7		Comment is noted. TMM is choosing not to resubmit the cover letter.	RESOLVED.		
8	Note. Bullet list; numbers 1 & 5. Statements regarding specific percentages of reduction in footprint or impacts cannot be verified without the previous mine plans. Absent this and other information, such assertions are speculative. RGU reserves judgment as to relevance for disclosure in future documentation. No action requested.	Comment is noted. TMM is choosing not to resubmit the cover letter.	RESOLVED.		
9	Cover letter; pg. 2; bullet list Future information request. Bullet list; number 2. Kinetic testing is required to state tailings would not produce ARD (or AMD). DNR will need to review this data and evaluate if the assertion is supported. No action requested. DNR will be making a specific request for the data.	Comment is noted. TMM is choosing not to resubmit the cover letter.	RESOLVED.		
10	Note. Bullet list; number 8. Regarding assertion that	Comment is noted. TMM is choosing not to resubmit the cover letter.	RESOLVED.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
11		Glossary; acid rock drainage. Definition asserts ARD always contains both metals and sulfate. Action requested: Confirm proposed definition or remove statement.	The ARD definition within the glossary is from the GARD guide glossary produced by the International Network for Acid Prevention. It is consistent with the glossary definition of ARD in the Twin Metals Minnesota Mine Materials Characterization Program Volume 1. TMM's use is consistent with the GARD guide definition – low pH, presence of sulfate and metals.	RESOLVED for purpose of scoping.		
12		Glossary; closure. Closure is defined in Minns Rules part 6132.0100, subp. 6. Action requested: Add reference to Minnesota Rules in the text.		RESOLVED for purpose of scoping.		
13	xv	Glossary; construction stormwater. Because instances may be present where constituent loading occurs to construction water that requires additional management, the definition should be modified to reflect this potential situation. Action requested: Modify text to read: "Construction stormwater: direct precipitation or stormwater that has contacted surfaces disturbed by construction that could have increased constituent loading."	See Comment 181.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	data submittal text. Definition now reads "Construction stormwater: Direct precipitation or stormwater that has	The definition of construction stormwater has been revised and incorporated the suggested language in the glossary and in the data submittal text. Definition now reads: "Construction stormwater: Direct precipitation, precipitation runoff, stormwater runoff, snowmelt runoff, and surface runoff that has contacted surfaces disturbed by construction activities that could have increased constituent loading."
14		Glossary; contact water. Note on water management classifications and definitions. It will be necessary to consider implications of definitions of the various types of water in terms of regulatory definitions. This can be a source of confusion. RGU- and regulatory-approved definitions for the EIS and any subsequent permitting will need to not only make sense for describing the project but must also align with language and definitions in permits. Will require future consultation. No action requested.	See Comment 71.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	and Project water nomenclature as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW or the MDNR scoping EAW.	In order to better align with regulatory classifications in response to MDNR comments on the SEAW data submittal, TMM has made the following revisions to water nomenclature associated with the Project: -Process water: water used in the concentrator to process the oreMixed water: a mixture of process water and one or more other types of water. Managed as either process water or contact water, depending on its propertiesContact water: water that comes in direct contact with ore or waste rock (except construction rock) or infiltrate into tailingsIndustrial stormwater: direct precipitation, precipitation runoff, stormwater runoff, snowmelt runoff, and surface runoff and drainage that has contacted industrial areas or activities that could have increased constituent loading and is not process water, contact water, or mixed water. This would include stormwater and snowmelt runoff from the surface of dry stack facility tailings assuming such water is in compliance with applicable standardsNon-contact water: direct precipitation, stormwater, and surface water that has not contacted ore, waste rock, tailings, industrial areas, industrial activities, or surfaces disturbed by construction activities, including runoff from reclaimed surfaces and water from adjacent watersheds diverted around the facilityConstruction stormwater: direct precipitation, precipitation runoff, stormwater runoff, snowmelt runoff, and surface runoff and drainage that has contacted surfaces disturbed by construction

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
"	· · · · · · · · · · · · · · · · · · ·					activities that could have increased constituent loading. -Construction dewatering water: surface water and groundwater removed to dry and/or solidify a construction site to enable construction activity. These terminology and definition modifications are intended to align more closely with regulatory requirements and more clearly communicate the water management approach for the environmental review and permitting processes. TMM anticipates that Project water nomenclature, definitions, and application of definitions may continue to be refined based on agency discussions during the EIS process.
15		chemical, biological, or radiological elements at	document. Generic or plain language is used in some cases. These are not intended to be legal or regulatory definitions, nor are they intended to encompass or			
16	XV/	Glossary; corehole. Action requested: Provide definition		RESOLVED.		
17	xvi	· ·	retrieve a core sample." Text has been edited to read: "Dam: A structure that impounds water and is defined in Minnesota Rules Chapter 6115.0320, Subpart 5."	UNRESOLVED. The proposed definition with excerpt is incomplete. It would more completely read: "Dam: A structure that impounds water <u>and/or waste materials containing water</u> and is defined in Minnesota Rules Chapter 6115.0320, Subpart 5." Action requested: Modify text to offer a more accurate summary of the rule definition.	The term "dam" has been removed from the glossary. It was not used to describe the Project in the data submittal.	
18		use describing the project states: "a dry stack facility does not require a dam or berm." For this definition to apply as listed, the facility would have no berm (i.e., that creates slope to contain the tailings). Action requested: Confirm no berm is proposed at the dry stack facility.	·	UNRESOLVED . The proposed definition with excerpt is incomplete. It would more completely read: "Dam: A	Removed reference to dam in definition of dry stack facility. Text has been edited to read: "A dry stack facility is the most sustainable method used to store filtered tailings cake produced from the processing after the 4% of the ore that is copper, nickel, cobalt, platinum, palladium, gold and silver is recovered. Before placement at the dry stack facility, the tailings would be filtered and the majority of water is removed. The dry stack facility would be a lined facility where the tailings filter cake (silty sandy material) is placed and compacted in lifts. The dry stack facility is constructed in three stages (stage 1, stage 2, and stage 3), generally from west to east."	

mment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
19	xvi	Glossary; dry stack facility. For the purposes of the EIS, the definition should better describe the actual proposed facility in more detail, not expressly focusing on its function or how it is constructed. Action requested: Modify text.	Glossary is meant to introduce terms at a high level. The dry stack facility is explained in detail in the text (see lines 843-872 for construction and lines 933-990 for layout and operations). Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS.	RESOLVED for purpose of scoping.		
19	XVI		Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details on the dry stack facility and operating details of the dry stack facility.			
		Glossary; development rock. Text identifies the definition of development rock as "sulfide barren." No rock is devoid of sulfur. The mine materials characterization plan is intended to address the appropriate cut-off of rock reactivity that could be used for construction. Action requested: Modify definitions accordingly and use consistently throughout the document.	glossary text has been changed.	UNRESOLVED. Additional clarification. Consistent with Comment 42, there is also a need need to indicate (in the definition) the fact that some ore is from the Giants Ridge Batholith (GRB) and is outside the basal mineralized zone (BMZ). Action requested: Modify the text with the additional clarification.	revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	In an effort to better align with the current Mine Materials Characterization Program and respond to MDNR comments on th SEAW data submittal, TMM has made revisions to rock nomenclature and material handling practices associated with the Project. No revisions have been made to tailings nomenclature as the definition used for tailings remains consistent with Minn. Rule part 6132.0100. Revisions to rock nomenclature and material handling within the SEAW data submittal are as follows: 1) The term "development rock" has been removed from the SEA data submittal.
						2) TMM would manage mined rock as one of three categories: a. Ore: rock mined that contains the targeted metals – copper, nickel, cobalt, platinum, palladium, gold, and silver – which wou recovered through the concentrator to produce three concentrator. b. Waste rock: rock that may or may not contain metallic mineralization but is not profitable to process for the purposes of producing concentrate. c. Construction rock: a subcategory of waste rock that could be as construction material. This rock would have primary objective and selection criteria that will be determined by the ongoing Mi Materials Characterization Program.
						3) During construction, there would be three types of rock: ore, waste rock, and construction rock (a subcategory of waste rock

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
20	xvi					Ore and waste rock that does not met the selection criteria for construction rock would be placed on the temporary rock storage facility and would be processed during the initial phases of operating the concentrator. Rock meeting the necessary criteria to be considered construction rock would be used as construction material.
						4) During operation, there would be three types of rock: ore, waste rock, and construction rock (a subcategory of waste rock). During the operation phase, ore would be crushed underground and transported by conveyor to the primary ore stockpile. Waste rock mined during operations would be managed underground by placing the waste rock in mined out stopes prior to backfilling with engineered tailings backfill. As required and as determined by selection criteria developed as part of the Mine Material Characterization Program, some of the waste rock may be utilized as construction rock.
						5) As a result of the changing rock nomenclature to better align with Minn. Rules part 6132.0100, TMM no longer states, "no waste rock would be brought to surface" within the data submittal. TMM identifies that no permanent waste rock stockpiles will be placed on surface.
						With regards to addressing an appropriate "cut-off", TMM agrees that one of the purposes of the Mine Materials Characterization Program is to develop the appropriate selection criteria for categorizing rock and intends to continue assessing the results of that work in a collaborative nature with MDNR to better inform these criteria.
21	xviii	"used to recover dense minerals and produce gravity concentrate." Greater consistency with the definition of the flotation circuit would include a reference to the target metals. Such text might read: "used to recover targeted metals, including platinum, palladium, and gold to produce gravity concentrate. Requested action: Review recommended text for accuracy, revise if necessary, and adopt.	circuit: Process circuit within the comminution circuit used to recover targeted metals, including platinum, palladium, and gold to produce gravity concentrate. The gravity concentration circuit uses the differences in the	RESOLVED.		
			Definition of concentrator has also been corrected to read: "concentrator: A subset of the process related to recovery of the target metals. The concentrator would include grinding, gravity concentration, flotation, concentrate dewatering, concentrate storage and loadout, and reagent makeup. The concentrator would be located at the plant site."			
22	xix	supply water to glossary. Action requested: Add the definition.	Text has been edited to read: "mine supply water: Water that would be pumped underground and used for dust suppression and equipment requirements like drill water."	RESOLVED.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
23	xxi	the definitions of the flotation circuit and gravity circuit respectively, consider adding phrase: "through the concentrator to recover targeted metals into three concentrates, two from flotation and one from gravity. Ore is found" Action requested: Review recommended text for accuracy, revise if necessary, and adopt. Glossary; overflow ore stockpile and pre-operational ore stockpile. From comment at text at Lines 605-605. Action requested: Modify text to make distinction	the targeted metals which would be processed by TMM through the concentrator to recover targeted metals into three concentrates, two from flotation and one from gravity. Ore is found in the basal mineralized zone of the Maturi deposit." Additionally glossary had been expanded to include definition of concentrate, copper concentrate, gravity concentrate, and nickel concentrate. "concentrate: Concentrates would be the end products of the TMM project. These concentrates would contain the minerals that would be separated from rock in the mine. TMM's concentrates would be produced either through the flotation process or the gravity concentration process and would be sold on a global market." "copper concentrate: The first flotation product that would recover copper, gold, silver, platinum, and palladium while minimizing the amount of nickel and cobalt recovered." "gravity concentrate: The product of the gravity concentration circuit that would target the recovery of Overflow ore stockpile and pre-operational ore stockpile are two different ore stockpiles that would exist at different times on the footprint of the temporary rock			
25	xxii	clearer. May need to refine definitions in the glossary. Glossary; proposed action and proposed project. Outside each respective definition, the term "proposed action" is used three times in the document while "proposed project" is used once. The use of these terms in the text have a specific context in NEPA and MEPA respectively, with the term "Project" referring to the Twin Metals Minnesota Project subject to the EIS. Action requested: For the definitions for "proposed action" and "proposed project" respectively, add the NEPA and/or MEPA qualifying language to better distinguish between the two.	occurs within the glossary and the term "proposed project" only occurs within the glossary and an explanation of cumulative potential effects.	RESOLVED for purpose of scoping. Response noted. If the Scoping EAW includes a glossary, then the indicated qualifiers regarding MEPA and NEPA contexts will be included in the definitions to provide both clarity and consistency with future EIS-related documents. No further action requested.		
26	xxii	outlined in Minn. Rules part 6130, subp. 29, but references Minn. Rules parts 6132.2000 to 6131.3200. Action requested: Revise in line with rules and then ensure consistent use throughout document.	that successfully accomplish the requirements of Minnesota Rules, parts 6132.2000 to 6132.3200. Actions intended to return the land surface to an equivalent undisturbed condition. When the objective of reclamation is to return the land to pre-mining conditions and uses, it is sometimes called restoration." Minn. R. 6130 and 6131 would not be applicable to the Project.	rule. Additional text does not provide clarity. Action requested: Eliminate remaining two sentences after rule citation text. Ensure use of the term "reclamation" is consistent with the rule definition throughout the document and revise accordingly.	Text has been edited to read: "reclamation: Activities that successfully accomplish the requirements of Minnesota Rules, parts 6132.2000 to 6132.3200."	
27		Glossary; reclamation stockpile. From comment at Lines 826-828. Add definition for mine reclamation stockpile to glossary. Action requested: Add term to glossary.	Text has been added to glossary: "reclamation stockpile: stockpile of material suitable as a growth medium such as topsoil and peat for reclamation. Material would be stripped and stored during clearing and construction of the Project."	RESOLVED for purpose of scoping.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
28		Proposed text: "temporary rock storage facility: Physical infrastructure on which the pre-operational ore	operational ore stockpile, and the overflow ore stockpile in operations, would be located. It is a lined facility at	operational life of the project. Use of the term "temporary" in the name of this project feature does not convey this fact. A more accurate qualifier would be	proposing to remove temporary rock storage facility, preoperational ore stockpile, overflow ore stockpile and simplify to define the infrastructure as the construction rock storage facility and the secondary ore storage stockpile. TMM anticipates agreed upon language will be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	Based on feedback from agencies through the SEAW data submittal review process, TMM has reviewed infrastructure naming conventions and has changed the nomenclature of the rock storage facilities to: 1) Temporary rock storage facility: physical infrastructure on which ore and waste rock that does not meet the selection criteria for construction rock would be stockpiled during the construction phase of the project. It is a lined facility at the plant site that would convey precipitation to the plant site pond 2. 2) Primary ore stockpile: covered ore stockpile that is the primary feed stockpile for the concentrator during the operations phase of the project. 3) Secondary ore stockpile: the secondary ore stockpile would be utilized when the primary ore stockpile is at capacity; this condition would occur intermittently during operations. Ore on the secondary ore stockpile would be rehandled and transferred to the primary ore stockpile on a priority basis as capacity within the facility allowed.
29		less than the ore grade cut-off? Action requested: Please confirm and state more directly. Apply any clarifications to the glossary definition.	Text was edited to read: "waste rock: Rock mined during operations from the basal mineralized zone below the targeted cut-off grade that would be managed underground and placed in mined out stopes for permanent storage." From the basal mineralized zone was added to convey that TMM anticipates waste rock to have sulfide mineralization.	RESOLVED for purpose of scoping.		
30	xxv	Glossary; wetlands. Wetland delineation definition does not include enough specificity. Add that it also differentiates between types of wetlands. Action requested: Revise as needed.		RESOLVED for purpose of scoping.		
31		note WCA has been amended since 2000. Action	Text has been edited to read: "This act was passed into law in 1991 (and amended in 1993, 1994, 1996, and 2000, and 2009)"	UNRESOLVED. The new text in parents () should have one additional piece of text for accuracy. It should read: "(and the rules were promulgated in 1993 and amended in 1993, 1994, 1996, and 2000, and 2009)" Action requested: Modify starting text within the parentheses to match the proposed language.	Text has been edited to read: "Wetland Conservation Act: This act was passed into law in 1991 (and the rules were promulgated in 1993 and amended in 1993, 1994, 1996, 2000, and 2009)"	
32	9-11	RGU note. The term "preliminary" is applied to a number of designs and locations. This is appropriate at this stage however the public review Scoping EAW will evaluate the Project proposed by TMM. Because the MEPA review per se results in no final governmental actions, it is possible for project features to change over the course of the EIS. Therefore, information presented at this time may or may not be reflected in future documentation. No action requested.	Comment is noted.	RESOLVED for purpose of scoping.		
33	13-14	"provide information needed for the environmental		RESOLVED for purpose of scoping.

#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
35	152	RGU note. Project locations with section, township, and range information will be verified by agency staff. No action requested.	Comment is noted.	RESOLVED for purpose of scoping.		
36	210-211		Additionally the targeted minerals of gravity concentrate are explained on line 672.	RESOLVED for purpose of scoping.		
37	221-222	concentrate is where all metals except copper and nickel would collect during processing. If correct, the gravity concentrate definition on page xviii could be improved by stating that. Action requested: If accurate, consider		RESOLVED for purpose of scoping.		
38	224	independent of when all permits and approvals would have been secured? In other words, is it possible for the construction phase to commence in Q1, Q2, or Q4 of Yr-3? Action requested: Confirm and clarify, with any further RGU recommendations predicated on the response.				
39	231	Clarification. Use "progressive" instead of "concurrent" to match the language used in Minn. Rules Chapter 6132. Action requested: Text substitution.		RESOLVED for purpose of scoping. Response noted. If the Scoping EAW includes a glossary, then the indicated qualifier "progressive" will be included in the definition to provide both clarity and consistency with future EIS-related documents. No further action requested.		
40	238-241	complete release would be the goal at the end pursuant to Minn. Rules part 6132.4800, subp. 3? Action requested: Modify text to match project intent with this provision in Minnesota Rules.	marked by completing all applicable maintenance and monitoring requirements set forth in federal or state surface authorizations, mineral leases, permits, and	RESOLVED for purpose of scoping.		
41	242		There is no plan to have "lean ore." All ore brought to the surface would be processed through the concentrator.	RESOLVED for purpose of scoping.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
42	248	of sulfur. The mine materials characterization plan is intended to address the appropriate cut-off of rock reactivity that could be used for construction. Action	construction aggregate and would be mined during the construction of the declines and ventilation raises, and	is from the Giants Ridge Batholith (GRB), and thus is outside the basal mineralized zone (BMZ). Action requested: Modify the text with the additional clarification.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.
43			See Comment 29. In addition to updating the glossary definition, the description of waste rock in line 253-255 was clarified to state that waste rock is expected to be rock from the basal mineralized zone which has sulfide mineralization.	UNRESOLVED. Agencies will engage TMM to identify anticipated level of sulfur content of waste rock. Further discussion required.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.
44		be aligned with the definition of waste rock in Minn. Rules part 6132.0100, subp. 34. For example, development rock would be a sub-category of waste rock. Action requested: Review the cited rule and modify, as needed, the Project definitions to match the rule. This will introduce clarity into both the EIS and permitting.	In the Mine Material Characterization Program volumes, TMM states that within the Mine Material Characterization Program that TMM will be aligned with Minn. R. definition of waste rock. Consistent with the response to Comment 15, the description of waste rock is intended to help a wide audience understand how TMM is using terms within this document. Generic or plain language is used in some cases. These are not intended to be legal or regulatory definitions, nor are they intended to encompass or resolve the comprehensive and differing definitions and interpretations that can be found in federal, state, and local law and rule. Regulatory definitions can be adopted in TMM documentation after agency engagement on definitions is complete. Documents requested by the state that aim to satisfy EIS- and permitting-level analysis will adopt regulatory language as required.		TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.
45	264	Clarification. The text indicates the "cut-off point" would be determined as mined rock would be monitored and tested during construction of the mine declines and ventilation raises. Best mining practice would suggest the "cut-off point" be determined ahead of time. Testing at the time of construction would then be used to determine which rock exceeds sulfide mineralization criteria and that which does not (e.g., development vs waste rock vs ore). No action requested but anticipate further discussion as it may be beneficial in development of later information submittals.	responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
46	264	additional detail on "monitoring and testing" proposed	TMM intends to work with the MDNR through the development of the Mine Materials Characterization Program to define the details on the monitoring and testing required.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	Text referencing "monitoring and testing" has been removed and the following text has been incorporated in the data submittal in Section 5.3.1 to provide clarity: "The current focus of the material characterization program is to continue static testing to further inform where kinetic testing is necessary. Results from future static and kinetic testing will further inform material management and engineering controls, as necessary."

