acid into a river in the Democratic Republic of Congo · more than a million dollars in environmental fines worldwide since 2010 · 500,000 Euro Belgian court fine in a corruption case · various contracts with Iran during sanctions · named the number one most difficult company to do business with by an international coalition of environmentalists · Glencore subsidiary fined for violating copper trading rules. Why do we even want these guys in our state, let alone undertaking such delicate operations in our pristine waters. It's like letting a known child molester babysit your own kid. Not wise. Wrong. Bad decision. Please stand up for what's right. Please look impartially (as the EPA has done) at this deal (warning: hold your nose). Pleadingly, Mimi Jennings

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: Please increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please also reschedule the public meetings proposed for January 2014 so that they take place later in the comment period. Please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This simply isn't fair. Please also make available to the public the long list of references in the document claimed to support the SDEIS conclusions but not found there. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS, at 2,169 pages long. * The SDEIS is not well written. It is neither clear nor concise. It obfuscates, repeating the same information over and over without once providing the basis for its conclusions. Much work is needed just to make sense of what is there. * The SDEIS doesn't explain some of the most important issues, for instance, why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed or why the level of financial assurance proposed is needed. * The SDEIS does not respond to, not even to dismiss, well-documented Tribal Major Differences of Opinion which call into question main points, such as claims that mine pits, waste rock piles and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS has a long list of references, but they are not available to the public. The public must be allowed to find and check on references claimed to support the SDEIS conclusions. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and putting public meetings in January (when bad weather is likely) make it hard for us to both review the documents and to travel to hearings. Given the level of public mistrust we fear this is by design. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of suspicion that government decision-makers are not impartial - not at all interested in either the science, the financial risk, or what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period are essential in reassuring us that the PolyMet sulfide mine project will receive a fair evaluation. Science and the opinions of Minnesota citizens, not just short-term gain and ideas of foreign corporations, must matter when the government makes its decisions. Sincerely yours, Mimi Jennings 2222 Hillside St Paul, MN 55108 651 644 4510

Feb 22, 2014 Minnesota Department of Natural Resources 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 Dear Department of Natural Resources, I have serious concerns about PolyMet's alarming plans to mine sulfide ore in northeastern Minnesota. The Supplemental Draft Environmental Impact Statement (SDEIS) is insufficient and should not be approved because, among many reasons, it lacks vital information about centuries-long water treatment and how it might be assured-information that is necessary to evaluate the environmental effects of this proposal. How can anybody seriously entertain a proposal to assure water quality for longer into the future than our country has existed. What person or agency can reliably follow up on transgressions or mishaps over that time. It's almost comic. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest No precious-metal mine anywhere in the world has ever operated successfully in wetlands. More than 900 acres of wetlands would be directly destroyed by the mine, with an additional ten square miles of wetlands projected to be indirectly impacted by toxic dust and dewatering. The SDEIS proposes no mitigation for the indirect wetland impacts. In addition to this destruction of wetland habitat, sulfates and toxic metals such as mercury, copper, and nickel that are not captured for treatment would affect the aquatic organisms and habitats downstream to Lake Superior. Birds that depend on fish and other aquatic organisms for food would be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns, and Common Loons. In addition, four bird species of greatest conservation need would likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. As an Audubon Society member, I take seriously the duty to protect avian wildlife. I ask the US Army Corps of Engineers to explain their reasoning for supporting the Section 404 wetlands permit. I ask the Minnesota Department of Natural Resources to reject this dangerous proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Thank you for considering my comments. Sincerely, Ms Mimi Jennings 2222 Hillside Ave Saint Paul, MN 55108-1609

Mar 9, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. This is an exceedingly risky proposal with little upside, which is reason enough to distrust estimates provided by PolyMet without independent state verification. In addition, its parent company's checkered history and that of its board chair demand extra vigilance. That is what I ask you to carry out. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Mimi Jennings 2222 Hillside Ave Saint Paul, MN 55108-1609

Minnesota Geological Survey 43014

Attached to this email, and also copied below, are comments on the NorthMet SDEIS. Sincerely, Anthony Runkel Chief Geologist Minnesota Geological Survey 2642 University Avenue West St Paul, Minnesota 55114 612-627-4780 ext 222. Comment on the NorthMet Supplemental Draft Environmental Impact Statement. I recently read much of the November 2013 Supplemental Draft Environmental Impact Statement (SDEIS) entitled "NorthMet Mining Project and Land Exchange", as well as several of the reports referenced in the document. The purpose of this commentary is to offer some suggestions that can be considered for improving the conceptual model of hydrogeologic conditions at the proposed Mine Site and Plant Site/Tailings Basin area. Improving the quality of the conceptual model will lead to improved prediction of potential impacts to groundwater, engineering of containment systems, and design of monitoring systems. Broadly summarized, my comments focus on improving the understanding of flow through fractured bedrock. The current conceptual models in the SDEIS characterize the Duluth Complex and Giants Range Batholith bedrock as bulk masses of rock with low, uniform permeability. Although this type of characterization is sometimes deemed sufficient for some purposes, such as numerical modeling of water budgets (flux) at relatively large scales, it has well known deficiencies when applied to numerical modelling of smaller-scale sites, especially for predicting solute transport. Instead, the development of conceptual models that employ techniques whereby discrete fractures or fracture zones are more fully considered, results in improved prediction of solute transport, including better estimates of travel times, and recognition of variation in flow directions and discrete pathways in three dimensions. Investigations aimed at characterizing the hydrogeologic conditions of fractured bedrock for the purposes of predicting solute transport in crystalline bedrock elsewhere on the Canadian Shield routinely use a number of well-known techniques that were not applied in the hydrogeologic studies at the NorthMet Mine Site and Plant Site/Tailings Basin area. A key component of those investigations is the acquisition of hydraulic and water chemistry data at relatively discrete intervals of bedrock, with the focus on fracture characterization. In part this is accomplished through testing and water sampling of boreholes constructed with relatively short open hole intervals at variable depths (eg "nested" wells) and/or discrete interval packer testing and water sampling of long open holes. When these techniques have been used in generally similar hydrogeologic settings elsewhere on the Canadian Shield, the results support hydrogeologic conceptual models that differ substantially from those proposed for the Duluth Complex and Giants Range Batholith described in the SDEIS. Of particular significance for solute transport, the conceptual models commonly include key fractures or fracture zones of relatively high hydraulic conductivity, and multiple flow systems within the bedrock at individual sites. These flow systems are variably connected to the surface water system, have variable residence times, can have upward and downward vertical gradients within a local area, and horizontal flow directions that differ from one another. The data collected thus far from the proposed NorthMet Mine Site and Plant Site/Tailings Basin area are not sufficient to recognize the kinds of hydrogeologic features known to be characteristic of other crystalline bedrock settings on the Canadian Shield, described above. Nor are the data sufficient to adequately support the simpler conceptual model currently depicted in the SDEIS. The comments below specifically address where improvements could be made to the conceptual models for the Mine Site and Plant Site/Tailings basin area. Mine site The SDEIS indicates that hydrogeologic characterization of the mine site i

Miranda Steinmetz 38885

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Miranda Steinmetz 1239 Brainerd Ave Duluth, MN 55811-2427 (715) 271-3183

Miriam Snyder 58068

Stop the mines! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dnniange has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Missy Bailey 43597

Dear Ms Fay, To all who have a vote, Will you please consider the environment above all else and deny the permit for PolyMet. I am not going to restate the reasons that so many others have written but simply say, I live on White Iron Lake in Ely and it is one of the most beautiful places on earth. We have direct access to the BWCA and have enjoyed the peaceful forest and lakes for over 30 years. Please help us preserve the waters in the BWCA. There is no other place like it in the United States and my hope is it will continue to be enjoyed in its pristine state by many generations to come. Thank you for your consideration. Missy Bailey Missy Bailey 1620 Hill Ridge Terrace Minnetonka, MN 55305

Mitch Gunderson-Palmer 10754

My major concern with this proposal is the possible impacts on groundwater. Minnesota still has one of the most unspoiled natural environments and a wealth of clean fresh water. I predict that in the not too distant future clean water will become the most valuable resource on the planet. Any short-term economic gain from the mine would be worthless to us if it contaminated our water and environment. Please be careful.

Mitch Kezar 40211

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Sir/Madam: My name is Mitchell J. Brunfelt and I reside at 5751 Rocky Road, Aurora, MN 55705- My e-mail address is mbrunfelt@colosimolaw-com I am submitting this e-mail, as part of the public comment process, to confirm my support for the Polymet draft EIS. First, I would like to note that, as a resident of the eastern end of the Iron Range, I live relatively close to the site of Polymet's proposed processing facilities. In addition, I am an avid outdoorsman and conservationist My family and I spend a considerable amount of time enjoying and engaging in various outdoor, recreational activities in the area fairly close to Polymet's proposed mine site, as members of my family have seasonal cabins in the area of the Skibo road (Partridge River/Colvin Creek area) and between Skibo road County Rd 16- So, we have a deep interest in protecting the environment, particularly in that area. With that being said, I believe that the Polymet draft EIS demonstrates and proves that the science is there to proceed forward with this very worthwhile project and that it can be done while at the same time protecting the local environment. This very detailed and thorough draft EIS shows that modern day science and engineering allow for this type of non-ferrous mining to be done in a way that protects and safeguards the environment. From the draft EIS, it is very clear that Polymet intends to employ the latest advancements in technology, science and engineering to make certain that this project fulfills all environmental safeguards and regulations. Finally, there needs to be a note of reminder here that the site of Polymet's proposed processing facilities (utilizing the former LTV property), and the area surrounding those facilities, already is an existing brownfield, industrial site. Polymet's proposed project will put that site back into a productive use and a use which (with modern day advancements in technology, science and engineering) will likely be more environmentally sound than the existing state of that site. Thank you for the opportunity to submit this commentary in support of the Polymet draft EIS and in support of this very worthwhile and important project. Mitchell J. Brunfelt

I was skeptical at first, but after reading reports and various research I now believe this Project is a wonderful venture. It will give many people jobs and help our local, state and federal economy. Also I read there is a kickback to MN schools fund with the use of the land. This is a great investment for MN growth in many many ways. Keep up the Great work PolyMet.. Michael Krohn 2108 55 St NE Buffalo, MN 55313

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, MK Smith MD PleaseUseEmail Mankato, MN 56001

Please do not allow mining in the BWCA. It is a fragile environment and will suffer under this kind of mining. As a resident of Minnesota and a person who enjoys the wilderness, I believe this project should not go forward. Thank you.

Mar 12, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the PolyMet mine. As someone who loves to enjoy the beauty and safety of the North Shore and Boundary Waters I ask you to please consider what we are risking. The damage this mine could cause could last until my great grand children's generation. The costs outweigh the benefits. PolyMet will no be creating long-term jobs for Minnesotans or benefiting the communities they could potentially destroy. Please carefully consider the stakes of this matter. I hope you're not really to risk it either. Sincerely, Ms Molly BARTZEN

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. Threats to the Great Lakes impact not only my home state of Michigan but all of the surrounding states. So much depends upon maintaining the health and integrity of these waters for tourism, the enjoyment of future generations and the surrounding ecosystem. The implications of so much that is done in the name of profit to our waterways is only beginning to be understood. I have watched throughout my lifetime as beaches, lakes and rivers have become unsafe for swimming, their fish unsafe for eating and the environment toxic to the wildlife that have become dependent upon us for their future survival. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Molly Bugamelli 39323 Columbia St Harrison Township, MI 48045-1745 (586) 954-0920

Molly Cooney

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Molly Cooney Minneapolis, Minnesota

Good afternoons, I am writing to express my concern with the proposed PolyMet copper nickel mine operation in NE MN. I have the following concerns and respectfully request a considerable slowdown on the permitting process to adequately address these concerns. Revise the PolyMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrological impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." I understand the regulations are in place to ensure adequate safety and environmental standards. I have not seen evidence that PolyMet will be able to responsibly (Financially or environmentally deal with "accidents" that will happen whether true bizarre accidents, or acts of human negligence. I live in Ely, am raising 2 young children and are happy to call this home. We owe it to ourselves and our children's' children to not do anything that will cause irreparable damage to the state and region. We are trusting you and others to watch out for the well being of our community, region and state. Sincerely, Molly Johnston Molly Johnston 737 S. 5th Ave E Ely, MN 55731 218-235-8209 cell: 612-730-0828

I am absolutely opposed to the Polymet mine. How can a few hundred jobs for 20 or so years compare at all to 500 years of pollution. Let's get our priorities straight here. We should be encouraging green energy industries and getting jobs related to those up to the people on the range rather than risking our most precious resource – our water - with such a dangerous undertaking. I am stunned that this project is even being considered. Thank you. Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Montana D 15280

Are you guys crazy. No to copper and nickel mining in northern Minnesota.

Morgan Ekmark 46013

Hello, My name is Morgan Ekmark and I am a second year Metallurgical Engineering Student, minoring in Geology, at South Dakota School of Mines and Technology in Rapid City. I graduated from North Woods High School (first graduating class) in 2012 from Cook Minnesota. I full heartily support Polymet. Here are a few reasons why; 1- Increase in Jobs. 2- Polymet has worked hard in improving its environmental impact. (Environmental Impact Statement (EIS), DNR, 2013) 3- Polymet plans on "refurbishing" the land that will be mined after the project is completed. 4- Mining has changed a great deal since the start of environmental protection acts. 5- A large group of people who are apposing this plan do not even live in the Iron Range area and have no education towards the processes and chemistry involved with sulfide mining. [HYPERLINK "mailto:morgan.ekmark@mines.sdsmt-edu"](mailto:morgan.ekmark@mines.sdsmt-edu)morgan.ekmark@mines.sdsmt-edu Cell: (218) 966-0928 chrome-extension://lifbcibllhkdhoafjfnlhfpfnpldf/call_skype_logo.png(218) 966-0928

To whom it may concern: I am writing on behalf of young Minnesotans (I myself am a high school senior) who are concerned about the proposal for the copper nickel mine Polymet is attempting to construct. Personally, I firmly stand against the building of such an establishment. The reasons bolstering this opinion are varied and abundant. Firstly, Polymet has no experience dealing with mines of this sort, and building a mine of this magnitude as a "test run" could have devastating consequences. Polymet's promise to maintain and rehabilitate the area during and after mining seems far fetched to say the least. The people of Minnesota have no assurance that Polymet will even be in operation hundreds of years into the future (when the clean up would still be occurring). Further speaking on environmental facets, this mine is essentially an assurance that the Boundary Waters, Minnesota's ecological crown jewel, will be urbanized or destroyed in part. Copper nickel tailings, as you must well know, are extremely dangerous to ecological systems. The environmental impacts are inextricably linked with economic ones. It is clear that Polymet will glean an incredible profit from the mine, but it must be realized that this company boom comes at the expense of stability in neighboring rural communities. Mines such as this perpetuate the boom and bust cycle that plagues mining towns not only in Minnesota, but across the nation. This is not even to touch on the fact that the proposed mine would create far too few jobs for that to be considered an initial benefit. Polymet is preying earnestly on those that are less economically established, and this portrays a devastating lack of propriety on the part of the company. In short, Polymet has neither the means nor the ethical rights to construct this mine. Mining institutions such as this desecrate valuable natural environments and essential ecological resources. Economically speaking, this mine benefits no entity but Polymet. The domineering nature of the proposal is in itself alarming, and Polymet's horridly evident lack of experience does nothing to quell the fears of those who will be impacted by it for hundreds of years to come. The legalities may, in the end, work out in favor of Polymet. However, it can be ascertained by common sense that no company wants to be remembered as one who destroyed lives or the world which we all share.

Moriah Ulbricht

54355

Moriah Ulbricht
Adv. Science; Hour 4
Mrs. Christopherson
February 11th, 2014
Dear Ms. Lisa Fey, EIS Project Manager.
My name is Moriah Ulbricht and I was excited to know that we were writing these letters for science. Why? I already knew about the mining that might take place and I was already quite unhappy about it. I ask that you read this letter, thinking about my statements and opinions with an open mind instead of merely as another child's uneducated thoughts. To begin, have a few questions about the effects of the mining.
• How does this affect the BWCA? This is my main concern about the mining and it's how I knew about it in the first place. Your website stated that, "Neither the proposed mine nor the processing facility is in the watershed containing the Boundary Waters Canoe Area Wilderness." This may be true but we all know that harmful toxins can be carried away from the mining site by streams or rivers. So, in thinking that the worst will happen, does the site affect the BWCA in any way shape or form?
• Does the mining site affect any other water bodies?
• Do the mine's benefits outweigh the disadvantages?
I am happy to hear that "PolyMet proposes to avoid and minimize wetland effects by optimizing the placement of mining features such as the mine pits, waste rock and overburden stockpiles, haul roads, water management systems, and supporting infrastructure." I am also pleased that PolyMet wants to minimize their effect on cultural resources. I have one final concern. I feel as though after the 20 or so years of mining; in addition to the 18 mos. of preparation, it would leave about 6,700 acres of land stripped and demolished. Including 913 acres of wetlands that would be permanently lost. That sounds like an awful lot of lost land and it leaves me to wonder, is it worth it? To conclude, if proper safety precautions take place, I am not entirely opposed. However, I am still not in favor of the mining to take place.

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” Reading about the proposed mining project greatly worries me, as a young person, 18 years old, I will live through the effects of this project longer than those who are planning to gain from it. We would not benefit from this in the long run, long after everything is mined deemed of value the effects of this hazardous operation will remain. I am worried about our ecosystems, wildlife will be greatly impacted. Wildlife is not something for us to look at and think it is pleasant, and sacrifice it for short term profit, for short-term jobs. Without our wildlife, there would be nothing. We cannot risk to poison what we have left of our precious wildlife, which is still home to many beautiful species. I am worried that Polymet will poison our waters, our animals, our plants, which has been food and medicine for countless generations. We cannot continue to separate ourselves from the natural world, because after all that can be mined is mined, and there are no jobs, except for toxic clean up jobs, we will realize we have poisoned our precious earth that provided health and happiness, and what is life without that. The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely Mose Picard mose Picard 2826 Fillmore st NE. Minneapolis, MN 55418

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Mr g. west everett wa everett, WA 98201 US

Ms. Melody Scott

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Melody Scott Perham, Minnesota

Considering the prospect of disturbing even more of this fragile environment equipped with the present level of human understanding is a true measure of our damning "Uncivilization". The everlasting detriment far outweighs the prospect of any (fleetingly) happy corporation stockholders and the temporary jobs (which will peter out after maybe one generation or two). Every rock turned over to satisfy man's greedy quest is an insult to this Earth we happen to inhabit.. Please do not proceed. We do not know enough to risk so much..

I would like to comment on the proposed mining project in Northern Minnesota. I think we should not go ahead with this project until Polymet comes up with a better plan to monitor and maintain the toxic seepage caused by the mine. So far the mine plan requires an absurd and unachievable level of monitoring and maintenance for many centuries to come. Taxpayers could be left with enormous clean-up costs, polluted water and land and economic disaster. The natural resources in the watershed of Lake Superior are too precious of a national treasure to jeopardize their well-being for centuries to come. Please do your job, DNR, of protecting our natural resources and do not let the plan go forward as it is. Myra Arnold [HYPERLINK "mailto:arnol005@umn-edu"arnol005@umn-edu](mailto:arnol005@umn-edu)

Myra Theimer

Dear Ms Fay, I am concerned that the PolyMet SDEIS does not reveal the effects of fibers in the rock at the Mine Site. If these fibers are toxic and are dug up and released into the air it could pose a significant health risk to Minnesotans that breathe the air either locally or carried in the wind. There are so many unpredictable events that could happen in the next 200 to 500 years, especially with global warming. I can't see how the project can estimate and protect various pollutants, such as mercury, from eventually negatively affecting the ground water. We should be extremely vigilant of protecting our water especially in light of how precious it will be in a warming climate. I think this project and the other projects that are being proposed combined will certainly have a negative effect to human health. Thank you for taking my comments, Myra Theimer Box 1452, Grand Marais, MN mtheimer@boreal-org Boreal Access Web Mailer

Myrl Moran

I think the risks far outweigh the benefits. Let's not do it. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

hi there, i'm writing to register my concerns about the polymet mine proposal. my primary concern is that it seems very shortsighted with respect to environmental impact. while we may only get a few decades-worth of commercial benefit from the mine, minnesotans may be dealing with environmental consequences ranging from water contamination and species dislocation for hundreds of years. we need to be better stewards of our natural resources for the coming generations. thanks for your thoughtful consideration of this project, n. w. hyslop minneapolis

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mrs Nadine Lee PO Box 205 Saint Francis, MN 55070-0205

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Najeeb Jindeel 1626 London road #741 Duluth, MN 55812

To the DNR officials considering Copper/Nickel mining in northern Minnesota: Although being sensitive to the issues of employment and future job opportunities in the northern Minnesota area, I have many questions and concerns regarding the environmental impact of copper nickel mining in northern Minnesota. The impact of mining sulphite ores was first brought to my attention while traveling about 35-40 years ago through the Sudbury Ontario area of Canada. While I realize that there have been improvements in mining methods and techniques I was absolutely astounded by the moonscape appearance of the area. The effects of sulphite mining and the potential for polluting the lakes, rivers, underground water tables and the wild rice beds in our state worries many of us. Our family travels north often during the course of the year to utilize the BWCA and park areas in and around Ely and Lake Superior. We are indeed blessed to have these pristine areas in our state. The concerns of many people that I have talked with are that too often officials and agencies have assured us that all the safeguards and sure fired protections are in place on projects such as this. However, we have come to realize that through the use of official variances, oversights and just human error the environment has been degraded and compromised. I believe it is time that we consider the environmental impact of this type of mining, weighing the short term unsustainable gains as opposed to becoming true stewards of our environment. Please be thoughtful and deliberate in making your decisions. Stephen Nippolt President of NALCO Printing Co.

Dec 19, 2013 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I have been a Boundary Waters tourist for many years and to even think about this area being compromised (and it will there is no doubt) makes me sick. The area is a treasure to our state and country and a mine that will pollute the waters and land for years, a mine where accidents WILL happen and leaching WILL take place and polluted waters will stand and seep and damage for many years is unthinkable. How can anyone with a conscience approve such a plan. I don't care how much money a company would put aside for clean up. This does not do anything for clean water and land, a healthy environment or a bright future for tourism or businesses which have to reside and make a living in a damaged area for years. Does it make sense to anyone. NO. Don't let it happen. There will be more regrets than praises in the end. And it will be too late.. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public intereSt The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Nan Corliss 10300 Morris Rd Bloomington, MN 55437-2825 (952) 835-6832

Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Nan Corliss 10300 Morris Rd 10300 Morris Rd, Bloomington, MN Bloomington, MN 55437

Dec 19, 2013 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I have been a Boundary Waters tourist for many years and to even think about this area being compromised (and it will there is no doubt) makes me sick. The area is a treasure to our state and country and a mine that will pollute the waters and land for years, a mine where accidents WILL happen and leaching WILL take place and polluted waters will stand and seep and damage for many years is unthinkable. How can anyone with a conscience approve such a plan. I don't care how much money a company would put aside for clean up. This does not do anything for clean water and land, a healthy environment or a bright future for tourism or businesses which have to reside and make a living in a damaged area for years. Does it make sense to anyone. NO. Don't let it happen. There will be more regrets than praises in the end. And it will be too late.. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Nan Corliss 10300 Morris Rd Bloomington, MN 55437-2825 (952) 835-6832

To whom it may concern, As a lifelong Minnesota native, I am writing to express my great concern and dismay at the prospect of the Polymet copper mine. The possible environmental issues that may plague our beautiful and beloved natural areas for years to come - for the sake a 'blink of the eye' 20+ year job producer - is ridiculous. The mere fact that 500 years is even mentioned as a possible time frame for remediation and clean up processes is a dead give away that the project is completely and absurdly unrealistic. Our country isn't even 500 years old, does anyone actually think that a company entity will last that long. And if they did, that they would cheerfully and willingly pay to clean up their putrid, toxic mess for such an unimaginably long time frame. Honestly, who in good faith could ever realistically propose such a preposterous idea. And for what. Twenty some years of work for a relatively small group of people. People in Northern Minnesota do need good work with liveable wages, but this is not a good solution. It Is a solution proposed by greed and supported by those in desperation. We can do better. Minnesota is innovative and forward thinking. if this is really a priority to our state, then we need to put some effort and resources into finding a healthy, long term, innovative strategy to not just create a few short term jobs, but bolster the economy and nurture the people of our state. I am urging those that have the power at the DNR to please come to their common senses and reject this dangerous, short sighted, small profiting yet incredibly giantly consequential project. Most sincerely, Nan Langevin St Paul, Mn Sent from my iPad

Nan Lightner 46124

I am writing to urge very careful consideration for mining operations in Minnesota. We must think Long term consequences so our children's children will not be grappling with sad and irretrievable outcomes. Good water is "gold", scarce and a necessity for the World. Please do not let your decisions jeopardize its future. Thank you. Sincerely, Nan Lightner 1758 Goodrich Avenue; St Paul, Minnesota 55105

I truly oppose any mining activity in the beautiful Minnesota wilderness. Yes, it creates jobs, but only in the short-term and it will pollute the watershed for hundreds of years. Not a good trade-off. We have the ability to recycle old minerals and use renewable sources for energy. I suggest we do that. I do not want to see mining in this area EVER. thank you. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. I am concerned that underwater storage of the most toxic category 2/3 and 4 stockpiles will lead to groundwater contamination and potential surface contamination. Once this material is disposed of in this manner it will be impossible to mitigate any unforeseen consequences. If this disposal method is to be followed it must be done with an extremely high level of analysis of the surrounding and underlying rock, any rock fracturing, and hydrologic conditions in and near the pit. If necessary any potential toxic migration must be prevented by sealing or encapsulating the waste mass. If this isn't possible, alternative above ground disposal methods that confine these toxics would need to be evaluated before the project proceeds. Would a benzoate seal on the walls be possible or useful. Perhaps fine grained layers between the more and less toxic wastes would also protect the pond above from seepage of toxics into the surface waters. Thanks for all the hard work on this project. Nancy Atzen 600 west superior st apt 1105 duluth, mn 55802

Nancy Bratrud 18343

Hello. My name is Nancy Bratrud. I'm ceding my time to Michael Koppey.

Nancy Brown 18288

My name is Nancy Brown. There is a long history of mining companies declaring bankruptcy to avoid the cleanup of their sites. I feel that if we are going to sign up for 500 or more years of pollution, I would rather take this money, the taxpayer money, that will be spent to clean up that pollution and pay the people who need jobs up north right now. They could work in industries that will promote the long term resilience of the Iron Range and will be supporting the local economy, while preventing my tax dollars and my childrens' tax dollars from going into cleaning up this mine site for hundreds of years to come. That's my statement.