54	276	actual ore onsite at the same time, and if yes, how would this rock be managed? Has storage capacity been estimated and addressed in the design? Action requested: Address the item and modify text as warranted.	conveyed to surface and added to the coarse or stockpile that then feeds the concentrator. The pre-operational ore stockpile is processed at this same time and is reclaimed from the pre-operational ore stockpile and fed to the coarse ore stockpile where it would be mixed with ore that was currently being mined.	clarification. How much pre-operational ore is to be stored on the surface before the first ore is processed? In other words, what is the maximum size of the ore stockpile? As noted in v2 lines 719-720, a maximum mass of 1.2 million short tons is provided; preliminary	Table 3-5 has been added that shows the pre-operation ore stockpile dimensions.	
55	278-279	during construction as drifts are excavated and before stopes are created? Action requested: Address the item and modify text as appropriate.	Capacity would be created and the underground mine could start accepting engineered tailings backfill within approximately six months after mining starts. Waste rock as necessary could also be added to mined out stopes in that same time period before engineered tailings backfill is added. Additionally, refer to lines 263-275 for the treatment of rock brought to surface during the construction phase.	the first six months after mining starts), and if yes, where will this waste rock be stored underground? It is unclear how much material would require management prior to the ability to placing it in the mined-out stopes. Also to confirm, there is no plan to bring this material to the surface as crushed ore once mining commences? Action	Waste rock generated during the first 6 months of operation will be processed and thus we have considered it as ore (further referred to as low-grade ore in this response). During the first 6-9 months of operations (the ramp-up period) the ramp-up of production is mine constrained meaning it takes longer to ramp up the mine production than it takes to ramp up the concentrator production. Therefore during the ramp-up period, it is beneficial to send low grade ore (that may otherwise be classified as waste rock at another year in the mine) to the concentrator because it is not off-setting any higher grade ore.	
56	277-278	development or "construction" rock generated during operations. Does this align with this text? Action requested: Confirm and clarify text as warranted.	Development rock would be mined periodically throughout the project. See lines 281-284. "At no point in time throughout the construction or operation phases would waste rock be transported to the surface; rock transported to surface would either be classified as ore (and processed through the concentrator) or development rock (and used as construction aggregate)."	language to be used in scoping and EIS. Further discussion required.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.
57	281	1	Text has been edited to read: "At no time would waste rock be brought to the surface"	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
58	281	Clarification. The text states no waste rock will be transported to the surface. When tunneling into the basal unit and encountering low grade ore (waste rock), where would it be placed if it cannot be transported to the surface? Action requested: Amend text as appropriate to address comment.	If low grade ore was encountered during construction it would be transferred to the pre-operational ore stockpile and processed through the concentrator as ore. See lines 263-275.	RESOLVED for purpose of scoping.		
59		Clarification. As noted previously, by definition in Minnesota Rules, this rock is waste. Action requested: Please clarify the text is consistent with rock definitions in Minn. Rules part 6132.0100, subp. 34.	See Comment 44.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.
60	281-284	Clarification. Rock that would be transported to the surface during construction would be considered waste rock during the operational phase. Action requested: Consider eliminating the statement "that no waste rock will be transported to the surface during construction and operational phases."	See Comment 57.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.
61		Clarification. The section appropriately has a focus on ARD potentials. Are there other non-targeted metals (such as arsenic or similar) or other compounds in tailings? Action requested: Address the item and modify text as appropriate.	Text has been edited to read: "Metal leaching (ML) potential of the tailings is currently being analyzed through kinetic testing as summarized in Section 5.1.3." Additionally the definition of tailings has been edited in the glossary to read: "tailings: Tailings are the leftover finely ground (milled) ore after the desired minerals have been physically separated and removed."	RESOLVED for purpose of scoping.		
62	285-288	,	the Project and the rock management strategy, the	RESOLVED for purpose of scoping. Because it is not yet "known" whether tailings with less than 0.2% S are expected to produce AMD or not, it is likely the Scoping EAW will include additional language clarifying that additional testing and analyses are pending.		
63	288	If there is no temporary waste rock storage, then the phrase "permanent waste rock" is not needed. Action requested: Please clarify and revise the text to be	Text has been edited to remove permanent, so the sentence now reads: "First, the Project would not have waste rock stockpiles on surface, due to the underground mining and processing strategy of ore, thus avoiding the potential for ARD from waste rock stockpiles on surface." This change has been applied universally to be consistent with the definition of waste rock presented in the SEAW data submittal.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	TMM recognizes that under the regulations development rock is a subcategory of waste rock and is revising nomenclature related to material handling and management to align with Minnesota Rules, Part 6132.1000 and recent discussions with MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
64	292	Clarification. The text reads: "the Project would recover most sulfides from the ore, producing tailings with sulfur less than 0.2% S." Whether the tailings have less than 0.2% S or produce no AMD is yet to be determined. Also to be determined is the potential for release of trace metals in neutral drainage. Action requested: Consider eliminating the statement that the potential for ARD has been avoided recognizing this will be an issue receiving detailed coverage in the EIS. Another approach is to state "preliminary analysis suggests that; see Sections 5.1.3 and 5.3" or similar.	See Comment 62.	RESOLVED for purpose of scoping. Because it is not yet "known" whether tailings with less than 0.2% S are expected to produce AMD or not, it is likely the Scoping EAW will include additional language clarifying that additional testing and analyses are pending.		
65	292	detailed analysis during the EIS. Information in this section will eventually be cross-referenced to its proposed treatment in the SEAW and draft scoping decision. No action requested.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	TMM is revising nomenclature related to material handling and management to better align with the Mine Materials Characterization Program and recent discussions with the MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	The initial assertion Comment 65 is referring to was a summation of key points taken from the studies referenced in Section 5.1.3 of the data submittal. As a result of initial MDNR feedback, TMM removed this summation of key points within Section 5.1.3 as part of the initial response to comments submitted to MDNR on July 24, 2020.
66	294	this line of text: "demonstrated that sulfur content at	Text has been edited to read: "has demonstrated that sulfur concentration at this level to be non-acid generating"	RESOLVED for purpose of scoping.

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
112	Figure #	Clarification. How would crushed overflow ore be moved to the stockpile from the crusher and then back to the coarse ore stockpile? Understanding this part of the project allows insights on assessment of potential impacts from dust and dust control, spillage, and water management. Action requested: Modify text to address the item as appropriate.	Text has been edited to read: "The conveyor transfer system on surface has the ability to divert ore from the main decline conveyor to one of two conveyor: 1) the coarse ore stockpile feed conveyor or 2) the overflow ore stockpile feed conveyor. During operations when the coarse ore stockpile is temporarily full, crushed ore would be diverted to the overflow ore stockpile feed conveyor and conveyed to the overflow ore stockpile. If there is ore in the overflow ore stockpile and there is space available in the coarse ore stockpile, ore in the overflow ore stockpile would be reclaimed by front end load, loaded onto a conveyor, transferred to the coarse ore stockpile feed conveyor and conveyed to the coarse ore stockpile, along the same conveyors as the preoperational ore stockpile was reclaimed. The overflow ore stockpile would exist intermittently, based on the maintenance schedule of both the underground mine and the concentrator."	UNRESOLVED. Clarification. The overflow (coarse) ore stockpile apparently does not have a cover so more detail is needed on potential impacts, especially dust control as the ore sits there and is moved by front end loader. Would mitigative measures similar to that proposed for the pre-operational ore stockpile be applied to the overflow coarse ore stockpile? Action requested: Provide a response and supply supplemental text as warranted.	Twin Metals Round 2 Response The overflow ore stockpile would be used intermittently to feed the concentrator during shutdowns of the underground mine. Since the overflow ore stockpile would not be used continuously there would be flexibility in its operation to mitigate dust issues. Additionally, BMPs similar to those utilized with the preoperational ore stockpile would be used and the conveyors that would feed the overflow ore stockpile would be covered and water sprays would be provided at transfer points, as needed, to control dust.	Twin Metals Response After Additional Discussions with RGU
113	636 - 658	Question. Why is the pre-operational ore stockpile / overflow ore stockpile not covered like the coarse ore stock pile? Action requested: Provide a rationale for no covering this project feature.	lines 1706-1709: "The coarse ore stockpile would be covered; Conveyors would be covered and water sprays would be provided at transfer points, as needed, to control dust." Additionally, Plant Site Contact Water Management section outlines the management of water in these areas. The ore in the pre-operational ore stockpile is not crushed and the overflow ore stockpile would only be t used intermittently. Note while these are not covered the temporary rock storage facility - where both these stockpiles would be located - is lined.			
114	696	Clarification. Please confirm the gravity concentrate only recovers platinum, palladium, and gold as target metals. Cobalt and silver are recovered from the two flotation circuits, along with copper and nickel. Action requested: Confirmation.	See lines 668-673. With gravity concentration TMM is targeting the recovery of platinum, palladium, and gold, but it's worth noting that: 1) the gravity concentrate may recover some silver, and 2) TMM has found instances where gold and silver occur together as an electrum in Maturi ore.			
115	718-732	Clarification. The text indicates reagents would be used in the copper flotation circuit. What type of reagents added? Action requested: Include complete listing.	See Table 7-2 Process Reagents for reagents used by the Project.	RESOLVED.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
116	790	contact water ponds, any contaminated soils, and water management in terms of where the latter would be routed. Also no mention of vegetation type. Because the site is near the water, the impact on run-off water	Text has been edited to read - relating to contact water ponds: "Building areas would be graded to promote proper runoff and drainage. Pond liners and other debris would be hauled to a licensed landfill for disposal. Additional soil cover would be imported as needed to provide sufficient soil cover thickness over remaining buried infrastructure. " Additionally, text has been edit in response to Comment 119.	address potential soil issues regarding the likelihood of having and requiring treatment of contaminated soils. These seem likely in the areas where non-contact water was present outside of the lined pond areas, in areas where heavy equipment operated, and potentially in areas where spillage occurred. The future scope in Section 5.3 does not address this issue. Action requested: Identify any potentials for contaminated soils to be generated during operations, thus requiring action in closure and reclamation. Modify text as appropriate commensurate with the response. May involve new text in both Sections 5.3 and 6.3.2.	Part of the future scope of the water resources will be to evaluate potential contamination. Text has been added to the surface water supplemental scope that reads: "This model will also assess potential contamination at the Project – contact water pond liners, soils, and road – that would need remediation during reclamation." In addition to the water modeling, TMM will conduct a spill probability analysis and assess the areas where contaminated soils are most likely to occur. If these analyses indicate that there is potential for contamination the reclamation and closure plan would be updated to include sufficient remediation in reclamation and closure. The analyses and updated details on reclamation and closure would be provided during EIS development to satisfy EIS scope.	
117	797-798	and structures shall be removed and foundations razed and covered with a minimum of two feet of surface	Text has been edited to read: "Building foundation walls and equipment foundations that are above-grade or buried 0 to 2 ft (0 to 0.6 m) below grade would be broken and buried in place and covered with a minimum of two feet of surface overburden."	·	Text has been edited to read: "Building foundation walls and equipment foundations that are above-grade or buried 0 to 2 ft (0 to 0.6 m) below grade would be broken and buried in place and covered with a minimum of two feet of surface overburden. Foundations greater than 2 ft (0.6 m) in depth are proposed to be left in place."	
118	804-808	Advisory. Project-related changes in surface hydrology and wetlands at the plant site will need to be fully understood. Whether the closure condition results in return to the pre-project hydrology, or some derivative thereof, is necessary to estimate any permanent impacts on aquatic habitat such as Keeley Creek and wetlands. This will be a factor in determining the EIS's treatment of these issues in scoping. Future discussion item.	impacts to aquatic resources will be assessed using results from the future scope for water resources outlined in Section 6.3."	RESOLVED for purpose of scoping. RGU notes the Scoping EAW will likely require detailed analysis of the proposed post-closure grading gradients, relative to pre-Project flow directions and discharge locations, as being necessary to fully assess potential impacts and mitigation to aquatic resources.		
119	815	management area, the type of vegetative cover is important for water quality and can be a factor in degree of change to runoff quality and quantity, and impacts to aquatic habitat. Action requested: Address the item and	site would include use of water management infrastructure to control erosion and stormwater quality, quantity, and rates. Once the planned plant site post-closure surface topography is established, reclamation	RESOLVED for purpose of scoping.		
120	821-823	Clarification. The tailings dewatering plant seems to be a series of buildings as in figure 3-13. Consider labeling the figure to coincide with the text or alter definitions. Action requested: Comment submitted on Figure 3-13.	See Comment 762.	RESOLVED.		
121	826-828	Glossary. The reclamation material stockpile should be defined in the glossary. Action requested: Add to glossary.	Glossary revised in response to Comment 27.	RESOLVED.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
122	843	Future action. RGU notes there are specific methodologies for the siting of dry stack facilities. During consideration of potential locational alternatives, it will be necessary to describe how the site location was determined, including the methodology and parameters used in that siting. No action requested. Future discussion item.		RESOLVED for purpose of scoping.		
123		Action requested: Edit.	Text has been edited to read: "The dry stack facility would be developed in three stages from west to east and development would occur during the construction phase and continue through the 25 years of the operation phase."	RESOLVED.		
124		during periods of precipitation. Action requested: Incorporate text that addresses the item.	See lines 954-958: "Placement at the dry stack facility during wet periods or during cold periods (below 5 degrees Fahrenheit) would be avoided as much as practicable. Placement of tailings filter cake at temperatures below 5 degrees Fahrenheit increases the likelihood of re-handling and re-compaction and thus preference would be to avoid placement at that time."	RESOLVED for purpose of scoping.		
125	849	should be provided. Sentence would read: "placement on the drystack facility where it would be dozed into place and compacted with mobile equipment to a projected K value specification of X." Action requested:	The K value of compacted tailings is still being evaluated. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope.	RESOLVED.		
126	853 Figure 3-13	appear to identify where contact water ditch and groundwater cut-off wall would be. It will be necessary to depict these features so that the resulting flow patterns can be assessed for potential impacts. Action requested: Address the item and modify the text and	A contact water ditch label was added to Figure 3-13. The groundwater cutoff wall occurs between the perimeter haul road and the contact water ditch, we recommend reviewing Figure 3-20 to see a typical cross-section that include the road, groundwater cutoff wall, and the contact water ditch. Lines 1385-1399 in the text describe the location of the groundwater cutoff wall.	RESOLVED for purpose of scoping.		
127	857-858	delayed. If for example that site clearing would be	clearing and grubbing discussed on lines 860-861. Text has been edited to read: "This staged approach would minimize the footprint of the dry stack facility for as long as practical to delay impacts related to clearing and	RESOLVED for purpose of scoping.		
128		with exposed bedrock. Is blasting of the bedrock expected to occur at the DSF? Action requested:	Text has been edited to read: "The majority of the area is expected to be fill, however localized blasting may occur in high reliefs areas and sections of the contact water ditches may be blasted depending on elevation."			
129	864	Question. Is 6 inches of sand adequate for a liner foundation over bedrock, especially if bedrock is sharp or jagged? Action requested: Provide response and modify text as warranted.	bed layer additional fill will be used.	RESOLVED for purpose of scoping.		

Comment	Line # Table #					
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
130	872	They seem to be bermed, which leads to the question of whether these would constitute some type of failure risk to downslope public waters? Most of these ponds are just uphill from public waters so the design is important.		RESOLVED for purpose of Scoping. Comment remains for EIS.		
131	874	Correction. Figure 3-17 does not appear to be the correct figure. Consider Figure 3-13. Action requested: Revise as needed.	Correct. Figure reference has been edited.	RESOLVED.		
132	880	Clarification. Fig. 3-13 does not identify all components of water management infrastructure such as the contact water ditch. It also shows a culvert from the dry stack facility to an area that does not have a contact water pond. On Fig 3-31, this culvert is shown between the label for "E-house Switchyard" and the label for "Emergency Pond." Action requested: Because this text specifically summarizes the content on Figure 3-13 (the correct reference), modify text and or figure to address the item. Action requested: A comment is provided at Comment 3-13.		RESOLVED for purpose of scoping.		
133	886	Clarification. Is characterizing the tailings filter cake as being "dry" a common terminology for a product exhibiting a 13% to 16% moisture content? Action requested: Provide response and modify text as warranted.	"Dry" is common industry terminology used to describe tailings filter cake.	RESOLVED for purpose of scoping.		
134		Information request. What is the moisture content of these tailings when saturated? Action requested: Provide response.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that will be provided in updated project descriptions including operation details of the dry stack facility.	RESOLVED for purpose of scoping.		
135		Information request. What is the degree of saturation of 15% moisture of these tailings? Action requested: Provide response.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that will be provided in updated project descriptions including operation details of the dry stack facility.	RESOLVED for purpose of scoping.		
136	886	Operations. DNR notes these are optimal moisture contents. Dry Stack operations commonly do not achieve this level during the first year or two of operation and depart from this level during system upsets such as precipitation, snow, or high humidity. Action requested: Modify text to address the item.	The feasibility of dry stacking tailings as proposed by TMM is high based upon widely accepted criteria and engineering analyses. TMM proposes to backfill stopes when dry stacking conditions are not favorable. TMM looks forward to continued dialogue with the MDNR on this technology.	RESOLVED for purpose of scoping.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
137	888-891	would be to "minimize movement of water" through the engineered backfill. Question: Is the hydraulic conductivity of the engineered tailings backfill known? Action requested: If yes, the text could be modified to read: "increase structural integrity, minimize	The K value of the engineered tailings backfill is still being evaluated. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope.	RESOLVED.		
138		pond is not clear. This is the only time it is mentioned except on Fig. 3-13. Action requested: Provide text to address the item.	Text has been edited to read: "The emergency pond would be lined with a 60 mil HPDE or engineer-approved alternate geomembrane liner over a 1-ft (300-mm) thick, low-permeability, compacted soil liner; the soil layer would be compacted to meet maximum hydraulic conductivity requirements of not more than 1 x 10-6 centimeters per second (cm/sec)."			
139		Provide response. Modify text if warranted.	Text has been edited to read: "The filter cake would be transported via covered short-run conveyors to either the backfill plant or the filter cake storage and loadout building."	RESOLVED for purpose of scoping.		
140		Clarification. The text indicates the load out building is being designed with a capacity to house 1.5 days of tailings production. A sentence should be provided that	See lines 949-958. With placement of engineered tailings backfill underground increases the flexibility of the overall tailings management system and reduces the tailings storage capacity required. The filtered tailings is not expected to gain any appreciable amount of moisture from the air.	engineered tailings underground as backfill provides sufficient flexibility such that greater storage capacity in the filter cake storage and loadout building is not warranted. More detail is needed regarding how the size of the load out building was determined to substantiate this assertion. The concern is the size of the building may need to be changed depending on the outcome of future analyses and discussion. Agencies will	Additional text has been added that reads: "The capacity of the filter cake storage and loadout building would be 33,000 tons (30,000 tonnes) which would equate to approximately 36 hours of filter cake storage capacity at full production. The filter cake storage and loadout building would only be utilized to temporarily store filter cake before it is loaded onto trucks to be placed on to the dry stack. This building would be utilized to store filter cake between shifts when trucking, placement and compaction may not occur (a maximum of 12 hours) and when environmental conditions wouldn't allow for trucking and placement onto the dry stack. If environmental conditions would prevent trucking and placement onto the dry stack for more than a few hours, preparations would be made to switch tailings disposal to backfill deposition underground. When backfilling, the filter cake storage and loadout building would not be utilized. Since TMM has the flexibility to deposit tailings underground as a backfill, the filter cake storage loadout building would be able to be smaller as it doesn't need to store filter cake for the full durations of weather events or equipment downtime."	
141	920	Clarification. The text indicates the load out building is being designed with a capacity to house 1.5 days of tailings production. 1.5 days of storage provides a small margin considering that dry stack tailings cannot be deposited in severe cold, during snow melt, and at other times of liquid precipitation, which can last for days. In addition, would the heated tailings draw moisture from the air while in storage? Action requested: Address the issue and modify text as appropriate.		RESOLVED for purpose of scoping.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
142	Figure # 927	Clarification: Confirming the correct term for the backfilled tailings is "thickened tailings" and not "paste tailings." Thickened tailings are less dense than paste tailings. Action requested: Address the issue and modify text as appropriate.	As referred to in line 927, engineered tailings backfill is a blend of thickened tailings and tailings filter cake. This is done to achieve the desired moisture content for the engineered tailings backfill where it remains pumpable and still achieves the required strength as backfill after a desired cure time.	RESOLVED for purpose of scoping.		
143	937	Closure. DNR notes that given the final design height of the dry stack facility, it would likely be a source of ongoing dust generation, even after closure. Even with a good topsoil, it would be difficult to maintain a good vegetative cover, especially during droughts. Action requested: Address the issue and modify text as appropriate.	potential impacts. TMM looks forward to engaging the MDNR on the details of air quality analysis during EIS development.	RESOLVED for purpose of scoping. Regulatory Guidance. Drought planning should be addressed in the Operations and Management Plan for the project. It remains to be determined if and how project impacts due to drought or extended drought conditions may be assessed in the EIS. Additional study may be warranted. No action requested.		
144	938	Clarification. Based on local elevation data (see also Figure 10-1), the statement "similar to hills in the area" is not particularly accurate. Action requested: Consider eliminating the sentence or provide a rationale to warrant retaining it. There is no apparent rationale from the lake view projected in Figure 10-1.		RESOLVED.		
145	943	Clarification. The K value spec for the compacted tails should be provided. Action requested: Make edit with K value included.	See Comment 125.	RESOLVED.		
146	943	·	See Figure 3-19. The overall slope is 4H:1V so the slope would be steeper than 4H:1V between benches.	RESOLVED for purpose of scoping.		
147	943	between benches. Rainwater erosion could be a problem. Maintenance could also be a challenge. Existing facilities are known for instances of sediment flows and pond filling during periods of intense rain. Action requested: Address the issue and modify text as	flattened to provide a stable embankment slope that would not only meet or exceeds slope stability requirements but would also limit erosion potential and support the establishment and long-term sustainability	RESOLVED for purpose of scoping.		
148	945	1	of a vegetated reclamation cover." Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details on the dry stack facility.	RESOLVED.		
149	949-958	would be handled during these periods. How was 5 degrees F chosen as the temp below which tailings can't be placed on the dry stack facility? More detail should	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including operating details of the dry stack facility.	RESOLVED for purpose of scoping. The scoping decision will require a more detailed tailings management plan to support the EIS analysis, including a detailed discussion of how environmental factors affect tailings placement and stability.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
150	949-958	Clarification. Provide more information on how wet conditions affect tailings placement and how tailings would be handled during these periods. More detail should be provided regarding dry stacking operations during wet conditions. Action requested: Consider breaking the treatment of dry stack facility operation into "wet" and "dry" sections to address these issues; if there's an appreciable break in management prescriptions at a particular rainfall rate, probability, or similar, provide the rationale and use that.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including operating details of the dry stack facility.	RESOLVED for purpose of scoping . The scoping decision will require a more detailed tailings management plan to support the EIS analysis, including a detailed discussion of how environmental factors affect tailings placement and stability.		
151	955	Clarification. "Practicable" as applied in this instance should be better defined. Action requested: Address issue and modify text as appropriate.	The determination of practicability is a combination of meeting permit requirements, engineering specifications, and operational objectives or constraints that are managed hour to hour.	RESOLVED for purpose of scoping.		
152	956	Clarification. If understood correctly it would not be possible to sequester thickened tailings underground during the first several years of operations. How would the large volume of filter pressed tailings be addressed for those early months that cannot be placed at the DSF due to cold and rainy conditions on the surface? Action requested: Address the item and modify text as appropriate.	The underground mine can start accepting engineered tailings backfill within six months after mining starts. Once the concentrator begins processing ore and creating tails there would be space available in the underground mine for engineered tailings backfill. The Project would be capable of producing 100% tailings filter cake for the dry stack facility, 100% engineered tailings backfill, or different portions of each.	RESOLVED for purpose of scoping.		
153		Clarification. Details of the stages of construction are lacking. This is important when assessing potential water management impacts. Action requested: Provide additional detail as warranted.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details on the dry stack facility.	RESOLVED for purpose of Scoping. Comment remains for EIS.		
154	978-979	DNR note. More detail on the two-dimensional stability analyses that were performed, and figures showing all 2D cross sections that were modeled, will be a future information needs. Stability analyses will likely be required to consider how higher than average annual precipitation and extreme precipitation events could affect stability. No action requested. Future information and discussion item.	may be provided in updated project descriptions including design or construction details on the dry stack	RESOLVED for purpose of scoping . The scoping decision will require more detailed information on the stability analyses for this project feature.		
155		Clarification. The text should include a sentence identifying the rationale as to why buttressing is not required as an additional added factor of safety to ensure the stability of the dry stack facility. Action requested: Add sentence to address item.	Text has been edited to read: "Based on the dry stack facility design and initial stability analysis, buttressing would not be required. The purpose of buttressing is to increase resistive forces at the toe of a slope. This can be an effective solution when a slope is too steep or when shear stresses have already mobilized along a failure plane. Another means of improving slope stability is to flatten a slope. The dry stack facility design of the 4H:1V exterior slopes and well-compacted tailings in the structural zone have shown, through limit equilibrium analysis, that the dry stack facility would meet target design factors of safety and provide long term stability around the perimeter of the dry stack facility. The exterior slopes were flattened to provide a stable embankment slope that would not only meet or exceeds slope stability requirements but would also limit erosion potential and support the establishment and long-term sustainability of a vegetated reclamation cover."	safety are not warranted.

165	1025	Clarification. Provide a reference of an existing figure for access road location and USFS road. Consider whether		RESOLVED. Response Complete for both Spreadsheet		
166	1029-1031	DNR note. Sizing culverts to handle more than a 100-year, 24-hour storm event should be considered (as they may not be adequate). No action requested. Future discussion item.	Comment is noted. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details of water management features.	RESOLVED for purpose of scoping. The sizing of culverts and other storm water storage and conveyance structures will need to be discussed in more detail during the EIS process. Structures may need to be upsized to handle larger storms because precipitation records indicate the return periods for 100-yr storms are becoming less than 100 years for some locations.		
167	1049	Clarification. Change "ordinary high water mark" to "ordinary high water level elevation." Action requested: Text edit.	Text has been changed in Section 3.0 and in Section 4.0.	RESOLVED.		
168		Clarification. The text states the water intake pump house would be located 100 feet from the OHWL on Birch Lake. Is that outside of the shoreland setback also? Action requested: Based on answer, modify text to read: "ordinary high water mark of Birch Lake reservoir, which is within/outside? the shoreland setback."		RESOLVED.		
169	1049	Question. What is the OHWL elevation of Birch Lake? Action requested: Based on answer, please include within sentence. Sentence could read: "ordinary high water level <u>elevation of XX</u> for Birch Lake reservoir, which is"	Text edited to read: "A water intake pump house would be located 100 ft (30.5 m) from the ordinary high water level elevation of 1419.99 ft (432.8 m) for Birch Lake."	RESOLVED.		
170	1049	Question. At what elevation above the 100-year flood elevation would the pump house infrastructure be constructed? MDH Well Rules Chapter 4725 state: "to prevent the entry of flood water by: A. extending casing at least 5 feet above the regional flood level." Action requested: Respond to question and modify text to address.		RESOLVED for purpose of scoping.		
171	1050	Clarification. The text indicates a water intake pipeline would be installed underground and then proceed under the lake. Will this part of the project actually involve any physical activity below the Ordinary High Water Level? Action requested: Modify text to address the item, either yes or no.	· /	RESOLVED.		
172	1053-1055	Permit need. The proposed activity is subject to a DNR permit. Action requested: End the paragraph with a new sentence that reads: "A DNR Public Waters Work Permit will be required for the water intake structure proposed to be placed on the bed of Birch Lake reservoir."	TMM uses the Table 3-17 through Table 3-19 exclusively to identify needed permits. To introduce the need for one or all permits again in the text is redundant.	RESOLVED for purpose of scoping . The scoping decision will likely require the EIS to list each individual water appropriation permit and public waters work permit that will be needed for the project.		
173	1065	RGU note. Rather than speculate on conditions that may or may not be present at closure, more direct to just	saleable equipment or salvageable materials at the fwater intake facility would be removed and transported to an approved landfill for disposal or abandoned in place, either of which would be subject to required site closure provisions."	RESOLVED for purpose of scoping. DNR clarifies our original comment to note that "abandonment in place" is not an option for the water intake. It's removal from the lake will be required. DNR will ensure the Scoping EAW appropriately characterizes the situation.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
174	1085	RGU note. Characterizing the power supply as "sufficient" is not relevant to the project description. Simply noting power would be sourced from a regional power provider is fine. Action requested: Modify sentence to read: "a regional power provider would supply the Project with power."	Text has been edited to read: "At the off-site electrical substation, the Project transmission line would connect to an existing transmission line, and a regional power provider would supply the Project with power."	RESOLVED.		
175		Clarification. DNR notes the reclamation and closure should plan for complete removal of the power infrastructure. Action requested: Revise text accordingly.	Text edited to read: "Future use of overhead electric transmission lines would be based on future input from the utility provider and pursuant to state and federal reclamation requirements." Additionally, updated project descriptions will be furnished during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including details on reclamation and closure.	particular State regulations require complete removal of power infrastructure.	Text has been edited to read: "At closure, overhead electric transmission lines providing power to the plant site and tailings management site would be disconnected from Project infrastructure. Transmission lines would be removed or provisions would be made for continued subsequent use pursuant to Minn. R., 6132.3200 subp. 2 E."	
176	1100	Guidance. Both DNR and MPCA will need a detailed water balance to assess TMM's claim that there would be no discharge of process/contact water. The water balance will need to cover different potential operating options (full operation, partial shutdown, temporary idle and similar) and cover the full range of reasonably possible climatic conditions (for example). Action requested: Ensure the appropriate Future Scope sections of the document identify this as an information need. Future discussion item.	Comment is noted. TMM will produce detailed water balances for various operating conditions and climatic conditions as part of Phase 2 of the surface water supplemental scope described in Section 6.3.1 and will	RESOLVED for purpose of scoping.		
177	1105	Regulatory Guidance. Four types of water for purposes of management are defined. Consider revising the definitions to be more consistent with rule and permit definitions. For instance, process water and contact water as defined would be considered wastewater and would require an NPDES/SDS permit to discharge (which the text indicates would not be required as there would be no discharge). Similarly, non-contact water would be considered stormwater associated with industrial activity, which would require a different NPDES/SDS permit to authorize discharge. Action requested: Consider the guidance in reviewing potential definitions of water being managed with the project. Apply revised definitions in next data submittal as appropriate. Future discussion item.		RESOLVED for purpose of scoping. Comment remains for EIS. Requires RGU-approved definition of waters for scoping and EIS.		
178	1106-1127	Guidance. Both DNR and MPCA will need a better definition/understanding of the proposed categorizing process of wastewater vs contact water, as it relates to both regulatory definitions and practical considerations. This will be necessary for the state to be able to fully assess potential environmental effects as well as what water quality permits may or may not be required for the proposed project. Action requested: Modify text if possible to address the item. Future discussion item.	See Comment 71.	RESOLVED for purpose of scoping. Comment remains for EIS. Requires RGU-approved definition of waters for scoping and EIS.		
179	1106-1127	Question. Would any of the water described as "contact water" be proposed to be regulated under a general Industrial Stormwater permit? Action requested: Answer the question and modify text as appropriate.		RESOLVED for purpose of scoping. Comment remains for EIS. Requires RGU-approved definition of waters for scoping and EIS.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
180		Definition of contact water. It will be necessary to consider implications of definitions of the various types of water in terms of regulatory definitions. This can be a source of confusion. RGU- and regulatory-approved definitions for the EIS will need to not only make sense for describing the project but must also align with language and definitions in permits. It is possible contact water would be defined to also include water that comes in contact with development rock, or temporary waste rock, or pre-operational ore, or overflow ore. No action requested. Will require future consultation.		language to be used in scoping and EIS. Further discussion required.	TMM plans to resolve regulatory classifications of water and Project water nomenclature as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 14.
181	1126	constituent loading occurs to construction water that requires additional management, the definition should be modified to reflect this potential situation. Action requested: Modify text to read: "Construction stormwater: direct precipitation or stormwater that has contacted surfaces disturbed by construction that could have increased constituent loading." Comment also provided in glossary.	Minn. Construction Stormwater General Permit. TMM has edited the Project's definition of construction stormwater to more closely align with the regulatory	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	Definition of construction stormwater has been revised per MDNR's suggestion. See Comment 13.	See Comment 13.
182	1134-1137	balance will need to cover a range of potential operating scenarios, climatic conditions, and rock reactivity. For example, it is possible that constituents could build up to the point where it might interfere in the concentration	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been	not address the need for a detailed chemical balance. Action requested: Modify text to address the issue, including the Future Scope section(s), or provide a rationale why a chemical balance would not be informative as a study need for the EIS.	A detail chemical balance will be provided in updated project descriptions during EIS development to satisfy the EIS scope. Text has been edited to read: "Additional details that will likely be utilized in updated project descriptions may include but are not limited to: •details on process water flow, including water appropriations; •details on water definitions; •details on water management; •details on chemical balances; •design or construction details of water management features, including ponds, dikes, and ditches"	
183	1147-1148	Question. Would contact water need to be treated before it can be added to the process water? If so, the text should describe what type of treatment might be needed, and any bi-products (and their disposal) that might be generated during the treatment process. Action requested: Modify text to address the item.	used as process water.	not require treatment before potential use as process water. The basis of this conclusion must be better understood, most likely demonstrated through geochemical modeling for the EIS showing that no treatment of contact water or process water will be	TMM plans to resolve regulatory classifications of water and Project water nomenclature as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	Water quality of process and contact water streams will be evaluated as part of modeling; contact water is not anticipated to require treatment before mixing with process water.
184	1158	Glossary. There needs to be a definition of mine supply water in glossary, which may include information from lines 1205-1207. Action requested: Create definition and add to glossary.	Glossary revised in response to Comment 22.	RESOLVED.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
185	1158	explanation would be useful on the need to bring "mine inflow" back to surface rather than using it for "mine supply water." Action requested: Provide clarifying text and modify accordingly.	Text has been added to Underground Mine Process Water Management: "Mine supply water for the underground mine would flow from the mine water tank to the portals to feed the underground mine-wide supply water distribution system. The mine water tank would be supplied from the fresh/fire water tanks, when new water can be added to the system, otherwise the mine water tank would be fed by the sediment pond. Mine supply water would and be used for dust suppression and equipment requirements like drill water." and "Underground mine water would need to be cleared of sediment as well as de-oiled before it could be re-used for underground equipment or as process water. This would occur at the sediment pond before recirculating back underground through the mine water supply system or added to the process water circuit for use in processing."	UNRESOLVED. Following up on the response, what is the source of oil being referenced?	The oils would be fuels, drilling fluids, and lubricating oils from underground mine equipment. While TMM will implement robust plans to deal with spills - there is potential minor spillage and leak that are not recovered and would report to the underground sumps of which the de-oiling system is meant to capture, reclaim, and recover for appropriate management.	
186	1159	Guidance. The naming convention for DNR Public water 69-3P in the EIS will be Birch Lake. First usage in all EIS-related documents will be as follows: Birch Lake reservoir (Birch Lake); subsequent usage as follows: Birch Lake. Action requested: Global revision requested throughout in text, tables, and figures.		RESOLVED.		
187	1159	the overall water management program. Action	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including details on process water flow.	RESOLVED for purpose of scoping. Further discussion necessary for EIS		
188	1179-1186	Clarification. The text lists a series of bullets for process water losses. Question: Could process water be lost via seepage through water collection ditches that are not lined with liners? Action requested: If the answer is "yes," revise and/or add to the bullet list accordingly.		RESOLVED for purpose of scoping. The scoping document will likely identify potential seepage/losses of process water through the collection ditches as an information need.		
189	1205	Clarification. The document is unclear as to the mine supply water source? In addition and as relevant, some explanation would be useful on the need to bring "mine inflow" back to surface rather than using it for "mine supply water." Action requested: Provide clarifying text and modify accordingly.	See Comment 185.	RESOLVED.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
190	1205-1207	Guidance. Mine supply water would be pumped underground from the process water pond and used for dust suppression and equipment requirements like drill water. Excess mine supply water would be recaptured through a series of sumps. This results in pumping of wastewater into the mine. This will be an issue of interest for permitting under the Class V injection well program. Action requested: Ensure the Future Scope of the appropriate section(s) addresses the item. Modify text as appropriate to address the item. Ensure Table 3-8 addresses the item.	sediment pond's feed is precipitation and the underground mine water that is pumped from the mine; the water pumped from the mine is classified as process water as it is a mix of mine inflow, process water associated with the engineered tailings backfill, and mine supply water.	V Injection Well issue, which is identified as a potential permitting requirement in Table 3-17. Action requested: Specify why the proposed water sources would not be considered wastewater as defined under the Underground Injection Control (UIC) program. Modify the text as appropriate to address the potential applicability of this approval.	Text has been added to the future scope section of water resource that reads: "Additionally, Volume 1 will include discussions on relevant regulations including: •Clean Water Act applicability to surface water; •MDNR applicability to permitted structures and works in public waters; •MPCA rules applicability to waters of the state; •MDH, MPCA and EPA standards applicability to groundwater resources; •MDH and MPCA permits and water quality requirements; and •40 CFR 144.81(8), Class V underground injection well / control requirements."	
191	1212	Project description. The text states that the water from these pumps and sumps would be de-oiled and clarified. The section would benefit from a basic statement identifying the process for de-oiling, where it takes place, what equipment/process and to what degree, and what is the fate of the de-oiling byproduct? Action requested: Provide additional text to address item. If this is a complex procedure, providing high-level treatment is appropriate at this stage. A more expansive explanation can be provided in the detailed Project Description necessary for the EIS.	believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that will be provided in updated project descriptions including process water flow and water management.	Action requested: If exactly how de-oiling will be achieved has not been determined, then provide a description of potential options for achieving this project objective. The issue is relevant at scoping because of the potential for environmental releases and any subsequent	Additional details on the de-oiling process will be provided in updated project descriptions during EIS	
192	1225-1230	Question. The sediment pond accepts process wastewater, where the process wastewater pond is double-lined. Why is the sediment pond not similarly double-lined? Action requested: Address the question and modify text as appropriate.	The sediment pond would handle water dewatered from the mine. While this may contain some process water it would be diluted with mine inflow and other water sources.	RESOLVED for purpose of scoping. Regulatory note: Requirements for wastewater pond liners may need to be revisited during permitting or after process wastewater flow routing is more defined.		
193		Guidance. It is noted that the proposed design will be subject to agencies' review and approval. No action	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be	RESOLVED.		
194	1220	requested. Clarification. What is the K Value spec for the low- permeability compacted liner? Action requested: Modify text to include K value specification. Text could read: "thick, low-permeability, compacted soil liner (K = XX) and would be sized"	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that will be provided in updated project descriptions including liners and cover systems.	RESOLVED for purpose of scoping. The scoping document will likely identify the need for the K Value specification for the low-permeability compacted liner as an information need for the EIS assessment.		
195	1230	Clarification. The text should provide detail on how it would be done, frequency, and under what criteria would sediment pond be cleaned out and how would the removed sediment be managed? Action requested: Modify text to address the item.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including operating details of water management features.	RESOLVED for purpose of scoping. Comment remains for EIS.