Nancy Carpenter 991

Greetings, My concern is simply put. Any project that relies on several hundred years of continuous water treatment should not be given a moment's consideration. As a society, we can't even count on a company's existence for a few decades, much less 2-5 centuries. The environmental risks and costs are far too great to even come close to balancing out the jobs and boost to the northern Minnesota economy. The mining jobs will mean very little when, not if, but when the contaminated water begins to show its effects. The tourism and hospitality industries of the northland, not to mention the life in the northern wilderness, cannot cope with the inevitable environmental disaster that a mine like this would create. Human beings are not capable of designing and carrying out a flawless plan, and that is what this mine would require. My 2 cents. Nancy P Carpenter 32425 151st Ave Montgomery, MN 56069 651-387-5161 HYPERLINK "mailto:puschcarpenter@gmail-com"puschcarpenter@gmail-com HYPERLINK "mailto:nancy.carpenter@spps-org"nancy.carpenter@spps-org

Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Nancy Conger North Branch, Minnesota

36801

Minnesota's natural spaces are too valuable to jeopardize them for the sake of mining. There are far too many risks involved, and history has proven that mining companies often disregard rules and laws created to protect the environment. The SDEIS is insufficient, and should be rejected. It does not provide important information, such as the details of the proposed water treatment systems or how the centuries of operations, maintenance, monitoring and reconstruction of water treatment facilities will be paid for. Sincerely, Nancy Dowling

Nancy Ellis

38713

Not only am I concerned about the mining because of the pollution of the lakes and rivers, but the jobs that are already there, like the Baptism River Inn, the National Forest Lodge, the rice the Indians harvest, the canoe outfitters and camp grounds and many others. Let's try to find other ways of providing jobs that some seem to be so concerned about regardless of what happens to our waters in Minnesota. I am 78 years old and my family and I care about jobs, of course, but not mining sulfide ore in the Boundary Waters watershed and the Lake Superior watershed. That is not the place for it. Nancy Ellis and James J. Ellis, 11051 Russell Ave S Bloomington, Mn. 55431 952 888 3340 On Tue, Mar 11, 2014 at 4:55 PM, *NorthMetSDEIS (DNR) <[HYPERLINK "mailto:NorthMetSDEIS.dnr@state.mn.us"NorthMetSDEIS.dnr@state.mn.us](mailto:NorthMetSDEIS.dnr@state.mn.us)> wrote: Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. I guess I need a class in penmanship. Thank you. Good evening, everybody. My name is Nancy Gibson and I am the co-chair of the Legislative Citizens Commission on Minnesota Resources. In addition, I'm the co-founder of the International Wolf Center. But I want to make it clear that I'm not speaking on behalf of either one of those organizations. However, as a recipient of extensive knowledge from the Geological Service, via the Environmental Trust Fund, I speak with considerable concern for the proposed PolyMet project. Here is what I know: Water will be the agent that will carry any contaminants; No. 2, the proposed project has admitted to some water contamination, via the water modeling data package; No. 3, there are no guarantees that there will not be an unforeseen mishap with water. But here is what we don't know and where there are some faults with the SDEIS. The geological complexity of northeastern Minnesota lacks a high level of investigation, execution me, and testing to achieve stringent management of potential contaminants. The work today doesn't address fracking in the subsurface areas and fracking adequate levels. Three, there are no robust characterizations of those fracking at the mine and processing sites. Four, the monitoring for potential contaminant releases will be difficult or ineffective, yet needs to be examined. Five, lack of effective groundwater maps above the bedrock need to be assessed to better understand the distribution of aquifer and non-aquifer sediments. In summary, this is a (inaudible) system and must be mapped as accurately as possible. This includes the subsurface area for containment and contaminants and meaningful monitoring for it to be achieved. Therefore, I advocate for additional work to characterize those systems. And in addition, there needs to be a development of approximate containment of monitoring systems. While not a perfect science, it will give us one more tool for monitoring of contamination. I will close with what our governor said last week at the Department of Natural Resources Roundtable. The 2008 legislature (inaudible) was the ultimate testament that Minnesotans care deeply about our natural resources. We need to apply an unbiased approach to our natural resources and measure and evaluate all likely outcomes. We need as much scrutiny as possible so that people are getting their monies' worth and that we examine all possible results. Please, advocate for more science. Thank you.

47107

The sulfate standards 10mg/liter has just been re-established as sound science after a 3-year study. These standards are at the upper level limit for the healthy production of wild rice. Sulfides released from mines that interact with sediment bacteria produces high levels of sulfates thus destroying surrounding wild rice plants that need a strong root system. These valuable plants are a good source of food for wildlife and humans. Polymet needs to address the sulfate standards and how they will comply to protect the existing stands of water bodies that were previously documented stands present within a water body dating back to November 28, 1975- The SDEIS lack this compliance issue. I am co-chair of the Legislative Citizens Commission of Minnesota Resources; however I want to make clear that I do not speak for the Commission. Yet, I do speak as a member who has endorsed and supported the accelerated funding of the Minnesota Geologic Service from these lottery proceeds. As a recipient of extensive knowledge from this Geologic Service, I speak with considerable concern about the proposed Polymet project. Here is what we know: Water is the agent that will carry any contaminants. The proposed project has admitted to some water contamination via the water modeling data package. There are no guarantees that there will not be an unforeseen mishap. Here is what we don't know: 1. The geologic complexity of northeastern Minnesota lacks a high level of investigation and testing to achieve stringent management of potential contaminants. 2. The work to date doesn't address fractures in the subsurface areas and their effects to an adequate level. 3. There are no robust characterizations of those fractures at mine and processing sites. 4. The monitoring for potential contaminant releases will be difficult or ineffective yet needs to be examined. 5. Lack of effective groundwater maps above the bedrock needs to be assessed to better understand the distribution of aquifer and non-aquifer sediment types. In summa this is a complex system and must be mapped as effectively as possible. This includes the subsurface areas if containment of contaminants and meaningful monitoring are to be achieved. Therefore, I advocate for additional work to characterize these systems. In addition, there needs to be development of approximate containment and monitoring systems. While not a perfect science, it will give us one more tool of necessary information in this area so that Minnesotans have more knowledge and confidence to make these serious decisions.

58101

A critical omission of the SDEIS is the study of moose and the impact on its population dynamics. The initial Polymet project proposes to drain 93 wetlands in moose habitat. Where will those wetlands be replaced? The trade-off in wetlands may or more likely not aid our dwindling moose population. Are we willing to make that gamble? The SDEIS does not mention Minnesota's latest designation of moose as a species of special concern: a species that has been decreasing in alarming numbers. Yet/ a species that has also garnered significant state research dollars/ some of which comes from the State's Environmental Trust Fund that I co-chair. A current study with radio-collared moose will map locations that will give us an applicable estimate of wetland use in this region. Water and moose are inseparable. 1. To date, there has been a lot moose research conducted in northern Minnesota more in Royale located miles the coast Minnesota. Isle Roya has similar habitat to northeastern Minnesota with bedrock and sedimentary layering that creates ample forms of water. To maximize reserves for survival, moose rely on high quality forage summer months. Aquatic habitats are readily selected because 20% higher crude protein and times more nitrogen ca atom comparison to terrestrial plants. In a 2011 published study, it was found that moose slightly prefer submergent vegetation such as yellow pond lily, they did not discriminate amongst rhizomes, stems and flowers from the 88 species observed. Most of the activity between moose and aquatic foraging occurred on the inland western region of the Island that is rich wetlands and small ponds. This summer intake of nutrients is important for pregnancy rates the subsequent year. What we don't know??? How will sulfides vegetation needed for moose survival? copper mining affect the aquatic vegetation needed for moose survival? 2. A 1983 scientific paper published by noted researcher Rolf Peterson and P. Stephens, summarized that moose calves are born near water. It is a critical predator avoidance strategy for moose. What we don't know??? How will fewer water resources affect the calf/cow ratio? 3. In 1987, researcher Timothy Ackerman showed that the radio-collared moose suffer from heat related stress and need the wetlands and other waterways to cool their bodies. What we don't know??? Will fewer heat sink water resources cause additional stress for moose? 4. The final paper I will site is by Clifford and Witmer (2004) which describes the facial anatomy of the moose that ends with a long overhanging nose that is specifically adapted to aquatic feeding up to 16 feet below the surface. What we don't know??? Will the sulfides sink to the lower water levels affecting the nutritional value of aquatic vegetation and for how long? The interrelationship between water and moose is a gaping hole in this document a can make me if other aquatic species such as amphibians, turtles, mussels a fish have received any attention and scientific on their survival needs.

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Nancy Giguere 1471 Edmund Ave 1471 Edmund Ave St Paul, MN 55104 651-642-1378

Thank you for giving the people of Minnesota the opportunity to weigh in on this issue. I have been going to the BWCA off and on for many years, and I can't believe that mining as described will in any way NOT affect the BWCA area, the water and the future for that area. The small amount of jobs that would occur with the mining for the short period of time that they are mining does not seem like a good balance for the state and nation in this area. There is also NO confirmation that the people getting the jobs would be from the northern area of Minnesota at all. The jobs could go to people out of state and therefore would be of no benefit to the people of that area. Even if they set aside a billion dollars for clean-up of the area after the mining, it will no longer be the pristine area that it is now. You can't take back what you destroy in nature. We want to preserve that area for our grandchildren and beyond, so that they can learn to appreciate and enjoy what a national treasure that is there. Please listen carefully to the people opposed to this mining operation because what you do if you allow the mining to occur cannot change our environment back to what it is now clean and untouched by man. We need to be good stewards of God's environment and all he has entrusted to us. Thank you, Nancy Graham Rich 20891 Aztec St NW Anoka, MN 55303 763-753-1225

Feb 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

57883

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, nancy locken Minneapolis, Minnesota

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 13, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. i am unable to decide a hierarchy of importance when it comes to issues related to the polymer mining and future mining/exploitative industries in the area. thus, i have chosen this particular area to address. over the years, my family and i have spent much time in the mountains of colorado and the deserts of utah. to see the leftovers and the unintended consequences of the silver, nickel, gold, uranium and copper mining is eye opening. there is no way that what appears to be quite a slippery company and an equally slippery plan should be allowed to further destroy our planet and its inhabitants. There has been enough done. They say there will be an excellent economic impact (jobs). well, that's great for 10- 20 years not mining. then, perhaps there will be further job security if you are in the business of cleaning up poisons and treating horrific medical conditions. maybe even a mortician. ad all of the beautiful creatures that share this magnificent jewel in space need to have advocates assuring their interests will be considered. the children, the moose, the lynx, the squirrel, the wolf, eagle, and so many, many from microscopic to giant are counting on us to stand between them and their nearly certain destruction. we have no obligation to green the pockets of these film-flam men/women. i have read some of their papers presented to groups of others representing their interests. they are not in this for the good of the many. they are in this purely for the dollars. they have spoken about the fact that there is an increasing amount of regulation on mining interests, causing the profitability to drop. they have even go so far as to explain to their peers that the next big thing would be fracking and the mining of tracking sand. due to the fact

My name is Nancy McReady. I'm from Ely. Actually I live on Fall Lake which is in the (inaudible) 4,000 people all across the United States. Back in the 1970's environmental organizations made us a little bit more aware of pollution and environmental issues. We have the Clean Water and Air Act due to their efforts. Also in the 1970's there was much talk about wanting to mine copper-nickel. Well, that didn't happen as we didn't have strict pollution regulations. Times have changed. We have more pollution and environmental regulations to protect our water and air than we did 40 years ago. And right along with those regulations we have far better mining technology. So-called environmental groups are making the same arguments today as they did 40 years ago. "It's never been done before." "All copper-nickel mines pollute." They have become extreme preservation groups against economic development. These preservation groups refuse to acknowledge advances in mining technology instead of embracing new technology and working with PolyMet and others. They have done the same with lobbying. These are the same groups that have opposed a cell phone tower near Fall Lake (inaudible). This is all outside of the Bound Waters. "Too close to the Boundary Waters." The Boundary Waters has no buffer zone. The environmental community should be ashamed of themselves. They should be embracing new technology and working together to make this project happen. Conservation and common sense supports the SDEIS and the permitting process of the PolyMet project. We support scientific data and objective analysis of the government agencies and the elected officials when making and implementing land management and environmental policies. Public input is also important. But hopefully science will prove or disprove if PolyMet can be done safely. And that decision making isn't left up to the courts and environmental (inaudible). Enough with the delays. Let's get this project going. Thank you.

46937

Dear Ms Fay, My husband and I have lived on Fall Lake (in the Kawishiwi watershed) for nearly forty years. We care very much about the Boundary Waters and we do have concerns about the water in our lake, but the PolyMet copper/nickel mining project is not one of them. We know PolyMet is not in the same watershed as the Boundary Waters. We have followed the progress of PolyMet for over eight years. We believe the SDEIS prepared by the three agencies is a good document and addresses environmental issues thoroughly. The technology of today is far superior to that which was used in the copper mines of years ago. There are several precious metal mines that are operating today, or which have operated recently, without harm to the surrounding environment. For environmental groups to say that precious metal mining has never been done safely is not true. Flambeau Copper Mine in Wisconsin, Stillwater platinum-palladium sulfide in Montana near Yellowstone National Park, McLaughlin Gold Mine in California, Viburnum Zinc Mine in Wisconsin, the Cannon Gold Mine in Washington – all of these mines have taken great care of the environment. Some even have partnerships with environmental groups to make sure the environment is not harmed. We support the SDEIS process the PolyMet project is going through and have faith in the agencies to approve the permit to mine if the science is there to prove that PolyMet can do the mining right. Thank you for the opportunity to comment. Nancy and Doug McReady P O Box 252 Ely, MN 55731

47621

Dear Ms Fay, One thing we forgot to mention in our comments on the PolyMet SDEIS is the fact that mining these strategic metals here in Minnesota, where there are strict environmental regulations, is a matter of national security. In an article from 2012, <http://www.wired-com/dangerroom/2012/08/rare-earth-elements/> it was stated that in 2009, Congress was asking the Pentagon HYPERLINK "<http://www.wired-com/dangerroom/2009/08/defense-geeks-fret-over-rare-earth-metal-supplies/>" to look for alternatives and lessen the US dependency on foreign imports after the Chinese government said HYPERLINK "<http://www.wired-com/dangerroom/2009/08/china-all-your-rare-earth-metals-belong-to-us/>" it was considering limiting exports of the minerals. China has 95% control of many of the precious metals that are needed for our national defense. The article goes on to say, "The DoD would like to find ways to produce more rare earth elements here in the States. The first proposal is to find a way to improve separation. Efficiency is not the only concern. The Pentagon wants new, environmentally "less-aggressive techniques," to separate rare earth elements from minerals. Finding new ways to do it "would improve the availability, decrease the costs of extraction, and decrease the environmental impact of the extraction," says the proposal." We believe the new technology is available and PolyMet, and Twin Metals to follow, will be able to aid the Pentagon with recovery of these precious metals and make the United State strategic metal independent. Thank you for the opportunity to comment. Nancy and Doug McReady P O Box 252 Ely, MN 55731

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. PolyMet is a disaster in the making, no matter what protestations of prevention and repair PolyMet is making. The cost is too great, exchanging our beautiful natural resources for a handful of jobs for the short haul. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Nancy Miller 1201 Yale Pl Apt 611 Minneapolis, MN 55403-1956 (612) 333-5135

47483

To whom it may concern, Please stop Polymet. I am for responsible mining, and the proposed mine will further pollute our waters. I know 2 men who died from cancer within the past 9 months who lived in Aurora. In my own neighborhood near Eveleth, 5 people within a 3 block radius have died from various cancers and another 5 others who have had cancer / or tumors including myself twice, who are surviving. Please listen to us- these decisions are irreversible in our lifetime, have little economic benefit, and definitely have a heavy financial and health cost that seriously outweighs the economic benefit. Please listen to reason. Sincerely, Nancy Miller

Nancy Norr

18352

Thank you. My name is Nancy Norr. N-O-R-R. I am the director of regional development for Minnesota Power. I have a master's degree in agricultural economics from the University of Wisconsin-Madison. I spent a quarter of a century as an economic development professional in this region. Also currently my (inaudible) jobs as a Minnesotan. A state-wide coalition of labor, business and local industry, as well as units of government. And on behalf of those 55,000 labor union members, and as well as the 2500 businesses and other organizations that we represent, I want to commend the regulatory agencies for working closely together to reach this important milestone. The economic basis in this region is and always will be mining. The growth of this industry is critical to the this region and will support a way of life for generations to come. In the SDEIS is the economical impact of the NorthMet project, EIS Section 5.2.10, and refers to these impacts in other sections of the report. The report quantifies the direct, indirect and induced employment effects of the construction and operating phases of the employment effects and the mine utilizing the implant model. The University of Minnesota-Duluth Department of Labor and Bureau of Economic Research performed an analysis using prudent and reasonable assumptions and was conducted in accordance to the requirements under the law. The integrity of the model and research team that performed the work was the highest caliber. The implant model was designed in the 1970's under the auspices of the Forest Service and updated over time with the University of Minnesota. The model has been used extensively since its inception by prior businesses, as well as state and federal government entities, including the Obama Administration, the EPA and Federal Reserve Bank. Users of the model, including schools, gather regularly to share information and to work together to enhance its features and its peer reviews. Critics of the SDEIS (inaudible) in mining closure have to be factored in. I would suggest that although the permitting process has been based on a 20-year mining plan, the vast resources of the Duluth complex indicates that responsible mining can continue for centuries to come, just as iron mining has been conducted here for years. In my day-to-day work at (inaudible), I see the no-action alternative. The "no-action alternative" is a death sentence for the communities of the east Iron Range. I don't know how you quantify empty storefronts and classrooms and boarded up houses. I don't know how you quantify families moving away. This is a thorough SDEIS and we are prepared to move forward in the permitting phase. Thank you.

47282

Dear Ms Fay: On behalf of your colleagues at the DNR, EMS, the US Forest Service, and Army Corps of Engineers, please accept my sincere thanks and appreciation for the highly professional handling of the information sharing on the PolyMet project. The three public events were very well managed and provided the public with incredible resources. The web site information, fact sheets and videos have also raised the bar on how projects of complex and often controversial nature should be handled. In my 25 years of experience as an economic development professional, I've never come across an opportunity as important to northeastern Minnesota's economic future as copper-nickel mining. A significant economic base for this region is and will remain mining. The growth of this industry is critical to the long term success of the region and will support a way of life for generations to come. The economic opportunity stretches from the environmental technician at the mine site in Hoyt Lakes to the engineering professionals located in downtown Duluth. PolyMet Mining's proposed NorthMet project represents a continuation of our strong mining tradition. As the public comment period for the project's Supplemental Draft Environmental Impact Statement (SDEIS) comes to a close, we are one step closer to bringing 360 full-time mining jobs to the Range and more than 600 spinoff jobs in other industries. These are career opportunities that our young people need to support families. Too often in Greater Minnesota we see empty storefronts and classrooms and industrial parks. Long-time residents are forced to move their families out of town to find work. This is the present, but it does not have to be the future – we can have thriving communities again. Every development – from new office buildings to housing developments to airports to the highways that bring vacationers to northern Minnesota – impacts the landscape. All businesses and industries in this region, including those that transport and process natural resources, potentially impact on the environment and human health. That is why we have multiple local, state and federal agencies tasked with ensuring each project is designed adequately to address its ability to mitigate potential environmental impacts. Our former mines are now lakes that enhance our environment and by bringing mining companies and communities together, the Laurentian Vision Partnership guides future land use after mining closure. The nay-sayers keep referring to a 20-year mine and suggest the benefits are temporary. But the vast resources of the Duluth Complex indicate responsible mining could continue for many more years – just as iron mining has existed for a century. The benefits from copper-nickel mining will be felt by generations of hard-working Minnesotans. Copper-nickel mining will provide millions of dollars in local and state taxes to support our communities and educational systems and will create a domestic source for metals essential to our quality of life. Furthermore, our state has some of the strictest environmental regulations in the country, and the environmental review process for the NorthMet project has been sound and thorough. Keeping jobs here and doing mining the right way is arguably the real definition of economic and environmental justice. It would be irresponsible to import these metals from countries that do not have strict environmental standards when Minnesota has the opportunity to mine responsibly. As a state, we have the opportunity to enter a new era of mining that will create hundreds of jobs, foster a strong economic future for Minnesota families and bring families back to this area. These families will sustain and build the future vitality of this region. We do not have to choose between economic growth and protecting our environment. We can have both. Please share my thanks with Commissioner Landwehr. Sincerely, Nancy Norr cc: Rep. Tom Huntley Sen. Roger Reinert Nancy Norr 3

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Please make very sure that this project will not harm the quality of Great Lakes water before you approve the Federal land exchange of protected Superior National Forest land to facilitate PolyMet's open pit sulfide mine. Sincerely, Nancy O'Bryan 8635 Silver Creek Dr Novelty, OH 44072-9694 (440) 338-5350

Nancy Olson

58034

I do not agree with Poly Met's environmental impact statement. I have seen the "deal river" with trout fishing a vegetation destroyed by copper mining, which is the Clark Fork River that flows on the Eastside of Missoula Mt. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Dec 10, 2013 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Nancy Pena 535 Kim Ln Owatonna, MN 55060-2743

<http://www.nmworg-org/> The Supplemental Draft Environmental Impact Statement is Inadequate Economic Impacts The SDEIS contains no cost/benefit analysis of the PolyMet mine. The SDEIS does not say whether wages paid to mine employees will stay in Minnesota or whether they will go primarily to transient employees who will spend only a fraction of their income in Minnesota. The SDEIS does not discuss the impact of the loss of jobs when the price of copper declines and mining becomes unprofitable, although it acknowledges that such job loss is inevitable: "Mining-related employment is volatile and fluctuates from year to year due to the market price of commodities being extracted." SDEIS, 4-325—4-326- The SDEIS fails to assess the cost of unemployment benefits and other social services, increased crime rates, and other societal costs associated with volatility in employment. The model used to calculate the alleged economic benefits of the mine does not take into account the costs to the environment; the displacement of other economic activity, including among other things tribal rights to hunt, fish, and gather under the 1854 Treaty; the infrastructure, government, and social service costs resulting from the mining; and the consequences of the unpredictable influx and outflow of mine employees. What would be the costs for public infrastructure, lost opportunities to engage in other economic activities incompatible with mining, depressed real estate values, lost recreational opportunities, social upheaval, and perpetual clean-up that the public would be required to bear. Permanent Water Pollution PolyMet admits that water pollution by sulfuric acid and heavy metals will last for at least 500 years. Not all of the polluted water will be captured for treatment. Annually, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. Annually, 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated. The SDEIS fails to adequately assess the long-term impacts of the pollution resulting from the release of this untreated water. The computer model used by PolyMet may understate the actual pollution impact, because it has been shown to be inaccurate in representing current conditions for water quality around the mine site. Absence of Planning for Inevitable Accidents and Failures The SDEIS fails to provide contingency plans for the kinds of failures and mishaps that routinely occur in mining operations. During operations, at least 6-2 million gallons of polluted water would need to be treated every day. Pipeline spills, accidental releases, failure of water collection and treatment infrastructure, and tailings basins failures are virtual certainties. And because the provisions regarding financial assurance are so plainly inadequate (see below), the SDEIS does not tell us how the costs of responding to such failures will be covered. The SDEIS provides no details on the impacts to water quality, wildlife, or human health if the water treatment system ceases operations at some time during the 500+ years during which the polluted water is being discharged. The Mine Plan Requires an Absurd and Unachievable Level of Monitoring and Maintenance for Many Centuries Minnesota Rules 6132-3200 requires that the site must be maintenance-free at closure, but the PolyMet mining plan calls for at least 500 years of active water treatment. 526 acres of land, covered by more than 167 million tons of waste rock, would be covered by a plastic sheet and surrounded by a system that would supposedly collect contaminated seepage. All would require monitoring and maintenance constantly for hundreds of years to fix leaks, repair perforations, and remove deep-rooted plants. A mining pit "lake" would require pumping to prevent the toxic brew of acid and heavy metals from spilling into the nearby Partridge River, and a tailings basin pond would require

Nancy Schuldt

48546

Good afternoon: I certainly didn't need any more conflicting information to process at this moment while I am trying to complete comments on behalf of the Fond du Lac Band, but this is very troubling to me. John's 'discovery' is also relevant to a comment I've been struggling to articulate, regarding how the ash dump is proposed to be dealt with under the proposed project; like many other issues in the SDEIS, it seems to be getting kicked down the road for future permitting discussions. But if the plant site model has been constructed to not incorporate the ash dump (which is full of toxics), when in fact it does, this is another significant potential source of contaminant loading that is not accounted for in the water modeling and water quality predictions. At literally the eleventh hour of a 90-day public comment period, we just shouldn't be trying to figure out basic model construction, source loads, and water quality impacts; it should be clear in the SDEIS. To the extent that you can provide any feedback to John's discovery or my question before 4:30 tomorrow, I would very much appreciate it. Otherwise, you might re-consider extending the comment period to allow all of us the time we need to truly understand how the models have informed environmental impact predictions. Thank you, Nancy Schuldt Water Projects Coordinator Fond du Lac Environmental Program 1720 Big Lake Road Cloquet, MN 55720 218-878-7110 ph 218-878-7168 fax

Dear Ms Fay, Mr Bruner and Mr Dabney: Nancy Gail Schultz 9926 National Forest Lodge Rd Isabella, MN 55607 All the reasons that support the permitting of the PolyMet mine will disappear when we have destroyed the natural resources which we depend on to keep us healthy. The PolyMet SDEIS completed by the world's most polluting industry suggest that they now have a way to preform extraction of sulfide containing metals safely, this however has no credible foundation in which to support this statement. In fact, there is more data to suggest just the opposite. All the proposed methods in this SDEIS are not new, and if they were, testing them in a highly sensitive wetland and environmentally rich native wild rice ecosystem sounds like a really bad idea. The consequences of polluting our water, with its highly varied flow patterns and rates system, is too great for the short term gains of a mining economy. I am an owner of a small business that serves public entities in creating sustainable improvement solutions for their facility infrastructure. Our services rely heavy on the integrated assessment of all systems that impact the operation of a portfolio of buildings. One of our first lines of defense in creating a sustainable building is to focus first on conservation measures. Reducing the need for energy to operate a buildings greatly reduces our need to depend on unstable energy costs and expensive/environmentally destructive mechanical and electrical systems needed to keep its occupants comfortable. This is one of many ways we can reduce the need for materials that are obtained at great risks to our natural resources, such as what is being proposed by this SDEIS. Ultimately a sustainable business practice is a closed loop systems that has no waste/pollution. Being fully aware that this is an ever evolving lofty goal, it is one of that provides little down side. This proven approach is good for the economy, good for our health and good for the environment. To move us in this direction, we should not be taking risks that have irreparable damage and depend on quality control processes that must be in place forever. Following are a list of questions that summarize why I do not think the SDEIS effectively manages the risk associated with irreparable destruction of our natural resources: •Why doesn't the statement require that the 939 acres of wetland being destroyed, at the very least be replaced with wetlands that do the same job and serve the same habitat and the same streamS It doesn't deliver this hence destroying 68% of the wetlands by not having them associated with the Lake Superior Basin at all. •The SDEIS admits that the sulfide mine will directly destroy 913 acres of wetlands. It then says that as much as another 7,351 acres of wetlands could be lost due to pollution and changes to water patterns in the mina dn tailings site. Why aren't there alternatives provided in the SDEIS to avoid or minimize this wetlands loss. •When flooding occurs during the 10 and 100-year rains, why isn't there a plan or indication of impacts for how the waste area will impact the waters when this massive acres of waste storage is flooded. •PolyMet sulfide mine tailings will be stored on top of the old, already leaking, LTV tailings dump. This site is an unlined pile about two miles across set on top of peat and streamS It was built for taconite, not for sulfide mining, at a time when they wanted tailings piles to leak so they would be less unstable. There will be no liner under the new sulfide mine tailings. This tailings pile will need to be treated forever, how do you put a cost and sureties on forever. •The tailings basin is proposed to be completely unlined, there is no indication that fractures beneath the tailings site would transport pollutants, which is completely unrealistic. Further indicating the high level risk we are going to take because of these assumption that the tailings site has no potential of transporting polluti

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mrs Nancy Solberg 1211 Archibald Ct Northfield, MN 55057-2808

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: It's legacy time, folks. If you approve a faulty water model, inaccurate water flow assumptions, and all the other problems inherent in the PolyMet NorthMet SDEIS, you will be sentencing current and future humans (not just Minnesotans.) to a legacy of poisoning in the foundation of all life, water. Not even close to worth the risk. Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone to assess the impacts of slope and dam failure at the mine site waste rock piles and the tailings piles, instead of just assuming that no failure can happen. (SDEIS, p. 5-546). PolyMet's tailings would be placed on top of huge, leaky and unstable existing tailings piles. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Nancy Songer 8010 275th Ave NE North Branch, MN 55056

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS understates the impact of the proposal on greenhouse gas emissions and does not account for reasonable mitigation measures for the carbon emissions associated with the project. The PolyMet SDEIS argues that the direct and indirect increase in carbon dioxide emissions from the project would be to increase Minnesota CO2 emissions by less than 0-5%. However, the project would rely heavily on electricity from the most coal-heavy electrical utility in Minnesota, and should be evaluated against the backdrop of Minnesota's goals to reduce greenhouse gas emissions 15% from 2005 by 2015, and 30% from 2005 levels by 2025- Over the proposed life of the NorthMet mine, its proportion of Minnesota's greenhouse gas emissions will increase, unless there are additional mitigation measures added to the mine plan. Please take the following actions: 1)Revise the SDEIS to specify the plant sources of electrical power drawn on by the PolyMet NorthMet project and the proportion of coal, natural gas, hydropower, wind, solar, and other forms of electricity generation. 2)Revise the SDEIS to consider on-site, carbon free alternatives like on-site wind and solar for a portion of the electrical power needed by the NorthMet project. 3)Revise the SDEIS to analyze the feasibility of purchasing electrical power generated by wind, solar, and hydropower for a portion of the electrical needs of the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I am also concerned about the Moose population impact and the effect on wild rice production. Nancy Youngdahl 3712 W. 57th Street Edina, MN 55410 Sincerely, Mrs Nancy Youngdahl 3712 W 57th St Edina, MN 55410-2332

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, NAOMI LITTELL 514 N 41ST ST PHILADELPHIA, PA 19104 US

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms Natalie A Carter 562 Maple Ave Newark, OH 43055-5936

Natalie Duncan 44813

Natalie Duncan 1740 Bohland Avenue St Paul, Minnesota 5516 How many years will it take to clean up the mess the PolymMet mining project is certain to create. Multiple organizations and individuals, from nonprofits to passionate environmentalists, have repeatedly warned on the cons if this project goes through. To name a few, the destruction of the habitats of Minnesota's wildlife, and the irreversible and indisputable damage to the nearby water sources. Are we really willing to pay the cost for small and short-term benefits. Some of PolyMet's stated benefits include the extraction of abundant copper-nickle and more job creation. The natural resources up north are rich, but the resources will not last forever. In fact, PolyMet has put out no information on how long the copper-nickle will last and when they will have to strike again. They also say that many jobs will be reared. In reality, it is only around 350 jobs and in the long-run these jobs are not solutions to the job crisis. The so-called benefits are flawed and outweighed by the cons.