196	1231	Action requested: Provide response and amend text as	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details of water	RESOLVED for purpose of scoping.		
197	1231	pond guidance recommends HDPE liners at least 100 mil for uncovered applications. Additionally, for exposed liner a dual - white on black - liner is recommended. Action requested: Conduct global document edit to	believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details of liners and	RESOLVED for purpose of scoping. Regulatory note: Comment remains for plan and specification review of pond liner design. Absent any updated detail, the liner systems eventually described in the Scoping EAW may or may not meet MPCA requirements based on waste type(s) and local conditions.		
198	1236	information need.	cover systems. Comment is noted. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details of water management features.	RESOLVED.		
199	1236-1241	be more specific than "probable maximum precipitation" when describing how the process water pond would be	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been	RESOLVED for purpose of scoping. The Scoping EAW will likely provide text that is more specific than just a simple reference to the PMP in sizing the process water pond. DNR will work with TMM in developing this more precise language.		
200	1236-1241	area in the event the maximum free board is reached. No action requested. Future discussion item.	Comment is noted. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during	RESOLVED for purpose of scoping. The scoping document will likely identify the need to consider greater than 100-yr, 24-hr event for sizing the pond. Unless can be demonstrated otherwise, having the capability to pump water to another area in the event of a PMP will need to be assessed. DNR will work with TMM to develop the appropriate language.		
201	1239	recurrence interval/event size for sizing? Action requested: Provide the answer and modify text to	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS.	Resolved for purpose of scoping. Comment remains for EIS.		
202	1240	the PMP should be listed. Action requested: Add footnote to address the item.	The storm event considered was the 72-hour PMP event. Text was edited to read: "therefore the process water pond would be designed with appropriate freeboard to contain the 72-hour probable maximum precipitation from direct precipitation for the process water pond footprint."			
203	1241-1245	Guidance. It is noted that the proposed design will be subject to agencies' review and approval. No action requested.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
204	1244	Clarification. The text reads: "or engineer approved alternate geomembrane." MPCA notes that generally 40-mil HDPE is the minimum synthetic liner. Action requested: Consider this point and modify text as appropriate.		RESOLVED for purpose of scoping. Regulatory note: Comment remains for plan and specification review of pond liner design. Absent any updated detail, the liner systems eventually described in the SEAW may or may not meet MPCA requirements based on waste type(s) and local conditions.		
205		Question. Is the tailings dewatering plant the same as the "Filter Plant" (Fig. 3-13)? Action requested: Respond to the query.	See Lines 895-899. "The tailings dewatering plant would consist of • Tailings thickener; • Filter plant – which would produce filter cake; • Filter cake storage and loadout building; and • Backfill plant – which would produce engineered tailings backfill." Definition of tailings thickener has been edited in the glossary to read: "tailings thickener: The equipment that would be used to initially dewater tailings before being	RESOLVED for purpose of scoping.		
			fed to the filter plant to produce a tailings filter cake."			
206		DNR note. The potential for the draining of entrained water from the tails would be classified as draindown. Where would that water report to? Action requested: Modify text to address item.	Draining of entrained water from the tailings would mix with any infiltration and the combined stream would be referred to as draindown. The draindown would be collected by the above liner drain before reporting to the contact water ditch. See Lines 1361-1370. "The intercepted precipitation that would infiltrate through the tailings – referred to as draindown – would be intercepted by the liner and collected by a network of gravel finger drains constructed above the liner extending across the dry stack facility footprint in the same location as the under-liner drains (i.e., natural drainage courses). A gravel blanket drain would also be constructed around the full perimeter of the dry stack facility at the toe, having a width of 160 ft (50 m). The over-liner drains - both finger drains and blanket toe drain - would discharge to the perimeter contact water ditch. The potential magnitude of draindown has not yet been quantified and would be addressed as a future scope of work, as discussed in Section 6.3.2. " The definition of draindown has been edited in the glossary to read: "draindown: Draindown is any draining of entrained process water that would mix with infiltrating precipitation and be collected by the dry stack facility liner system."			
207	1263	All such future study needs should be captured in the	specifically lines 4410-4415: "Potential pathways for how process water and/or contact water could be released to groundwater will be considered and then quantified	included in modeling and assessment of surface and groundwater impacts. DNR believes most of these are identified throughout Section 6.0.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
208	Section starting at 1267	Clarification. The text provides discussion of contact vs. non-contact areas, as well as a non-contact water diversion area. The layout of these areas all influence changes in surface hydrology and surface permeability. Additional detail will be necessary to inform the scoping process in offering the potential significance of impacts for the EIS. Providing supporting material, such as a map/figure identifying these areas, or a table giving area measurements, could be warranted. Action requested: Consider how to beef up the text, plus what additional supporting materials would be useful, to assist in better understanding the project and its potential impacts.	EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including details on water management and design or	RESOLVED for purpose of scoping. Comment remains for EIS. RGU notes that if the Proposer is unable to provide a table providing area measurements, or map identifying the contact versus non-contact areas of the site, both of these remain as an information need for the EIS.		
	1280-1281 1236-1241 1403-1404 1405-1407	1404) and diversion dikes (tailing management site [lines 1468-1471]) are to be designed for the historical 100-year 24-hour storm event. Based on the project	Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details of water management features.	RESOLVED for purpose of scoping. DNR notes the sizing of the contact water ponds will need to be discussed in more detail prior to deciding on a final size for the ponds. The scoping document will identify the need for a hydrologic analysis to be provided in the EIS to justify the sizing of the ponds.		
210	1280-1281	in adverse impacts to adjacent public waters. Also, the proposed sizing criteria may not be adequate to accomplish a "no discharge" project goal. Additional	Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been	RESOLVED for purpose of scoping. DNR notes the sizing of the contact water ponds will need to be discussed in more detail prior to deciding on a final size for the ponds. The scoping document will identify the need for a hydrologic analysis to be provided in the EIS to justify the sizing of the ponds.		
211	1281-1285	Guidance. It is noted that the proposed design will be subject to agencies' review and approval. No action requested.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.		
212	1284	Design note. The text refers to a secondary soil liner with conductivity 1x10-6 cm/s. Wastewater soil liners typically require conductivity to be an order of magnitude lower, or at 1x10-7 cm/s. Action requested: Consider the item and modify text as appropriate.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that will be provided in updated project descriptions including design or construction details of liners and cover systems.	RESOLVED for purpose of scoping. Regulatory note: Comment remains for plan and specification review of pond liner design. Absent any updated detail, the liner systems eventually described in the Scoping EAW may or may not meet MPCA requirements based on waste type(s) and local conditions.

213	1288	Action requested: Provide the confirmation and modify text to address the item. This needs to be clear as noted in comment for Line 1267.	Management to read: "The non-contact area at the plant site would include, the security gatehouse, reclamation material stockpile 1 and 2, the plant site electrical substation, the ball storage bunker, the concentrator, the concentrator services building, the reagent storage building, the coarse ore stockpile, and the areas surrounding and connecting these facilities that are not directly involved in transport of ore or tailings by truck." The concentrator and the coarse ore stockpile are both covered facilities which would prevent direct	For example, it appears snow from plowed storage areas would be considered contact water, while snow plowed from roads not directly involved in transport of ore or tailings by truck would not be? Also of note it appears that the transport areas where the trucks are hauling concentrate are not considered contact areas; wouldn't spillage be possible thus making precipitation fall there contact water? Action requested: Provide a response and modify text as appropriate. RGU notes this also	,	Based on the definitions outlined in Comment 14, the text has been revised to specify that the majority of the plant site will be categorized as industrial stormwater. This includes the exterior of the concentrator and the primary ore stockpile (both which are covered facilities) and on-site haul and access roads. TMM anticipates that Project water management may continue to be assessed and refined based on agency discussions during the EIS process.
214	1289-1291	Consider the design recommendation and modify text as appropriate. Future discussion item.	The storage capacity is based on a preliminary water	RESOLVED for purpose of scoping. Note: A well-defined water balance and modeling will be essential for pond sizing.		
215	1292-1293	than HDPE for this structure? Action requested: Answer the question and modify text as appropriate.	, ,	RESOLVED for the purpose of scoping. Note: Assumptions around the performance of proposed cover systems will reflect the type of material proposed for use.		
216	1293 1355 Figure 3-14	text (line 1355) and in figure. Action requested: Rectify		RESOLVED for purpose of scoping.		
217	1293-1295	integrity. Is any additional protection anticipated, such as geotextile? Action requested: Answer the question and modify text as appropriate.	Text has been edited to read: "The temporary rock storage facility would be lined with an 80 mil (2.0 mm) linear low-density polyethylene (LLDPE) or engineer-approved alternate geomembrane liner. The LLDPE liner would be installed over 12 inches (300 mm) of compacted low permeability soil. The liner would be protected by 12 inches (300 mm) of sand which would be pushed into place by dozers and compacted prior to any truck traffic being allowed over the liner. "	RESOLVED for purpose of scoping. The State expects to engage TMM over the EIS and any subsequent permitting on the appropriate liner thickness for these facilities.		

Comment	Line # Table #	2012 142		2012 100		
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
218	1295-1297	Design recommendation. The proposed 10-year storm event capacity may not be sufficient. Another consideration would be where would the water go if a larger event? In addition, the text does not identify the duration (intensity) of the event; shorter, higher intensity events are generally more important for collection systems. Also, the proposed sizing criteria may not be adequate to accomplish the "no discharge" project goal. No action requested. Future discussion item.	The storage capacity is based on a preliminary water balance and will be updated based on water balance modeling outlined in Section 6.3.1. Project descriptions	RESOLVED for purpose of scoping. DNR notes the appropriate storm event for pond sizing will need to be discussed in more detail prior to deciding on a final size for the ponds. The scoping document will identify the need for a hydrologic analysis to be provided in the EIS to justify the sizing of the ponds.		
219	1302	tire wash? Another detail may be describing what	believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during	RESOLVED for purpose of scoping. The scoping document will likely identify the need to clarify water management for contact and non-contact roads. DNR will work with TMM to develop the appropriate language.		
220	1308	Clarification. The text identifies that there would be three snow storage areas at the plant site. Describe in more detail how plant site snow-related runoff, both within and outside the designated snow storage areas, including where it would report to. Action requested: Provide greater explanation on snow-related runoff management.	Text has been edited to read: "Snowmelt would also be managed as contact water. For snow that is not plowed snow-related runoff would end up in the same location as if it were rain water. For snow plowed in active areas there would be three designated snow storage areas. Grading of the plant site would ensure snow-related runoff from snow storage areas would flow into one of the plant site contact water ponds."	RESOLVED.		
221		Clarification. Add to the text how would snowmelt from the snow storage areas be collected? Action requested: Provide this detail to the discussion.		RESOLVED for purpose of scoping. The scoping document will likely identify the need to provide more detail on how the plant site would be designed to convey snow runoff to the plant site water ponds to support the EIS analysis. DNR will work with TMM to develop the appropriate language.		
222		Clarification. Add to the text an explanation on why snow storage areas were designed to handle a snow water equivalent of 7.3 to 11.9 inches. Action requested: Supplement text with this detail.	additional detail and analysis is covered in Comment 557.	RESOLVED for purpose of scoping. It will be necessary for the scoping document to identify the appropriate climate data sets and identify appropriate design storm/runoff sizes that infrastructure should be designed to handle. DNR will work with TMM to develop the appropriate language.		
223	1310	snowfall per year have been accounted for in the three	Sizing of water management features and request for additional detail and analysis is covered in Comment 557.	UNRESOLVED. Agencies will engage TMM to identify the appropriate precipitation amounts for assessing storage needs and potential project impacts. The scoping decision will likely include guidance on this and other weather/climate assumptions and parameters to support the EIS analysis. Further discussion required.	TMM acknowledges that climate change impacts will need to be considered as part of impact analysis and GoldSim modeling. TMM plans to resolve necessary climate considerations as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	The snow storage area designs can be found in Section 3.6.2.11 - Water Management Plan - Industrial Stormwater Management. These designs are anticipated to be refined based on final climate scenarios identified for each phase of the Project.

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
224	Figure #	Clarification. According to the text describing the	See Tailings Management Site Non-contact Water Management lines 1509-1517 for a discussion on management of water from the tailings management site reclamation material stockpile.	RESOLVED.		
225	1314-1316	Future activity. More information on items 2 and 3 is needed before designating these as noncontact water. Runoff onto the liner may have contacted tailings and the areas of partial cover would need to be confirmed as noncontact water. Note that erosion of dry stack TSF is an ongoing concern within the industry. Action requested: Modify text if can address the item. Future discussion item.	believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been	RESOLVED for purpose of scoping.		
226	1318-1320	Project description. The text indicates contact water would be used for dust control. Question: Would contact water need to be treated before it can be used for dust control at the tailings management facility? If so, elaborate on what type of treatment might be needed, and any by-products that might be generated during the treatment process. Action requested: Modify text to address the issue.	dust control. Future analysis will inform the potential need for treatment.	RESOLVED for purpose of scoping. The scoping decision will likely require more information on the geochemical modeling that will be needed to predict contact water quality to determine whether treatment would be required prior to use for dust control to address potential impacts. If adverse water quality is determined to be possible, then there may be a need to consider treatment or other water sources if untreated contact water would be inappropriate for dust control. DNR will engage TMM on the language needed to address this issue in the scoping document.		
227	1332	is the gravel blanket drain? How is contact water from the surrounding road diverted? Figure 3-13 lacks water management details. Action requested: Assessment of potential impacts would be aided by additional detailed maps of the three stages of tailings pile construction, where contact and non-contact water areas are clearly defined, ditching and berming is identified (as it may change with each stage?), and surface water flow	ditch. Additionally Figure 3-21 has been included to show phased dry stack facility construction.	RESOLVED for purpose of scoping.		
228	1344-1346	Clarification. The sentence includes two separate statements separated by a comma. Question: Are those two separate reasons for underdrains, which would have an "and" after the comma? Or, does limiting phreatic head prevent the uplift of the liner prior to tailings placement? Action requested: Provide clarification and edit text if warranted.	foundation soils under the geomembrane liner to prevent uplift of the liner prior to tailings placement. "			
229	1350	Information requirement. Potential magnitude of seepage needs to be addressed to inform environmental review. Action requested: Ensure Future Scope addresses the item in the appropriate location (s) in the document.		RESOLVED for purpose of scoping. Comment remains for EIS.		
230	1351-1354		Section 6.3.1 identifies detailed water balance modeling as part of the planned future scope.	RESOLVED for purpose of scoping. Comment remains for EIS.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
231	1355-1360		Comment is noted. TMM looks forward to continued engagement during the EIS development and will be	RESOLVED.		
232	1358		responsive to inquiries and requests. Text has been edited to read: "The liner would be protected by a minimum 1 ft (0.3 m) thick layer of compacted tailings on top of the liner which would be, pushed into place by dozers and compacted prior to any haul truck traffic being allowed over the liner."	RESOLVED.		
233	1365	other figures as appropriate.	Text is accurate in describing the gravel blanket drain. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details on the dry stack facility.	RESOLVED for purpose of scoping.		
234	1362-1368		The purpose of this paragraph is to describe what would happen to draindown within the dry stack facility. The sequence described in the text is: 1. draindown would be intercepted by the liner, 2. draindown would collect in the gravel finger drains or gravel blanket drain, 3. draindown in finger drains and blanket toe drain would discharge to the perimeter contact water ditch.	RESOLVED.		
235	1368-1369	drain down quantities is needed to assess potential impacts to water quality. Action requested: Ensure	Potential pathways for how process water and/or contact water could be released to groundwater will be considered and then quantified is part of Section 6.3.2 planned future scope.	RESOLVED for purpose of scoping. The scoping document will likely state the need to identify and assess potential pathways for how process water and/or contact water could be released to groundwater.		
236	1378-1384	designed to convey? Action requested: Amend text to include the storm event size.	Text has been edited to read: "The contact water ditch would route the water to the closest contact water pond. For significant portions of the perimeter length, the contact water ditch would be excavated into bedrock. The contact water ditches would be sized for the peak flow from a 100-year, 24-hour rainfall event."	RESOLVED.		
237	1378-1384	necessary on the proposed design. Action requested: Modify text as appropriate to address the item. Future discussion item.	Comment is noted. The capacity is based on a preliminary water balance and will be updated based on water balance modeling outlined in Section 6.3.1. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details of water management features.	capacity for the contact water ditch. DNR will work with TMM to develop the appropriate language.

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
244	1402		Text has been edited to read: "Five tailings management site contact water ponds would be constructed, as shown on Figure 3 13, in addition to two interim contact water ponds that would be installed to manage water during stage 1 and stage 2 of the dry stack facility before the facility is at the full footprint. The interim contact water ponds would be designed and function the same as the contact water ponds and are necessary to accomplish the phased staging of the dry stack facility. The interim contact water ponds would be located in the allowance for water management features as shown in Figure 3-21. The ponds are temporary as tailings would eventually need to be stacked in their locations." In this context, temporary is meant to convey that the ponds are only present during Stage 1 and Stage 2 of the dry stack facility and at the end of the respective stages, are reclaimed.	RESOLVED for purpose of scoping.		
245	1403-1405		balance and will be updated based on water balance modeling outlined in Section 6.3.1. Project descriptions	RESOLVED for purpose of scoping. It will be necessary to discuss the sizing of the contact water ponds in more detail prior to deciding on the final size of the ponds and subsequent hydrologic analyses for the EIS. DNR will engage TMM on the issue of justifying the sizing of the ponds for the EIS. DNR will work with TMM to develop the appropriate language for the scoping document.		
246	1405-1407	was used when determining snowpack size the contact water ponds should be able to handle? Was a rapid melt scenario considered? How does a 100-year snowpack compare to a 100-year, 24-hour storm event and why was it chosen? Action requested: Provide background	balance and will be updated based on water balance modeling outlined in Section 6.3.1. Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are	RESOLVED for purpose of scoping. It will be necessary to discuss the sizing of the contact water ponds in more detail prior to deciding on the final size of the ponds and subsequent hydrologic analyses for the EIS. DNR will engage TMM on the issue of justifying the sizing of the ponds for the EIS. DNR will work with TMM to develop the appropriate language for the scoping document.		
247	1407		-	RESOLVED for purpose of scoping . This value will need to be quantified for the EIS analyses.		
248	1413-1419	Clarification. Cite existing figures as they align with the stages. Action requested: Amend text with figure citations.	See Comment 244.	RESOLVED for purpose of scoping . DNR notes Figure 3-21 depicts general shape and location of "temporary ponds." There may be other aspects of the facility layout needed, but that can be revised as needed during the EIS process.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
249	1413-1419	Recommendation. Consistent with text there would be benefit with development of new figures with the various stages (i.e., stages for figure 3-13 or 3-14). This would include location of interim ponds, for example. Action requested: Comment submitted in figures.	See Comment 756.	UNRESOLVED . The response to Comment 756 does not appear relevant to this comment. Please clarify relationship to providing new figures for various stages of the project.	There was an error in the response. The response meant to read "See Comment 227." An additional figure (Figure 3-21) was added to show phased dry stack facility construction and the location of interim ponds. Additionally, text was added in response to Comment 244 which described the location and purpose of the temporary ponds.	
250		geomembrane enough to protect from long term degradation? Action requested: Provide text identifying the purpose of the two feet of cover soil.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details of liners and cover systems.	RESOLVED.	compositive positions.	
251		from a more-detailed description of "hydraulic barrier." Action requested: Modify text to address the item.	Text has edited to read: "The cover would consist of at least 2 ft (.6 m) of cover soil underlain by a hydraulic barrier. The type of hydraulic barrier would be selected based on future design evaluations that would assess compatibility with infiltration design criteria and availability of cover soil materials. Infiltration criteria would be determined based on future tailings geochemistry test work results and permitting requirements."	RESOLVED for purpose of scoping. Comment remains for EIS.		
252	1430	non-contact areas, as well as a non-contact water diversion area. The layout of these areas all influence changes in surface hydrology and surface permeability. Additional detail will be necessary to inform the scoping process in offering the potential significance of impacts for the EIS. Providing supporting material, such as a map/figure identifying these areas, or a table giving area measurements, could be warranted. Action requested: Consider how to beef up the text, plus what additional supporting materials would be useful, to assist in better	The sizing of ditches, ponds and diversion areas will continue to evolve based upon further engineering, impact assessment, public input, and agency engagement on a number of water-related topics. It is premature to offer specificity described. Updated project descriptions will be furnished during EIS	RESOLVED for purpose of scoping. Comment remains for EIS. RGU notes that if the Proposer is unable to provide a table providing area measurements, or map identifying the contact versus non-contact areas of the site, both of these remain as an information need for the EIS.		
253	1432	Permit need. The diversions dikes and ponds may need dam safety permits. No action requested.	See Comment 727.	RESOLVED for purpose of scoping.		
809	1442-1476	Design Note. In general, it would be important to ensure	engagement during the EIS development and will be	RESOLVED for the purpose of scoping. Comment remains for the EIS.		
254	1452 and 1462	Clarification. In concert with text at Lines 1452 and 1462, the non-contact ditches are not clear on Figure 3-13 (e.g., thickness correct?). Recommend add legend or label as needed. Action requested: Comment provided in the figures section.	See Comment 764.	RESOLVED.		
255		diversion dikes flow/control. Action requested: Ensure appropriate future scope section identifies this analytical need.		RESOLVED for purpose of scoping. DNR anticipates further development of information in EIS process specific to diversion dikes flow, control, and other factors.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
256	1458	Guidance. In typical usage a dike is a means to prevent flooding of an area. Similarly, in typical usage if water is being held back or stored, the structure is a "dam. Action requested: If the structure is a dike, then modify language to read: "These dikes would <u>not</u> result in ponding of non-contact water from adjacent surface flows." If this is not an accurate statement, then modify language in entire paragraph replacing the term "dike(s)" with "dam(s)" where the structures do result in ponding or similar action.	precipitation event, water may pool temporarily upgradient of the dike and be diverted through non-contact water ditches.	RESOLVED for purpose of scoping.		
257	1464-1467	Clarification request. Cite appropriate figure or develop figure with greater detail to illustrate water management. For example, does this refer to the noncontact "pond" adjacent to contact water pond 5 on figure 3-13? Action requested: Add citation and possibly provide visual that better illustrates water management.	See Comment 227.	RESOLVED.		
258		• •	Sizing of water management features and request for additional detail and analysis is covered in Comment 557.	RESOLVED for purpose of scoping. It will be necessary for the scoping document to identify the appropriate climate data sets and identify appropriate design storm/runoff sizes that infrastructure should be designed to handle. DNR will work with TMM to develop the appropriate language.		
799	1468 - 1476	Future analysis. The non-contact water ditches around the tailings management site are designed for a 10-year 24-hour storm event with no erosion and also designed to convey the 100-year 24-hour storm event with a minimum freeboard of 1 ft. With shorter higher intensity storm events becoming more frequent, the design of the non-contact water diversion ditches should be analyzed to see how they perform over a wide range of shorter intense storms, including the 10, 25 and 100-year 1 and 2-hour events. Also – extreme 24-hour storm events such as the 200 or 500 year – 24-hour event should be analyzed and the results reported. It is very important that stormwater is diverted around the tailings management area. There should also be a discussion of what the response would be to an extreme storm event that overtops the diversion berms and floods the tailings management area. Action Requested: Ensure Section 6.3 identifies this analytical need. Provide suggested text to address the situation of an extreme storm event that overtops the deversion berms and floods the tailings management area.		RESOLVED for purpose of scoping. Comment remains for EIS. Note: Response 556 did not directly address the specifics on storm event sizing, including a wide range of shorter intense storms or extreme 24-hour events. These should be included as a component of future assessments.		
259		Clarification request. Why are non-contact water ditches designed to convey the peak flow from only a 10-year, 24-hour storm event with no erosion? Action requested: Provide clarification.	ditches at this stage in project development. During	RESOLVED for purpose of scoping. It will be necessary to discuss the sizing of the non-contact water ponds in more detail prior to deciding on the final size of the ponds and subsequent hydrologic analyses for the EIS. DNR will engage TMM on the issue of justifying the sizing of the ponds for the EIS. DNR will work with TMM to develop the appropriate language for the scoping document.		
260	1471	the same as the diversion dikes? This is the only use of	Reference to overflow weirs was removed to simplify description. Text has been edited to read: "The noncontact water ditches would be designed to convey the 100-year, 24-hour storm event with a minimum freeboard of 1 ft (0.3 m)."	RESOLVED for purpose of scoping.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
261	1477-1499	Regulatory guidance. Several water management activities appear to be classified as industrial stormwater. All areas that generate and may discharge industrial wastewater need permit coverage, and any discharges of industrial wastewater would require sampling. Note that industrial wastewater cannot be categorized together with upstream diversion water. For example, things like office buildings and parking lots would not be considered industrial wastewater, but maintenance areas, fuel storage, fueling areas, material handling, refuse sites, waste storage, plant yards, and buildings where industrial activities occur are considered industrial wastewater areas. The site drainage areas (with surface flow direction arrows) and the activities within those drainage areas need to be better defined and illustrated to determine areas where industrial wastewater is generated. Some areas that are now identified as non-contact water may need to be regulated as industrial wastewater. Action requested: Consider the regulatory guidance against how water is proposed to be classified at this time versus a more appropriate regulatory construct. Modify text as appropriate. Future discussion item.		RESOLVED for purpose of scoping. Comment remains for EIS. Note: Areas of the site that contribute industrial stormwater, contact water, and noncontact water would need to be better defined for the EIS analysis.		
802	1477	management discussion states during extreme storm events, stormwater in the non-contact area at the plant	262 from 7-24-2020 response. Definition has been added to glossary: "extreme storm event: unexpected, severe, or unseasonal weather events, specifically weather	RESOLVED.		
803	1477	contact area would be either: 1) diverted away from the plant site to minimize the amount of contact water	See Comment 71 from 7-24-2020 response. TMM is still evaluating the regulatory classification of water and thus the management of stormwater as non-contact stormwater, industrial stormwater, or contact water.			
262	1479	Clarification. The text indicates management flexibility needed to address extreme storm events. Explanation would be valuable in distinguishing extreme storm events versus typical precipitation years. Two approaches appear viable. One is to add term "extreme storm event" to glossary and define in a way that	event: unexpected, severe, or unseasonal weather events, specifically weather events at the extremes of historical distribution." The term "appropriate discharge controls" means stormwater control structures designed and maintained in compliance with permit requirements such as controlling erosion and discharge of sediment.			
263	1486-1490	Guidance. Additional information will be needed to conclusively determine how runoff from each of these features would be managed from a regulatory perspective (i.e., process/contact water vs industrial stormwater, etc.). No action requested. Future discussion item.	See Comment 71.	RESOLVED for purpose of scoping. Requires RGU- approved definition of waters for scoping and EIS.

800	1500	the various stages of the dry stacking part of the operation. Action Requested: Suggest text to address the issue.	incorporated into Section 3.6.2.11 - Water Management Plan during subsequent revision periods: The perimeter water management infrastructure around the DSF (perimeter DSF road, ditches, diversion dikes, etc.) necessary to divert off-site runoff and manage onsite runoff, will be in place prior to placement of filtered tailings within the DSF. The DSF would incorporate temporary erosion control measures to limit erosion from the exposed tailings. The selection of temporary erosion control measures would be based on applicable recommendations from the Minnesota Stormwater Manual. The temporary erosion control measures may include fiber logs and straw bales, swales and ditches, rock check-dams, gravel riprap at locations of concentrated flow, attenuation ponds, or other controls measures. The selection of temporary erosion control measures would be tailored to the characteristics of the area, the development schedule, the tailings placement method, construction equipment used and overall water management approach. These temporary erosion control measures would be regularly inspected, maintained, and adjusted as required.	RESOLVED.		
267	1507	"portion of the tailings dewatering plant" to assess potential impacts. The layout of this area influences changes in surface hydrology and surface permeability. Additional detail will be necessary to inform the scoping process in offering the potential significance of impacts for the EIS. Providing supporting material, such as a map/figure identifying these areas, or a table giving area measurements, could be warranted. Action requested: Consider how to beef up the text, plus what additional supporting materials would be useful, to assist in better understanding the project and its potential impacts.	defined type of water for the project in consultation state agencies during the EIS development and subsequent permitting. Industrial stormwater is likely to better describe the stormwater run-off and can provide some further clarity to this, after the coordination between TMM and the agencies occurs. As industrial	RESOLVED for purpose of scoping. Comment remains for EIS. RGU notes that if the Proposer is unable to provide a table providing area measurements, or map identifying the contact versus non-contact areas of the site, both of these remain as an information need for the EIS.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
268		the TSF as noncontact water requires consideration. Fugitive dust and precipitation runoff may impact undeveloped areas. Action requested: Future discussion item.	Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including design or construction details on the dry stack facility.	RESOLVED for purpose of scoping.		
269	1525	1256 as "The footprint of dry stack facility stage 2"	Text edited to read: "The footprint of dry stack facility stage 2 would be managed as non-contact water during operations when tailings are placed on stage 3."	RESOLVED for purpose of scoping.		
270		Clarification request. How will runoff from the tailings stack be handled to prevent it from running onto exposed sections of the dry stack facility liner? Would it be easier to manage all sections of the exposed liner as contact areas and any areas that have yet to be constructed as non-contact areas? Action requested: Modify text to address the issue. Could be a topic of future discussion.	each stage of the dry stack facility, the liner would be installed over the entire footprint of that stage, an area of approximately 120 to 160 acres. Tailings filter cake would be placed and compacted gradually from west to east across the lined area, with a portion of the liner remaining exposed until the stage is complete. To			
271	1530	dry stack facility be separated from the stage 2 area during stage 2 construction and up to the point of tailings being deposited in stage 2? Action requested:		RESOLVED for purpose of scoping. DNR notes the proposed response does not address the time when deposition into the phase 1 area of the basin would need to cease presumably while phase 2 would be constructed. This will be addressed during the EIS process to inform the assessments of potential impacts.		
272	1530	Clarification request. Explain in detail how portions of the exposed dry stack facility liner would be managed as non-contact water. Action requested: Provide the detail and modify text as requested, which may be substantial enough such that the section warrants reorganization into two sections (?).	See Comment 270	RESOLVED.		
273		Clarification. How would the water from the non- contact areas be managed? Action requested: Address item and modify text accordingly.	See Comment 270	RESOLVED for purpose of scoping . RGU notes that if the Proposer is unable to provide a table providing area measurements, or map identifying the contact versus non-contact areas of the site, both of these remain as an information need for the EIS.

Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been	RESOLVED for purpose of scoping. Comment remains for EIS.		
277		Modify text to reflect the response to the question.	Text has been edited to read: "In these areas, a temporary non-contact water ditch would be constructed near the toe of the dry stack facility inside and above the contact water ditches, as shown on Figure 3-20. These temporary non-contact water ditches would have the same design and function as the other non-contact water ditches and would drain to controls to remove suspended solids." See line 1470 for the description of the storm event for non-contact water ditches.		climate considerations as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	The non-contact water ditch at the dry stack facility has been renamed to be the "dry stack facility runoff collection ditch". The dry stack facility runoff collection ditch will collect runoff that will be classified as industrial stormwater when the tailings are exposed and would be classified as non-contact water once the tailings slopes are reclaimed. The dry stack facility runoff collection ditch is designed for 100-year, 24-hour rainfall event for the purposes of the SEAW data submittal assessments. Final design will assess multiple storm events and other factors of safety.

796	1572-1578	Regulatory Guidance. The construction stormwater permit requires permanent stormwater treatment for new impervious surfaces created by the project that will discharge off the site. This includes gravel roads, parking areas, buildings, etc. No action requested. Provided as information only.		RESOLVED for purpose of scoping . Comment remains for EIS.		
797	1572-1578	Corridor, Transmission Corridor, Ventilation area, and any other similar areas during operations. This topic is broached for the ventilation raises in the Underground Mine Area. Where stormwater treatment is necessary,	found in Tables 3-8 - 3-16 of the 7-24-2020 response submittal. The comment is noted and will be taken into consideration as a part of future evaluation of regulatory classification of water as industrial stormwater and the future development of the description of the industrial stormwater management features. See Comment 71 from 7-24-2020 response for more information on the status of defining industrial stormwater areas for the	RESOLVED for purpose of scoping. Comment remains for EIS.		
798	1572-1578	stormwater runoff be explored first before moving to	stormwater during the permitting process as a part of future development of indsturial stormwater management features.	RESOLVED for purpose of scoping. Comment remains for EIS.		
283	1585	General note. DNR will seek further information regarding construction stormwater management, including ponds, collection, treatment, and conveyance in order to support the EIS impact analysis. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.		
805	1585	Regulatory Guidance. In the construction stormwater management section, the text should identify the progression of the site from coverage under the Construction Stormwater permit to when it transitions to Industrial Stormwater permit coverage. For example, the construction of the temporary rock storage area would most likely be covered by the construction stormwater permit, but once rock is being stored in this area, it would transition over to Industrial Stormwater permit coverage. This should be noted for relevant features for all major areas of the site. Action Requested: Consider the issue and suggest text to address it.		RESOLVED for purpose of scoping. Comment remains for EIS.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
806	1585	Clarification. In the stormwater management section, the text should identify the use of temporary sediment basins during construction. The CSW permit requires the use of temporary sediment basins any time ten or more acres of disturbed soils drain to one location. Action Requested: Consider the issue and suggest text to address it.		RESOLVED.		
284	1603-1604	Clarification. This sentence seems contrary to the claim that all contact water would remain on the project site. Either specify what is meant by "discharged" in the context of no contact water leaving the site, or explain otherwise. As has already been noted, the management of contact water during construction, operations, and closure is of high interest. Statements that discharges would be "in compliance with permits" does not negate the need to fully detail what may be planned. Parameters of interest around any such discharge include: source/where; volumes; predicted water quality; timing; and destination. Action requested: Provide qualifying text to the paragraph on this discharge. Ensure that Future Scope in the appropriate section(s) addresses the item.	Text corrected to indicate that "Construction stormwater would be discharged, as required, in compliance with permits."	RESOLVED for purpose of scoping.		
285	1618	RGU note. Preliminary review of the information suggests contributing watershed impacts to wetlands, in terms of a new surface hydrology in operations and closure, will receive detailed analysis in the EIS. A focus area would be to evaluate the degree to which wetlands may or may not receive run-off in the same amounts, and at the same rates, as the pre-project or No Action Alternative. Action requested: Ensure Section 6.3 identifies this item as a future information and analytical need for the EIS.	related to surface water and groundwater. The modeling results from the Section 6.3.1 and 6.3.2 will inform the potential indirect impacts to wetlands.	RESOLVED for purpose of scoping.		
286		Information need. Detail will be necessary on drain down and seepage water quality and quantity after closure. Action requested: Ensure that Future Scope in the appropriate section(s) addresses the item.	As outlined in Section 6.3.2 future work will include modeling to quantify Project influences on groundwater systems. This modeling is for all Project impacts including reclamation and closure and will include modeling drain down and seepage water quality and quantity and will be provided during EIS development.	RESOLVED for purpose of scoping. Comment remains for EIS.		
287	1619-1620	trees growing, could alter permeability is an information need for assessing potential impacts in closure. Action requested: Ensure that Future Scope in the appropriate	hydrologic system will include baseline conditions, the	RESOLVED for purpose of scoping. Comment remains for EIS.		
288		Clarification. The text states: "it would be routed to non-contact water ditches." Action requested: Would non-contact water ditches remain in closure? If yes, ensure consistent treatment of this proposed closure condition and modify text as appropriate.	Text edited at the end of Non-contact Water Diversion Area Water Management section to read: "The non-contact water ditches would discharge to existing drainage ways or other diversions ditches through energy dissipation devices (e.g., rip-rap, erosion control mats, etc.). Non-contact water ditches would be maintained throughout concurrent reclamation activities and would be integrated into drainage features at the tailings management site during the closure stage of the Project."

	Line # Table #	RGU Round 2 New Comment	Twin Metals Response	Twin Metals Response After Additional Discussions with			
#	Figure #		Round 2 Response on Comment 190.	RGU			
810		Clarification. Is the potential use of contact water as "drilling water" possibly subject to USEPA Underground Injection Control Regulations? Table 3-17 identifies potential need for a Type V Underground Injection Control as a possible permit need. Action requested: Provide a response.					
811	v2 593-600	Regulatory Guidance. If any portion of the plant site overlaps state land, then timber damages, reproduction damages, and any reforestation costs would be assessed to the Proposer. Any timber cleared from that land would be non-certified because this is a land use conversion. No action requested. RGU will identify appropriate language for future EIS documents.	TMM has reviewed the guidance provided and will consider the guidance in future work products.				
812		how often this stockpile will have coarse ore stored on it?	The text was updated to indicate "The overflow ore stockpile would exist intermittently, based on the maintenance schedule of both the underground mine and the concentrator. The purpose of the overflow ore stockpile would be to decouple the underground mine and concentrator during shutdowns. Shutdowns would occur due to both planned and unplanned maintenance activities. Based on preliminary review of downtime, it is expected that the overflow ore stockpile would be present at various times adding up to a total of 2-6 months over the calendar year. Over the 2-6 months, the stockpile averages approximately 10,000 tons (9,072 tonnes) and not the peak volume of 2.5 days which equates to approximately 50,000 tons (45,360 tonnes)"				
813	v2 944-955	Regulatory Guidance. If the tailings facility is sited on state land, then timber damages, reproduction damages, and any reforestation costs would be assessed to the Proposer. Any timber cleared from that land would be non-certified because this is a land use conversion. No action requested. RGU will identify appropriate language for future EIS documents.					

Comment #	Line # Table # Figure #	RGU Round 2 New Comment	Twin Metals Response	Twin Metals Response After Additional Discussions with RGU
814	v2 1256-1278	Clarification. The section for the Water Management Plan describes the "four types of water" to be managed by water quality at v2 Lines 1256-1278. At v2 Line 1271, it is noted that non-contact water include "stormwater from undisturbed portions or reclaimed portions of the Project Area." Similar observations are provided for the contact pond contributing areas. Is "undisturbed" analogous with "natural," or would some degree of site preparation, limited vegetation control, or other measures be expected to occur in these areas within the project boundary? Action requested: Provide a response and DNR will determine appropriate treatment in the Scoping EAW during its development.	In this context, undisturbed is analogous with natural.	
815		after it has passed through the sediment pond and only if that is not sufficient, then use fresh water "when new water can be added to the system" noted at line v2 1362. Action requested: Provide an explanation as to whether this is a potential consideration in water management for the project.	treatment is required it is typically the removal of solids/suspended solids from the water. Therefore the comment is correct that TMM would only pull water	

Comment #	Line # Table # Figure #	RGU Round 2 New Comment	Twin Metals Response	Twin Metals Response After Additional Discussions with RGU
816		prior to use as process water or for underground equipment. Why wouldn't the underground mine water also be treated prior to its use as dust suppressant?	In this context, underground equipment use was meant to be inclusive of the dust suppressant water as the water trucks would source their water from the mine supply water (same source as the other mine underground equipment). Therefore, dust suppressant water does get treated through the sediment pond prior to use in the water truck. To aid in clarity, the sentence was updated to "Underground mine water would need to be cleared of sediment as well as de-oiled before it could be re-used as mine supply water or process water." The previous paragraph clarifies mine supply water: "Mine supply water would be used for dust suppression and equipment requirements like drill water."	
817	v2 1671-1677 v2 1703-1709	Clarification. Under Plant Site Non-contact Water Management (v2 Lines 1671-1677), the text indicates during typical precipitation years the non-contact water will be collected and used in the process. The next section, Tailings Management Site Reclamation Material Stockpile (v2 Lines 1703-1709), says the stormwater from the Reclamation Material Stockpile sedimentation pond would have "an ultimate outlet through the non-contact water ditch to the west (line 1708)." It is unclear where this ditch discharges, but it appears the water is discharged to Birch Lake. If there is a potential for leaching of mercury from the peat, clarification should be provided if Reclamation Material Stockpile "non-contact" water is used in the process as is proposed with the Plant site non-contact water (that is, essentially manage it as contact water). Action requested: Address the item and modify the text as appropriate.	TMM plans to resolve regulatory classifications of water, Project water nomenclature, and several considerations of project water management as part of future	Text has been added to Section 6.3.1.2 acknowledging potential impacts to water quality, specifically mercury, from the storage of peat will be considered as part of the EIS. The text is as follows: "Could there be surface water quality impacts from the storage of peat?"