Hello, My name is Natalie. I'm a student at the University of Minnesota, Morris studying biology and environmental studies. I have grown up in Minnesota, and much of my family is from the iron range. In fact, my family came to Minnesota in the first place because of mining jobs. While I appreciate and respect our Northern communities and the work that sustains them, I have also studied our Northern ecosystems. I completed my senior seminar this year on sulfide cycling in wetlands, and as a part of this process I analyzed the Polymet proposal and the ecosystems surrounding the proposed mine site. As you are well aware, sulfates and sulfides are incredibly toxic under the proper conditions, primarily in wetlands. If anything were to go wrong with this project as sulfides were to leak faster or in greater quantities than expected, the surrounding habitats would be forever lost. Sulfides are directly toxic to the parenchyma tissue of aquatic plants like wild rice. However, generalist species such as cattails are better adapted to toxic environments. Polymet admits in its plan that 1600 acres of wetlands will be impaired by the process, which will lead to the destruction of current habitat, but will also allow more invasive species to take hold, which will have impacts far beyond the 1600 acres. In addition, the fact that Polymet has asked the state to reconsider the sulfide standard, which has been universally accepted in the scientific community since John Moyle's discovery of sulfide toxicity in wetlands in the 1930s and 40s, begs the question of whether or not it is truly in Polymet's best interest to follow our state's standards. In addition, while the project will inevitably create jobs, the wild rice in its proximity also supports the livelihoods and cultural identity of hundreds of individuals. If this company impacts the wild rice, will the jobs be worth it. Secondly, the EPA estimates that Americans only recycle 25% of their electronics. This means that as we stand currently, there is no need to mine these metals. We already have abundant metals in our homes and in landfills. Before mining, why don't we set up better recycling programs (which would create jobs) and prove that we actually know how to use our resources before exploiting our fragile ecosystems for more. As a young person in Minnesota, I have fought tirelessly for renewable energy, pipeline regulation, and a cleaner, healthier environment. Minnesota has some of the best environmental regulations in the world, so we're in a great place to continue that tradition and to lead the country in renewable technologies. This company has no reason to carry on that legacy. I believe that at some point, the Duluth complex will be mined. So while I'm not inherently opposed to mining, this company is not the one to do the job. Minnesota has great regulations, but Polymet does not. Their subsidiary Glencore has a horrible human rights record as well as a poor environmental record. The company has no financial incentives to invest in keeping Minnesota clean and beautiful, to employ local workers, or to keep the money generated in our communities. At a recent Enbridge hearing, a commissioner on the PUC told the company "Minnesota does not need your company, you need our state." We don't need Polymet, they need our minerals. So to settle for a company with a terrible track record that has already asked our state to reconsider our standards seems crazy. Thank you for reading so many comments and allowing Minnesotans to be a part of this process, Natalie Hoidal

My name is Noah Shavit-Lonstein. I'm from St. Paul, Minnesota. And I would like to actually cede my time to someone not wearing a suit. And that is my friend Natalie Holdal. Hi. My name is Natalie Holdal. N-A-T-A-L-I-E, H-O-L-D-A-L. I'm a student at the University of Minnesota (inaudible). I want to thank the DNR. I think it's pretty cool that we live in a state where we can all get together in a room and talk like this. One of the things that is missing in this room is youth representation. And we anticipated that coming into this. A couple of friends and I this month came up with a youth petition. And over the last two weeks we have gotten over 500 student signatures against sulfide mining. And given that we the young people in this state inherit the consequences of this decision, I think it's pretty important to consider what we are saying. And when (inaudible) who pays for pollution, and that is going to be us. So I'm just going to give two of my personal reasons for opposing this. The first is, I admit I use a cell phone. I have a computer. There is a need for these metals. But these metals already exist. The EPA estimates that only 25 percent of our electronics are actually recycled. And so it seems a little bit wasteful that we are continuing to mine for more when we haven't figured out how to use the ones that we already have. Secondly, I am a biology student. And this last semester a seminar on sulfides cycling through wetlands. And one of the things studied -- I studied a little bit of the PolyMet proposal, but also impacts on wild rice. And the DNR obviously has more qualifications than I do as an undergrad to analyze that. But I found that wild rice is incredibly fragile. And if anything goes wrong with this proposal, the wild rice that brought people to Northern Minnesota in the first place, and that continues to sustain the livelihood and the cultures of thousands, maybe hundreds, of people, if that is destroyed, then this project is completely disastrous. And so a couple people have gotten up and said, "Minnesota has the best environmental regulations in the world. Why are we not doing it here if the alternatives are shipping it overseas?" And I would like to point out that Glencore, one of the primary investors behind this project, has a mine in Zambia where they are currently polluting the water. And so I just want to conclude by saying that these are huge risks that this project has. And I don't want to live the rest of my life dealing with those consequences, and neither do these 500 young people.

Natalie Obee

I do not support the PolyMet Mining Project in northern Minnesota. The other issues notwithstanding, the potential 500-year clean up and the undetermined nature of who pays for that clean up, are reason enough to not green light this project. Minnesota and its inhabitants are justifiably proud of our natural environment; letting business interests pull mineral resources out and leave us, the taxpayers, to foot the bill in the event of an environmental problem, is absolutely and completely irresponsible. Watching our state agencies and some of the public be swayed by the lure of a paltry few hundred jobs, is pathetic in light of the potential devastation this mine could bring to Minnesota. The economic sustainability of our natural environment and the tourism dollars that that environment makes possible should take precedent over any potential, short-term gains from the mine. I am a Minnesotan, born and bred, and I do not support this project. Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Natasha Villanueva

It is imperative that we protect our natural resources, if we don't we shall lose it! Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine dminage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federalland within Superior National Forest, and cumulative impacts, and support the No Action Altemative.

Thank you, I have additional concerns that there has been incomplete analysis of the impact of mining using real weather pattern models that include climate change. Aquifers can be affected when climate change is accurately assessed particularly when observed under a worst case scenario basis. Please analyze the impact of mining under the conditions of flood and drought that are an unpredictable possibility in the future as a result of unprecedented climate change. Thanks again Nathan Anderson Sent from my iPad On Feb 7, 2014, at 12:03 PM, "*NorthMetSDEIS (DNR)" wrote: Thank you for providing comments on NorthMet Mining Project and Land Exchange SDEIS. Feb 21, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS contains inadequate analysis of risks to public health from the proposal. The DNR should conduct a health impact assessment (HIA) to fully analyze the public health implications of PolyMet's proposed mine. Health impact assessments are a tool used in environmental review. The State of Alaska has adopted HIAs as a best practice for environmental review of mining and natural resources extraction proposals and has established procedures and a toolkit for conducting an HIA in that context. In Minnesota, HIAs have also been conducted as part of the environmental review for Minnesota projects, such as the Central Corridor LRT project in the Twin Cities. Please take the following action: Conduct a health impact assessment for the PolyMet project, and include the results of the assessment in the EIS. The HIA should include examination of all aspects of public health affected by the proposal, including analysis of the social determinants of health. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Please apply the same worst case scenario basis as is adopted by the EPA for the purposes of public safety and prevention of exposure to lead. Sincerely, Mr nathan anderson 3565 Rustic Pl Saint Paul, MN 55126-3038

The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Nathan Bronk 2019 E. 1st S Duluth, MN 55812 651 717 5084

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr Nathan Carroll 5129 Abbott Ave S Minneapolis, MN 55410-2144 (612) 850-3551

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Nathan Fritz 919 Birch St Niles, MI 49120-3118 (351) 025-1464

Nathan Indresano

Feb 6, 2014 Ms Lisa Fay MN Dear Ms Fay, While yes, I am jumping on a generalized note, I hope you take the time to read this message. I write you as a 20 year old college kid who, like most my generation, is being brought down apathy, brought on by a bleak future. When we think about our future, we not only have to fear high unemployment (a familiar economic problem), but we are faced with changing ecosystems that humanity will struggle to adapt to. A quick look around will show that we are already struggling to cope. Polynesian nations are planning evacuations. Places around the globe are regularly experiencing weather events that previously might not of occurred in a life time. Cancer rates and pollution related disease are ever rising. Many of my generation envision a dystopian future of great hardship. By preventing this sulfide mine from going ahead, you are helping make sure that we are actively pursuing a disastrous future. Better yet, when you make the right decision in the end, make sure to capitalize on the victory. Use the political steam to push Minnesota to a sustainable future. Help make a future that inspire the next generation not push it to hopelessness. Sincerely, Mr Nathan Indresano 1104 23rd Ave SE Minneapolis, MN 55414-2629

Nathan Keller

Dec 9, 2013 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible.

Nathan Peters

9538

Dear Commissioner Fay, I am writing to oppose the proposed PolyMet project. First, the SDEIS must be revisited and updated. New water modeling is absolutely necessary. Data from the 1980's is insufficient and useless for making accurate analyses and predictions about future water flows and pollution escaping from the mine site and rubble stockpiles. Perhaps we will have technology and means to extract these metals safely someday, but we are not there yet. Our freshwater and groundwater are far more precious than 20 years of mining. The complex ecosystems of Northern Minnesota have suffered enough from previous mines that already leak and pollute our water. This type of mining has never been done safely or well. 500 years of monitoring and water treatment are ridiculous burdens for the state to take on. The head of the parent company that owns PolyMet is Tony Hayward, the former head of BP. He is the chairman of CompactGTL. He was at the helm when BP committed the largest crime against the Earth and against humanity as its Deepwater Horizon rig burst into flames and spewed oil for months. In short, PolyMet cannot be trusted. Your own scientists have said that major parts of the SDEIS need to be re-done. Tell PolyMet "No." Tell them to go away. There are already enough resources for everyone. We do not need to mine more minerals from the Earth. We need to work on our distribution of wealth and resources. We do not need to poison and permanently pollute the precious waters and groundwaters of Northern Minnesota. At a minimum, please require accurate modeling with useful and relevant data. Please require PolyMet to set aside billions of dollars in advance for the hundreds of years of remediation. Please require PolyMet to be more careful when mining and operating. Thank you for safeguarding Minnesota's precious resources. Respectfully submitted, Nathan Peters 2616 Blaisdell Ave #4 Minneapolis, MN 55408 J.D. expected May 2015 University of St Thomas School of Law

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. National Forest lands belong to all the people of this country. They are vital to the preservation of the natural heritage of the United States which is the birthright of all our citizens, present and future. Far too much damage has already been done to the land and resources of this nation in the name of corporate profit. Whether the threat is fracking, the Keystone XL pipeline, or the Pebble Mine in Alaska, concerned citizens are ready to take a stand and say that enough is enough. We are prepared to speak out for wildlife, wild lands and all other aspects of our environment. No sulfide mine in the Superior National Forest - now or ever. Sincerely, Neal M and Linda S Adams 6 Hollow Oak Ln Brookfield, CT 06804-2511 (203) 775-2870

Ned Bouril

9787

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the entire experiment in the long-term, to ensure that the permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota, is otherwise never realized. This project would violate water quality standards for generations to come. Sincerely yours, Ned Bouril Ned Bouril 3618 Xenia Ave N Street 2 Crystal, MN 55422

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. To reiterate the spirit of many comments from previous public forums, the basic tenets of the current PolyMet Mine project and its inadequate SDEIS proposal beg credulity on an epic scale. Even if every proposed detail of every phase of this project were to be flawlessly implemented for even the first 100 years of the proposed 500, there cannot possibly be any reasonable belief that "we" could predict that the subsequent 400+ years of sulfide mining pollution remediation would continue without issues as planned. For example, in the SDEIS, the lack of any substantive financial assurances designated for any toxic seepage which may escape the mine site boundaries or its intended storage facilities should be enough of a red flag to halt and abort this excursion into the absurd. Settings aside the environmental, scientific, and public health aspects, just the logistics of this proposal alone are incredulous, as it has all of the earmarks of a classic "cut and run", in this case most likely realized by some form of an "unanticipated" bankruptcy, leaving not PolyMet, but the State's citizens to pick up the pieces financially. And on a geo-political level, is it not possible that the bulk of the extraction profits will not only be leaving MN but most likely the USA as well, via the mufti-national PolyMet parent investor Glencore and its partner Xtrata. And after trading 20 years of temporary employment for 500 years of toxic remediation, who, ultimately will benefit from this arrangement. And to those who piously declare that it is our own techno-centric culture which is the primary force driving the need for further exploration and extraction of these minerals so necessary to make our electronic gadgets (gizmos) run well, I would ask them to review current metal recycling technologies and their ensuing economies as implemented in many industrialized countries as well as revisit the phenomenon of commodity stock piling and the boom and bust cycles created by international commodity price fluxuations. Even a cursory examination of these latter issues may unveil what is really motivating multinational corporations such as PolyMet and Glencore. Globally, the world of the "extraction industries" has for decades been awash in technical mishaps, catastrophic failures, and the willingness to violate multiple federal, state, provincial, and local safety/health codes and laws, often resulting in the permanent devastation of pristine lands and/or natural resources and the toxification and displacement of local populations. Since the proposed PolyMet mining techniques have never been successfully implemented anywhere else globally, why would the MNDNR be willing to approve this pristine watershed to be ground zero for what is clearly an ill-conceived and unproven "experiment" in post-peak mineral extraction technologies. It is a shame that the Polymet engineers and the various governmental authorities providing oversight didn't first locate rich veins of logic and common sense as well as the minute percentages of target minerals they sought when first engaged in their exploratory drilling. I would ask you deny approval of this particular mine as planned in the SDEIS

Mar 10, 2014 Tim Dabney, USFS Dear Dabney, USFS, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the many problems with the draft mine plan, I believe that this mine should not be built as described. To reiterate the spirit of many comments from previous public forums, the basic tenets of the current PolyMet Mine project and its inadequate SDEIS proposal beg credulity on an epic scale. Even if every proposed detail of every phase of this project were to be flawlessly implemented for even the first 100 years of the proposed 500, there cannot possibly be any reasonable belief that "we" could predict that the subsequent 400+ years of sulfide mining pollution remediation would continue without issues as planned. For example, in the SDEIS, the lack of any substantive financial assurances designated for any toxic seepage which may escape the mine site boundaries or its intended storage facilities should be enough of a red flag to halt and abort this excursion into the absurd. Settings aside the environmental, scientific, and public health aspects, just the logistics of this proposal alone are incredulous, as it has all of the earmarks of a classic "cut and run", in this case most likely realized by some form of an "unanticipated" bankruptcy, leaving not PolyMet, but the State's citizens to pick up the pieces financially. And on a geo-political level, is it not possible that the bulk of the extraction profits will not only be leaving MN but most likely the USA as well, via the multi-national PolyMet parent investor Glencore and its partner Xtrata. And after trading 20 years of temporary employment for 500 years of toxic remediation, who, ultimately will benefit from this arrangement. And to those who piously declare that it is our own techno-centric culture which is the primary force driving the need for further exploration and extraction of these minerals so necessary to make our electronic gadgets (gizmos) run well, I would ask them to review current metal recycling technologies and their ensuing economies as implemented in many industrialized countries as well as revisit the phenomenon of commodity stock piling and the boom and bust cycles created by international commodity price fluctuations. Even a cursory examination of these latter issues may unveil what is really motivating multinational corporations such as PolyMet and Glencore. Globally, the world of the "extraction industries" has for decades been awash in technical mishaps, catastrophic failures, and the willingness to violate multiple federal, state, provincial, and local safety/health codes and laws, often resulting in the permanent devastation of pristine lands and/or natural resources and the toxification and displacement of local populations. Since the proposed PolyMet mining techniques have never been successfully implemented anywhere else globally, why would the MNDNR be willing to approve this pristine watershed to be ground zero for what is clearly an ill-conceived and unproven "experiment" in post-peak mineral extraction technologies. It is a shame that the Polymet engineers and the various governmental authorities providing oversight didn't first locate rich veins of logic and common sense as well as

Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: • The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs • The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. • The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. • The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the entire experiment in the long-term, to ensure that the permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota, is otherwise never realized. This project would violate water quality standards for generations to come. Sincerely yours, Ned Bouril Ned Bouril 3618 Xenia Ave N Street 2 Crystal, MN 55422

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. There is no evidence anywhere that sulfide host rock mining can be accomplished in an environmentally responsible manner. The minimum standard for Wisconsin metallic mineral mining in sulfide ore bodies is evidence of no pollution in ten years of operation and after ten years of abandonment. No permit applicant has been able to show evidence of either of these standards anywhere in North America. Mining pollution does not go away and compromises environmental quality for short term profits that do not benefit local communities. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Ned Gatzke 10498 Jancing Ave Sparta, WI 54656-4465 (608) 269-2033

Feb 14, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, I have concerns about the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. We are All Connected. Therefore, We are All AFFECTED. We're not only talking about the dangerous effects of Sulfide mining and Acid Mine Drainage in Minnesota, we are also talking about the affects it will have on ALL Other Surrounding and Connecting Areas, like Michigan and Canada. WHY would anyone want to destroy the very thing that sustains life. WATER is Priceless and should guards and protected. This Decision should not be based upon Profits to a handful of greedy evildoers. This Decision is a lot bigger and needs to be carefully considered. As it will surely painfully Destroy Our Planet and seal the faith of death to generations to come. I have grave concerns about this project's potential impacts on our region's natural beauty and resources as well as ALL walks of Life. After all, we all know there will always be some sort of "Human Error" to factor in AND IT's Not Worth the Risk. Facilitating PolyMet's destructive and polluting open pit sulfide mine is NOT in the Best Interest of the Public or our Planet. Do Not Allow this Dark and Destructive Force to Overcome Us. STAND STRONG Thank you. Neil and Cherie Billington Sincerely, Neil Billington 4031 Gleason Rd Waterford, MI 48329-1209

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Repair the errors and omissions. This is the precedent for perhaps many more . Take the time to do it right again. For as long as it takes. Plenty of poor stewardship worldwide as examples done wrong by same few multinational companies. Careful , thanks , Neil Gardner Sincerely, Neil Gardner 8069 Mark Lake Rd Side Lake, MN 55781-7401 (218) 254-3702

Neil Huppert

Sulfide mining has never worked without polluting. Why would we do this—particularly by a national treasure like the BWCA? The PolyMet pollution study is inadequate at best. No-no-no. Short term gains, long term disaster.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to provide a reasonable range of probabilities for liner leakage at the hydrometallurgical waste dump, rather than just assuming zero leaks forever. The SDEIS should also disclose the volume and level of contamination of this permanent, highly toxic waste facility. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. A friend of mine, an electrician, died from IT HAS BEEN ABATED ABUSED AND DISCUSSED AND LAWYER UP BOTH SIDES, going out of their way, they wait for the patient to DIE. AND DEVIDE HIS ASSETS AND AWARDS. Then there are no wittiness to the crime. PLEASE, Don't do it. Sincerely yours, NEIL STECKER 49739 153RD PLACE ISLAND LAKE TAMARACK, MN 55787

39329

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit [HYPERLINK "x-apple-data-detectors://0"500 Lafayette Road, Box 25](#) [HYPERLINK "x-apple-data-detectors://1"St Paul, MN 55155-4025](#) Miss Fay and Esteemed Colleagues, I am a wannabe techie from the millennial generation. I live my day with an expectation of instant gratification. I text my mom for an address while I'm at the postoffice. I call Jimmy Johns and in 3 mins I'm chowing down and watching the latest movie on Netflix. If it's an afternoon kayaking the river to a brewery tour I'm making reservations, checking the forecast, and getting directions to the kayak spot, while sending snapchat invites to all my pals. Then of course you look for the app that will do all of that for you. And if it's not possible with current technology – create an app for it. Create it being the real lesson of my generation. You do not have to accept the status quo, you can change it to suit your well-being, think of a better way, create a way to make it right. This is also the principal that needs to be considered for the NorthMet Open-pit copper, nickel and PGE mine project – commonly referred to as the sulfide mine. Is the technology there to reap the benefits of Minnesota's expansive mineral deposits while protecting the diverse but unique land of northern Minnesota. Based on the SDEIS, the answer remains no. On first reviewing the document and factsheet, my instant-gratification-mind thought, "not too shabby." With the proposal we will be gaining millions of dollars for the education system, we'll actually gain national forest property, and PolyMet promises to clean up – sounds like a win, for an instant. But the glaring statistic that is tainting the appearance of the "win" is that we are risking our land based on 90% models and predictions. The Water Quantity Fact Sheet of the NorthMet SDEIS states that, "Polymet would install and operate a system to capture at least 90 percent of the groundwater seepage at the proposed tailings basin and the permanent waste rock stockpile." Section 5-2-2-39 of the SDEIS states that, "the estimate total discharge rate of the flowpath groundwater into the Embarrass River is 292 gallons per minute." I acknowledge that I am not a statistician however: 292 gallons per minute for the 20 year duration of the proposed NorthMet Mining Project and Land Exchange is equal to 3,069,540,000 gallons of flowpath groundwater into the Embarrass River. All fine and good, but as the models PolyMet is using to support their environment protective strategy are based on 90% assurance. This leaves 10% up to chance. 10% is equal to 306,954,000 gallons of water that the proposed models are leaving up crossed fingers and high hopes. 306,954,000 gallons just of the flowpath groundwater into the Embarrass River, this doesn't even include the rate into the tributaries. 10% of groundwater seepage that the company is saying they have no means, or no interest, in capturing, and that coming from a junior mining company that has never operated a mine before. Pardon the jargon of my generation, but WTF. Why the first. Where is an example of a large-scale surface open-pit sulfide mining project that has operated effectively, protected the natural surroundings, and not left tax payers with the clean-up burden for unknown centuries to come. Please, let's not make Minnesota the guineau pig in this project. Let's wait for a proposal that can uphold the instant ideal of my generation. When the mine closes, after 20 years of operation, that should be the end of it. If the minerals are worth enough to the Swiss-based Glencore company and Canada's PolyMet, they should create the technology that allows instant purification of byproducts to a environmentally stable state. If the company is about to put billions of dollars on the table to harvest 1% of what's in Minnesota's treasured northland, they should be willing to put a little mor

To Whom it May Concern: As a local citizen, business owner, and engineering professional, I am keenly aware of the opportunities, sensitivities, concerns and benefits that are being debated by the impacted communities. After careful review of the Supplemental Draft EIS report, I am writing to demonstrate my support for Polymet's Northmet project. Minnesota is a state with a strong tradition of responsible environmental protection and responsible resource development. These two values are not mutually exclusive, but have a demonstrated history of integrated success over 100-years. The regulatory structure, compliance management, and strong values of the people of this State give society the opportunity to develop a much needed resource to responsibly serve the needs of local, national, and international Society. Specific to the Northmet Supplemental Draft EIS and non-ferrous mining in general, the State of Minnesota, after much thought and debate, implemented regulatory standards for these activities within our borders. The Federal government has regulatory standards that further measure impacts and compliance for these activities. These regulations and the best available science and planning processes are the tools Society uses to measure the impacts and benefits. As an Engineering Professional, and citizen of this region, involved in the study and planning of resource projects around the world and the Northmet project locally, it is my belief that the science of the study and its reflection on the natural environment and communities of the area reflect the best available science, engineering, and impact/benefit analysis available to the process. The people involved in the process are not just experts in their fields, but have a further personal interest in ensuring the development of these resources are done to protect the interest of their families, communities, and the environment that sustains us. Polymet's Northmet project is an example of successful development balanced with sound planning and environmental sustainability. To that end, I strongly support the projects Draft Supplemental EIS. Sincerely, Nels J. Ojard 4976 Pike Lake Place Duluth, MN 55811

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, nelson myers 2802 george st harrisburg, PA 17109 US

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely Woody Gilk Newood Gilk 698 West 5th Street Grand Marais, MN 55604 218-461-0465

Being a Minnesota native, I have an inherent love for the beauty and nature Minnesota has to offer. Planning to mine is a terrible idea for a number of reasons. One main reason is the risk you are putting towards harming the boundary waters, which are a huge aesthetic haven for both Minnesotans and people visiting Minnesota. The boundary waters are no doubt the crown jewel of the state of Minnesota. Now, apart from this being a horrible idea ecologically, it is also a horrible idea economically. This would only provide about a hundred jobs for about twenty years, then what is to happen after that. Also, you say you will monitor the mine for about 200 - 500 years, where will this money come from. There's no possible way to predict the price of monitoring 100 years from now, so there's no possible guarantee you can give that you will have the money to do so. Please, do not begin the mining process in this beautiful state of Minnesota. Sincerely, Nic Kramer (Prior Lake High School, Senior)

Mar 12, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Thank you for providing this important opportunity to comment on Polymet. I have significant concerns about Polymet and copper-knickle/sulfide mining. My connection is quite strong. While my address on this form is St Paul, my family is from Ely, MN, and Silver Bay, MN. My grandpa is the former president of the Reserve Mining Company; he and my great-grandfathers mined in NE Minnesota. I know mining well and understand the "need" in the Arrowhead. However, I also understand that sulfide mining is drastically different than taconite mining, and that our waters are in jeopardy. And my family understands this, too. My grandpa passed away last summer and now my family is trying to figure out what to do with the cabin that he and my grandma own, which my great-great-grandfather built in the 1920s. I have spent a considerable amount of my life and disposable income on the cabin and in Babbitt and Ely; I've even lived at the cabin for periods of time over the years. My family treasures this place I can't underscore this enough. We really want to keep it in the family, but most of my extended family is so afraid to own property on Birch Lake because of the sulfide mining. And now the cabin is on the market with the hopes that we can cash out before the cabin is worth nothing or very little. Already we hear from our realtor, Wendy Johnson, that buyers are turning to other areas because they're reading the news about the pending mine. I've seen very little in the news about the affect sulfide mining could have on area real estate. While my example is anecdotal, I believe it speaks volumes. My fiancé and I have been toying around with buying the cabin ourselves. We could pull this off, but we're in our ear

54545

My great great grandfather built my family's cabin on Birch Lake outside of Babbitt. I have spent a solid chunk of my life on Birch Lake. From a nostalgic/family history AND real estate perspective, is the state confident that our cabin/Birch Lake are safe? How? I'm very concerned.