Twin Metals Minnesota EIS

301	1780	at a variety of scales (e.g., regional; ~ 10 miles; 25 miles). It may be beneficial to break land use into a broad regional category along with a well-defined Project area section (~ 10 miles). Action requested: Consider	Recreational uses are described in a wider scale to capture the large number of recreating opportunities in Northern Minnesota. Text has been revised and added to Section 15.1 where effects on recreation and future scope are addressed.	RESOLVED for purpose of scoping. The Scoping EAW will provide a clearer distinction between regional versus localized land uses than presented.	
302	1780	Aid (GIA) snowmobile trail in the approximate location of NWNE sec 29, T61N, R11W. This trail is managed by the Ely Igloos snowmobile Club. Action requested: Modify the text to address the item. Text should be added indicating the project's compatibility with this recreation	Aid snowmobile trail, which currently runs through the footprint of the transmission corridor, is maintained by the Ely Igloos Snowmobile Club. The trail crosses the footprint of the transmission corridor in NWNE Section 29, T61N, R11W." Potential effects on recreation will be studied as outlined	RESOLVED.	
303	1780	on, the Spruce Road. The Spruce Road is within the project boundary. Facilities on the Spruce road include the South Kawishiwi River Water Access, Prospector Loop ATV Trail, Tomahawk Snowmobile Trail, and the Little Gabbro lake Water Access. The project should avoid ingress or egress impacts to Spruce Road. Action	Lines 1827-1832 generally discuss the recreational uses within 25 miles of the Project area. These recreational facilities are outside the Project area and no impacts are planned to Spruce Road which would impact ingress or egress. Impacts to recreation will be assessed as Section 15.1 and some text has been moved from Section 4 into Section 15.1.	RESOLVED for purpose of scoping. The Scoping EAW will identify any potential land use conflicts, or other potential impacts, to recreational facilities along the Spruce Road.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
304		,	See Comment 311. Impacts to recreation will be assessed as part of Section 15.1.	RESOLVED.	
305	1802	Addition. These categories are appropriate land uses to add to the list provided: Water oriented commercial businesses (e.g., resorts; houseboat rental; fish guiding; other); Lake shoreland residences. Action requested: Modify text.	Text has been edited to include additional bullets.	RESOLVED for purpose of scoping.	
306	1 X 1 1/4	Clarification request. Review of Figure 4-4 appears to indicate both resorts and parks occur within 10 miles of the Project, which is analogous to the distance to Babbitt and Ely. Action requested: If accurate, then modify bullet text to read: "Recreation (resorts, parks).	This is covered in list with: "Hunting and fishing; Year-round recreation, including downhill skiing, snowmobiling, off-highway vehicle (OHV) use, mountain biking, hiking, and golf; Recreational trails." Additionally bullets in text have been edited to include: "Water oriented commercial businesses (e.g., resorts; houseboat rental; fish guiding; other);" in response to Comment 305.	RESOLVED.	
307	1805-1822	uses currently are for timber production and recreation. Recreation is a high use of the area, including on Birch Lake and connected waters. It is noted that mining and industrial uses of the area have not occurred, although there is a history of mineral exploration. Past mineral	The text discuss previous land use in the Project area and this correctly includes mineral resource development. Mineral resource development continues within and near the Project area with exploration drilling from TMM and Encampment Minerals as well as mineral development in Kasota Stone's 120-acre industrial mineral lease with the state of Minnesota (MLIN200002) within the footprint of the Project.		
308	1806	Text clarification. The text reads the Project area has a history of both mineral "exploration" and "development." Depending on the defined boundary of "Project area," uncertain that "development" applies. Clearly however	Mineral development is appropriate as Kasota Stone is an industrial mineral producer with a quarry currently operating in the proposed footprint of the tailings management site with an industrial mineral lease with the State of Minnesota.	RESOLVED for purpose of scoping. The Scoping EAW will identify the area having a history of both mineral exploration and mineral development.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
309	1815	· · · · · · · · · · · · · · · · · · ·	In addition to Kasota Stone (see Comment 308) there are timber harvest activities on Federal and State land near the Project area as well as commercial resorts and travel options near the Project. No change made.	RESOLVED for purpose of scoping.	
310	1817		disturbance - the northeast end of the access road	RESOLVED for purpose of scoping. For scoping DNR will need to consider if the 5 mile distance cited has any significance, which will also include examining a potential PTM mining area and how far that is to the southwestern border of the Boundary Waters Canoe Area Wilderness.	
311	1833-1837	recreation management classifications of state and federal ownerships, including permitted uses and targeted experiences. As appropriate it may be relevant to identify SNF recreation classifications for the greater area around the project as a function of the extent of project impacts. There are areas of Semi-primitive Motorized Recreation both to the northeast and south of the project. The parts of the Project area within the SNR are classified as General Forest, which too specifies recreation settings and permissible activities. More broadly, the non-motorized recreation use that is present typically occurs on lakes, trails, portages, and low standard roads. This management type is along all the shore of Birch Lake and the South Kawishiwi and there are two back country campsites immediately adjacent to the project site; these should be acknowledged. There are	camping sites are located within 1,000 ft (300 m) of the Project area on the eastern shore of Birch Lake – these campsites are accessible by any type of watercraft. Additionally, two USFS designated moderately developed	RESOLVED for purpose of scoping.

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
316		Clarification. Does the Lake County Plan end in 2013? The reference document listed at Lines 6842-6843 was effective June 2017. Action requested: Confirm duration compared with project activities; modify text if warranted.	This document was effective June 23, 2017 and the reference to 2013 is in the document approved by the Lake County Board of Commissioners in 2017. However, to avoid confusion "until 2013" has been removed from the text.	RESOLVED.	
317	1908	Clarification. Other potentially relevant land use plan goals, which will have to be assessed for project compatibility, include: General Goal 1: C5) Work with federal and state officials to retain resident hunting, trapping, and fishing rights on publicly owned lands and waters, and C6) Work with applicable entities to maintain public access to all public land and waters in Lake County.	Text has been edited to read: "The plan provides the general goals as follows: General Goal 1: Continue to develop Comprehensive Plan to guide decision-makers that considers the values, traditions, and customs of County residents, utilizing locally accepted comprehensive planning principles. General Goal 2: Assure a balance between development and quality of life considerations."	RESOLVED for the purpose of scoping. RGU note: DNR will coordinate with the respective local governmental units to ensure the Scoping EAW reflects the appropriate level of goal disclosure to assess compatibility with existing land use plans.	
318	1909	with multiple categorized goals. General Goal 2: Assure a	land use goal as follows:	RESOLVED for purpose of scoping.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
319	2049	Clarification. The management areas of the proposed project are identified in the SNF Plan are "Semi-primitive Non-motorized Recreation" and "General Forest" (https://www.fs.usda.gov/Internet/FSE_DOCUMENTS/fs m91_050602.pdf). This section should provide more information on the intent of the management areas as the basis of assessing the treatment of this topic in EIS scoping. Action requested: Modify text to address the item as determined appropriate.	To clarify, the Project area is within General Forest and Recreation Use in Scenic Landscape management areas. The Project area is outside any Semi-primitive Nonmotorized Recreation (see Figure MAS-6 in the SNF Plan). Text has been edited to read: "The SNF is broken out by management areas which are assigned desired conditions, objectives, standards and guidelines. Most of the Project area is in General Forest management areas with portions near Birch Lake identified as Recreation Use in a Scenic Landscape management areas. General Forest Management Areas General Forest management areas "emphasize land and resource conditions that provide a wide variety of goods, uses, and services" (USFS, 2004). These management areas are the most common in the SNF, may have buildings and structures to support resource management objectives, and most special uses can be accommodated. Recreation Use in a Scenic Landscape "Recreation Use in a Scenic Landscape management area emphasizes land and resource conditions that provide a scenic landscape for recreational activities in natural-appearing surroundings" (USFS, 2004). Developed facilities and access may result in concentrated recreation and a high degree of user interaction. The management areas may have buildings and structures to support resource management objectives and most special uses can be accommodated." In addition to these edits see Lines 2355-2374 for Project impacts to the SNF Plan.	the Project area and surrounding areas that was omitted. The project site lies within the area for High and Moderate Scenic Integrity Objectives with corresponding goals. This should be added to the text Version 2 - lines 2298-2301. RGU note: DNR will engage the Superior National Forest to ensure the Scoping EAW appropriately identifies the Project compatibility with the forest plan. Action requested: Modify the text to address the issue.	See Visual Project Impacts Sections 10.2 which outlines the desired scenic resource conditions outlined in the SNF Land and Resource Management Plan. Text has been edited to read: "Within this plan, the location of the Project area is identified as having moderate and high scenic integrity objectives."
320	2049	Clarification. The SNF Resource Management Plan relies on monitoring and evaluation to improve ongoing management and inform planning decisions. The 2017 Superior National Forest Monitoring and Evaluation Report allows the USFS to determine how well the desired conditions, goals, objectives and outcomes of the Forest Plan have been met. Potential applicability of the findings of this report should be considered. Action requested: Modify text to address the item as determined appropriate.	TMM has not incorporated these findings as they are not currently reflected in the SNF Land and Resource Management Plan. Further considerations as to the applicability of the 2017 Superior National Forest Monitoring and Evaluation Report will be assessed by the RGU as identified in Comment 335 during development of the EIS.	RESOLVED for purpose of scoping.	

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
321	Figure # 2072	Clarification. DNR notes that planning for the cited plan is underway, while the previous applicable subsection plan is out of date. Action requested: Modify sentence to read: "drafted with an anticipated completion in the near future. The state forest management units"	Text has been edited to read: "The Northern Superior Uplands Section Forest Resource Management Plan is in the process of being drafted with an anticipated completion date of 2019 according to information available on the MDNR website. drafted with an anticipated completion in the near future."	RESOLVED for purpose of scoping. DNR notes the text does not bring forward detail from this plan as it does for other similar plans. This could be accomplished during EIS development. No action requested.	
322	2077-2085		Text has been edited under the Shoreland Zoning Provisions to read: "Structures developed within the shoreland of these water courses are required to be setback 100 ft (30.5 m) from the ordinary high water level elevation. Structures within shoreland zoning are subject to certain requirements including placement, design, height, and vegetative standards."	RESOLVED.	
323	2079	Clarification. Activities on DNR administered state lands may require compliance with all applicable municipal, county and state laws, ordinances and regulations, and obtaining and paying for all leases, licenses, easements and permits as may be required by its use. Action requested: Modify text by breaking out stateadministered lands from the joint sentence with federal lands. In new sentence use same language regarding state lands plus clarifying text.	Text has been edited to read: "Federal lands are not subject to local zoning controls but are governed by federal rules and regulations. State lands are not subject to local zoning controls but may require compliance with all applicable municipal, county and state laws, ordinances and regulations, and obtaining and paying for all leases, licenses, easements and permits as may be required by its use."	RESOLVED.	
324	2085	Clarification. At the appropriate location provide a bulleted listing of all project elements that occur within shoreland districts that is consistent with Figure 4-3. According to the figure, the Plant Site, DSF, and Transmission Corridor encroach within designated shoreland districts. Action requested: Review figure and ensure text and figure are consistent. RGU recognizes there may be a data layering issue that will be rectified in future submittals.	Plant site; and	RESOLVED.	
325	2133	Clarification. Shoreland zoning involves more than buildings meeting setback requirements. This section on shoreland zoning provisions should include text identifying the specific controls on shoreland alterations (Sec. 7.08), shoreland excavations (7.09), and road location (Sec 7-10) that are likely relevant to the proposed project. For example, greater detail will be necessary to assess the proposed amount of excavation and vegetation removal for impacts. Action requested: Modify text to address the item.	Text has been updated to state, "Additionally, shoreland zoning provisions also describe requirements for shoreland alteration, shoreland excavations, and road locations." Further considerations as to the applicability of these provisions will be assessed by the RGU as identified in Comment 335 during development of the EIS.	RESOLVED for purpose of scoping.

Action requested: Address the issue and incorporate into text as warranted.	brown, sandy till that contains basalt, gabbro, and other rocks." Rainy Lobe contains a large variety of rocks from differing provenances not all necessarily from the Duluth Complex. Given this unsure of what outlining the potential for Duluth Complex rocks adds to the SEAW data submittal.	RESOLVED for purpose of scoping. The scoping document will identify the need for investigation as to potential reactivity of glacial till due to inclusion of Duluth Complex rock, depending on the use and/or storage of glacial till with the project.		
362	2574	Text edit. Action requested: Heading should be changed to "Unconsolidated Material Thickness."		RESOLVED.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
363	2582	Clarification. The use of Acid Rock Drainage (ARD) here is out of context. Typically ARD is reserved for natural occurrences where acid is released from weathering rocks. The term Acid Mine Drainage (AMD) is more appropriate here because the topic is anthropogenic influences that may impart the release of acid. See Rimstidt and Vaughan (2003) Pyrite oxidation: A state-of-the-art assessment of the reaction mechanism, in Geochimica et Cosmochimica Acta vol. 67 no. 5 pp. 873-880, Section 1. Introduction and references within that section. Action requested: Consider point and revise text accordingly. If relying on the proposed literature, add to reference material.	The term is accurate as offered. TMM will continue to use it for documents it prepares. See GARD guide and terminology adopted by the International Network of Acid Prevention. TMM's use of ARD is widely accepted and understood. TMM understands that the MDNR will adopt language it prefers in documents it publishes.	RESOLVED for purpose of scoping. It is true that the usage of ARD is not wrong as a generic term. However, this is a mine project in an area where there are no existing ARD occurrences. Therefore, in an effort to be most accurate and concise, and portray the project in the most transparent light, AMD is the most appropriate term to be used for actions related to mining. In addition, though the GARD guide and INAP are useful references, the mining and reclamation rules for the State of Minnesota are the primary guidance that needs to be followed for mine projects both active and proposed. Mine permit documents that are part of a mine permit application will be required to use the ARD and AMD terms as required by state regulatory authority. One of the purposes of Environmental Review is to inform decision makers, thus Environmental Review documents need to use consistent language as well. DNR will determine the appropriate uses of the terms ARD and AMD in State environmental documents, including the Scoping EAW and scoping document. DNR will engage TMM as needed to consistent usage of these terms over the EIS.		
364	2583	Clarification. ARD is not the correct term. Because the required EIS is related to a mining action, therefore the characterization work being performed would be to evaluate the potential for AMD, where AMD is not the result of natural oxidation. Most commonly AMD is from the excavation of earth materials taken from a geochemical stable environment and placed in a highly reactive environment. Action requested: Modify text. Apply global fix to document UNLESS there is a circumstance where usage of the term ARD is appropriate as DNR is defining it.	See Comment 363.	RESOLVED for purpose of scoping. It is true that the usage of ARD is not wrong as a generic term. However, this is a mine project in an area where there are no existing ARD occurrences. Therefore, in an effort to be most accurate and concise, and portray the project in the most transparent light, AMD is the most appropriate term to be used for actions related to mining. In addition, though the GARD guide and INAP are useful references, the mining and reclamation rules for the State of Minnesota are the primary guidance that needs to be followed for mine projects both active and proposed. Mine permit documents that are part of a mine permit application will be required to use the ARD and AMD terms as required by state regulatory authority. One of the purposes of Environmental Review is to inform decision makers, thus Environmental Review documents need to use consistent language as well. DNR will determine the appropriate uses of the terms ARD and AMD in State environmental documents, including the Scoping EAW and scoping document. DNR will engage TMM as needed to consistent usage of these terms over the EIS.		
365	2584	Clarification. The text references "stages" in a series of chemical reactions that is somewhat unclear. The series of chemical reactions that constitute sulfide oxidation are acid generating. Action requested: Clarify text to better state what is expected.	Text has been edited to remove "and in stages" and the text "the process of oxidation occurs in a series of chemical reactions" remains accurate.	the concept of ARD, which is a collection of various mineral weathering processes. In particular, sulfide oxidation does not progress from near neutral to more acidic. Oxidation of iron bearing sulfide minerals	Text has been edited to read: "Geochemical characterization is a method for evaluating the reactivity of rock, minerals, and the potential for generation of ARD and ML. ARD is a result of the natural oxidation of sulfide minerals when exposed to air and water. Associated geochemical processes can also lead to ML, which is the release of metals into solution."	

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
366		does not depend on mineral content or climate. Action requested: Edit text.	of Acid Prevention. TMM understands that the MDNR will adopt language it prefers in documents it publishes.	that can influence the rate of sulfide oxidation, in particular temperature. However, it is conceivable that there are different climates for which the various competing factors (e.g., temperature and precipitation amount) will result in equal modifications to the rate of	Text has been edited to read: "Geochemical characterization is a method for evaluating the reactivity of rock, minerals, and the potential for generation of ARD and ML. ARD is a result of the natural oxidation of sulfide minerals when exposed to air and water. Associated geochemical processes can also lead to ML, which is the release of metals into solution."	
367	2586	"environmental."	Text has been edited to read: "The rate at which this reaction occurs can vary based on a number of different factors such as mineral content and climate."	RESOLVED.		
368		discuss chemical weathering or chemical weathering trends rather than weathering patterns. Action requested: Elaborate and revise text.	Weathering patterns has been revised to weathering rates. Weathering rates is the terminology utilized in the GARD guide in Section 5.4.12 when they discuss predictions from laboratory kinetic testing methodology. Additional text has been added within this section to further expand: "Kinetic testing are primarily intended to generate information on weathering rates of primary minerals (e.g., sulfides); information that can be used to estimate the potential for future net-acid conditions. Dissolution rates of readily soluble primary and secondary minerals present at the onset of testing can also be derived from kinetic testing results. "	RESOLVED.		
369		relative to acid neutralizing mineral surface area. This concept needs to be incorporated into the text. Action requested: Add perspective to discussion.				
370	2603-2609	Clarification. This assertion of higher total sulfur content rocks being capable of maintaining a circumneutral leachate only occurs for a very specific sulfur content and bulk mineralogy. Action requested: Provide more clarity and revise to make this an accurate statement.	See Comment 369.	RESOLVED.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
371	Figure # 2603-2609	Information need. Relying on a so-called lag time to acid generation to implement controls to avoid development of AMD requires additional investigations and analysis beyond what has been conducted to date. A complete plan will be needed prior to extraction of this type of rock. Action requested: Ensure Section 5.3 identifies this as an information need. Future discussion item.	See Comment 369. TMM looks forward to future discussion on this item as it relates to the TMM Project.	RESOLVED.		
372	2603-2609	Clarification. The assertion that higher [should state "lower"] total sulfur content rocks being capable of maintaining a circumneutral leachate only occurs for a very specific sulfur content and bulk mineralogy. Action requested: Provide more clarity and revise to make this an accurate statement.	See Comment 369.	appropriate characterization of the degree to which silicate minerals have the ability to neutralize higher total sulfur content rock. Further discussion required.	TMM is revising nomenclature related to material handling and management to better align with the Mine Materials Characterization Program and recent discussions with the MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 65.
373	2603-2609	Information need. Additional supporting evidence that the specific sulfur content and bulk mineralogy of the material would result in maintaining a circumneutral leachate is needed. Action requested: Further analysis will be needed of these rocks to determine if this is applicable to this project. Ensure Section 5.3 identifies this as an information need. Future discussion item.	See Comment 369. TMM looks forward to future discussion on this item as it relates to the TMM Project.	appropriate characterization program is implemented to		Based on discussion with MDNR, alignment with overall goals of the materials characterization program, and revisions to Comment 65 - the bullet has been edited to read: " A work plan for the implementation of the program."
374	2610	Clarification. The text offers an oversimplified description of the control on metal leaching. Acid drainage would either not occur or the waste would be managed to avoid, thus the control on metal leaching is more about pH and substrates for sorption. Action requested: Modify text.	See Comment 369.	RESOLVED.		
375	2612	Clarification. Because the material characterization program is not finished, using the term "developed" gives the impression of an approved set of activities even though it is later acknowledged to be "ongoing." Action requested: Revise text to read: "TMM is developing a Project-specific material characterization program"	Text has been edited to read: "Although a fundamental understanding of the potential for ARD and ML within Duluth Complex rocks exists, TMM is developing a Project-specific material characterization program in consultation with MDNR and in alignment with Minn. R., part 6132.1000."	RESOLVED.		
376	2615-2617	TMM pilot tailings. The current status of activity should	characterization of sulfide mineralization and ARD and ML potential of tailings, waste rock, development rock, and ore associated with the Duluth Complex and GRB rock;"	RESOLVED.		
377	2618-2619	of characterization data to inform material management. The current status of the activity should be better reflected. Action requested: Modify second bullet to read: "Future utilization of characterization data"		RESOLVED.		
378	2620-2621	Clarification. DNR notes DNR-LAM has not reviewed or been provided any documentation regarding incorporating characterization program data for understanding impacts to water quality. The current status of activity should be better reflected. Action requested: Modify third bullet to read: "Develop a plan for inclusion of data obtained"	Text has been edited to read: "Develop a plan for inclusion of data obtained from the material characterization program into modeling to further understand potential impacts to water quality."	RESOLVED.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
379	2622		Text has been edited to read: "To date, TMM has conducted chemical analysis (elemental and whole rock analysis), acid-base accounting, net acid generation, and mineralogical and petrological analyses on development rock, waste rock, and ore; and chemical composition, acid base accounting, mineralogical and petrological, and preliminary kinetic testing analyses on tailings"	RESOLVED.		
380	2623-2625	Clarification. No definite chemical classification has been made as to what constitutes "development rock," which would be a management-based classification subcategory of waste rock. Therefore, discussion regarding the ARD potential of development rock is premature as it has not been defined. Action requested: Modify text to acknowledge uncertainty in any prediction of ARD potential for development rock until it is defined.	See Comment 381.	RESOLVED.		
381	2623-2625	Clarification. At this time the statement is unsupportable and thus is false as offered. The existing rock characterization data is not well suited to make determinations of ARD potential. This is because the static tests performed are designed for carbonate bearing rocks that are importantly beyond the very modest amounts found in the Duluth Complex. Furthermore, the existing characterization indicates that about half of the ore is acid generating. Action requested: Eliminate the sentence or revise the text to provide a more accurate assessment based on the known limitations of the existing work to date.	Statement has been removed.	RESOLVED.		
382	2623-2627	Clarification. Note that this is only based on static testing, not kinetic. Action requested: Modify text to specify that only static testing has occurred, not kinetic. Should occur early in the paragraph.	See Comment 381.	RESOLVED.		
383	2630-2633	Clarification. Regarding the "planned future testing" program noted in the text, what is necessary to inform the EIS and permitting is subject to DNR approval. Starting the sentence as "Planned future testing" gives the impression of a fully-vetted and approved methodology that has not happened. It is also noted this	characterization of the development rock, waste rock, and ore will need to include continued static testing to inform necessary kinetic testing and additional mineralogical analysis with a specific focus towards the	RESOLVED.		
384	2642-2643	program that is being developed with the DNR. Based on the current understanding that the test duration was 20 weeks, this data will not be applicable to the long term		RESOLVED for purpose of scoping. DNR will engage TMM over the course of developing the Scoping EAW and scoping document to develop appropriate text describing the status of the materials characterization program to date along with future information requirements to support both the EIS and any permitting. This will include the appropriateness of the 20 week tests as being representative of long-term reactivity.