Nicholas Bowlin

Ms. Fay, I'm writing because I think the BWCA is special and that the Poly Met mine poses a serious threat to the wilderness of Northern Minnesota. It is largely untouched by humans, and there are few places like that left. I encourage you to do whatever you can to block the Poly Met Mine.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Nicholas Eltgroth 36399 Burr Oak Blvd Cohasset, MN 55721

43321

Stop Polymet now. The pollution they will generate will destroy our water and the surrounding land. Please read the studies about ground water leakage and how it will destroy our drinking water. Sincerely, Nicholas Eltgroth, Cohasset, MN

Dear NorthMet, ****This specific email will only address your reclamation process.**** I understand that your company has proposed a copper-nickel mine in northeast Minnesota. As a lifelong resident to the State of Minnesota and an Environmental Science undergraduate, I **STRONG OPPOSE** the construction of your mine and any additional facilities. It is well known that there are serious environmental hazards associated with mining operations (eg, acid mine drainage). I noticed the proposed mine site is situated among, and completely surrounded by, a number of lakes, streams and other tributaries. Could you please explain how "capturing and treating affected water using mechanical and/or non-mechanical methods for as long as needed" will truly protect surface waters located near the site, and how far off site will monitoring take place. Also, could you please define "as long as needed." It is imperative that there is a legal definition for "as long as needed." In the unfortunate event that your company is granted a permit, citizens must be able to hold your company accountable for contaminating surface waters and potential sources of ground water. We as citizens must fully understand the criteria NorthMet will follow when determining the adequacy of your treatment techniques. Additional questions: 1- What type of vegetation will be planted in the reclamation areas and will it all be vegetation native to Minnesota. 2-How effective or what is the efficiency of the "covers" that will be used to protect water seepage from getting into the rock stockpiles, tailings basin, and hydrometallurgical residue facility. 3- What is a hydrometallurgical residue facility. 4- How will storm water be managed to prevent erosion and pollution flowing off site. 5- What kinds of pollution, toxins or other harmful chemicals could potentially become released into the environment (please supply list). 6- What will be done with the demolished buildings. 7- Regarding the destruction of wetlands, what is the approximate size in hectares that your company intends to destroy. 8- How does your company intend to "establish new wetlands." 9- According to your financial assurance plan, you estimate that roughly \$200 million will adequately compensate environmental contamination and the destruction of numerous ecosystems How did your company determine \$200 million would be adequate. What method did your company use to place a price on nature. 10- Define "environmentally acceptable condition." 11- Define "free of hazards" (because it is obvious that the site will not be truly clear of hazards regarding environmental pollutants). 12- Will you be mining in an aquifer or groundwater. 13- How will the water be captured for treatment. 14- What additional methods will your company employ to minimize hydrological impacts. 15- Regarding erosion, in what quantities or volumes of sediment does your company anticipate could potentially contaminate surface water. Sincerely, Nicholas James Stephan 209 Center Street Mankato, MN 56001

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Environmental Committee, I urge you to decide against copper-nickel mining in northeastern Minnesota. I cherish the woods and waters of the northeastern Minnesota, a connection I know is shared by many around the world. But protecting some of our most prized landscapes is not only about those who know its value, it is about protecting the resource for those who have yet to discover it. As a user of products that require copper and nickel, and as a geologist who has worked on copper mines, I understand that metal extraction must occur. But it is also important that we consider the costs of extraction and realize that our demand must be met pragmatically. Certain landscapes, like those of northeast Minnesota, are too sensitive to the negative side effects of sulfide mines. The risks are just too great. This decision comes down to values, as well as numbers. At face value, the numbers alone demonstrate the disparity in costs and benefits of proposed mining. The enormous amount of money proposed to be held for future cleanup alone demonstrates the environmental risks. When compared to the relatively few jobs created, it is clear Minnesotans collectively stand to lose much more than they will gain from mining. You have a difficult and momentous decision ahead of you. Your decision will set a precedent for sulfide mines proposed in northern Minnesota's future. Therefore, the burden of proof that mining will cause no lasting harm must be greatest now. The negative effects of deciding to allow sulfide mine will only compound into the future as more mines are developed. Thanks for your careful consideration, and for your work in protecting Minnesota's land, air, and water. Sincerely, Nicholas T Legg 5258 N Commercial Avenue Portland, Oregon 97217 [HYPERLINK "mailto:ntlegg@gmail-com"ntlegg@gmail-com](mailto:ntlegg@gmail-com)

Dear DNR, I am opposed to this project. Though I understand the short term benefits for the economy and the jobs this project would provide, the long term effects will have a negative impact on the environment, and these negative effects far outweigh the positive ones. The beautiful natural resources of Northern Minnesota, including the BWCA and other protected forests are the most valuable resource for the Northern Minnesota region. The perennial tourist dollars these natural wonders bring must not be put in jeopardy. A benevolent denial of any requests to mine the area is urgently needed. Copper mining unleashes hazardous materials for hundreds or thousands of years and will pose a direct threat to the natural wonders, the tourism, and the economic viability of the region. No short term get rich scheme is worth those negative consequences. If people need jobs, then lets find a way to get them jobs preserving the environment, rather than destroying it. Why destroy the area for some precious metals under the ground. Once the precious metal is gone we will have a cesspool that poisons the surrounding area, and no techniques for being careful or mitigating the leaching of hazardous material will be successful enough to prevent that from happening. PolyMet either has false hope or is lying if they think they can prevent this. Citizens have a legitimate need for jobs, but those needs do not justify the destruction of the natural area that provides plenty of jobs and economic benefit for the local area already. Do you really think this company will be around to pay the bills for cleanup 200 years from now. Does the Hudson Bay Company or the Dutch West Indies company still pay for their mistakes or wrongdoings. NO. Please DENY the PolyMet/NorthMet Mining Project and Land Exchange..

***** Also, I don't know what the mission statement or motto for the DNR is, but I think it is weird that it seems the DNR is always working hand in hand with people or organizations that threaten to destroy the natural resources of our great state. The first objective of the DNR should be preservation. The DNR should not be the facilitator that provides access to destroy everything, or kill everything. Stop holding hands with these people. I don't care what economic benefits you think this will bring, and you're lying to yourself or lying to the public if you think this mining project is worth hundreds of years ruin.

***** Thank You, Nicholas Loch Minnesota Resident 7328 Fremont Avenue S Richfield, MN 55423 [HYPERLINK](#)

Mar 11, 2014 Ms Lisa Fay MN Dear Ms Fay, I am a great advocate for Minnesota and all that it has to offer. In fact, I think it is a hidden gem. After years of travel and residing in other places, I am happy to call Minnesota my home again and the place I have chosen to raise a family. It brings me great concern to think that the Minnesota and the BWCA is going to be threatened by a short sighted mining project that uses job creation as its major selling point to our state. I can think of a lot of other places in which job creation would have a greater overall impact to our state and at the same time directly improve our environment. As the father of two small children, I want to make sure that Minnesota's waters, especially those of the BWCA are kept pristine and clean for their enjoyment and exploration. Let's consider the gift we have been given by the leaders of this state before us and pay this gift of clean water and wilderness forwaRd On a related note, this is also a racial justice issue. The direct impact on wild rice should be enough to stop this project immediately. Let's not continue our legacy of racial injustice by destroying a sacred food source of our Ojibwa community. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Mr Nicholas Olson 61369 223rd St Litchfield, MN 55355-5801 (320) 693-5502

My name is Nick Balcom Raleigh. N-I-C-K, B-A-L-C-O-M, R-A-L-E-I-G-H. I'm a futurist facilitator. I'm the founder of Future Space, an organization that promotes futuring literacy among people. This is the largest group I've ever facilitated any sort of exercise with. But I'm going to invite you to participate in a exercise that I've made for this specific moment. A specific intersection of possible futures. There are many. There are some that are dire. There are some that are beautiful. They all exit right now in this moment. So if you are willing to come along with me for this ride in two minutes, I invite you to close your eyes and follow along. I would like you to imagine what is happening 12 months from now in your life. What are you doing? Who are you with? Where do you live? Who is around you? Now I want you to imagine five years from now. What are you doing for work? Who is around with you now? What is PolyMet like to work for, if that's what you're imagining? How pristine are these environments, if that's what you're imagine now? I would like to fast forward a little bit. A little faster. You are now elderly, if you are not now. It's 2030. What is happening now? Are you retired? Do you have grandchildren? Do you have people that you care about in your life? What is the environment like? What is the weather like? What is the climate like? Do you have any technology and devices around you? Do you have electricity? I want you to imagine these things for a moment. Now I'm going to fast forward us even further to a scarier year. The year 2100. It's only scary because we're not there. I want you to imagine who is there. Who are these future people? You may know some of their relatives. You may know some of them. Some infants might live that long. What do you imagine that they are doing? What messes are they cleaning up? What work are they doing? What governments do they have? Do they vote? Do they cybernetically connect with each? How do you imagine this world to be? Now fast forward again to 2514. These are the decedents of these people that you imagined earlier. What do they do?

Nick Bougalis

Nick Boyd

3959

Hi DNR. Thanks for taking comments from the public. I'm glad it is an important part of the review process. My comment is as follows: Based on a 2010 survey of US miners' salaries, providing 360 jobs over 20 years would yield a total of about \$275,000,000 in pay. The cost of cleanup to taxpayers of similar sulfide mines across the United States in several cases has surpassed 225 million dollars. The ecotourism that this region benefits from could also be negatively affected in the long run. With all these points considered, is the allure of the monetary benefits of sulfide mining still validated. Nick Boyd 4900 Otter Lake Rd White Bear Lake, MN 55110

The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

To Whom it May Concern, I would like to add to the public record my opposition to the PolyMet copper-nickel mine in Northern Minnesota. This whole thing is ridiculous and short sighted. The investors will benefit the moSt The locals that work on the job may benefit for a little while, however, in the long run this project will have a disastrous impact on the natural wonders that are the most important economic resource for Northern Minnesota. No mitigation of the negative effects from copper-nickel mining will be enough to prevent this. Just leave it alone. I don't care if the negative effects last 20, 200, or 2,000 years. The idea is to keep untouched pristine areas that way. We aren't fighting WWII here. We aren't trying to win a war with taconite mining that will build tanks. Business prospectors in Europe and the US are trying to exploit the land for raw materials with no "true" care for the negative effects that will come from it. My faith in the DNR actually protecting anything is non-existent. How many hunters, cronies and businessmen have weaseled their way into your ranks. Just stop. Stop man from destroying everything. Nicholas Loch 7328 Fremont Avenue S Richfield, MN 55423

10704 Prescott Ct. Burnsville, MN 55337 Ms Lisa Fay EIS Project Manager MDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 March 13, 2014 Dear Ms Fay: This letter is to comment on the NorthMet Mining Project and Land Exchange, Supplemental Draft Environmental Impact Statement (SDEIS). I have several major concerns about the proposed mining project and land exchange that were not fully analyzed and discussed in the SDEIS. A major concern is the proposed land exchange of 6,650 acres of federal land with up to 6,722 acres of privately owned land of a combined equal value, located within the 1854 Ceded Territory in Minnesota. As was stated in the Executive Summary, the US Forest Service (USFS) does not believe that the mineral reservation gives PolyMet Mining, Inc. (PolyMet) a right to surface mine National Forest Service (NFS) land to access the minerals. Allowing private surface mining would be inconsistent with USFS legal mandates for acquiring and managing these lands. This legal issue must be resolved prior to the project being authorized by the USFS. The inconsistency as stated by the USFS is not acceptable without resolution. PolyMet intends to exercise private mineral rights that were reserved when lands for the Superior National Forest lands were conveyed to the United States and now PolyMet is proposing to develop a surface mine. The USFS has taken the position that the mineral rights that were reserved do not include the right to surface mine as proposed by PolyMet. Also of concern, is the approval by the Iron Range Resources and Rehabilitation Board (IRRRB), of a \$4 million loan to PolyMet for the acquisition of both a 5,272-acre tract of land and a 32-acre tract of land, both of which would be used for a proposed land exchange with the USFS to allow surface mining of non-ferrous materials near Hoyt Lakes, Minnesota. As the IRRRB is under control of the Minnesota Legislature, it is inconsistent with the both the National Environmental Policy Act (NEPA) rules and Minnesota Environmental Policy Act (MEPA) rules that significant monetary resources have been put towards the development of this proposed project by PolyMet prior to a Record of Decision by the USFS and the US Army Corps of Engineers; along with the Minnesota Department of Natural Resources. The information regarding financial assurances for the proposed project are inadequate for the purposes of making any decisions regarding mine operations and closure in the SDEIS. Simply stating that the engineering and design planning required to calculate a detailed financial assurance analysis was not available in the SDEIS and would be done during the permitting stage makes a huge assumption about the ability of PolyMet to mitigate land and water pollution should the project get approved. The preliminary cost estimates for mine close do not appear to be based on actual data and the time frames used (up to 20 years) are conjecture. In the Economic Assessment of the Underground Mining Option, a 2012 report was quoted as concluding that underground mining would not be economically feasible. This conclusion seemed only to be based on metal prices and similar operations elsewhere. No information was provided in the SDEIS that valued the impacts to recreation on USFS lands both at the project site and within the nearby federally designated wilderness area (ie the Boundary Waters Canoe Area Wilderness). As opportunities for quiet and primitive recreation becomes less available, the economic analysis must include these values. Canada lynx, which are currently listed as federally threatened under the Endangered Species Act (ESA), were documented in 2010 by the USFS and the US Fish and Wildlife Service (USFWS) within the proposed mine site. Only the USFS was mentioned by the SDEIS. In 2013, the USFWS proposed the northern long-eared bat for listing as endang

Hello, I don't appreciate that the Polymet website puts default words into my message. I wanted to comment that the Polymet website's tone and phrasing, to me, complicates the issue. As it's currently posted, Polymet is not appearing to display a cooperation with the DNR, EPA, or MPCA, at least it's not apparent enough. I feel this way because the site's terminology doesn't directly reflect theirs. I shouldn't have to scrounge around the website in a confused state to find concrete ways they're following up on environmental standards. Instead, there are phrases like "major milestone reached" that seem to carry a sense of authority but come out of thin air. I want to see, right up front on the Polymet website, concrete, set dollar amounts of how much money they're putting down upfront to protect Minnesota's environment. This should be coupled with a set number of years they'll stay committed after the mining project concludes. Something else that would be beneficial would be a statement of their in-depth ecological understanding of the area. However this understanding mustn't simply come from a Polymet expert, but should be documented to be in cooperation with the DNR, the EPA and the MPCA. Again, having all of this more easily accessible on the main page would be the best case scenario, and much more respectable as the decision-making process moves forward. Because this level of concrete assurance is needed, I feel that if pressure is placed to get it posted on the website, it will have added incentive to be a reality behind the scenes as well. As for the DNR, please don't proceed with the mining project until such concrete details are pinned, with liability and accountability to back them up. Lastly, I'm not sure as to the origin of Polymet, but with Twin Metals LLC being a Canadian and Chilean company, I would respect a completely US-based, Minnesotan company to carry out such projects. Thank you for your time. Nick

The proposed copper-nickel mine is short sighted thinking and I oppose its development. The risk to water quality is too high no matter how much metal is in the ground. That metal will be used for some electronic gadget for someone today and generations of people after will be left with the pollution from its extraction. What's the rush anyway. Copper does not spoil if left in the ground. Maybe someday a truly safe way to extract it will be developed. At the moment, the technology that the mining companies use has proven to make its shareholders rich and the local people and environment poorer afterwards. The jobs it creates will come and go as all the others have and they will lie to the workers about their safety and their families safety. The people who do the work will be taken advantage of and the people giving the orders will profit heavily. That is not what Minnesota represents and that is not what I want my tax dollars supporting. Again, I oppose this mine and any other copper-nickel mine that might be proposed. Nicklas Sandstrom 41942

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Nicklas Sandstrom Chanhassen, Minnesota

Nickolas Felten 40201

Hello, I like many other Minnesotans want to voice my humble opinion about the PolyMet Sulfide Mine proposal. Yes, the mine will provide more jobs. However, I believe this is a very short sighted view. After all, cleaning up the poisoned waters of Norther MN will provide jobs too. I simply wish to say that I am wholeheartedly against the proposal allowing PolyMet to open new mines. I believe that such mining activities will put a great Minnesotan treasure, known as the Boundary Waters, in great jeopardy. Once ruined, these freshwater ecosystems cannot be brought back quickly and easily, if ever. Please consider the long term effects that PolyMet will have before allowing them to mine and then regretting the decision for generations to come. Thank you. Nickolas Felten 995 Jefferson Commons Circle, St Paul, MN.

I am a senior at Como Park Senior high in St. Paul and we had a speaker in our AP Environmental class about the mine they are thinking about putting in and I don't think it is a good idea. The Boundary Waters is a beautiful place that has many tourists and it brings people from all around. The mine might make the waters dirty and not as beautiful.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Nicole Hamilton stanley rd Bloomington, MN 55437

To Whom It May Concern, I'm concerned about the wild rice and the fact that that area has a lot of water ways. I respectfully ask please, please, do not move forward with the Polymet mine. Thank you, Nicole Hendrickson 5722 Bemidji Ave #b Bemidji, MN 56601 Phone: 612-913-6603

Nicole Johnson 19924

Polymet could potentially ruin the forests of the animals that inhabit in this area, we are already really low in moose numbers and with this proposed mining it could really effect numbers more. There are also health effects that will increase in this area in which we have a clean environment; this will cause the tree huggers of this area which is a high number to not want to be here anymore. I am not a tree hugger by any means but I don't want to be breathing in harmful chemicals. We will be breathing in increased mercury emissions, have exposure to asbestos-like mineral fibers, lead, and arsenic from copper mining. I feel it would not be best to do this in Northeastern Minnesota, I love living here and enjoying the outdoors and I do not want this experience ruined. Thank you for your time, Nicole A Johnson 1718 8th Avenue Two Harbors, MN 55616 Nicole Johnson Technical Services Analyst 1 (218)726-2238 [HYPERLINK "mailto:johnsonn@stlouiscountymn-gov"](mailto:johnsonn@stlouiscountymn-gov)johnsonn@stlouiscountymn-gov

Nicole Lindberg 9709

I am writing regarding the PolyMet NorthMet environmental impact statement, which, in my view, is inadequate and demonstrates unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet 4 fundamental clean water principles (principles the mining industry previously agreed to). 1) The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. In addition, the model used to predict impacts to water quality significantly under-represent pollution risks and used inaccurate conditions for water quality surrounding the mine site, demonstrating an unreliability in accurately predicting future water conditions. 2) The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. As recent history demonstrates, accidents happen, and having a plan in place is a small start at safeguarding our natural resources. 3) The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. Millions of tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. Not to mention the pit "lake" and the lengthy network of pipelines that would need to be monitored and maintained for hundreds of years. 4) The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about who will pay for and be responsible for it. It can be assumed, that it will end up being the taxpayer, as it is hard to imagine how the company could be held responsible for centuries of costly water treatment, or how the public will be protected from liability. Please protect the longterm livability of our State, and not be blinded by short-term jobs. Truly, Nicole Lindberg 5729 Oliver Ave S. Minneapolis, MN 55419 612-929-2188 (cell) 612-207-8489 [HYPERLINK "mailto:nicole.lindberg@comcaStnet"](mailto:nicole.lindberg@comcaStnet)nicole.lindberg@comcaStnet

Nicole Nordman 54198

I strongly disagree with you letting them start mining. This is a beautiful place and if you mine here you'll be taking away the beauty. Many people enjoy the boundary waters; mining here will make this place somewhere nobody wants to go. This is a popular place by mining here you'll make this place somewhere people will not want to be around. We drew lines on a map saying that we wouldn't mine here, that we'd keep this place clean. We can find other places to mined but we may not find another place as beautiful and as pure as the boundry waters. The effects of mining will destroy the river and the economy around there. You'll be digging really deep for something we don't need all that bad. I'd rather have beautiful landscape. We need to think about more then just money, we need to be thinking about what we're doing to our economy. Please take this into consideration. Thank you.

Nicole Ogborn 44594

Hello, I am a young adult in the great state of Minnesota, and I personally feel that the Polymet copper-nickel mine is not a good fit for our state. We are constantly releasing a large amount of harmful toxins into the atmosphere, and adding another mine would do exactly what we're trying to prevent. Although positions for the unemployed are important, and mines as well, I feel as though there are already enough mines in the area. Is there an absolute need for this mine, or can we try to procrastinate our somewhat clean air for just a tad longer. As a high school student, this subject is extremely important to me, and I greatly appreciate your time and consideration. Prior Lake Student, Nicole Ogborn

Nicole Sippola 57351

Nicole Sippola. I am against the PolyMet mine proposal despite their promises that they will be funding the cleanup. I find it difficult to trust that they will be there for the next 500 plus years, funding cleanup that may or may not be complete inside that amount of time. The proposal clearly states that our water will be contaminated for at least that long, too, if not longer. Reading through the 200-page proposal, there are areas of pollution where it clearly states the status is unknown or there has been, "no action to date." Is this something that we are willing to leave our descendants with? Our world is in need of care. By adding to the pollution with our planet, we will be the ones responsible for the destruction of our planet. As a Minnesota native, I have grown up enjoying the outdoors, swimming in our many lakes and streams, as many others have done. I want to be able to share this love for the environment we live in with my children and grandchildren and I want to see this passed down for many generations to come. To think that these precious resources are at risk of being lost in exchange for 20 years' worth of jobs and only 25 percent of them promised to local Minnesotans is heartbreaking to me. While I understand that times are tough right now for many people, the fears that I have heard expressed that without the mine, these towns will become ghost towns, will be inevitable if this mine is built. With the amount of pollution that it will cause in the water and the wetlands of these communities, it will be more devastating for years to come. Can we, as a community, rise up against the pollution of our water and of our wetlands and stand up for something that cannot stand up for itself? I encourage the DNR to rethink the destruction that this mine would cause. Please do not let it happen. That's all.

Nicole Swensen 44604

Hello, my name is Nicole Swensen, I am a senior in high school. I believe that mining the area near the boundary waters would be a very bad idea. That area needs to be preserved. If we mine that area, we only get twenty years out of it and have 200-500 years of cleaning it up. Tell me if I'm wrong but doesn't that sound crazy. A beautiful Minnesotan area will be turned into a mine that can possibly pollute the boundary waters, a beautiful place where people can visit. Let's keep the mine away from the boundary waters because it is not needed. Let's preserve Minnesota's beauty instead of killing it. Sent from my iPhone

Nijah Williams 54215

Dear DNR, please do not go through with Mineing the Boundry Waters is a big part of the community Many people like to go there to get away from there everyday lives. There are many different wildlife and if this goes through they will have no where to go Also mineing will cause a lot of pollution in the environment as shown in other places So we the students of como park senior ask that you do not do this kind of mining and not pollut our water with sufferic acid.

Nikki Crow 18120

My name is a Nikki Crow. N-I-K-K-I, C-R-O-W. I bet you think I'm here to talk about wild rice. Nope. What is missing from the SDEIS is a socioeconomic impact (inaudible). I'm talking about the rise in sex trafficking and with that an increase the need for increased policing and education of police when called to help prostituted victims and victims of sexual violence and for sexual assault nurse examiners to be available, including housing for victims will be necessary. This is a quote from (inaudible). It is generally believed that human trafficking is a human rights abuse which fundamentally (inaudible). The reality today is sex trafficking is a mining issue and an environmental issue. How would PolyMet work to protect the vulnerable population of the communities they will be moving in? How will they help fund the organizations that work to help victims of trafficking and rape? How will they help to educate employees? The SDEIS is not complete until these impacts are addressed.

Nikolas Bayuk 38118

I believe the environmental review process has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all state and federal regulations. Minnesotans have a history of solid and safe mining practices and there is no reason to think this project would be any different. Polymet has passed the strong regulations set by all of thier regulators and this should go straight to approval to start work. The Iron Range needs these jobs, the surrounding area's will benefit from the revinue, and the country will benefit from the resources. Thank you for your consideration, Nikolas Bayuk Nikolus Bayuk 12 E Faribault St Duluth, Minnesota 55803 The views and opinions expressed in this message my own. I am solely and individually responsible for the content. This is not intended to represent or reflect anyone else's views or opinions, including those of my employer, ALLETE, Inc.

nino ritchi 40373

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, nino ritchi musketrue 54e maastricht, ot 6218TW NL

In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Nissa Manley Plymouth, Minnesota

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Nissa Sandley 2719 S 8th St Minneapolis, MN 55454-1412 (612) 386-9299

I ask you to oppose PolyMet's proposal for sulfide ore mining in the Superior National Forest at the headwaters of the St. Louis River. They plan to excavate or fill 900 acres of wetlands directly during mining, while indirectly draining or poisoning (with wind-blown toxic metal dust) an additional ten square miles of wetland habitat in the area. The mining will leave square miles of talcum powder-fine waste, piled high. Unlike taconite, sulfide mining waste, when exposed to air and water forms sulfuric acid. The acid will leach toxic metals such as mercury, copper, silver and nickel from the waste rock. PolyMet suggests that to prevent pollution of the St. Louis River watershed they will collect the hundreds of millions of gallons of rain and snowmelt waters that filter through the waste every year and run them through water treatment plants ... for up to five centuries. The risk of long-term negative impacts to the wildlife and people of Minnesota is reason to oppose this project. The cost liability for cleanup over centuries is also a great cause for concern. Please oppose this project.