396	2866-2871	evaluations. Action requested: Assess utility of this	Comment is noted. TMM has incorporated data from the Minnesota Regional Copper-Nickel Study as part of the Regional Surface Water Quality baseline description and will evaluate and include relevant data in a during EIS development to satisfy EIS scope.			
397	2878	modify the text as appropriate. Ensure Section 6.3 identifies this item as a potential information need for the EIS.	As indicated in Table 6-5 through Table 6-6, stream flow data is not available for Keely Creek. TMM plans to collect Stream flow data for Keeley Creek, as described in Section 6.3.1.			
398	2893	Data availability. Surface water monitoring data, related to the Dunka Pit, is available through 2020 on the MPCA Wastewater Data Browser (beyond year 2013). Action requested: Update with new data; modify text as determined appropriate; add reference to Section 17.	The data provided for Dunka Pit is adequate for purposes of scoping for the TMM Project EIS.	RESOLVED for purpose of scoping. RGU notes that the scoping decision will require collection of publicly available MPCA water quality data through (at least) 2020 for the Dunka Pit.		
399	2896-2900	Data requirement. A complete record of water quality data (i.e., individual sample results) will need to be made available (in addition to the summaries and averages, etc. provided here). No action requested. Expect a great deal of scrutiny on this topic. Future discussion item.	scope.	RESOLVED for purpose of scoping. RGU notes that the data deemed necessary will be determined by the RGU.		
400	2909; 2922	Terminology. The term "relatively impermeable bedrock" (used here and elsewhere in the document) should be used cautiously. The degree of GW interaction between the surficial materials and bedrock (including bedrock transition/weathering zones) will need to be thoroughly investigated before conclusions can be drawn. No action expected. Expect a great deal of scrutiny on this topic. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
401	2923-2929		Comment is noted. TMM will submit necessary hydrographs and stream flow data during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. RGU notes that the data deemed necessary will be determined by the RGU.		
402			A stream gage has not yet been installed in Keely Creek. Creeks with the lowest flows, as shown on Table 6-7, are North and South Nokomis Creeks. Text has been edited to read: "Magnitude of flow varies widely with stream size with the highest flows measured in the South Kawishiwi River and the lowest flows in North Nokomis Creek and South Nokomis Creek."			
403	2930-2948	Future discussion. Initial efforts at characterizing base flow using PART will need to be further discussed and evaluated. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
427	_	-	During the performance of the pumping tests, water levels were monitored at other wells located in the same well pad, although these wells were screened in different hydrogeologic units (HGUs) than the pumped well. Generally, water levels in the other HGUs did not respond to pumping in the pumped well. No nearby wells were available for monitoring in the same HGU as the pumped well. Typically, the nearest well located within the same hydrogeologic unit as the pumped well that could have served as an observation well, was located several hundreds to over 1,000 feet away. Considering the flow rates and the durations of the pumping tests, the effects of pumping were not projected to result in drawdowns at such large distances.	RESOLVED.		
428		Data need. The details of the "standard aquifer test analysis" will need to be made available. No action requested. Future discussion item.	Comment is noted.	RESOLVED for purpose of scoping. RGU notes that the data deemed necessary will be determined by the RGU.		
429			Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.2, including aquifer testing and analysis will be provided during EIS development to satisfy the EIS scope.	UNRESOLVED. Clarification. At v2 Lines 3571-72, the text reads: "Aquifer testing of the 2019 monitor wells is anticipated to be completed in 2019." This text is unclear whether the 2019 program was completed as projected. Action requested: Answer the question, and if "yes," the sentence is no longer relevant and should be deleted.	Aquifer testing of 2019 wells was completed in 2020. Sentence has been removed.	
430		Clarification. What are the "select constituents" and how were they selected? Action requested: Modify text to address the item.		RESOLVED.		
431	3240-3253	Future discussion. It is advisable that the selection of locations, parameters, frequency, and similar be done in consultation with the state. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
432	3260-3262	Future discussion. It is advisable that these future monitoring activities for the plant and tailings be done in collaboration with the state. No action requested. Future discussion item.	responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
433		Clarification. Is there site-specific information on site ET rates? Action requested: If yes, modify text to address the item. If no, could potentially be a future information need to be identified in Future Scope.	provided that TMM believes are adequate to scope	RESOLVED.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
#	Figure #		·		- Will McCall Roulla 2 Response	1 Mill Metals Response Arter Additional Discussions with Rdo
434		Clarification. Is there site-specific information on site recharge rates? Action requested: If yes, modify text to address the item. If no, could potentially be a future information need to be identified in Future Scope.	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.2, including analysis and modeling of site recharge rates will be provided during EIS development to satisfy the EIS scope.	RESOLVED.		
435		Clarification. Providing data or analysis will be of use given interest in fracture flow. Please provide further detail. Action requested: Modify text to address the item.	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.2, including aquifer testing and hydrophysical logging will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. The scoping document will identify the need for further information and detail regarding potential fracture-related flow in the shallow bedrock units.		
436	3360	Clarification. Below 300 feet the flow zone frequency is less. What is the flow zone frequency value below 300 feet? Further discussion needed regarding this analysis. Action requested: Modify text to address the item.	See lines 3365-3377. "The average fracture flow zone frequency is approximately 0.5 measurable fractures per 100 ft (30.6 m) of vertical thickness in the depth range of 300 ft to 4,000 ft (91.4 to 1219.2 m) bgs."			
437	3395		TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
438	3419	Clarification. General note for section that lacking in analysis of flow to Keeley Creek. Absent this data, impact assessment not possible. Action requested: Ensure Section 6.3 identifies this item as a data need. Modify text as current information allows to address the item.	See Comment 391.	RESOLVED for purpose of scoping.		
439	3420-3432	Clarification. Available data looks to be focused only on the underground mine area. Will need additional data/evaluation for plant and tailings sites (including potential effects on Keeley Creek). Action requested: Modify text to ensure correct geography indicated. Plant and tailings site should be considered a future data need;				
440	3428-3430	Question. Why was it determined that 1419.5 ft was the hydraulic head? How does this elevation compare to long-term average lake and river elevations? Action requested: Provide a rationale for the hydraulic head value. Modify text to address the item as determined appropriate.	The Birch Lake water elevation used for creating the potentiometric surface figures was taken from the MDNR Lakefinder (the DNR official source for lake level readings statewide) site on 6/5/2019 as documented in note #5 on Figures 6-14, 6-15, and 6-16. The elevation of Birch Lake, as measured at the dam by Minnesota Power between 2007 and 2019 varies seasonally between approximately 1417.2 and 1419.9 feet.	RESOLVED for purpose of scoping . DNR notes it is likely for more discussion to be necessary to determine what historical Birch Lake water level measurements will be used to estimate Birch Lake water levels for EIS.		
441	3453	Correction. Is "rand" supposed to be "range"? Action requested: Modify text with correction.	Text corrected. "rand" changed to "range"	RESOLVED.

#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
442		Future review. There will be a need to more fully evaluate and document potential groundwater-surface water interactions. Action requested: Ensure Section 6.3 identifies this item.	Section 6.3.1 describes surface water supplemental scope "supplemental data acquisition and analysis will better define the surface water baseline environmental conditions, hydrologic regime, surface water / groundwater interactions and relationships, and potential Project impacts to the surface water system." Both the surface water and groundwater supplemental scopes will be necessary to define this interaction and relationship. The results of these supplemental scopes will be provided during EIS development.	RESOLVED.		
443		context considering the known MPCA impairments. Action requested: Modify text to address the item.	2018 average aluminum concentrations in groundwater are provided in Table 6-26 through Table 6-28. Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.1, including water quality will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping.		
444		of individual sample results. It is correct that 2019 data (and likely beyond) will need to be gathered and incorporated into the analysis. Action requested: Ensure	provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the	RESOLVED for purpose of scoping. RGU notes that the data deemed necessary will be determined by the RGU.		
445	3545-3546	Clarification. The phrase "more dilute than" is not meaningful. Clarity could include: for all parameters? how much? implications? or similar. Action requested: Modify text to address the item; provide specificity to make less vague.		RESOLVED.		
446	3551-3566	secondary groundwater/drinking water standards. To the extent that this may be claimed as "natural background," additional data and documentation will be needed. Action requested: Ensure Section 6.3 identifies this item as an information need. Future discussion item.	documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.2, including groundwater quality will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping.		
447	3595	Clarification. It should be noted that this statement pretty much refers to the one well. This is not the foundation for it to be offered as a definitive statement on overall conditions. Action requested: Amend the text to better characterize available data or provide a rationale for the assertion.	Text has been edited to read: "The cations / anions in well MN-503B4 were significantly more concentrated than surface water as would be expected in a monitor well screened within the mineralized BMZ, however the average TDS concentration was two orders of magnitude lower than the concentration defined as a brine."	RESOLVED for purpose of scoping.

448		balance for the project. Action requested: Ensure that		RESOLVED for purpose of scoping. RGU notes Scoping EAW will identify need to assess potential for "saline" waters to be encountered, as well as any potential consequences to the chemical balance, to support the EIS analysis.		
449	3605	General note. The Scoping EAW will require a summary discussion of the frequency, duration, location, depth, and parameters of existing wetland monitoring, and include how it is proposed in the future. The EIS will require robust baseline wetland hydrology, water quality, and vegetation data to serve as a comprehensive baseline with which to compare future data for possible direct and indirect effects on the quantity and quality of the water resources. Action requested: Ensure Section 6.3.3 identifies these as a future information need. Future discussion item.	Section 6.3.3 currently details the plans to establish baseline conditions and compare to future data for possible direct and indirect effects to wetlands	RESOLVED.		
450	3605	General note. MPCA indicates the antidegradation portion of Section 401 requires an inventory of the existing uses and level of water quality necessary to protect existing uses (Minn. Rules part 7050.0250), and mitigation thereof. Existing uses are the highest existing on or after November 28, 1975. These are not necessarily current uses or quality. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
451	3605		Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.

453	3699	Wetland Plants and Plant Communities of Minnesota and	Edited Text, Table 6-29 and Table 6-31 through Table 6-38, and Figures 6-19 and 6-20 to reflect "Shrub-Carr" verses "Shrub Wetland"	RESOLVED.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
454		Future data need. Wetlands need to be documented in an area that is larger than the defined project area to be able to determine the potential for indirect wetland impacts. Increase area for delineation accordingly. Action requested: Ensure Section 6.3 identifies the item as a future information need. Modify text to address the item as determined appropriate. Future discussion item.	indirect impacts.	UNRESOLVED. DNR will engage TMM to better define the delineation protocols for assessing potential direct and indirect wetland impacts to be described in the scoping documents. Better understanding is needed to develop text describing the methods to be used in determining the project area for wetland delineations to be conducted. For example, if a buffer from project features is to be used, a width of the buffer would need to be provided. If topographic contours will be used, some discussion on methods to determine areas to be included and those to be excluded is necessary.	TMM plans to resolve wetland delineation comments as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon langauge would be reflected in any subsquent revisions of the SEAW or the MDNR scoping EAW.	TMM agrees that there may be wetlands outside of the Project area that will need to be assessed as part of the EIS. Section 6.3.3.3 - Phase 2 has been edited and now reads: "As part of the future scope of work, an area of analysis will be developed that coincides with wetland resources that may be affected by the Project (both direct and indirect). Wetland delineations will be conducted to identify wetlands, regulatory boundaries, and functional assessments for wetlands identified as part of the EIS area of analysis. The area of analysis will be developed considering the influences to wetland hydrology, soils, and vegetation from Project infrastructure such as: changes to groundwater contributions, changes to surface water contributions, wetland fragmentation, and air deposition."
455		Question. Can an equally definitive statement be made for "contact water?" Action requested: Answer question and modify text as determined appropriate to address the item.	As stated in the Water Management Plan section, the project is designed not to require a discharge of contact water. Future scope, described in Section 6.3.1, will include detailed assessment of process water and contact water flows. Please refer to lines 307-308.	RESOLVED for purpose of scoping.		
456	3781-3786	Clarification. What is the source of domestic water and how would it be stored prior to off-site disposal? Issue of better understanding of the proposed water management. Action requested: Answer question and modify text to address the item as determined appropriate.	Text added in the project description (Line 813): "The domestic water source required to provide the services described in the mine services building and concentrator services building has not been identified. Preliminarily considerations include a domestic water plant that would source water from Birch Lake. Potable water source has not been identified; preliminary considerations for potable water would include transporting water jugs to site."	RESOLVED.		
457	3783-3788	Clarification. Water balance information needed regarding how does the cycle of reusing process water end at closure? For example, what if water would have to be released if the system was seasonally high (e.g., due to precipitation and/or snowmelt)? The section also does not address decommissioning contact water ponds (dewatering and restoration), with the potential for site contamination not being addressed. Potential impacts are possible to Keeley Creek and Birch Lake, in the form of changes in quality and quantity of surface water runoff. Action requested: Answer question and modify text to address the item as determined appropriate. Ensure Section 6.3 addresses the item as a future information need.	Comment is noted. Section 6.3.1 specifies that the future scope includes development of a water balance model that will simulate process water flow. Text added to read: "Closure and reclamation of the plant site and tailings dewatering plant would include use of surface water management features to control erosion, and stormwater quality, quantity, and rates."	WNRESOLVED. It seems some detail on how water would be be removed from contact water storage ponds and ditches at closure is advised. In addition, the scoping documents will need to ensure the future water balance addresses the concerns. Action requested: Provide a sentence or two to address the item.	TMM will be developing a reclamation and closure plan that is informed by the environmental review process. Additional information regarding hydrology, water quality, and water management will be provided within the water resource data package to be delivered as part of the EIS preparation. Future engagement with the agencies regarding regulatory classifications of water and Project water nomenclature will assist in preparation of the water resource data package.	
458	3786	Clarification. From where does the domestic water come? Presume it should be accounted for in project losses? Action requested: Answer question and modify text to address the item as determined appropriate.	See Comment 456.	RESOLVED for purpose of scoping. The scoping document will identify the need for the water balance to account for a domestic water source and potential project losses.		
459		Clarification. What constant rate value was used for this calculation? Action requested: Answer question and modify text to address the item as determined appropriate.	Calculation assumes 800 gpm as stated as the project description as the instantaneous rate of pumping in Line 361. Please further refer to Lines 3798-3803 which further expands on how this over estimates the required withdrawal as it was assumed across the full year for this calculation. The rate was additionally added to Line 3797 in the text.			