Lisa Fay, EIS Project Manager MNDNR Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road, Box 25 St. Paul, MN 55155-4025
Dear Ms. Lisa Fay, EIS Project Manager: I am writing concerning the EIS mining project. I am 13 years old and in the 8th grade. I have read the documentation on your site and do not think the project is a good idea. On the surface, the plan sounds great. It first appears that many new jobs would be created and that everything possible would be done to protect the environment. However, upon reading the material, there is no solid documentation of how long the clean up after the project would last, exactly what it would entail, and what if there are more issues than are predetermined? I think my biggest concern is your plan to borrow water from Colby Lake if there is a shortage. As stated in your facts document, shortfall in water requirements would be made up by withdrawing raw water from Colby Lake using an existing pump station and pipeline. What happens if there is a problem with the existing pump and pipeline? What happens if they break? How do you then make up the water shortage? What other source do you have as a back-up? I understand the computer models showed it the water requirements would effect the area, but there is no way this can be guaranteed. Colby Lake, as stated in the fact's document has many tributary streams. This project could have negative effects on all of them if there are any problems. My other big concern is how this project will effect the wetlands. At a minimum if damage, Polymet, is required to replace only 913 acres near, but not on the project site. Also, the document doesn't cover how the wildlife of the wetlands is affected. It only covers the seepage, waste rock, overburden stockpiles. In summary, it seems to only cover the fragmentation of the wetlands, not how it could actually hurt the wildlife of those wetlands. In summary, I am for a project that will create jobs because I understand there is a great need for jobs in this state and all other states. However, I am not for destroying the environment without more documentation on how it will affect water quantity and quality. My other concern is how the wildlife in the area will be affected. Overall, I am not for this project. I don't think there are enough solid facts to show that the environment will be unaffected or noticeably unaffected. Thank you in advance for considering my opinion on this project. Sincerely, Noah Filla

Noah Shavit-Lonstein

58149

I think it is absurd to destroy five centuries of water for 360 jobs (or less) that will disappear quickly. As our state auditor has said, we cannot afford this mine.

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. No no no. no If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Ms noelle olson 2016 Yorkshire Ave Saint Paul, MN 55116-2588

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site.

The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Nora Nell Hamburge 1752 Montreal Ave St Paul, MN 55116

Dear Ms Fay, Dear Mr Bruner, Ms Fay and Mr Dabney, I'm writing to ask you not to let the PolyMet NorthMet sulfide mine destroy irreplaceable wetlands in the Partridge River watershed of the Lake Superior Basin. My comments are made both on the PolyMet SDEIS and the Army Corps "Section 404" Clean Water Act Permit that would allow wetlands destruction in the Superior National Forest. PolyMet should not be allowed to destroy high value wetlands in the 100 Mile Swamp and the Partridge River headwaters for its open-pit sulfide mine. The SDEIS admits that PolyMet would directly destroy 913 acres of wetlands and as much as 7,351 acres of wetlands due to air and water pollution, mine dewatering and diverting water from wetlands. That could be the single largest wetlands loss ever proposed in Minnesota in the history of the Clean Water Act. Wetlands in the 100 Mile Swamp and Partridge River Headwaters have been changed very little for thousands of years, long before human settlement. They are important for water quality and as a habitat for moose and other at-risk species. Wetlands at the PolyMet mine site also bind up mercury, so it doesn't get into downstream fish and harm the brain development of our children who eat St Louis River and Lake Superior fish. Wetlands that would be harmed or destroyed by the PolyMet mine are water resources of national and international importance. The environmental review process is supposed to let us weigh alternatives. The PolyMet SDEIS doesn't suggest any alternatives to reduce impacts on wetlands at the mine site. The SDEIS rejects underground mining without studying how avoiding an open-pit could reduce environmental harm. It doesn't look at alternatives that would restore wetlands on site or clean up mine water and keep it in the Partridge River watershed. The "compensation" wetlands plan proposed by PolyMet is also completely inadequate. More than 2/3 of the replacement wetlands are outside the Lake Superior Basin and there is no mitigation at all for indirect wetlands loss. Monitoring and maybe doing something later is not an answer, especially since the Army Corps has never required mitigation for dried out or polluted wetlands after-the-fact. Under federal and state environmental laws and Clean Water Act Section 404, please:

- Reject the PolyMet sulfide mine due to its unacceptable impacts on wetlands and water resources of national and international importance.
- Reject the PolyMet SDEIS as inadequate due to the fact that no alternatives that could reduce water pollution and wetlands destruction are analyzed in the SDEIS.
- Deny the Section 404 permit for the PolyMet sulfide mine plan, since it would destroy irreplaceable wetlands, peatlands and wetlands functions.
- Deny the PolyMet Section 404 permit, since the PolyMet SDEIS plan provides no mitigation for thousands of acres of foreseeable "indirect" wetlands losses.
- Deny the PolyMet Section 404 permit unless all "compensation" mitigation for wetlands is provided within the Lake Superior Basin.
- Require the SDEIS to be redone to analyze alternatives that could avoid, minimize or mitigate impacts on Partridge River watershed wetlands and water quality. These alternatives should be considered: 1-Underground mining, looking at the full ore deposit and PolyMet's real costs; 2-Putting a liner under the Category 1 waste rock stockpile; 3-Placing all tailings on a new completely lined facility; 4-Returning the Category 1 waste rock to the West Pit to reclaim 500 wetland acres; 5-Building the reverse osmosis on the mine site in year 1 to treat (up to standards) and discharge runoff and pit water on site to minimize impacts to wetlands.

Please reject PolyMet's SDEIS as inadequate and reject PolyMet's sulfide mining plan. Please also deny the Clean Water Section 404 permit and require PolyMet to analyze alternatives that would reduce harm to wetlands and nationally and internationally important waters. It is our job to

To State Officials working on the Polymet Mine Proposal, The minerals that Polymet proposes to mine are not going anywhere. The minerals most likely will not become less valuable. Elements of the proposal and the environmental safeguards involve monitoring waste and waste water for decades, perhaps centuries. The overall costs to monitor and/or treat waste products is not and cannot be realistically estimated. The history of open pit mining operations and its aftereffects is extremely dismal. I am strongly against the Polymet Mining Proposal in its current configuration. Sincerely, Norbert Heimann

February 7, 2014 Administrator U.S.D.A. Forest Service Region 9626 East Wisconsin Ave. Milwaukee, WI 53202 RE: This letter was submitted to the Minnesota DNR Dear Administrator: I am writing to convey my questions and concerns related to the Polymet Sulfide Mine proposal presented to the Minnesota Department of Natural Resources (DNR) to extract copper, nickel and other metals in northern Minnesota. I. Can the DNR be assured that any leakage of toxic chemicals into all land and waters adjacent to the mine site be monitored by either a third party or the DNR to be cleaned as soon as detected? 2. Will Polymet be responsible for the cost of cleaning up all toxic discharges indefinitely? 3. Will the residents of Minnesota have first priority for the employment related to the construction and extraction process? 4. Will the DNR be assured that the natural attraction of the Boundary Waters Canoe Wilderness and adjacent lakes and rivers be protected from any degradation? 5. Will the DNR be assured that tourism will not be adversely affected by the mining? 6. Will the DNR be assured that the wild rice areas will be protected from toxic chemicals? As a resident of Minnesota I am placing my trust in the DNR to have in its best interest the protection of our land, waters and fauna of Minnesota. Personally, I do not support sulfide mining in an area so rich in clean waters. I understand the need for mineral exploration to meet the global demand for copper, but I am wary of mining in a fragile and vulnerable area such as northern Minnesota. Sincerely, Norm Herron 2617 E. Fifth St. Duluth, MN 55812-1536

Norm Voorhees

18337

Hello. My name is Norm Vorhees. The last named is spelled "V," as in Victor, O-O-R-H-E-E-S. I am a born and raised Duluth resident. I am also a representative for Ironworkers Local 512. I have been an ironworker for 27 years. It has enabled me to earn a decent living, provide for my family, put my daughters through college. I am also a representative for Ironworkers Local 512 for the last 11 years. And being involved in that aspect, it has allowed me to be actively recruiting ironworkers and giving young people in northern Minnesota the opportunity that I had to earn a decent living, building in Minnesota. I have been to several meetings regarding PolyMet. I toured the facility two times; at the old LVT site. It is a brown field. It is open and sitting there. PolyMet to me seems that they are proposing to do something responsibly from everything that I have been able to learn. And we have got the regulatory agencies here to make sure that that happens. If you look at pictures from the turn of the century, late 1800s, of Duluth, it looks nothing like it does now. To me, it looks like rape and pillage. And over the years we have evolved and have been able to utilize our resources, create good jobs, create living-wage jobs, and respect the environment and be able to have the best quality of life in the country. I have had to travel around the United States when there was no work here and I have seen how things are done in other parts of the country and I think Minnesota is the best place that you can live in the United States. If you look at what happens in other parts of the world, there is -- there is no regulatory structures in place, like China, Brazil. These precious metals are needed for our society right now. Hopefully, with the great learning institutions that we have in Minnesota and the young people going through them, we may be able to trend away from them, but right now we can't. We are all using them. Even everybody that is opposed to this mine. You know, it is your cell phones, your cars that you drove to get here, your ride in a canoe in the Boundary Waters. So, I stand in support of this project. And thank you.

47021

I have confidence in the DNR and believe the SDEIS process for PolyMet Mining's proposed NorthMet project has been sound and thorough. The state and federal regulators will ensure that PolyMet's project design, and its controls and measures will address potential environmental impacts and will meet all applicable state and federal regulations. I'd also like to address some misinformation that has been reported in the media about the 200 and 500 years referenced in the SDEIS. In the groundwater flow model in the SDEIS, water percolates through the bedrock at an extremely slow rate of travel. For this reason, the model was run for 200 to 500 years, allowing enough time for water to move through the aquifer and reach the compliance point at the boundary included in the SDEIS. It is commendable that the modeling completed in the SDEIS is so thorough that it addresses the slow, minimal flow of water for such a period of time. It also shows the project will still meet water quality standards even that far out. This does NOT mean that the mine or processing facility will need treatment for that long. This model demonstrates that PolyMet's plans comply with Minnesota's laws. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Norman Berghuis

18287

Norman Berghuis, Lakeville, Minnesota. 250 years ago what there was of this country and nation was about a thousand miles from here. At that time, and thousands of years before that, what is now Minnesota, and thousands of miles around us, was ruled by Native American nations or no humans at all. Now PolyMet is a company that is owned and controlled by foreign corporations and was formed only for the purpose of the toxic sulfide mine. Only 20 years after they begin mining, the copper and nickel will be depleted; however, the pollution will continue for 500 years. It will need to be contained and cleaned up somehow, but it appears that nobody really knows how. Now, in 20 years, when mining has ended and there are no more profits from this mine, anybody that believes that this foreign company called PolyMet will still be around probably also believes in Big Foot, the Lochness Monster and Santa Clause. The PolyMet sulfide mine is a very bad project for Minnesota.

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Novelett Jensen 39590

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Say NO to Polymet and say YES to a beautiful, healthy Minnesota for our generation and generations to come, PLEASE. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Miss Novelett Jensen 3012 Dupont Ave N Minneapolis, MN 55411-1346

Nurmi Family 5

Hello, Like dozens of people I talk to daily up here, I am appalled at the cost incurred by Polymet for a permit to provide jobs. Mining is what we have up here. I do not voice my opinion for how people, cities, or government abuse the land for highways or whatever in other areas. I could care less if \$apolis sank in the ground. THEY CAN HANDLE THEIR AFFAIRS, just let us handle ours. By the way, I am not impressed with that ungodly mess they have in the cities; however, it is not my right to object. Naturally, I do care about our environment up here in God's Country. I know of no one whom wants to see a Sudsbury. However, I believe it is the responsibility of our state DNR to give out or deny permits in a timely manner. That is why they get paid (salary) with our tax dollars. There should be no place for special interest groups or even guys like me. Until Polymet refuses to follow their guidelines or does something criminal, give them the permit and let's at least attempt to bring life back up here on the 'Iron Range'. I do not believe in vigilante like groups trying to impose their might. If the DNR does not believe Copper/Nickel Mining has more benefits than downs, pay Polymet back for the costs incurred and stop the whole thing. We have so many examples of cost vs benefit. Police speed and hurt people. Good or bad, we need them and live with it. Politicians can hardly ever get a large majority to agree with them. They sell out and trade favors for votes. We put up with them. Lots of examples out there. Maybe it is time to try it and see with safe guards in place. Thank you, Lyndon Nurmi 8992 Posimoke Drive Britt, Mn 55710 218-749-4033 Posimoke@accessmn-com
nursnews 7056

To the DNR – Please do not let Polymet or any other mining entity exploit one of the finite and few semi-pristine wilderness environments left in the country. Please consider what can and likely will go wrong in the plan to “contain” contaminated water for hundreds of years. The environmental impact of this proposal on the lakes, the air, the sound and the sights in the Ely area will be devastating. Please let rational minds who care about future generations prevail. Once this direction is set, there is no turning back time only you and your legacy of shortsightedness and devastation. We believe in you, DNR. Do the right thing. Barbara Schlaefer 612-618-6797 5404 Park Place Edina, MN 55424

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I'm also of the belief that the short-term economic gain produced by mining will be lost many times over with long-term scarring of the countryside that we as Minnesotans hold to such high regard Sincerely, Mr Oliver Garrison 622 4th St SE Apt 301 Minneapolis, MN 55414-1836

Olivia (Vivi) Grieco 57172

My name is Vivi, I'm a high school student in Minneapolis, and I am passionate about developing economic equity in an environmentally sustainable way. It is vital that we think beyond the next 20 years and think about clean water in our state for our children and grandchildren. Olivia (Vivi) Grieco 3046 15th Ave So Minneapolis, MN 55407

Olivia Jane Riggins 57195

Allowing the Polymet mine to be built would mean taking huge, unjust risks. Not only is it incredibly short-sighted to believe that PolyMet will continue the necessary cleanup, but in any case, the PolyMet mine would be a threat to future generations and current American Indian groups. Olivia Jane Riggins 900 Water St S Northfield, MN 55057

This world is not simply made of resources for humans to exploit at will. Our primary support system – wry of thriving as human beings – is the sun, the earth, the water, and the plants and animals that live within its system. The Polymet sulfide mining project would critically damage three of then from systems which we depend upon to survive. How much long term damage are we willing to inflict to our national support structure for a short term monetary given? PolyMet’s own studies report that sulfide mining will create “acid mine drainage,” leaking mercury, arsenic, lead and sulfuric acid into Minnesota waters. The decision that we make now will not only seriously impact the lives and wellbeing of ourselves and generations to come, but allow set a precedent for the way we treat our natural home into the future. In a time of perceived [ILLEGIBLE] when many voices demand that we strip the gift and beauty from our world in the name of limitless consumption we believe its still possible to choose to conserve and recycle rather than export and deplete. We implore you to see how the damage of sulfide mining for outweighs the benefits. Please make the courageous decision to reject PolyMet proposed sulfide mining and protect the irreplaceable gift we have been entrusted with as Minnesotans. Thank you for making the decision based upon all of our perspectives.

Oren Olson

Feb 18, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. This cannot be accepted merely for a short term economic gain. In fact, no economic gain can compensate for the vastly negative outcomes of this mine. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come and would substantially damage the quality of life for those that live in the region. These concerns must be paramount, and the proposal must be rejected. Sincerely yours, Ove Kahn Ove Kahn 1747 Columbus Ave Duluth, MN 55803

Owen

11262

polymet mine should only get the go ahead if all lands currently proposed are given for the federal lands and under the condition that all federal lands revert back to federal ownership after the 20 year period and after polymet does land reclamation. also giving lands that already exist does not make up for destroying an equivalent amount of land, so polymet should have to pay an additional fee of 3,000 an acre to the dnr to make up for the destruction of habitat that will occur

Owner

46038

Dear Lisa, My husband Jerry and I want to convey our opposition to the Polymet mining proposal that is currently under review by the DNR. We have concluded after studying the issue at length, and in depth, that the risks in a human endeavor such as this is not worth the irreparable harm to our beloved Minnesota environment. Given the imperfect nature of all human projects, it is not IF but WHEN problems arise. Short-term gains will go mainly to the multinational corporations that champion this project, but the resultant problems will accrue to ordinary Minnesotans. PolyMet has never operated a mine, functioning as a front group for the Swiss investor Glencore. It's main selling point seems to be jobs, but the best, and most, of these will go to professionals from around the globe. We realize the DNR is tasked with conflicting goals, but we ask that you have the courage to speak for the powerless, for the ecosystems that cannot speak for themselves. Powerful corporations have a loud voice, and a very large footprint, and repeatedly show that they can get their way. But not now, please. Thank you for reading this, and for taking our views seriously. Jerry and Laura Raedeke PO Box 89 Nisswa, MN 56468 218-963-3877

Sirs, It has come to my attention that the project for mining heavy metals is a hazard to our health by negatively affecting the increase in pollutants in our environment. The metals themselves are toxic and the process that claims them with sulfuric acid is bad. Other sites around this country and other country's demonstrates the destruction that ensues. Not only is there the fallout on contaminates from this, but it just adds to the other 5,000 toxins in our environment and this is why there is an approximately 30% increase in cancers and immune disorders which are growing annually. The accumulative affect from all the toxins is horrible beyond belief and I fail to approve of the surge in mining or drilling to increase profits when it is costing every individual in the country his life. I am against this project. Judith Long 4627 Otsego St Duluth, MN 55804

P May

45536

Dear DNR PolyMet Mine Review Committee, This is a terrible idea. I'm sorry to be so blunt, but there's really no other way to say it. Poisoning our beautiful land for short-term gain is a really, really terrible idea. Sulfide mining brings with it a risk of acid mine drainage. This risk is particularly high in areas with lots of water, such as Superior National Forest. This pollution can last for anywhere from 2,500 to 10,000 years. This mine will only create around 360 jobs. But you know all this already, don't you. I won't insult your intelligence by presuming otherwise. You know all of this, and yet you're still willing to give this plan the go-ahead. I am not privy to your motives, but looking at it as a Minnesotan, an environmentalist, and a young person about to enter the workforce. This whole plan borders on insanity. Twenty years of work, and then what. Poisoned waters and devastated land. A future significantly darker than it was before. You know children, surely. Young people. Think about them for a second. They're the ones who are going to have to live with your decision, one way or another. I plan to go into environmental work when I graduate from college. The other day a friend of mine who is in the same field looked at me and laughed bitterly. "Why do we do this to ourselves." she asked. We're young. We're supposed to feel hopeful about the future, but we aren't. We're cynical. We've seen too many good people—people like you—make the wrong choices over and over again. Just this once, give us a reason to believe in the people in power. Please don't poison us. Thank you for your time, Phoebe Ward

Pa Yao Vue

Dear Ms. Fay, I'm a student from Humboldt High School. I'm very concern with polymet's environmental impact statement. The map in the environmental impact statement is wrong. They can't just redraw a map. Take a look at the map again. The polymet people left out 100 miles of the swamp. Governor Dayton needs to make the MN DNR do its job correctly. Use the correct map and measure the percolation of the water. They have to prove that the mine will NOT pollute the boundary water. I don't want the boundary water to be polluted for the next 500 years or so. Sincerely, Pa Yoa Vue 1498 Jackson St, #B St. Paul, MN 55117

Palmira Brummett

40741

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, As a US citizen I am very concerned with protecting our clean water. I have spent wonderful days in the Boundary Waters and have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Please keep in mind that wetlands once destroyed take generations and more to redeem, if they are redeemable at all. As a nation, we cannot afford to poison the protected lands and waters that we have left for the personal gain of a few. Please reconsider - do not facilitate the poisoning of our people, our birds, and our animals. Sincerely, Palmira Brummett, 198 Slater Ave, Providence RI 02906 Sincerely, Dr Palmira Brummett 198 Slater Ave Providence, RI 02906-5812 (865) 556-2426

30 December, 2013 I would like to comment in support of the SDEIS for the proposed NorthMet mine. This has been studied and evaluated by several agencies of the State of Minnesota and the Federal Government. The proposal for a mine, as laid out in the SDEIS, meets the standards that are set by all the agencies involved. The following are my reasons for supporting the project: First: The land exchange will be a good one for both Minnesota and the USFS. It will reclaim and add to state wetlands in exchange for the wetlands taken over by the mine. It results in a net gain in wetland acreage. Second: The effect on water resources in the mine area, and in the Lake Superior basin has been thoroughly reviewed by the agencies involved, and has been deemed to be satisfactory. The proposed mine meets or exceeds the standards set in Minnesota state law and federal initiatives. Third: The mine will meet air quality standards, as laid out in the SDEIS. It will not affect air quality in the BWCAW. It will also meet applicable noise standards. Fourth: It is a logical re-use of a brownfield site in the plant location and in parts of the mine site, as well as existing rail lines. Fifth: Approval of the proposed mine will create many direct jobs in the eastern end of the Iron Range, and will contribute many dollars in tax revenue to the State of Minnesota, the Federal government and to the local communities. In addition, indirect jobs will be created and the unemployment rate in Northeastern Minnesota will decline. Sixth: There will be up-front monetary guarantees for the monitoring of water, air, wetlands, etc after the mine closes. The mine closure plan is sufficient to maintain all the water quality standards that are now in place. I would like to encourage the US Corps of Engineers, USFS, and the DNR to publish a final EIS in a timely manner. I also want to urge the Commissioner of the DNR to declare the EIS adequate, and everyone involved to move the permitting process forward. Yours truly,
Pamela S. Backstrom Mailing address: 115 S. 14-1/2 Ave W. Virginia, MN 55792 Phone 218-780-6227 Email pam@ideadrilling-com Home address: 17 W. 3rd Ave N. Aurora, MN 55705

Mar 5, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Stop mining that will endanger our environment. Sincerely, Pam Barker 7084 Bluebush Rd Monroe, MI 48162-9124

Pam Curtis

40458

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Pam Curtis 5315 Clark Rd Conesus, NY 14435 US

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Have you EVER been to the Boundary Waters of upper Minnesota. They are wild and beautiful and CLEAN. They are full of waters that flow to Lake Superior and many of the other lakes in this area, to streams, to wetlands. It is one of the few places barely touched by noise pollution, one of the few places left on the N. American continent that is pristine, where people can go to reconnect with Mother Earth, where the animals, plants, fish and other creatures are able to live in their natural states. THIS IS NOT A PLACE TO PUT EVEN ONE OPEN PIT SULFUR MINE. Sulfur mines pollute EVERYTHING. They send toxins into the waters, the air and the land. They put the entire area at risk of dying, they put people who live anywhere in the area or who come to enjoy the wilderness at risk of becoming ill or dying. There are so many other ways economic growth can be created and managed, WHY do people in power keep thinking in terms of the dark ages.. We have the threat of radiation drifting to our shores from the melt down at Fukushima. We have massive droughts in the west turning grasslands, farms, meadows and prairie pastures into desert sands. We have dirty tar sands oil leaks and accidents all over the country polluting our rivers and lands, ruining peoples' homes and making them sick. We have well waters contaminated by gas frac mining in the north east and coal sludge making the waters of W. Virginia unfit to drink. The western borders of WI are being polluted by sand mining, spewing silica sand particles into the air and into people homes where breathing in even a small amount causes a deadly illness called silicosis. YOU ARE SUPPOSED TO BE MANAGING THIS COUNTRY AND PROTECTING OUR RESOURCES IN THE BEST INTEREST OF ALL OF US and yet, every time I turn around I read about one more precious resource, one more of the few remaining clean and wild forests, mountains or wetlands areas being sold out from under our feet to outside interests who will keep the profits and leave us with the cost of cleaning up the environmental and human health catastrophes. I am 60 years old. I have lived through times of intense political upheaval. I have fought over and over again to protect our communities from social, economic, health and environmental dangers. But never in all those years have I been so afraid of losing my country, my home, my health because greed is turning this beautiful majestic country into a wasteland of trash, waste and devastation. STOP IT before this country we are so proud of, which has been a shining jewel in the universe, is nothing more than a sludge pit. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Pam Fischer, RN 1344 Russell St Green Bay, WI 54304-3132

To Whom it May Concern, I believe the SDEIS is not sufficient and should not be approved for various reasons. The primary reason as it does not provide details as how up to 500 years of operating, maintenance and monitoring will occur and be paid for water treatment facilities. There has not been a financial institution that has lasted even 100 years let alone 500 years. Many mining projects have resulted in the largest and most costly environmental clean-ups in the nation. What will happen if Polymet and its backers decide they want to abandon this project in say 50 years. What guarantee is there that someone will continue to monitor and treat polluted waters for the remaining 450 years. Another reason I feel the SDEIS should not be approved is the inaccurate water flow model that was used in the impact statement. This error causes many of the assumptions about future mercury levels to be questioned. This data must be corrected and resubmitted for further study by the public. Mercury is a very hazardous element to humans and wildlife. I did not see where any study was made of an underground mine instead of an open pit mine was considered. Underground mines greatly reduce the impact on wildlife, forests and wetland losses. I believe an underground mine would be less destructive than the proposed open pit mine. Considering wetland losses, only some (912-5 acres) of the wetland affected is covered by the SDEIS. What about the more than ten square miles of other wetlands that are indirectly impacted by the toxic minerals and water use by this open pit mine. Bogs and swamps are very difficult to restore or rebuild. Once lost, there is a great likelihood that cannot be restored. The SDEIS does not address these issues. Finally, there are several endangered or threatened and special concern species of plants and animals on the mine site that will be affected by this mine. The area has been classified as a 'High Biodiversity Significance' area by the Minnesota Biological Survey and the SDEIS considers the impacts to be insignificant which I find impossible to believe. How can they claim over a dozen species of plants or animals as insignificant. The SDEIS needs to address this issue as well. In conclusion, I feel the SDEIS does not adequately address the above issues regarding environmental impacts and must be rejected. Sincerely, Pam Larson Frink 2228 Reiling Rd White Bear Lake, MN 55110

Hello Ms Fay - I am writing to express my alarm over the possibility that the proposed PolyMet mining project will be approved in Northeastern Minnesota. I am opposed to the proposal for one simple reason - I believe that the water sources in Minnesota, and the surrounding watershed, are being put at extreme risk. I believe that water is such a basic, life sustaining resource that we cannot move ahead with the water storage/reverse osmosis plan in good conscience. There is no precedence for this being an effective approach and the long term maintenance suggested (500 years) is preposterous. Water is essential to life and we are risking the lives of our children, our children's children and generations to come by not stewarding our water source properly. I am very sympathetic to the economic plight of those in the surrounding communities who are hoping for additional jobs, but I feel strongly that the stewardship of our greatest life sustaining resource - water - has to take priority over the possibility of a generation of improved economic and employment viability of the current population. I don't believe that these individuals and PolyMet advocates have the right to take such risky actions involving the resource of so many and for so long and the proposal should be denied. Please note my comments as strongly opposed to the PolyMet proposal. Sincerely, Pamela Larson Nippolt 369 Winslow Avenue Saint Paul, MN 55107

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to assess the impacts of heavy rains and flooding at the mine site, particularly at the "west equalization basin," which will contain reject concentrate from plant site reverse osmosis. The SDEIS should also reveal the level of contamination that this highly toxic "basin" would contain, long after the mine shuts down. •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Pam Leland 1783 Randolph Ave Saint Paul, MN 55105

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired

Dear Ms Fay: I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. We have experienced an EIS here is Scandia. Our experience showed us that mining companies, and other applicants, have a tremendous advantage over the environment. Many issues that face the environment fall outside the requirements, and therefor do not get adequately addressed. An alternative use for the proposed mining site has not been considered, including economic and environmental projects for an alternative use. The "NO BUILD" alternative should be given its due position among the considerations. The long term consequences of any undisclosed potential for error, contamination to ground water, ambient air pollution, dredging peat bogs cannot be measured against the very few proposed economic benefits to the local economy. A comprehensive EIS should include a state-wide economic and environmental overlay, with an alternative scenario for comparison. If there were a proposal to build a business that added natural resource benefits, jobs and a sustainable model for long-term environmental improvements, we would feel much better about a decision to approve or deny the SDEIS. As it stands, the SDEIS truly benefits the applicant. It does not fulfill our expectations for a complete picture including alternatives. Because the consequences could be so costly to the environment region-wide, the SDEIS should be challenged, and if no revisions are offered to support an alternative, it should be rejected in perpetuity. Frankly, the situation is heart breaking. There is NO SUSTAINABLE Sulfide Mining. John Cherry, who works now for PolyMet, has worked for many mining companies. He is a hired man, working to get approvals that meet other state and local authority conditions for mining operations. We are simply out gunned against these huge interests. All we have is hope that the DNR and State of Minnesota will have the courage to reject this proposal, against local enthusiasm for it. And, using it's lobbying effort, find an economic alternative for this region, which clearly needs an economic booSt We must protect some of our waters, and wild areas. This seems to be an opportunity for creativity. But it will require courage, and smarts. Thank you. Sincerely, Pamela Arnold 16560 220th St N Scandia, MN 55073-9434

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Pamela Miller 6230 Thomas Ct Tolar, TX 76476 US

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept my comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota. If approved, it will impact wetlands across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area. Since acid mine drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred, I have grave concerns about this project's potential impacts on the Arrowhead Region's natural resources and public health. Approving sulfide mining will present risks to water quality and harm to wildlife, including the threatened lynx and declining moose populations. Water supply systems, personal and public, may be impacted, requiring more expense to process to meet regulatory standards. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Pamela Skaar 2046 Helena St Madison, WI 53704-5520 (608) 241-5332

Feb 12, 2014 Ms Lisa Fay MN Dear Ms Fay, I, like most people, am very concerned with protecting our clean water. I have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Pamela Thinesen 6165 Green Valley Rd Ramsey, MN 55303-3272 (651) 779-3476

---Original Message--- From: pamela.thinesen@century-edu [mailto:pamela.thinesen@century-edu] Sent: Tuesday, March 11, 2014 10:03 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Pamela Thinesen 6165 Green Valley Rd Anoka, MN 55303-3272

Feb 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The NorthMet Supplement Draft Environmental Impact Statement (SDEIS) has a critical gap in describing and mitigating the impact of habitat loss on *Alces Americanus*, the moose. Despite being listed as a species of "Special Concern" by the State of Minnesota in 2013, the suspension of the 2013 moose hunting season, and a 50% decline in Minnesota's moose population since 2005, the SDEIS describes moose as a "regionally common wildlife species," and a "game species" (p. 5-635). According to the SDEIS, Moose have been observed in the NorthMet project area (p. 4-210), and the NorthMet project area is in the range of moose in Minnesota. According to the SDEIS, 2,775 acres of moose habitat would be lost if NorthMet is built as described (p. 5-377). In addition, despite the special significance of the moose to tribal members, there is no cumulative impacts analysis of the loss of moose habitat in the SDEIS. "Habitat fragmentation and loss" is recognized as a cause of the moose population decline, and the NorthMet project would add to existing habitat disruptions. The tribal cooperating agencies have noted this deficiency, but it has not been addressed in the SDEIS (Attachment 3, pp 45-46). As you revise the SDEIS, please include a cumulative impacts analysis that examines the impact on moose, recognize the changed status of the moose as a species of "Special Concern," and require PolyMet to mitigate the habitat loss for the moose caused by the NorthMet project. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. We truly value the protection of all creature. Sincerely, Ms Pamela Voigt 13287 37th St Clear Lake, MN 55319-9228

Dear Ms Fay, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from overtopping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability. PLEASE

Pat Combs 43472

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. Dear Ms Fay, Dear Federal and State Agency Leaders: Let's Prioritize our Resources with emphasis on Healthy Lives. Human's cannot live without clean water and air, and our immune system tend to break down as chemicals are added. In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was "inadequate" and the sulfide mine project would be "environmentally unsatisfactory." The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn't analyze the effect of pollution on workers' health or on nearby drinking water wells. It doesn't explore alternatives that could reduce PolyMet's destruction of wetlands. It doesn't examine the effect that PolyMet's sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters "would continue in perpetuity." Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota's fresh water for centuries, if not forever. Sincerely pat fillmore
lindsay court St Cloud, MN 56301 320 2590542

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Pat Makowski 5245 Neal Ave N. Stillwater, MN 55082

Pat Mullen

18374

I'm Pat Mullen. I'm a lifelong resident of the Duluth area. Living in Northern Minnesota being an avid runner I can't think of a better place to live and work. I'm employed by Minnesota Power as vice president of marketing, corporate communications, and energy supply. And Minnesota Power, like any electric utility, is heavily regulated by various government agencies. Even the basic price of what we charge for our product must be studied by regulators and brought before public hearing, and then testified to. I know that sometimes it takes a lot of input to reach a sound decision, and that's fine. So please let this work that way through this review process. There are many issues to examine around the state's copper-nickel mine. And our government representatives certainly gave the PolyMet proposal due diligence over the many years of reviews, studies, and meetings. For the over 2,000 pages prepared by the various agencies, I say thank you for looking at the PolyMet Mine from all angles. I have a great deal of confidence in the processes, the outcome of this study. And I do support PolyMet. More specifically, my comments this evening pertains to the adequacy of the review in terms of water quality, containment, and treatment. I know that has been an important aspect of this process and has created much concern. Minnesota Power also has the largest mining and natural resource based customers in paper, pulp, and energy that have extensive expertise in meeting rigorous federal and state standards and technology and project design as used in chapter 3 or further described in other portions of the report are very similar to those utilized successfully by different industries. In addition to the well-trained and experienced staff employed and available to the company for future needs, PolyMet will be operating in a region with extensive and environmental testing, consulting support with equipment maintenance services. Industrial processes, once operational, are extensively monitored and recorded hourly, daily, and often times continuously. In my opinion the checks and balances designed by the PolyMet proposal design will stand the test of time. Also, Minnesota has some of the most rigorous environmental standards in the nation. And a process that ensures a very thorough review of all the facts. The companies and the people who work for and support the industry have the know-how and the determination to meet our state's environmental standards even as we produce the metals, the forest products, and the energy we consume and demand every single day. Finally, it is my belief that our nation needs to be more engaged in actively mining precious metals that are needed for today's technology. The United States lags in mining the very resources that we have an abundant supply of in the Duluth complex on the Iron Range. This study confirms that Minnesota can be a leader in the responsible mining of these metals. I support this study and I support PolyMet Mining and I thank you for the opportunity to share my comments with you tonight.

Dear Mr Dabney, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from overtopping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from lia

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamMs •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Pat Stevesand 13109 Walnut Cir 13109 Walnut Cir Burnsville, MN 55337

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources Douglas Bruner, US Army Corps of Engineers Tim Dabney US Forest Service Dear Ms Fay, Mr Bruner, Mr Dabney: I'm writing to request that you increase the length of the comment period for the PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) from 90 days to 180 days. Please listen to the community – there is too much at stake to rush this. Please also consider rescheduling the public meetings proposed for January 2014 so that they take place later in the comment period. At the very least, please provide an additional public meeting toward the end of the extended comment period in May 2014- PolyMet and the agencies have had more than seven years to put together the PolyMet SDEIS. Yet, you are expecting the public to read everything and be ready to speak up about the project after just a few weeks, just after the winter holidays. This isn't fair or reasonable. Here are some reasons why we need more time to comment and to prepare for public meetings: * The SDEIS is too long. The SDEIS is 2,169 pages long. It is neither clear nor concise. In places, it is internally inconsistent. In others, it only makes sense after reading additional technical documents. * The SDEIS is not written so that members of the public can understand it. The SDEIS is confusing and repeats the same information over and over without providing the basis for its conclusions. It's going to take a lot of work just to make sense of what it is saying. * The SDEIS doesn't explain some of the most important issues. The SDEIS does not explain why other alternatives that could reduce pollution and impacts on wetlands weren't analyzed. No data is provided to support the level of financial assurance proposed. * The SDEIS is often one-sided. Well-documented tribal "Major Differences of Opinion" call into question many of the main points in the SDEIS, like claims that mine pits, waste rock piles, and tailings heaps won't seep pollution; that mining won't dry out wetlands; and that mercury contamination of fish and other toxic chemicals won't increase. * The SDEIS doesn't allow members of the public to find or check on the references claimed to support the SDEIS conclusions. The SDEIS has a long list of references, but they were not made available to the public. How can we tell if the conclusions in the SDEIS make sense. * The SDEIS comment period and public meetings come at the worst possible time. Release of the SDEIS right before the winter holidays and scheduling public meetings in January (when bad weather is likely) seem designed to make it hard for us to both review the documents and to travel to hearings. The PolyMet NorthMet sulfide mine proposal is very controversial, and there is a lot of mistrust about whether government decision-makers are really interested either in the science or the financial risk of the proposal, let alone what the public has to say. Extending the SDEIS comment period to 180 days and setting public meetings later in the comment period would go a long way to reassure us that the PolyMet sulfide mine project will receive a fair evaluation and that opinions of Minnesota citizens, not just the interest of foreign corporations, will matter when the government makes its decisions. Sincerely yours, Pat Stevesand 13109 Walnut Cir 13109 Walnut Cir Burnsville, MN 55337 952-895-0433

---Original Message--- From: ptstvsnd@comcaStnet [mailto:ptstvsnd@comcaStnet] Sent: Monday, March 10, 2014 6:44 PM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Pat Stevesand 13109 Walnut Cir Burnsville, MN 55337-3885

So, you really want to take a chance that our groundwater and surface water will be polluted because of sulfide mining in one of our most pristine areas in Minnesota and an area that attracts people from all over the world. It is difficult to fathom .. I am concerned, not only for the quality of water to be preserved, but also for the towns, most particularly Ely. Have you visited Wiliston, North Dakota or Dickenson, North Dakota. You would see towns that have changed, and not for the good. So, ask yourselves if 350 jobs lasting for 20 years is worth it. And, ask yourselves if destroying wilderness areas and water quality for years to come is worth it. It is time to say STOP to those who are greedy for money and have little concern for quality of environment that should be available for generations to come. Pat Burow Mendota Heights, MN

Patrice Hundstad 39879

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Patrice Hundstad 1319 Warren St Mankato, MN 56001-4948

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, There was a time when Lake Superior was once the standard for clean water in Michigan. It is still one of the cleaner bodies of water we have left. At a time when CA, NV and many other areas are experiencing droughts and water pollution, why would there even be any consideration to allow such a polluting industry to put this risk and probable inevitability of contamination of such a priceless gift as Lake Superior and the entire Great Lakes ecosystem over the welfare of 20% of the population of the USA.. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. On behalf of the moose, and in light of the dubious projections of the positive economic impact of mining for the region, I am finally chiming in. NO to PolyMet. Yes, it is complex analysis of the benefits vs. harmful consequences. But it is a simple proposition: Short-term (20 years) thinking vs. long-term action on behalf of future generations, human and non-human, the future of the watershed, the future of Mother Earth. Respectfully, Pat Benson Patricia Benson [HYPERLINK "mailto:pjbenson@frontiernet-net"](mailto:pjbenson@frontiernet-net) pjbenson@frontiernet-net 651-433-4126 (c) 651-303-9280 14281 St Croix Trl. N. Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. I am also concerned that besides all the possible pollution, we will be paying for hundreds of years of cleanup when the use for copper may be replaced with another product in a few years, just like has happened to so many other products that we used to use. Minnesotans have worked hard to preserve our natural resources and I don't want to see ll that work undone for a few hundred jobs. When the internet reaches this area there will no longer be a need for unhealthy mining jobs. Thank you for voting this issue down. Patricia Donnelly 9141 3rd Ave So. Bloomington, MN 55420 Sincerely, Miss Patricia Donnelly 9141 3rd Ave S Bloomington, MN 55420-3739 (952) 884-4915

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

After going to a number of open sessions, both pro and con, and reading and hearing much info about what PolyMet would do to our wonderful state of MN, I could write a dissertation on why not to allow such a project to happen.. It sounds to me that PolyMet would come to Northern MN for approximately 20 years and put their profits from our minerals in a Swiss bank, and walk away, leaving behind up to approximately 500 years of destruction to our northern area. Why would anyone with good common sense allow such a thing to happen. It sounds to me like another major mistake our DNR Commissioner is willing to approve without listening to the constituents of MN. Look at the statistics in this case and then follow the feedback of what the majority Minnesota's population is giving you. **DO NOT APPROVE THIS MINING PROJECT.** Thank you. Darryl J. Schwerzler 7524 E. Borman Ct. Inver Grove Heights, MN 55076

I'm writing to express my opposition to the proposed NorthMet Mining Project. Twenty years of mining and 200 jobs at the mine aren't worth the devastation that will occur, at sometime, in the pristine area of MN where the mine will be located. The people who live in the area and want this aren't thinking about the future of their children and grandchildren, not alone all the other people who vacation and enjoy this beautiful area of MN. The wild rice paddies and the Native Americans are another reason not to proceed. This is sacred ground to them and they have been there longer than the white man, and will be there long after NorthMet leaves its mark. There are no guarantees that something unforeseen won't happen. NorthMet can file bankruptcy and be out of the picture and leave the potential clean up for all of us to pay for. Some things in this world are worth more than money, and this area of MN is one of them. The people who live in the area need to do what I had to do; go to school and get retrained in a different career. Thank you. Patricia A. Flynn 7524 E. Borman Ct. Inver Grove Heights, MN 55076

Patricia Gunderson 7121

Hi, - The SDEIS is inadequate; it does not provide any reassurance that this mining will not result in irreparable harm to the watery environment in our Arrowhead. PolyMet issues as noted in the SDEIS: The PolyMet SDEIS describes significant environmental issues associated with this proposed mine. Please don not move forward with this plan unless there are assurances no harm will come to our water. Thank you. Patricia Gunderson 390 Harriet Ave Shoreview MN 55126

Patricia Hammel 44970

Dear Ms Fay, Dear Federal and State Agency Leaders: I am a Wisconsin resident and am very concerned about the effects of sulfide mining on the Lake Superior watershed and Lake Superior itself. Lake Superior is an exceptional freshwater resource of global importance for which we are responsible. The likelihood that the Polymet mine will result in sulfuric mine drainage, methylmercury pollution and asbestiform discharges into Lake Superior tributaries is an unacceptable risk. Polymet's prior environmental analysis was unacceptable to the EPA. The current SDEIS is also inadequate as it is based on unrealistic groundwater/hydrology models and assumptions about the capacity and integrity of tailings ponds. Mining is the primary source of mercury pollution in the Lake Superior region. The United States has both signed and ratified the Minimata Convention on mercury pollution pledging to limit new emissions of mercury and to clean up existing mercury sources. Allowing Polymet to obtain a mining permit without stringent safeguards to prevent mercury emissions violates our commitment to the Minimata convention. Last but not least the possible presence of asbestiform minerals in the mine area compels us to consider the health of the mine workers and local communities who, based on past experience, will bear the brunt of the release of asbestiform particles into the environment of the mine. Indigenous people living near the mine will be most heavily impacted because they live on their traditional lands and rely on wild rice and fish for food and cultural survival. Require that the SDEIS address these concerns, or deny Polymet's permit application. Sincerely Patricia Hammel 1424 Jenifer Street Madison, WI 53703 608 258-1441

Patricia Harlan-Marks

20062

From: hmfamily@aol-com [mailto:hmfamily@aol-com] Sent: Tuesday, February 25, 2014 4:05 PM To: Fay, Lisa (DNR) Subject: Concern re: proposed Poly Met mining in northeastern MN Dear Ms Fay, I am writing to express my concerns regarding the proposed PolyMet Mining open-pit mines on 67,000 acres of Superior National Forest. If permitted, these mines would leave behind sulfide-bearing waste rock that could result in sulfuric acid mine drainage and would require treatment of polluted water for hundreds of years. I seriously doubt that the mining can be done without toxic pollutants poisoning our fish, killing our wild rice and contaminating our ground water. My concerns are based on the following: 1- The newest DEIS provides no assurance that this mining can be done without irreparable harm to the watery environment in our Arrowhead. 2- There is no example in the world of a copper/nickel sulfide mine in a water-rich environment that has not resulted in contamination of surface and/or ground water with sulfates and toxic heavy metals. 3- When sulfide ore comes in contact with air and water it produces sulfuric acid, which kills all flora and leaches heavy metals from the soil, including mercury and arsenic. 4- Claims that sulfide mines have operated without violating water standards are based on mines located in deserts or mines that were exempted from ordinary water quality standards. 5- This kind of mine has never been tried in Minnesota; iron mines do not produce sulfide waste. 6- Mining companies routinely declare bankruptcy as the mine is exhausted, leaving the taxpayers to pick up the tab for attempts to clean up the environment. 7- PolyMet is a junior mining company headquartered in Vancouver, Canada. It has never operated a mine before and is backed financially by the Swiss company Glencore Xstrata. Glencore has a record of massive tax evasion in third world countries. Additionally, Glencore has suffered dozens of fatalities and been subject to six-figure fines for environmental breaches – 2008-2010- 8-Sulfide mining threatens our remaining stands of natural wild rice in the St Louis River. The sulfate standard for wild rice is 10 mg/liter, a standard the waste water from the mine could not meet. 9- The mine will impact over 4000 acres of prime wildlife habitat and impair wildlife movement through the area. 10-Processing the ore would increase Minnesota's greenhouse gas emissions significantly. It is imperative that our state make decisions which ensure the health of our environment for generations to come. The risks of damage which may be caused by the open pit mines are formidable. Please deny the request for Sulfide Mining by PolyMet. Our State must depend on wise stewardship to protect the environment and ensure that projects which may yield short-term gain will not result in long-term, irreversible damage to our forests, our land, our waterways, and our environment. Sincerely, Patricia Harlan-Marks

Patricia Hauser 5805 Minnetonka Drive Shorewood, MN 55331-2945 Lisa Fay, EIS Project Manager 500 Lafayette Road, Box 25 St Paul, MN 55155-4025 January 22, 2014 Dear EIS Project Manager, Lisa Fay, I believe any sulfide mining must be done without polluting our environment. The current Supplemental Draft Environmental Impact Statement regarding PolyMet is inadequate. It provides no reassurance that this mining will not cause irreparable damage to our Minnesota waters for hundreds of years. What are people thinking. Is it about 20 years of jobs (the projected time PolyMet Inc. wants to mine) versus up to 500 years of treating the polluted water caused by the mining process. Our country isn't even as old as it will take to clean up the poisoned water. And what about the birds, insects, animals and plants that use the water, where is the wildlife considered in this equation. As I understand it, leaking polluted water will get into the tributaries of the St Louis River (thus threatening the wild rice) and eventually into Lake Superior. What about our fish and other aquatic life. What about the people who make a living on tourism and fishing connected to Lake Superior. What about their jobs. What about the fact that Lake Superior needs to be protected and treasured. Do we really want dead zones there like we have in the Mississippi River. Do we really want to jeopardize that Great Lake for a measly 20 years of mining. Another thing, PolyMet is headquartered in Canada and has never operated a mine before. So there's no track record or mining experience. But it is financed by the Swiss company, Glencore, which has been implicated in past environmental disasters, labor violations and human right abuses around the world. Great, yet another rogue multinational company willing to trash our environment and walk away. In summary, the SDEIS should be sent back for improvements until PolyMet Inc. proves it can definitely be operated safely without any environmental damage. Sincerely, Patricia Hauser 5805 Minnetonka Dr Shorewood, MN 55331

To Whom it May Concern, I am not in favor of giving Polymet approval to open the copper nickel mine. The mining industry does not have a good track record in taking care of environmental concerns. I am concerned about air and water pollution and what happens in the future after the fresh water and clean air are so damaged and that it is unsafe to use. What happens when some unexpected event occurs to further contaminate the environment and the money Polymet originally sets aside runs out. Will Polymet be around to clean up the mess. In my opinion the company will be long gone and the state, which means the taxpayers, will be left to try to "fix" the mess left behind by the mining company. I understand the local citizens would like to see the employment opportunities come to their communities and that those jobs would enhance the local economies but the long term cost is just too high. I would like to see some other industry locate in northern Minnesota that could provide jobs for the residents there. Please do not allow Polymet to open the copper nickel mine. Clean air and water are essential. Please don't take chances with our most precious resources. Thank you for considering my request Patricia Johnson 13940 71st Ave N Maple Grove, MN 55311 Sent from my iPad

Mar 10, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Ms Patricia Loverink 403 19th St NE Austin, MN 55912-4147

As someone whose family has lived in the northern counties of Minnesota over the years, and seen the landscape ruined by the mines return somewhat to its former self, I am newly concerned at the environmental proposal for copper and nickel mining in this delicate region. Here are my questions with regard to the SDEIS: Are you sure that five hundred years is a proper window within which to return a forest to itself. Who would pay for the clean up once this company is no longer in business. How would you ensure the accountability of any owner of the property for such a long period. How can you be sure that the ground water will not accelerate the flow of run off of contaminated water into rivers and lakes. It is clear that the region has been depressed and looking for ways to make money. However, it does not make sense for the region to bring in a business that returns to old and polluting methods of mining. Sincerely, ?- Patricia Markert Aakre [HYPERLINK "mailto:pmarkert@fastmail.fm"pmarkert@fastmail.fm](mailto:pmarkert@fastmail.fm)

Feb 7, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Ten percent of Minnesota newborns in the Lake Superior basin already have unsafe levels of mercury in their blood at birth. Mercury is a potent neurotoxin with no safe dose, and the accumulation of mercury in fish that people eat means that mercury is a significant public health issue. The PolyMet NorthMet SDEIS describes a project that would add to the airborne and waterborne mercury load, has inadequate science to back its claim that the mercury emitted will be adsorbed by soil and tailings, and inadequate study to support its conclusion that no additional mercury methylation will occur. Please take the following actions: 1) Revise the SDEIS to provide more evidence to support the claim that the LTVSMC tailings will act as a mercury sink contained in wastewater from the plant site. Particularly, address concerns raised by the tribal cooperating agencies that the LTVSMC tailings may become saturated and may even become a mercury source, rather than a mercury sink. 2) Revise the SDEIS to include estimates of the amount of indirect airborne mercury emissions from the electrical power used by the NorthMet project 3) Revise the SDEIS to include discussion of the mercury methylation potential from additional sulfate loading and mercury released from stripped peat at the Mine Site. 4) Revise the SDEIS to include quantitative modeling of the effects of the proposed action on mercury in fish in addition to the qualitative discussion in the current draft. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Ms Patricia Moore 914 Greeley St S Stillwater, MN 55082-5969 (612) 386-7190

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, patricia mundy 803 smetana rd Apt 1 hopkins, MN 55343

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Mar 10, 2014 Ms Lisa Fay MN Dear Ms Fay, Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Ms Patricia Phillips 487 Wolcott Ave Kent, OH 44240-2355 (330) 678-6962

Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures: •The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streamS •The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge. •The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures. •The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Patricia Richard-Amato 4004 London Rd Apt. 1111 Duluth, MN 55804

Thank you so much for giving me this opportunity to express my environmental concerns about the proposed PolyMet copper mine. I am not a scientist myself, but I know what having a relatively unpolluted environment means to me and to my family, friends, and neighbors here on the shores of Lake Superior. We have only one EARTH and one Lake Superior. Why not protect them. The PolyMet sulfide mine plan is riddled with many issues and concerns: 1- Sulfate discharges in our wetlands could bring the levels of mercury in our fish up to dangerous levels. 2- One in 10 babies born in our area already has unsafe levels of mercury in its blood (please see the report by the Minnesota Health Department). 3- Hoyt Lakes itself could have its drinking water made unsafe to due to the mine waste piles proposed by PolyMet. 4- Huge areas of habitat for our wildlife would be threatened. 5- A full study of health effects on humans from mercury and asbestos-like fibers from rock at the mine site has not been done. Much of it could eventually leach into Lake Superior and into many of our rivers and streamS 6- We don't know what the cost of treatment of polluted water will be and for how many hundreds of years. I am very much against moving forward with the plan proposed for the PolyMet mine. There are too many unanswered questions and the risks are far too great, not only for us, but for future generations. Sincerely yours, Patricia A. Richard-Amato 4004 London Rd Apt. 1111 Duluth, MN 55804 (218) 625-8340 HYPERLINK "mailto:prichardamato@gmail-com"prichardamato@gmail-com

What could you be thinking!!! NO, NO, NO, Think of the total waste of Sudbury, Ontario. This pristine wilderness is worth far more unspoilt. Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Acid mine drainage has polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife, exchange of federal land within Superior National Forest, and cumulative impacts, and support the No Action Alternative.

Patricia Sannes

48177

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Patricia Sannes 729 Washington Avenue Crookston, MN 56716

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Patricia Stock 27001 Oakwood Drive Olmsted Falls, OH 44138 US

Mar 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mechanical water treatment. 2) Revise the SDEIS to address Minnesota Rules 6132-3200 and clarify how the post-closure activities described in the mine plan are consistent with the mandate that the closed mine site be "maintenance free." Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Dr Patrick and Brenda Alcorn PO Box 236 Red Lake Falls, MN 56750-0236 (218) 253-2094

From: anderick1@gmail-com [anderick1@gmail-com] Sent: Monday, March 10, 2014 5:43 PM To: Fay, Lisa (DNR)
Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board. Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems. The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. In addition, there is no factual basis for the cost per year figures (\$3-9 to \$6 M) put forth by Polymet. This is a fundamental flaw since it deprives the public an opportunity to adequately and appropriately review the accuracy of those figures. This flaw along with the ambiguous calculations for length of water treatment make it impossible to determine adequate financial assurances. While financial assurances will also be part of the permitting process, the factual basis for those calculations should be determined during the EIS phase. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Patrick Anderson 267 Peninsula Rd Minneapolis, MN 55441-4179

Feb 20, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsi

Patrick Byron

DNR and related staff, As a Minnesotan and frequent user of the BWCA, I have GRAVE concerns regarding the proposed PolyMet project. With a brother and sister-in-law having first hand knowledge of the mining related issues in the state of Montana and the HORRORS of corporate irresponsibility regarding water quality, I am unequivocally OPPOSED to this project. Even with promised jobs and development, the remote chance of tainting waters in the BWCA is too much of a risk to take. I have concerns about the data that exists on this project as well, in short, worst case scenarios have NOT been addressed. I have real fears that beyond the destruction of the environment, the people of Minnesota will be left with a clean-up bill and/or legal issues that would NOT be in the best interest of our state. This is NOT a project that serves the interests of ALL Minnesotans. Patrick Byron 157 West Third Street # 104 Winona, MN 55987 <https://mail.google-com/mail/u/0/images/cleardot.gif>

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. To create and leave a cleanup mess for the next ten generations is not right - simply not right. It is one thing to say we didn't know the side effects of asbestos or PCPs, but here we do know and there no way we can justify it. We have to say, "Not here, Not today, we have made too many mistakes. Lets leave it for future generations to decide." Sincerely, Patrick Chase 291 Rice Creek Ter NE Fridley, MN 55432-4329 (763) 572-8762

37629

I am against it on three grounds. First, the mining operation is to last twenty plus years and the reclamation period is hundreds of years. The persons involved in signing off will be long gone, legal issues of blame and cost will be in the courts for years. In twenty years there will be another pressing need for those jobs. Second, in a similar ecosystem has copper mining not polluted the surrounding environment. Third, the recent experience of the DNR handling the clear violation of Lutzen Ski Resort pulling water from a trout stream demonstrates the DNR's conflict between preserving nature and economic realities. The DNR chose jobs over preserving the natural environment. We are at that same pivotal point. We have a budget surplus, use part of that money to retrain the workforce in Northeast Minnesota. Or use some of the money to improve the infrastructure in that part of the state. It is a political tradeoff letting future generations make their choice when times are more stressful. With an unemployment rate of 6 %, we are not in position to gamble our resources for a few jobs today. I do go to the BWCA every year for it is a unique place. Patrick Cutshall 22054

We all use copper, nickel, etc every day. So if it is not mined in Minnesota's Iron Range it will be mined somewhere else. I have confidence in the state of Minnesota and Polymet that it will be mined in the right way for both job creation and the environment. If it is not mined here but somewhere else not only will those good paying jobs and the taxes go somewhere but the environment would actually be more polluted. We cannot afford to miss this job opportunity. Companies that are complying with all state and federal regulations should be allowed to obtain the necessary permits to produce the metals our modern world demands. --Original Message-- From: pdossmith@live-com [mailto:pdossmith@live-com] Sent: Wednesday, February 26, 2014 2:43 PM To: Fay, Lisa (DNR) Subject: PolyMet's SDEIS is poorly planned and needs to go back to the drawing board Dear Ms Fay: PolyMet proposes a complex mechanical system of pumps, pipelines, and filters that it says will capture and hold back the water pollution from getting into our rivers. PolyMet assumes the proposed expensive and complicated water treatment system will continue to operate effectively for long, long after the mining has stopped. It should be expected that mechanical systems like pumps, filters and pipes will eventually fail. In a 2007 report, an organization called Earthworks analyzed the records of 14 modern copper mines in five states found that 100% of these mines experienced pipeline spills or other accidental releases. 92% had failures of water collection and treatment systems that resulted in releases of contaminated mine seepage that significantly impacted water quality. But PolyMet's SDEIS lacks contingency plans for predictable failures in the proposed piping, pumping, and filtration equipment. By assuming that a complicated water treatment system will function indefinitely without fail, the SDEIS has failed to take the hard look required at the proposed PolyMet sulfide mine. Please send the SDEIS and PolyMet back to the drawing board with directions to include contingency plans for predictable failures in the water pumping and treatment system, and the power supply to run that system. In addition, the SDEIS proposes to dump tailings from the mining process on top of the former LTV Steel's tailings basin, which was built in the 1950s on top of three streams, was designed to leak. In fact, the existing tailings basin is already leaking millions of gallons of untreated water, yet the chemical composition of that large volume of leaking water has not been tested and characterized. The failure to test and account for known leaks of untreated tailings basin water from the existing LTV Steel tailings basin is another major problem with the SDEIS. Moreover, the tailings basin and the dam holding it back from flowing downstream are recognized to be unstable. If the tailings basin dam were to fail, vast quantities of contaminated tailings, sulfates, and heavy metals would be released into the headwaters of the St Louis River. In other mines, such tailings basin failures have sent a flood of millions of cubic yards of toxic debris as much as hundreds of miles downstream. The failure of the SDEIS to fully consider the potential for . and the consequences of . a tailings dam failure is a deadly flaw in the SDEIS. Sincerely, Patrick Doss-Smith 3959 27th Ave S Minneapolis, MN 55406-3043

---Original Message--- From: pdossmith@live-com [mailto:pdossmith@live-com] Sent: Tuesday, March 11, 2014 10:23 AM To: Fay, Lisa (DNR) Subject: PolyMet / NorthMet Comments Dear Ms Fay: If allowed to move forward, the PolyMet mine proposal would set a dangerous precedent for Minnesota's environmental safety. As a concerned citizen, I am asking you to send their proposal back to the drawing board Minnesota is uniquely vulnerable to climate change, particularly the boreal forest of northern Minnesota. PolyMet would be a huge consumer of electricity, much of it coming from dirty, inefficient coal power plants in Minnesota. As the SDEIS states, PolyMet would emit 707,342 metric tons of carbon dioxide pollution into the atmosphere every year. This would contradict Minnesota's goal to reduce carbon emissions. The Minnesota Next Generation Energy Act set a goal of reducing Minnesota's greenhouse gas emissions 15% from 2005 levels by the year 2015, and 30% from 2005 levels by 2025- The Minnesota DNR, through the mine plan, should require use of clean energy to reduce impacts of pollution. The PolyMet mine site has large amounts of peatlands that have been storing carbon for thousands of years. When PolyMet's regular mining practices disturb the peatlands, they will release nearly 200,000 metric tons of carbon pollution into the atmosphere. In order to stay on track for Minnesota's carbon reduction goals, these peatlands and their stored carbon should be left undisturbed. The SDEIS (page 5-124) uses 1980s data to plan for extreme weather events. It fails to examine the impact of precipitation events any greater than the "100-year storm." Given climate change, this design is insufficient. PolyMet must be designed to handle larger volumes of wastewater. The Minnesota DNR should include a 500-year storm analysis of both the mine pits and the tailings basin. Heavy rainfall such as occurred in June 2012 in northeast Minnesota could result in an overflow of contaminated water into the environment. This trade-off is not worth the risk. These are just a few of the reasons why the SDEIS should have included a thorough discussion of financial assurance - how much money, and in what form, the mining company should put down to cover the costs of cleaning up the site and addressing problems The SDEIS is over 2,000 pages long, but includes just a couple pages generally discussing financial assurance. There is no indication of how much financial assurance the agencies are thinking should be required, and there is no discussion of the agencies thought process in arriving at a figure. The agencies view that financial assurance be addressed in permitting is contrary to the intention of environmental review, and reduces the public's ability to comment as effectively as is possible during the SDEIS comment period. I'm a Minnesotan concerned about the impact of the PolyMet mine proposal and urge you to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. In addition, the SDEIS has serious flaws that need to be addressed. I urge you also to reject the SDEIS. Thank you. Sincerely, Patrick Doss-Smith 3959 27th Ave S Minneapolis, MN 55406-3043

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. The Boundary Waters are a treasure not only for Minnesota but for the rest of the world, and anything that damages the environment in this area is a bad idea. Also, while the employment opportunities arising from sulfide mining may be attractive in the short-term, in the long term the damage done would far outweigh these advantages and destroy the natural beauty that the local tourism industry depends on. -PG Sincerely, Mr Patrick Gibbons PO Box 626 Collegeville, MN 56321-0626

Mar 13, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for generations and endangers clean water and habitat in the Lake Superior basin. Environmental hazards are present during every step of the open-pit mining process. Hardrock mining exposes rock that has lain unexposed for geological eras. When crushed, these rocks expose radioactive elements, asbestos-like minerals, and metallic dust. During separation, residual rock slurries, which are mixtures of pulverized rock and liquid, are produced as tailings, toxic and radioactive elements from these liquids can leak into bedrock if not properly contained. The Polymet Draft Plan is in large part science fiction, based on assumptions long into the future that are unverifiable. The facility will require environmental stewardship long into the future - long past the projected 500 years of water treatment discussed in the EIS. No corporation has lasted that long and few governments have. According to Earthworks, 40 existing hardrock mines will annually generate 17 to 27 billion gallons of polluted water forever. The Polymet project will annually generate an estimated 93 to 256 million gallons of wastewater per year in perpetuity. In general, despite all precautions, these mines do not have a good track record. A review of the historical record suggests that catastrophic failure is the normal state of affairs and that in the end, the tax payers usually end up holding the bag. Some examples: Butte, Montana's Berkeley Pit mine is now one of the nation's largest superfund sites. Midnight Mine, operating from 1955 to 1988 is still a superfund site with remediation to continue far into the future. At 10 a.m. on February 10, 2011, disaster struck the Çöllolar coalfield in central Turkey, near the city of Elbistan. The northeastern wall of an open-pit mine collapsed, sending about 50 million tons of material into the mine. The debris buried and killed ten workers. Maine's Callahan Mine Site, now a superfund site, is the only open pit mine built in an estuary system. The mine operated from 1968 to 1972 and a recent Dartmouth College study indicates that dangerous concentrations of toxic metals continue to seep into the estuary from the mine site. New Mexico's Chevron Questa Mine, operated as an open pit from 1965 to 1983, produced over 328 million tons of acid generating rock waste stored in nine piles located around the pit and producing over 100 million tons of tailing stored in tailing ponds on the site. South Dakota's recently closed Gilt Edge Mine has already cost tax payers over \$30 million in cleanup costs and acidic mine wastes laced with heavy metals continue to threaten ground and surface water. A waste water treatment plant has been treating wastes from a capped waste rock pile but the entire site is toxic. California's Sulphur Bank Mercury Mine site initially was mined for sulfur from 1865 to 1871- Mercury ore was mined intermittently by underground methods from 1873 to 1905- The site was intermittently open pit mined from 1915 to 1957- It is now a Superfund site. Colorado's Summitville Mine operated as an open pit mine from 1984 through 1991 and became a Superfund Site in 1994- Toxic releases from the site killed most aquatic life along a 17 mile stretch of the Alamosa River in 1991 with additional kills recorded in 1992- The company declared bankruptcy in 1992 and walks away. To date, tax payers have spent \$150 billion in clean up costs. February 2, 2014 Duke Energy's tailings pond failed sending 82,000 tons of toxic coal ash and 27 million gallons of contaminated water flowing into the North Carolina's Dan river. 9:30 pm on April 11, 2013 165 million tons of rock s

Dear Ms Fay, Dear Federal and State Agency Leaders: With all due respect to the state of Minnesota and the right of it's people to use the state resources it possesses, please reject the permit requests for copper sulphide mining by PolyMet and all applicant mining companies. Copper-sulphide mining is way too contaminating to be considered in such a pristine and rare wilderness natural resource. I grew up in the area and my parents and grandparents lived in Ely. There is just no way in good conscious I can recommend this type of mining in such a delicate and vulnerable ecosystem. Please don't destroy this wonderful national treasure by approving permits for such an environmental devastating type of hard rock mining. Although we need and use the precious metals and we also need the jobs in the region, the environmental destruction that historically and inevitably happens every time this type of mining is performed is not worth the environmental cost. Please vote with your logical thinking and your heart. We all know that it has and will destroy these precious lands and waters. With all due respect, do not be manipulated into thinking otherwise. Sincerely and successfully,
Patrick G. Murn

Feb 11, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centur

Mar 11, 2014 Lisa Fay, DNR MN Dear Fay, DNR, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. if our state were a person, he would need dialysis after this mining. dialysis is not cheap. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on Minnesota's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forests to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest The proposed mine poses unacceptable risks to our waters and communities. I ask that the comment period be extended to 180 days, and I support the No Action Alternative. Sincerely, Mr patrick Needham 4132 19th Ave S Minneapolis, MN 55407-3422

Destruction of the BWCAW due to manmade toxic sulfide would be an unforgivable crime against nature and Minnesota. Think about the jobs and tourism lost to the Ely area if the BWCAW becomes polluted, or worse. The past article in the Star newspaper that Ely is dying because of the lack of jobs has been strongly refuted by most of the residents who also feel a great loss will ensue if this mining goes through. Just look at the radioactive waste that is currently contaminating North Dakota and you get an idea of how the Ely area will look after the miners are gone. I've been told that there has never been a copper mining operation anywhere that has not resulted in a disaster to the environment. Can't we find another alternative. Some "clean" industry to start up there instead. I've also been told that PolyMet is owned by a Swedish company that has destroyed thousands of acres of Swedish landscape with their mining efforts. And you want to trust a foreign company with the health of the Minnesota environment. I say nay, please say nay. Dear Ms Fay, Dear Ms Fay, Mr Bruner and Mr Dabney: Please reject the PolyMet NorthMet SDEIS as inadequate and acknowledge that the PolyMet open-pit sulfide mine plan would have unacceptable environmental impacts on surface and ground water quality for hundreds of years, if not forever. I'm also sending a copy of my letter to the US Environmental Protection Agency. In my opinion, the PolyMet SDEIS and the PolyMet sulfide mine plan still deserve a failing grade and both should be rejected. Recent news of internal DNR documents showing that base flow at the mine site was seriously underestimated confirms my opinion. Neither the SDEIS nor the sulfide mine project are based on good science. The PolyMet SDEIS relies on a number of improper and unsupported assumptions to minimize the threats of the sulfide mine plan and wastes on drinking water, surface water, wild rice, mercury contamination of fish and human health. The SDEIS must be redone, because its rosy predictions are completely unreliable and its methods conceal, rather than analyze environmental impacts. Here are a few critical failures:

- The SDEIS must be redone to use a reasonable calculation of the amount of groundwater flow in the Partridge River watershed. Both tribal hydrologists and MDNR staff have determined that the real baseflow is two to three times higher than the number used in the SDEIS. Baseflow affects pollution seepage and impacts on wetlands and streams
- The SDEIS must be redone to use a reasonable range of probabilities for the collection of polluted seepage from the Category 1 waste rock pile and the tailings piles, rather than just choosing one very optimistic number. The assumption that more than 99% of total seepage will be captured from the tailings basin (SDEIS, p. 5-159) has no support in the real world, yet allows PolyMet to minimize threats that wild rice, fish and human health will be harmed by tailings basin discharge.
- The SDEIS must be redone using accurate and complete predictions about effects on pollution seeps of fault lines and fractures under the mine site, the tailings basin and the proposed HRF waste dump. Geological survey maps and PolyMet's own reports for the Canada stock exchange reveal significant faults and fractures.
- The SDEIS must be redone to include a specific and reasonable plan for financial assurance of treatment for hundreds of years and to ensure that taxpayers won't end up paying for clean-up if the PolyMet mine or plant site becomes a Superfund site. The PolyMet SDEIS is not a fair and scientific analysis of water pollution threats. It is a biased document that relies on unjustified assumptions, conceals important facts, and won't allow members of the public to understand risks of accidents, failures or even routine violations of water quality standards. Please reject the SDEIS and the experiment in very long-term if not permanent pollution that the PolyMet sulfide mine plan would bring to Minnesota. This project would violate water quality standards for generations to come. Sincerely yours, Patti Donaldson 36413 370 Street Richville, MN 56576

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Patti Donaldson 36413 370th Street Richville, MN 56576

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, I am writing regarding the PolyMet NorthMet supplemental draft environmental impact statement. In my view, the SDEIS is inadequate and the proposed mine plan would have unacceptable environmental impacts. PolyMet Mining Company's proposed NorthMet sulfide mine fails to meet four fundamental, common sense clean water principles, principles the mining industry previously agreed to. The proposed mine plan does not keep Minnesota's water safe and clean. The best case scenario for the mine anticipates at least 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater and the environment without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater and the environment without being treated. In addition, the model used to predict impacts to water quality has many flaws that may significantly under-represent pollution risks. Indeed, the model has been shown to be inaccurate in representing current conditions for water quality surrounding the mine site undermining confidence that it can accurately predict future water conditions. The proposed mine plan does not put safeguards in place for when things go wrong. There are no contingency plans outlined for expected accidents that occur at all mines of this type, mishaps such as pipeline spills, accidental releases, failures of water collection and treatment systems, tailings basin spills. These are foreseeable events that should have emergency plans developed and articulated so the public has confidence in the company's ability to respond to a crisis. During operations, over 6-2 million gallons of polluted water a day will need to be treated. The mine plan does not describe what will happen if the water treatment plants break down. Will this pollution be discharged into the environment. The mine would contain a complex network of miles of pipelines, carrying polluted and treated water to and from various locations. The mine plan does not describe what would happen if a break were to happen in a pipeline carrying high concentrations of toxic metals and sulfates. The proposed mine plan does not leave the site clean and maintenance free. The plan for at least 500 years of active water treatment violates Minnesota Rules (6132-3200) that call for the mine to be left maintenance free at closure. 526 acres and over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit "lake" would be left whose water levels would need to be maintained through pumping to prevent contaminated overspills into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for at least hundreds of years. The proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to at least 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsib

While we cannot ignore the need for employment in the region, I don't see how a twenty year supply of copper and nickel—and profit for a single company—balances five centuries of pollution of Minnesota's most precious resource, water. This mine should not be approved, but the state needs to explore other more sustainable ways to bring jobs to northeastern Minnesota. Patricia Isaacs 13720 Paragon Ave N. Stillwater, MN 55082

Hello, It has been brought to my attention that the maps outlining the drainage area around the proposed mine in the environmental study for the Polymet mine are incorrect. The maps include incorrect outlines of the One Hundred Mile Swamp which is downhill from the mine site and will collect acid and heavy metal laced run off from the mine. While the true One Hundred Mile Swamp is over 10 miles long and drains out of its east end to the BWCA, PolyMet environmental impact statement maps draw a much smaller swamp less than 6 miles long that cuts off the eastern portion of the swamp, creating the illusion that the mine and BWCA are not connected. The fact that the incorrect maps outline the swamp with a dashed teal line on satellite maps with green backgrounds makes it extremely difficult to see. This discrepancy between the environmental impact statement maps and US government maps makes this environmental impact study inadequate. These maps are wrong and the environmental impact statement is inadequate until the maps have been corrected. Thank you for your time, Best Regards, Patricia Lange 2063 Ames Ave Saint Paul, Mn 55119 Sent from my iPhone

I do not want to see copper mining in Minnesota. No matter what the company says they cannot predict the future. Despite their best laid plans; what would happen if a truck with sulfuric acid overturned near the water. What about the weather. Horrible tornadoes. Another winter like this one (or two or three). What about fires. What about human error. Remember Fukushima. That nuclear disaster wasn't supposed to happen And what about something more recent and closer to home-the water crisis in Charleston, West Virginia-that wasn't supposed to happen either, but who is paying for it now - in dollars, health and stress. Freedom Industries has filed chapter 11, so they will be minimizing their payouts-so it's not them; the weight of the crisis falls on the citizens, as it will when something happens at a copper mine in northern Minnesota. Glencore, the company that it looks like will be heavily involved or end up with a large share of the mine, has a horrible track record If any of the things that happened at their Mapani mine happen here it would be devastating-environmental problems, health hazards, death of miners. And that mine is just a small part of the trail of environmental hazards, human hardship and financial costs it leaves in the local communities it does "business" in. Not too mention the big gaping hole the mining leaves in the earth-have you seen the pictures of current copper mines. They are horrid. Our water and natural environment are two of our greatest resources-in fact fresh water could be THE greatest resource-do we really want to risk our long term future for a short term benefit. If it's jobs you are trying to bring to that area of the state-there has got to be a better way. There are new (and green) technologies being developed all of the time-invest your time, effort and money into one of these technologies that can benefit all groups, now and in the future. Dear Ms Fey, Do you really want this legacy. Opening up the first future Superfund site in Minnesota. Why. Polymet has told you that the water will be polluted for 200-500 years. What kind of a statement is that. And what kind of a steward of natural resources would qualify it with consideration. Mark Twain said that a mine was a liar standing next to a hole. He was right. Polymet has never operated a mine before, and is backed financially by the Swiss company Glencore. Glencore has a significant financial stake in the company, and has an exclusive agreement to sell the mine's metals on the global commodities market. While PolyMet doesn't have a track record to consider, Glencore does. The company was founded by Marc Rich, the financier embroiled in scandal and pardoned by President Bill Clinton. The company has been implicated in environmental disasters, labor violations, and human rights abuses around the world. Certainly you've heard the plight of the neighbors of the fracking in the Dakotas. It's horrible and once the mining company moves in you cannot control them at all. What about the St Lawrence river, the wild ricing that will disappear, and the pollution of Lake Superior. The Great Lakes comprise 1/5 of the worlds fresh water. It is unbelievable. Why have a comment period of the comments are ignored. Your children and grandchildren won't have a wilderness to go to. You're probably too young to remember the Joni Mitchell song "Paved paradise put in a parking lot." Please take a minute to watch this video. <http://www.youtube-com/watch.v=3V3im2h89F8> Sincerely, Patty Murn

Lisa Fay, EIS Project Manager MDNR Division of Ecological and Water Resources The DNR is performing its duties in the SDEIS as a trustee for the water resources of the State. The groundwater, rivers, streams and wetlands are public assets and as trustees of those assets, The DNR must not deplete or destroy them. They must perform their duties as trustees of our waters for the people of Minnesota - not Polymet's. When I read about the DNR's role in the draining of White Bear Lake or the crash of the walleye population in Mille Lacs or the decimation of the moose in NE MN, I believe that the DNR has regulated itself to a role of firefighter - trying to saving what they can before its gone. The people of Minnesota expect more from the DNR and their tax dollars especially when it comes to protecting the most pristine water we have left. The SDEIS for the Polymet project is inadequate, incomplete, and based on many false and misleading assumptions and therefore must be rejected. Please note the specific issues below: The following are the main issues with the PolyMet SDEIS concerning environmental impacts to wetlands and watersheds: The main reason given for establishment of the Superior National Forest and the purchase of Federal lands through the Weeks Act was to protect the headwaters of the St Louis River. The proposed land exchange and destruction of wetlands in these headwaters is a violation of the intended purpose of these Federal lands. The land exchange sets a bad precedent and it is unknown how many additional land exchanges may be needed for future mine proposals. Allowing the loss of so much forest and wetland cover in these headwaters and the potential impacts to their hydrology and water quality are counter-productive to the MN DNR's mission of long-term protection of the state's surface and groundwater resources. Too much wetland and stream area will be destroyed or impacted by this project to be considered an environmentally responsible mine. The ecological quality of the stream and wetland complex that would be impacted by this project is very high and deserves the highest level of wetland mitigation. The proposed mitigation does not compensate for the loss of wetland functions and values in these headwaters. The potential toxic effects of sulfur and heavy metals upon wetland vegetation from fugitive dust and precipitation are not adequately considered or evaluated. It is not accurate to use the natural range of variation of stream levels as a way to measure potential impacts to riparian wetlands from long-term water level changes caused by mining. The failure of state agency regulation of iron and taconite mines to correct current pollution issues does not give us confidence that future problems with sulfide mines will be adequately addressed. The SDEIS gives inadequate consideration to the "No Action Alternative" of the land exchange. The No Action Alternative must be reconsidered because: The mining proposal as currently outlined in the SDEIS fails to meet multiple environmental regulations which would lead to destruction of the land and pollution of the waters for many centuries It fails to protect the rights of the tribes as guaranteed in the Treaty of 1854 There is inadequate review of human health impacts at the mine, in surrounding communities, and in the watersheds below the mine There is inadequate review of cumulative impacts resulting from all previous and existing mines, and for all proposed mines that could be permitted over the next 10-15 years in this watershed The economic analysis was biased by only modeling the benefits, with inadequate analysis of the practical projects costs The intent of Congress in acquiring the lands within the Superior National Forest under the Weeks Law were to protect the waters and promote the growth of forests, in perpetuity The exchange only marginally improves the conflict in the severed estates, and fails to fully resolve this confl

To Lisa Fay, EIS Project Manager Dear Ms Fay, I find the SDEIS overall to be impressive in scope and detail. I have done my best to digest the contents of the full SDEIS, as it has been made available by the MNDNR. In this process I have been able to identify my own primary concerns. Thank you for the opportunity to share them in the following comments. I will focus on two sorts of issues: "A" (comments 1-4), relating to the science and logic of the SDEIS's proposal; and "B" (comments 5-9), considering issues of more philosophical and moral character, since this proposal raises primary questions of economic value, quality of life, and environmental justice in northeastern Minnesota. A. ISSUES PRIMARILY OF SCIENCE AND LOGIC. 1- The SDEIS states, "It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modeled, NorthMet Project water quality performance, as determined through monitoring requirements. PolyMet would be held accountable to maintenance and monitoring required under permit and would not be released until all conditions have been met." This statement does not make sense. Although the predictive model referenced in the SDEIS makes use of simulations in which water treatment may be required for 200 and 500 years at the proposed mine and plant sites, supporters of the proposed actions have been quick to point out that these are only modeled predictions, and that no one really expects that water treatment will be needed for that long. Yet SDEIS also states that no one does or can know how long water treatment will be needed, except to say that it is expected to be a long time. Polymet has been created as a corporation solely for the purpose of designing, operating, and, in approximately 20 years, shutting down this specific mining project. Based on previous histories of such ventures, no one can reasonably expect that Polymet will even exist "long term." Yet the SDEIS states that Polymet will be held accountable for post-closure maintenance and monitoring "until all conditions have been met." If it cannot be assumed that Polymet will exist to conduct long term maintenance and monitoring which Polymet does acknowledge will need to occur, then who, or what corporate or public entity, will be responsible for seeing this necessary activity through to an acceptable conclusion. It seems that Polymet must somehow be held accountable for this promise prior to the granting of any permits for its proposed action. Yet, exactly how can Polymet be held accountable prior to permitting for activities which are proposed to take place only upon and following closure of the mining project. It would seem that financial assurance instruments should provide such a structure of accountability. But who can accurately estimate how much financial assurance needs to be provided to underwrite post-closure maintenance and monitoring that is projected to be necessary for an indefinite period of time. If we do not and cannot know these things, how can we then have any assurance that anyone at all will be held accountable to mitigate and restore potentially damaged lands, wildlife, resources, and communities, quite possibly several generations, or even centuries, into the future. Such a claim is logically nonsensical. This question must be resolved in a sensible and understandable way prior to the granting of any permits for Polymet's proposed action. 2- The SDEIS states, "The level of engineering design and planning required to calculate detailed financial assurance amounts is typically made available during the permitting process and was not available at the time that this SDEIS was prepared." Polymet is therefore suggesting that concerns about financial assurance should be addressed during, and not prior to, the permitting process. I strongly disagree. It is only reasonable to require that Polymet provide ade

As stated by Ted Kennedy: When will the greed end? Apparently never. As a 5th and 6th grade teacher I took my students to the Environmental Learning Center at Isabella and then Wolf Ridge MN each year. Instructing them in regards to conservation and protecting natural resources. This sulfide mining activity does irreparable damage to the water, wildlife and people living in the vicinity and outreaching areas. Hasn't anyone considered our children and grandchildren. Maybe not or they just don't care. It always comes down to the bottom line. Making wealthy people wealthier, and besides they won't have to live here. We do. Stand firm. Stay the course. Reject this proposal.

Paul Aslanian

I have reviewed the NorthMet SDEIS and was impressed by its thoroughness and professionalism. I have full confidence that the Minnesota DNR, the US Army Corp of Engineers, the US Forest Service and all other involved agencies can, and will, provide the needed oversight and regulation to allow safe, successful mining of the NorthMet Mining Project. We need the minerals. We need the jobs. And, we need the project to be done correctly. I am disturbed by the misreporting and misrepresentation put forth by the anti-mining interests. I want to see the project go forward, to be permitted, and to begin operations. Thank you. Paul S. Bauer 2479 Dunlap St N Roseville, MN 55113 612-719-7671

Paul Benwell 4514

I am a follower of the Polymet story and have been for a number of years .Management is very capable of moving this project forward .I have reviewed the SDEIS and am confident that everything has been addressed to the best of everyone's ability and that the permitting process should take place Thank you for your time Regards Paul Benwell 514-233-1036 Market Awareness and Introductions

4535

I have followed Polymet Mining for a few years and after visiting the site and listening to and questioning management I am very confident in their ability to move forward in a safe and secure manner. Thank you Paul Benwell and Associates 514-233-1036 Market Awareness and Introductions

Paul Danicic 40665

Mar 10, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS relies on a water model (GoldSim) to make predictions about the amount of water pollution generated at the site and how quickly it will travel into surrounding groundwater and rivers. The GoldSim model significantly understates the base flow of groundwater due to inaccurate and inadequate data. A DNR Hydrology memo shows that the average flow of the Partridge River is 1-5 CFS, while the GoldSim model uses a 0-5 CFS average flow. That figure was based on one year of data from 1984, a year of significant drought in the area. The memo suggests that to be accurate, additional field data may be needed beyond what is in the SDEIS. If the model understates base flow, all of the conclusions in the model are called into question. Pollution will move further and faster off of the site, and the amount of water that would need to be treated will be higher. This could present technical challenges, increase the costs of water treatment after closure, and add to the amount of needed financial assurance to pay for long-term water treatment. Lastly, the water model does not account for seasonal variations in groundwater and surface water flows on the plant and mine site. The GoldSim model should be run with accurate seasonal data to reflect the movement of pollution from the site in both high and low flow conditions. Please take the following actions: 1) Redo the GoldSim water model using assumptions based on adequate and accurate field data 2) Gather field data to fix gaps in flow data for the Partridge River near Dunka Road, as suggested in the DNR memo written by Greg Kruse on December 17, 2013 3) Recalculate and rewrite sections of the SDEIS based on the GoldSim water model predictions, including water quality, water quantity, post-closure maintenance, and financial assurance 4) Redo the GoldSim water model to account for seasonal variations in base flow and soil conductivity I appreciate the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described for the following reasons. A) Please revise the PolyMet NorthMet SDEIS to accurately and clearly predict the length of time that active water treatment would be required, and to clarify whether hundreds of years of water treatment complies with Minnesota Rules requiring that mines be "maintenance free" at closure. The GoldSim water quality model used to predict levels of pollution, movement of contaminated water, and effectiveness of water treatment predicts that water captured at the site will exceed water quality standards for hundreds of years after the mine stops operating. On page 3-72, the SDEIS says that "Based on current GoldSim P90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site " Other graphs and data in the water management plan that supports the SDEIS show that sulfates and heavy metals will dramatically exceed water quality standards for hundreds of years after closure. Minnesota Rules 6132-3200 sets a goal that after closure a mine site should be "stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." The mine plan calls for hundreds of years of maintenance and operating active water treatment plants, and violates this rule. I ask that you take the following actions: 1) Revise the SDEIS to clearly state how long the need for active water treatment (reverse osmosis or other mechanical treatment) is predicted, according to the models used in the SDEIS. Extend the water model timeline as far as needed to show when all pollutants would meet applicable water quality standards and provide the public with a clear statement of the best available prediction for the time frame of mecha

Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest. Sincerely, Paul Davies 3110 E Chattaroy Rd #24 Chattaroy, WA 99003

Paul Densmore 42442

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Paul Densmore 3435 Colfax Ave S Apt 102 Minneapolis, MN 55408-4043 (678) 381-3341

Paul Doffing 45180

My name is: Paul Doffing 13100 Pleasant Pl Burnsville, MN 55337 Comment: The SDEIS needs to be corrected and added to in order to address issues of mapping and lack of financial assurance. The Environmental Impact Statement is deficient in that it inaccurately portrays the effects of the mine/ watershed on the 100 Miles Swamp Area. According to US Government maps, the One Hundred Mile Swamp downhill from the mine is 10-4 miles long and drains to both the Saint Louis and Rainy Lake (BWCA) watersheds but SDEIS maps show a shorter 5-5 mile long swamp that is missing the portion of the swamp that drains to the BWCA. Omitting the portion of the swamp that drains to the BWCA supports PolyMet's conclusion that seepage of mine waste water to the BWCA watershed will not occur. Marking of important map features in such an obscure way may be seen as evidence of intent to avoid connecting an environmentally risky mine with the fragile and iconic BWCA wilderness. We, the community members of Minnesota, demand a longer public review period for the environmental impacts of PolyMet's proposed sulfide mine, and are more assured than ever before of the detrimental effects it would have on the Boundary Waters wilderness and the nearby waters of our beloved state. Polymet cannot control the contaminants it will release in this mining project. We are unwilling to allow mining that will effect not only the health and livelihood of nearby citizens of out state, but also may damage our fragile and iconic wilderness areas. Maximizing profits at the cost of human health and the environment is a short sighted, self serving choice. If Polymet cannot give financial and scientific assurance that our environment will not be damaged by their mine, they should not be allowed to mine. Period. They cannot give this assurance. Paul Doffing mobile: 612-709-6722

Paul Erdmann

41883

Ms Lisa Fay Project Manager, PolyMet SDEIS MN DNR – Division of Ecological and Water Resources Environmental Review Unit 500 Lafayette Road Box 25 St Paul, MN 55155 Dear Ms Fay: My name is Paul Erdmann; I have a Bachelor of Science degree in Conservation. I have worked for many years to protect our environment, restore ecosystems, provide habitat for wildlife, and educate the public on environmental issues. I am deeply concerned about the proposed PolyMet mine. I have reviewed the NorthMet SDEIS, the Executive Summaries, and many of the factsheets. In general, my comment to you on this proposal could be summed up as “not here, not now.” The SDEIS does not adequately address many of the environmental ramifications that would occur if the mine is approved, in a critical area of our country’s National Forest—the headwaters of a watershed that many people are working to address environmental damage that has already taken place. I have chosen to focus my comments on the proposed wetland impacts and destruction that would occur or have the potential to occur if the project is approved. Although this SDEIS is vastly improved compared to the original DEIS, more work has to be done to ensure that our critical wetland resources are protected. The SDEIS inadequately characterizes the wetlands loss and proposes inadequate mitigation measures. The PolyMet mine site is located in the middle of one of the most valuable wetlands in northern Minnesota, the 100 Mile Swamp. This wetland complex was deemed an Area of High Biodiversity Significance by the Minnesota Biological Survey, and the US EPA has stated that it is likely an Aquatic Resource of National Importance due to its high biodiversity. PolyMet proposes the largest permitted destruction of wetlands in Minnesota history. Wetlands replacement plans in the SDEIS are inadequate for replacing the biological function lost from these wetlands, and the SDEIS fails to adequately account for indirect wetlands impacts. The SDEIS lacks support for its assertion that 70% of the coniferous bogs on the site would be unaffected by groundwater drawdowns. Taking these points into consideration, I would propose that the SDEIS be revised or amended to include the following: 1) Revise the SDEIS to specifically outline measures that will be taken to reduce indirect wetland impacts and compensatory mitigation, as opposed to deferring such contingency planning to permitting 2) Revise the SDEIS to provide a range of estimates of indirect wetlands impacts and plans for mitigation based on these estimates, instead of waiting to see what the indirect wetlands impact will be 3) Revise the SDEIS to remove assertions that coniferous bogs would be unaffected by groundwater disturbances, as this is unsupported by scientific literature and field data 4) Revise the SDEIS to outline what types and amounts of financial assurance for wetland replacement would be required if indirect wetland impacts exceed the predicted area and extent of damage Our state has destroyed how many wetlands before we discovered the error of our ways. Our state continues to destroy and drain wetlands at an alarming rate. That we would now allow the largest permitted destruction of wetlands in Minnesota history is unconscionable and unacceptable. Even if PolyMet “mitigates” or “replaces” wetlands that are destroyed or damaged by this proposed mining activity at a ratio of 1 acre wetland loss to 1-5 acres of wetland “creation,” studies and experience have shown that these newly created wetlands have only a portion of the biological and water quality value of the natural wetlands. The state of Minnesota, federal agencies, and local government units that regulate these activities do not have adequate staff, funding, or time to ensure that these mitigation wetlands provide as much value as the natural wetlands that took thousands of years to evolve. Thank you for the opportunity to provide input on the PolyMet SDEIS.

Paul F. Tanghe

Mar 4, 2014 EIS Project Manager Lisa Fey MN Dear EIS Project Manager Fey, Please accept these comments on the PolyMet Mining Corp. NorthMet mining project Supplemental Draft Environmental Impact Statement. Sulfide mining has never been done in Minnesota and threatens wetlands, rivers, lakes and streams across the Arrowhead Region of Minnesota, including Lake Superior and the Boundary Waters Canoe Area Wilderness. Acid Mine Drainage and heavy metal contamination have polluted waters in all other places where sulfide ore mining has occurred. I have grave concerns about this project's potential impacts on our region's natural resources and public health, including: risks to water quality, loss of wetlands, harm to wildlife such as the threatened lynx and declining moose populations, and cumulative impacts from mining. I have seen the effects of sulfide mining at the Ray Mine near Kelvin, Arizona. Before mining companies fully appreciated the hazard they were creating there, rainfall resulted in sulphuric acid flow into Mineral Creek and the Gila River. As a commodity, the price of copper fluctuates widely. There is no guarantee that the PolyMet mine will be open for its projected twenty year life-span. The taxpayers of Minnesota will be required to protect the watershed for 500 years for a mine project that may not be viable for more than 5 years. Again, look to Arizona for the effect of fluctuating copper prices on the viability of copper mines controlled by foreign owners. The Federal land exchange of protected Superior National Forest land to facilitate PolyMet's destructive and polluting open pit sulfide mine is not in the public interest Sincerely, Paul Finsness 734 Larpenteur Ave E Saint Paul, MN 55117-2528

Why isn't this meeting interpreted for the hearing impaired?

Paul Forsman 18077

Hello. I'm Paul Forsman from Ely. I just wanted to make a couple of comments. I saw the land-exchange data, but I see from real estate, I'm a little bit involved, I think the corp service has done a great job are for us. And other things I wanted to say, we've talked about wetlands, here. I worked 30 years at the Minnesota mine here, close to Virginia, and when I was there, they came over this Gilbert Pit, six miles away, and the government, in their infinite wisdom, they said, we can't cross the swamps that made the headwaters in the Pipe River. We have to cross the river closer to where it's -- where we can cross it with one bridge and not go across, put a quarter-mile extra in the distance to the mine were all in rock do, but at least we didn't disturb those headwaters for that river and everybody knows that we don't want to disturb those mosquito-breeding grounds, you know. We want as many mosquitos to breed as we can, you know, it's good for Minnesota. But the thing is, is that in that infinite wisdom for 25 years each haul truck that gobbles 100 gallons of fuel a day -- an hour, is going a half a mile farther than it had to, creating a greater carbon index than ever needed to be, so when you're thinking about, you know, the mining company has to pay for it, think of the environmental big picture. I think that's very important. I mean, maybe it's still the right decision, but you know, I kind of question it when you have to burn so much are carbon for that. The other thing I wanted to say is that when I worked at the mine, they were, you know, digging the big pit, getting the road and had their dumps and stuff, and I always thought to myself, you got all this big equipment running around. Can't we put a little forethought into maybe when we're digging these pits, maybe we can put the dumps above it, maybe design a ski hill in the future or a trout fishing pond, something that this land could be when the mines are gone, into something that would be beneficial for the local economy? Put those kind of thoughts into your process of the -- of the EIS and not just what's mine, where they going to put it. Let's look at big picture in the long run and see if we can do this very right and be better than we've ever been before. Thank you.

Paul Forsman 57339

My name is Paul Forsman. F-O-R-S-M-A-N. This would be directed at the DNR or the Army Corp of Engineers, I'm not sure who does the organizing of it. I worked at Arcelor Mittal Mining Company. When we came over to the Gilbert pit, the DNR, or whoever it is that signs this stuff, there was wetlands of the beginning of the headwaters of the Pike River that were going to get affected by it and the wildlife, and then the floodwaters of the Pike River. The government decided that if the mining company moved a quarter mile down the road, they could cross the river and not the wetlands, where the wetlands drained into the river, and that they could cross the river. It was a quarter-mile out of the way from a direct route to the new mine pit. So, to protect those wetlands, they went a quarter-mile out of their way to -- and they crossed at where it was actually a river, so it didn't affect the wetlands. I thought the government did the wrong thing in this way: They saved the wetlands, the swamp that is combined to make the headwaters of the Pike River, but they caused each haul truck to drive a quarter-mile further. And what is the -- and greatly saved the wetland. Everybody likes someplace for the mosquitoes to breed. But they made each haul or each truck drive a quarter-mile or a half-mile farther per roundtrip. And those trucks burn a ton of fuel. And was the thinking right to save the ponds that make the headwaters? Did that justify wasting all of that extra carbon fuel to -- to satisfy the environment? I don't -- I don't think that that was well thought out. I think that the environment was better off serviced if they just put culverts in over the ponds that they were crossing and maybe went the straight route. But grant it, you know, everybody says, "Oh, save the wetlands," and it is okay for to save the wetlands, and, "The mining company is going to pay, it doesn't matter," but you are going to have to think about the big picture though. All of the extra carbon that was burned to satisfy a wetland that really wouldn't have been more affected anyways. That's all I wanted to say. Thank you.

Paul Freese 54788

Dear Ms Fay, Dear Federal and State Agency Leaders: In 2010, the US Environmental Protection Agency gave the PolyMet sulfide mine environmental study a failing grade, saying that the study itself was “inadequate” and the sulfide mine project would be “environmentally unsatisfactory.” The PolyMet SDEIS is still inadequate. It makes claims without facts behind them. It doesn’t analyze the effect of pollution on workers’ health or on nearby drinking water wells. It doesn’t explore alternatives that could reduce PolyMet’s destruction of wetlands. It doesn’t examine the effect that PolyMet’s sulfide mine, combined with other mines, would have on toxic pollution, like mercury contamination of fish. The PolyMet sulfide mine plan would destroy up to 8,263 acres of wetlands in the Lake Superior Basin. Its waste rock piles, mine pits, and tailings waste would leak and seep pollution into surface water and groundwater, increasing sulfates and toxic metals that harm fish, destroy wild rice, and impair health of adults and children. PolyMet makes a lot of rosy predictions, but the SDEIS shows that pollution from the mine tailings and waste heaps would last for at least 500 years. Pollution seeping from mine pits into the Partridge River surficial waters “would continue in perpetuity.” Please reject the PolyMet SDEIS and deny permits - like a permit to mine or a Section 404 wetlands permit - that would allow this open-pit sulfide mine to harm Minnesota’s fresh water for centuries, if not forever. Sincerely paul helbach p o 152 brule 152, WI 54820 715 372 5027

Paul Hunter

38829

Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. If approved, this first-ever sulfide mine in Minnesota would open the door for future mines that would endanger the Boundary Waters wilderness. For all these reasons, I urge you to reject the PolyMet mine. Sincerely, Mr Paul Hunter 2301 5th St NE # 2 Minneapolis, MN 55418-3503

Paul Jarvis

41996

Dear Minnesota Department of Natural Resources, I just signed National Audubon Society's petition on Change-org. Minnesotans are very concerned with protecting our clean water. We have serious concerns about PolyMet's plans to mine sulfide ore in northeastern Minnesota described in the Supplemental Draft Environmental Impact Statement (SDEIS). I believe that the SDEIS is insufficient and should not be approved because it is lacking vital information about long-term water treatment and how it will be paid for - information that is necessary to decision-makers. PolyMet would like to mine in high quality wetland habitat that is presently in federal ownership as a part of the Superior National Forest the largest designated Important Bird Area in Minnesota. In addition to this direct destruction of habitat, sulfates and toxic metals such as mercury, copper and nickel that are not captured for treatment will affect the aquatic organisms and habitats downstream. Birds that depend on fish and other aquatic organisms for food will be affected, including Belted Kingfishers, Hooded Mergansers, Common Terns and Common Loons. In addition, four bird species of greatest conservation need will likely lose suitable habitat if the mine is developed as proposed: Black-backed Woodpecker, Spruce Grouse, Northern Goshawk and Boreal Owl. I urge decision-makers to reject this risky proposal by PolyMet to mine sulfide ore in the headwaters of the St Louis River. Twenty years of mining, threatens hundreds of years of water pollution to sensitive birds and habitats. This trade-off is not worth the risk. Sincerely, Paul Jarvis Rosemount, Minnesota

Paul Jerome

40384

Dear Ms Lisa Fay, I am writing out of deep concern over PolyMet's NorthMet mining project. The proposed open-pit mine is the first of multiple attempts to mine copper and nickel from sulfide ores in northeastern Minnesota. The initial draft environmental impact statement for this proposal was harshly criticized by the Environmental Protection Agency, and the supplemental draft environmental impact statement (SDEIS) remains inadequate. PolyMet's proposed mine would result in unacceptable, irreversible environmental impacts and should be denied. The PolyMet mine would include three open pits, with two of the pits at depths of more than 600 feet. Nearly 1,000 acres of high-quality wetlands would thus be destroyed in this region, which has already lost many thousands of acres of wetlands to iron ore and taconite mining. The region of the proposed mine is also home to endangered lynx as well as moose, which are dramatically declining. The SDEIS acknowledges that the mine would "adversely impact" over 4,000 acres of wildlife habitat - much of which is critical lynx habitat. But the document barely mentions moose except to recognize that the mine "will affect moose individuals." Furthermore, a number of the lakes and streams near to and downstream of the mine site already exceed state standards. To meet water-quality standards for sulfates, mercury and other pollutants, the SDEIS acknowledges that PolyMet would need to mechanically treat its wastewater for at least 500 years. But the SDEIS fails to explain how PolyMet can provide financial assurance that the necessary funds will be available for hundreds of years after the mine has closed. According to the EPA, hardrock mining is the country's most toxic industry, and 40 percent of our nation's Superfund sites are devoted to cleaning it up. How will PolyMet's mine be different. The SDEIS supplies no answers. Finally, the proposed mine site is on Superior National Forest, where the Forest Service recognizes that open-pit mines are prohibited. But instead of rejecting the mine or considering an underground mine alternative, the Forest Service is proposing to exchange these lands with PolyMet to allow the open-pit mine to proceed. The Forest Service has yet to provide the public with sufficient information concerning this proposed land exchange in order to demonstrate that it is in the public interest. In sum, the SDEIS fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts - and so it should be rejected. Thank you, Paul Jerome 5027 Strain Ct El Paso, TX 79924 US

Paul Johnson

46930

Paul Johnson 4351 Sheridan Ave N Minneapolis, MN 55412 I have studied the mine proposal and have decided that it is a poor deal for Minnesota for the following reasons: 1- The Canadian company and their Swiss financiers have a poor environmental record 2- Recreational land is highly valued in Minnesota. Because of high natural runoff in the area the risk of major pollution would be high. If it happened I believe it is unlikely that any cleanup funds would be adequate to repair the damage. 3- After the mine closes the site may well have to be monitored for generations until the threat of pollution will have passed. Please take my concerns into account when deciding whether to approve the mine. Sincerely, Paul Johnson

Paul Love

39690

Dear Ms Fay, Dear Ms Fay and Mr Bruner, Please reject the PolyMet NorthMet SDEIS as inadequate and reject the PolyMet open-pit sulfide mine and wastes proposal due to its unacceptable risks to human health. Mercury is a huge concern for me. The Minnesota Health Department found 1 out of 10 infants in Minnesota's Lake Superior Region are born with unsafe levels of mercury in their blood. Fish in the lower part of the St Louis River are more contaminated with mercury than those in other regional waters. Downstream of the PolyMet project, the St Louis River and Embarrass, Wynne, Sabin, Esquagama, Colby and Whitewater Lakes are legally impaired due to mercury in fish. The PolyMet SDEIS analysis of mercury risks is inadequate and misleading. The SDEIS' claims that mercury and sulfates - which increase mercury in the food chain - will be "captured" are unreliable. There are huge gaps in the SDEIS where there should be information on mercury concentrations and seepage from waste rock, peat overburden, tailings and liner leaks. The SDEIS inadequately analyzes human health impacts of PolyMet's pollution. Not just mercury in fish, but impacts of manganese, lead and aluminum in water on the brain; impacts of air emissions including diesel, asbestos-like fibers, nickel and other particulates on cancer; and impacts of arsenic on cancer. The SDEIS does not explain potential harm to human beings, particularly for bottle-fed infants, children and the elderly, who are more vulnerable to the impacts of toxic pollution. The SDEIS completely fails to analyze any risks to workers on-site at the PolyMet mine or plant. The SDEIS fails to assess impacts on nearby residential wells from tailings basin groundwater seepage. The SDEIS inappropriately reduces the 70-year "lifetime" to 30 or 40 years to mislead the public about cancer risks at the PolyMet property boundary. The SDEIS arbitrarily denies effects of water pollution on the St Louis River. The SDEIS fails to recognize environmental justice effects of pollutants, such as methylmercury and arsenic, that may be found in fish, game and wild rice as well as water, and may cause particular harm to tribal members or low-income families who rely on fish, game and wild rice for subsistence. The PolyMet sulfide mine project and SDEIS plan should be rejected due to unresolved serious issues regarding mercury and other pollutants that affect human health. •Reject the PolyMet sulfide mine project due to its unacceptable health and environmental health impacts on Minnesota infants, children and adults, including low-income families and tribal members who fish, hunt and gather for subsistence. If you are not ready to reject the PolyMet project at this time, the SDEIS must be redone to address major gaps and flaws in the analysis of impacts on human health: •Redo the SDEIS to disclose mercury concentrations and how much mercury is released directly or indirectly into surface waters from all PolyMet sources. •Redo the SDEIS to assess mercury impacts without unreasonable assumptions, like the claim that almost all tailings seepage of sulfates would be captured. •Redo the SDEIS to evaluate methylmercury accumulation in the food chain due to hydrologic changes to peat and wetlands as well as due to air and water pollution. •Redo the SDEIS to require a separate and clear Health Risk Assessment prepared in conjunction with the Minnesota Health Department to analyze impacts of all PolyMet sulfide mine and plant pollution releases and accumulations on health, including: 1-Description of the known human health impacts of all pollutants in PolyMet's air emissions and water discharges in language understandable to the public. 2-Assessment of potential impacts on residential wells from tailings seepage. 3-Health risk assessment for on-site workers at both the PolyMet mine and plant. 4-Assessment of cumulative mercury risks, including actual hazard levels in lakes already impaired for mercury

Mar 8, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, I urge you to reject the proposed PolyMet mine. The project presents unacceptable environmental risks and should not be allowed. This dangerous sulfide mining operation threatens to pollute Minnesota water with sulfuric acid and heavy metals for 500 years and endangers clean water and habitat in the Lake Superior basin. We should never authorize a project that will require several generations of monitoring and clean-up. We owe our children and grandchildren not to mortgage their futures. Sincerely, Mr Paul Magee 764 Lincoln Ave Saint Paul, MN 55105-3347

I am writing today in opposition to the PolyMet mine. Many many many people, including my father-in-law and my sister-in-law, use enjoy the Boundary Waters. I do not believe for one second that the mining company will be around for the 200 years they say the waste water will need to be treated. Please do not threaten one of the upper midwest's great natural treasures. Sincerely, Paul Martz 2408 Chestnut St Harrisburg, PA 17104

Paul Nasvik 42898

To whom it may concern, Please accept my attached letter for inclusion to the public record against the Polymet Sulfide Mine Application. - Paul Nasvik 320 River Rd, Hudson, WI 54016

Paul Neimann 46135

Dear DNR, Putting the boundary waters, The Superior National Forest, Lake Superior, the St Louis River and other lands at risk for acid pollution as a result of mining copper is a poor decision and should not be taken. As a former resident of Pennsylvania, counsel for one of the largest coal companies in this country and as a person who has visited the coalfields of Pennsylvania, West Virginia and Kentucky I am familiar with the environmental damage caused by the acid derived from mining which for all practical purposes is permanent. The harm from copper mining will be no different. It is difficult to understand why we would put at risk our unique natural environment to create wealth for foreign corporations who will soon leave the state leaving the citizens with a permanent and ongoing mess to clean up. Every effort should be made to support a business environment which will create jobs, but not at the expense of our priceless natural inheritance. Thank You Paul Neimann [HYPERLINK "mailto:Paulneimann@yahoo-com"](mailto:Paulneimann@yahoo-com) 2720 Glenhurst Ave S. Mar 11, 2014 EIS Project Manager Lisa Fay 500 Lafayette Road, Box 25 St Paul, MN 55155 Dear EIS Project Manager Fay, As a Minnesotan, I regularly travel to the Boundary Waters and northern Minnesota for camping, fishing, and outdoor activities. It would be a terribly short-sighted plan to risk one of the only truly natural environments that Minnesota has left for the sake of a few hundred jobs. If PolyMet's proposal was more reasonable, I could see how this would be a difficult decision. However, knowing that 500 years of water treatment will be needed makes their proposal almost laughable. 500 years ago Columbus had just sailed to America, the Renaissance was still taking place, and Shakespeare hadn't even been born yet. To think of potentially ruining an environment, or at least making it a place that requires constant clean-up, for the next 500 years so that a business can make a profit is not a responsible use of our state's resources. I urge you to reject the proposed PolyMet mine. Not only is the PolyMet mine a bad idea, but it would establish a dangerous precedent of allowing new mining interests into Minnesota nature. I want better than that for the future of Minnesota. Sincerely, Mr Paul Nelson 2004 Edgerton St Maplewood, MN 55117-2112

Mar 8, 2014 Ms Lisa Fay, Department of Natural Resources To Ms Fay, Department of Natural Resources, The PolyMet NorthMet SDEIS differs in its estimates of federal and state and local taxes without explanation of what accounts for this difference. The 2010 NorthMet DEIS stated: "IMPLAN modeling estimates that during a typical year of operation the federal government would receive \$17-3 million and the state and local governments would receive \$14-5 million in taxes from the operation of the Project, excluding net proceeds tax" (DEIS 4-10-19). But the 2013 SDEIS says: "IMPLAN modeling estimates that, during a typical year of operation, the federal government would receive approximately \$30 million, and the state and local governments would receive approximately \$39 million in taxes from the operation of the NorthMet Project Proposed Action" (5-503). Table 5-2-10-3 in the SDEIS, showing estimated taxes paid for 2011 had the project been in operations, projects state taxes of \$15-6 million and federal taxes of \$64 million for 2011, a number far larger than the \$30 million described from the IMPLAN model. These figures lack explanation and rely on estimates provided by PolyMet without any verification. These estimates have also changed dramatically from the draft versions of the SDEIS circulated earlier in 2013 without any explanation. In the Track Changes Version 2-0 of the PSDEIS, Table 5-2-10-3 shows annual estimates of \$3-12 million of state taxes and \$12-8 million in federal taxes, increased by 500% to \$15-6 million and \$64 million. No explanation of the change is provided, and no source provided other than personal communication with PolyMet. Please take the following actions: 1) Revise the SDEIS to provide details of the calculations used to arrive at the estimated taxes paid and provide independent confirmation of these estimates from state and federal agencies 2) Revise the SDEIS to provide consistent numbers in estimated taxes across all sections of the document or explanations of the differences in the estimates. Thank you for the opportunity to provide input on the PolyMet SDEIS. Due to the problems with the draft mine plan outlined above, I believe the mine should not be built as described. Sincerely, Mr Paul Nelson 1531 Madison St NE Minneapolis, MN 55413-1426 (612) 781-8054