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
#	Figure #		·	RESOLVED for purpose of scoping. The scoping		The state of the s
460	3796-3798	Clarification. Please better describe what appropriation volume/pump rate was used to determine the impact on Birch Lake's water level. Discuss if anticipated Birch Lake pumping rates would change with mine life and what volume of water would initially need to be pumped out of Birch Lake to fill the process water reservoir, etc. Were potential changes in water appropriation needs taken into account when determining impacts on water levels? Action requested: Modify text to address the item.	calculation and Comment 76 for details on future	document will identify the need to assess potential impacts to Birch Lake water levels due to anticipated pumping rates over the life of the project, not just during operations.		
461	3804	Text addition. Add "for the project" after " water withdrawn" Action requested: Modify text.	Edited as requested.	RESOLVED.		
462	3807		Section 6.3.1 specifies that the future scope includes development of a water balance model that will simulate process water flow.	RESOLVED for purpose of scoping.		
463		Question. Is there a potential for the appropriation to affect ice safety? This could be a form of recreation impact? Action requested: Answer the question and consider where any issue of ice safety should be presented.	Winter recreation is practiced on hundreds of lakes near the proposed Project. Ice safety issues at the proposed water intake point should not be presented in the EIS. Any potential loss in ice cover is insignificant in comparison to the total acres of winter lake recreation available in the region. Moreover, natural weather variation causing seasonal late ice cover or early ice out is a far more significant impact to winter lake recreation year to year. Measures can be taken to warn people of the presence of any thin ice.	RESOLVED for purpose of scoping.		
464		Question. Is the proposed withdrawal compatible with the rule curve for Minnesota Power? Action requested: Answer the question. Modify text as appropriate.	Preliminary calculations using an overestimated process requirement show that appropriating water would result in <2 inches (5 cm) of water level decrease to Birch Lake. This calculation does not account for any inflows or dam operational water management. Compatibility will be verified as part of the Section 6.3.1 after the water balance has been finalized.	RESOLVED for purpose of scoping.		
465	3809	Clarification. "Seasonal" was not described in the paragraph above. How was that accounted for in order to include in this statement? Add detail as needed. Action requested: Modify text.	Text has been edited to read: "Based on this simple calculation, it appears that Birch Lake would be sufficient to supply the required make up water for the Project and the impact of water appropriations would be insignificant compared with the managed water level fluctuation of the reservoir."			
466	3812-3816		The reduction in volume of water flowing to affected streams and the time period of the impacts will be quantified as outlined in Section 6.3.1 and will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. DNR notes mitigation may be necessary if the assessment done for the EIS shows streams would be affected in the long-term by construction of the plant site and/or drainage patterns can't be adequately re-established after closure.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU

467		of the project? In normal usage, many construction effects are characterized as "temporary." The temporal dimension of operational effects is typically characterized in terms of permanence or reversibility. Action requested: Consider more targeted use of the term "temporary;" modify text accordingly.	Definition of temporary has been added to the glossary that reads: "temporary: lasting for only a limited period of time or a fixed duration and not permanent. If a potential impact would be reversed as a part of the Project, it has the characteristic of being temporary." In relation to impacts, temporary impacts may be shortor long-term and may or may not correspond to phases of Project development such as construction, operations, and reclamation and closure, however they are not permanent. If an impact could be reversed, it has the characteristic of reversibility. If a potential impact would be reversed as a part of the Project, it has the characteristic of being temporary. All temporary impacts have the characteristic of reversible but is not proposed as such.			
468	3815	·	reclamation natural drainage patterns would be re- established to the extent possible, minimizing the	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to topography and surface run-off as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
469	3816		Keeley Creek.	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
470	3818	Birch Lake. Were these included in the <5% in section 6.2.1? Should be a total expected addition to annual variation if going to state <5% above. Action requested: Modify text to address the item.	the potential impacts to surface water quantity, which includes Birch Lake.	RESOLVED for purpose of scoping. The scoping document will identify the need to quantify and assess potential project-related changes to surficial flows to Birch Lake, including both the plant site and tailings facility. DNR will engage TMM in developing the language for this issue.		
471	3818	looked at based on reductions in flow to the Birch Lake	includes Birch Lake.	RESOLVED for purpose of scoping. The scoping document will identify the need to quantify and assess potential project-related changes to surficial flows to Birch Lake, including the plant site.		
472	3820-3823	Clarification. Need greater detail to use term "negligible effect." Action requested: DNR will need to verify potential change to verify characterization as "negligible effect." Future discussion item.	engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.		
473	3822	Clarification. Containment and rerouting of surface water may have an impact on the quantity of water and needs further consideration. It may also have impacts on the quality of water if there is reduced infiltration of runoff. Action requested: Ensure Section 6.3 identifies this as a future information need. Modify text as current information allows to address the issue.	quality.	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the quantity and quality of all stormwater generated over the project as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		

Commont	Line # Table #					
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
474	3823	occurs elsewhere). If the intent of this phrasing is the issue is not being proposed for further evaluation, then probably better stated by ending the sentence without the phrase with new sentence that might read: "Containment and rerouting of stormwater are expected to have a negligible effect on surface water quality. No future scope proposed on the issue" or similar. Action requested: Consider intent of usage and modify text accordingly. Do a global document search on the term and revise consistent with this revision.		RESOLVED.		
475	3829-3833	much of the watershed would be removed by the	Section 6.3.1 specifies that the surface water supplemental scope will evaluate the potential impacts to surface water quantity and quality.	RESOLVED for purpose of scoping. DNR notes mitigation may be necessary if the assessment done for the EIS shows changes in stream alignment and drainage patterns and/or changes in runoff significantly impact the streams in the area where the tailings management facility will be located.		
476	3835	Information need. Containment and rerouting of surface water would change local watersheds both during the project and upon reclamation. Local watershed maps of before, during, and after project would be useful in assessment. No action requested. Future discussion item.	engagement during the EIS development and will be	RESOLVED for purpose of scoping.		
477	3835		Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
478	3835-3836	Clarification. Need greater detail to use term "negligible effect." Action requested: DNR will need to verify potential change to verify characterization as "negligible effect." Future discussion item.		RESOLVED for purpose of scoping. The scoping document will identify the need to assess potential water quality effects that may be associated with stormwater generated at the tailings management site.		
479	3839	Clarification. Is an impact "temporary" if it is for the life of the project? In normal usage, many construction effects are characterized as "temporary." The temporal dimension of operational effects is typically characterized in terms of permanence or reversibility. Action requested: Consider more targeted use of the term "temporary;" modify text accordingly.	See Comment 467.	RESOLVED. Future environmental documents will attempt to reasonably convey the context where use of the term "temporary" occurs. As the proposed definition states, a "temporary" impact can be reversed,. However, it remains to be determined as to whether any given impacts during operation can be reversed after closure. DNR will engage TMM in developing the appropriate language in the scoping documents.		
480	3842	Clarification. Potential effects also include reduced Keeley Creek watershed resulting in permanent lower flow in the creek, and consequent changes in aquatic habitat (due to changes in stream geomorphology). Also the impacts would not just be under low flow conditions. Action requested: Modify text to address the item.	See Comment 404 and Comment 466.	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
481	3847	Clarification. DNR has understood the term "textured" could be applied to describe the surface of the dry stack facility during progressive reclamation and closure. If this is correct, include discussion of the meaning and purpose of "texturing." Action requested: Modify text to address the item.	We have searched the data submittal text for "textured", "texturing", and "texture" and have not found this term to describe the surface of the dry stack during concurrent reclamation.	, RESOLVED for purpose of scoping . It will be necessary to understand the surface condition of the dry stack facility during progressive reclamation and closure.		
482		Clarification. The text states: "precipitation would be diverted back to the natural system" Where would water be diverted to? Locations should be specified in text. Action requested: Modify text to address the item.	A preliminary dry stack facility closure concept has been developed and the specific locations of discharges are still being evaluated. Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.1, including how project water management could affect stream routing and drainage patterns will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. The scoping document will identify the need to specify exactly where and how precipitation falling on the project features may be released back into the natural system. In particular, the Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
483		Clarification. The language "natural surface water system" is too vague to assess impacts. Where this water goes is important and is insufficiently described. Action requested: Modify text to address the item.	See Comment 482	RESOLVED for purpose of scoping. The scoping document will identify the need to specify exactly where and how precipitation falling on the project features may be released back into the natural system. In particular, the Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
484		Question. Why would it be that the cap "may" cause some additional loss via evapotranspiration? Presume that it would cause loss. Action requested: Answer question and amend text to address the item.	Edited to change the use of "cap" to "cover system" consistent with the description in Section 3 and added text to specify evapotranspiration will occur from the cover soil and vegetation.	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
485		Clarification. Permanent impacts to stream routing and drainage patterns caused by the tailings basin need to be quantified and the statement, "The total volume of surface water contribution would remain largely unchanged," needs to be better explained. What watershed/water body is this based on? Action requested: Answer the question and modify text as appropriate to address the item.		RESOLVED.		
486	3854-3856	Clarification. Need to provide more detail on routing characteristics for non-contact water at TSF during different stages in TSF life cycle. Action requested: Modify text to respond to the item.	Section 6.3.1 specifies that the surface water supplemental scope will evaluate the potential impacts to surface water quantity and quality.	RESOLVED.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
487	3862	impacts to surface water flow and stream channel effects would be minor cannot be supported at this time. No action requested. DNR will evaluate available information during the development of the Scoping EAW to determine the treatment in the EIS. Ensure that Section 6.3 adequately identifies this as a future information need.	documents, TMM will review the required analysis and	RESOLVED for purpose of scoping.		
488	3864	General comment for section. In the case in this section, more clarity and separation in the text between construction, operation, progressive reclamation, reclamation, and closure would make it easier to follow. Revise for a pattern to the discussion on these topics in the various sections. Action requested: Attempt to better separate the text by the stages of project activity.	Comment is noted. TMM declines to make the formatting change. It is TMM's understanding that the MDNR will re-format the data submittal.	RESOLVED for purpose of scoping. DNR will engage TMM to ensure the description of project features is accurate in the Scoping EAW.		
489	3868-3869	likely be altered with potential consequences to Keeley Creek. Action requested: Answer the question, and modify text to provide locations any current information on potential impacts to Keeley Creek. Ensure Section 6.3 addresses the item as an information need.	provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
490		Clarification. Add to the listing loss of wetland function and loss of aquatic habitat. Action requested: Modify text.	Sections 6.3 and 8.3 addresses the need to assess wetland function and aquatic habitat losses, respectively	RESOLVED for purpose of scoping.		
491		provide the requested detail.	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.1, including how project water management could affect stream routing and drainage patterns will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. The scoping document will identify the need for a detailed analysis of impacts to stream routing characteristics during project operation and at closure for the EIS.		
492	3891	characteristics would be permanently modified. Even the EAW states this in line 3933. Action requested: Modify text to address the item.	permanently modified. "	RESOLVED for purpose of scoping.		
493		surface water entering waterways. Action requested: Modify text to provide the requested detail.	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.1, including how project water management could affect volume of surface water entering waterways will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. The scoping document will identify the need for a detailed analysis of impacts to stream runoff volume during project operation and at closure for the EIS.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
# 494	3890-3892	Clarification. Is an impact "temporary" if it is for the life of the project? In normal usage, many construction effects are characterized as "temporary." The temporal dimension of operational effects is typically characterized in terms of permanence or reversibility. Action requested: Consider more targeted use of the term "temporary;" modify text accordingly.	·	RESOLVED for purpose of scoping. Future environmental documents will attempt to reasonably convey the context where use of the term "temporary" occurs. As the proposed definition states, a "temporary" impact can be reversed,. However, it remains to be determined as to whether any given impacts during operation can be reversed after closure. DNR will engage TMM in developing the appropriate language in		
495	3893		Text has been edited to read: "This change may also have a permanent indirect effect locally on surface water contribution to wetlands."	the scoping documents. RESOLVED.		
496	3894	,	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
497	3898-3908	Closure conditions. What is the plan with the features in this section at closure? Action requested: Modify text to provide requested detail.		RESOLVED for purpose of scoping. The scoping document will identify the need to ensure assessment of potential surface water impacts includes the proposed reclamation and closure conditions of the access road, water intake corridor, and transmission corridor.		
498	1 39111-3917	Note. DNR and MPCA agree that available information is insufficient to fully assess potential impacts and that future work is needed. Action requested: Ensure Section 6.3 addresses this item.	Section 6.3.1 includes the details regarding the plan to assess potential impacts to surface water resources.	RESOLVED for purpose of scoping.		
499		Future scope. Please provide how impacts to surface water will be assessed/modeled. Action requested: Ensure Section 6.3 identifies future work done to assess/model potential impacts to surface water resources.	Section 6.3.1 includes the details regarding the plan to assess potential impacts to surface water resources. Specific assessment and modeling methods will be informed by scoping, therefore remain under development. A detailed proposed approach to modeling potential impacts to surface water resources will be provided during EIS development. TMM looks forward to state input.			
500	3911	Future scope. What is the plan to obtain this information? Include plans as future work. Action requested: Ensure Section 6.3 identifies future work done to assess/model potential impacts to surface water resources.	See Comment 499.	RESOLVED.		
501	3914	9		RESOLVED for purpose of scoping. RGU Note: DNR will coordinate with Minnesota Power regarding any rule curve requirements that may interact with the Project. Potential treatment of the issue in the EIS has not been determined.		
502	3918-3920	Clarification. Define "temporary" impacts to Birch Lake; impacts may be temporary but long-term and require mitigation during operation. Action requested: Modify text to use a more targeted use of the term "temporary" as it may apply to impacts to Birch Lake.	See Comment 467.	RESOLVED for purpose of scoping. Future environmental documents will attempt to reasonably convey the context where use of the term "temporary" occurs. As the proposed definition states, a "temporary" impact can be reversed. However, it remains to be determined as to whether any given impacts during operation can be reversed after closure. DNR will engage TMM in developing the appropriate language in the scoping documents.		

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
503	3920	Clarification. In terms of the proposed location and site design for the DSF, DNR would expect there to be permanent re-routing of water with the permanent dry stack facility. Action requested: Modify text to address the item.	The potential for permanent impacts related to rerouting runoff around the tailings management site is addressed later in the same bullet list (lines 3927-3935).			
504	3921	Note. Information developed to date is insufficient to conclude that impacts to stream flow would be minimal. No action requested. DNR will determine potential treatment of the item in the EIS over the course of developing the Scoping EAW.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
505	3924	Clarification. Need to add Birch Lake water levels. Action requested: Modify text to address the item.	Edited to include Birch Lake water levels	RESOLVED.		
506	3925	Clarification. The text use of the phrase "the precipitation loss period" is not meaningful. This potential impact should be referred to as changes in surface run-off and routing, which is a permanent effect. Action requested: Modify text to address the item.	Text has been edited to read: "The net effect would be expected to be minimal as the impact would be temporary and limited to the period of mining operations"	RESOLVED for the purpose of scoping. Note: Premature to offer any conclusions on impacts.		
507	3931	would be "minimal" is not supported at this time. This is premature because the combined effects of loss and rerouting were not sufficiently evaluated to this point. In assessing the treatment in the EIS, both the temporary and permanent decreases in watershed size for Keeley Creek must be assessed. Action requested: Ensure Section 6.3 addresses this item as a future information need. Modify text as current information allow.	analyses for the EIS. Once the MDNR publishes the	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
508	3941-3951	of run-off. Also the loss of infiltration due to changes in topography and wetland changes is not evaluated. Shoreland management zoning is based on keeping vegetated surfaces, minimizing impervious surface, and reducing rate of run-off to reduce nutrient load to public waters. This was not considered in the discussion of potential changes to water quality. Action requested: Modify text to address the item.	SEAW, and the draft and final scoping decision	RESOLVED for the purpose of scoping. RGU note: The Scoping EAW will likely propose the potential for project-related changes to the contributing watershed to the surface water hydrology Keeley Creek as warranting detailed analysis in the EIS, including the condition during reclamation and closure.		
509	3966	Language check. Should "cone of depressurization" be "cone of depression"? Action requested: Confirm the usage and modify text as needed.	Cone of depressurization was intentional. Text edited to make consistent throughout document.	RESOLVED.		
510		• ,	See Comment 509.	RESOLVED.		
511	3971-3974	Note. Additional analysis will be necessary to verify the statement. Action requested: Ensure Section 6.3	Section 6.3.2 states that the future scope includes modeling to evaluate groundwater conditions in closure. No change made.	RESOLVED for purpose of scoping. RGU note: The Scoping EAW will identify the need to address the potential for groundwater depressurization to affect the Quaternary Unconsolidated Material.		
512	3972	Language check. Should "cone of depressurization" be "cone of depression"? Action requested: Confirm the usage and modify text as needed.	See Comment 509.	RESOLVED.		
513		effects on groundwater system. Action requested: Ensure Section 6.3 addresses the item as a future modeling need. Future discussion item.	modeling to evaluate groundwater conditions in operations and closure. No change made.	RESOLVED for purpose of scoping. The Scoping EAW and scoping document will specify the future work/modeling necessary to assess potential impacts to surface water features.		
514	3994-3995	Clarification. The groundwater would also be expected to contact waste rock backfill. Action requested: Modify text to address the item.	Edited to include waste rock backfill in list of items that groundwater would be expected to contact.	RESOLVED.		

Commont	Line # Table #					
Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
515	3994-4004	Clarification. The text identifies the potential for groundwater quality impacts. This paragraph needs additional content on groundwater quality, movement, and what is/is not expected. Such information is needed to characterize the treatment of the issue in the EIS. Action requested: Modify the text to address the item. Ensure Section 6.3 addresses any future information need.	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.2, including how project water management could affect groundwater flow and groundwater quality will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. The scoping document will identify the need for detailed assessment of potential project impacts to groundwater quality and flow due to the project. DNR will engage TMM on the appropriate language to address the issue.		
516	3998-4001	Note. Additional analysis will be necessary to verify the statement. Action requested: Ensure Section 6.3 addresses the item. Future discussion item.	Section 6.3.2 states that the future scope includes modeling to evaluate groundwater quality, including potential impacts from the flooded mine workings.	RESOLVED for purpose of scoping.		
517	4001	Question. The text identifies "exposed surfaces" as being a reason why changes to GW quality would not be expected. Aren't these "exposed surfaces" in part ore grade material in remaining in pillars or walls of stopes that one could infer might adversely affect water quality? Action requested: Answer question and modify text as determined appropriate.	TMM agrees that potential groundwater quality effects of exposed surfaces in the underground mine should be evaluated. A sentence was added to note that future scope will evaluate potential impacts to groundwater quality from the flooded underground mine (as stated in Section 6.3.2). Text has been edited to read "However, substantive changes are not expected in groundwater quality at distances away from the mine due to the very low hydraulic conductivity of the bedrock."	RESOLVED for purpose of scoping.		
518		be collected to confirm assumptions in this section. Action requested: Provide response on collection of	Figure 5-12. Baseline data and impact assessments have been	RESOLVED for purpose of scoping. The scoping document will identify the need for confirming assumptions and data behind depth to bedrock information to be used in the EIS impact assessment. DNR will engage TMM on the appropriate language to address the issue.		
519	4009-4026	Future discussion. DNR notes further discussions needed on stream flow characteristics. No action requested. Future discussion item.		RESOLVED.		
520	4017	RGU note. Absent any quantitative assessment, the potential for impacts, significance, and subsequent treatment in the EIS remains to be determined regarding	Section 6.3.2 states that the future scope includes modeling to evaluate groundwater conditions in operations and closure, including potential impacts due to "changes in land-use which can impact aquifer	RESOLVED for purpose of scoping.		
521	4017-4019	Clarification. The analysis will also need to quantify impacts due to changes in groundwater recharge. Action requested: Modify text to address the item.	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 6.3.2, including how project water management could affect groundwater recharge will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. The scoping document will require a detailed analysis of impacts to groundwater recharge during project operation and at closure for the EIS.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
522	4020-4022	Clarification. Define "temporary" impacts to groundwater recharge; impacts may be temporary but long-term and require mitigation during operation. Action requested: Modify text to use a more targeted use of the term "temporary" as it may apply to impacts to groundwater recharge.	See Comment 467.	RESOLVED for purpose of scoping. Future environmental documents will attempt to reasonably convey the context where use of the term "temporary" occurs. As the proposed definition states, a "temporary" impact can be reversed. However, it remains to be determined as to whether any given impacts during operation can be reversed after closure. DNR will engage TMM in developing the appropriate language in the scoping documents.		
523	4024-4026	Guidance. DNR will evaluate the projected impacts and provide a temporal characterization of impact. Foundation for minor, temporary effect not established. Additional analytical content necessary to support "minor, temporary effect." No action requested. Future discussion item.	Comment is noted.	RESOLVED for purpose of scoping. The scoping document will identify the need for detailed assessment of potential project impacts to groundwater quality and flow due to the project. DNR will engage TMM on the appropriate language to address the issue.		
524	4029-4049	Future discussion. Further discussions needed on stream flow characteristics. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.		
525		Clarification. The SEAW will need to quantify impacts to the QUM and shallow bedrock, and the amount of change in groundwater recharge. Action requested:	Section 6.3.2 outlines the groundwater supplemental scope. The goal of this work is to "better define the groundwater baseline environmental conditions, hydrogeologic regime, surface water / groundwater	RESOLVED for purpose of scoping. The scoping document will identify the need for detailed assessment of potential project impacts to groundwater recharge during project operation and at closure for the EIS. DNR will engage TMM on the appropriate language to address the issue.		
526	4044	Clarification. The text should address potential impacts to Keeley Creek. Action requested: Modify text to address the item.	Section 6.3 addresses the need to evaluate the potential for impacts to surface water resources, including Keeley Creek.	RESOLVED for purpose of scoping. RGU notes any project-related changes to groundwater recharge at the DSF will likely be proposed to receive detailed analysis in the EIS.		
527	4044-4046	Information need. The effects to resources which interact with groundwater need to be quantified, especially permanent impacts. Action requested: Modify text to provide the requested detail.	Section 6.3.2 outlines the groundwater supplemental scope. Modeling will assess changes to the groundwater system based on Project operations, specifically changes to the baseline conditions due to underground mine operations and changes in land-use.	RESOLVED.		
528	4047		Section 6.3 addresses the need to evaluate the potential for impacts to groundwater, surface water, and wetland resources.	RESOLVED for purpose of scoping. RGU notes any project-related changes to groundwater recharge at the DSF will likely be proposed to receive detailed analysis in the EIS.		
529	4052	Information need. What is the plan to obtain this information? Action requested: Ensure Section 6.3 includes information to address the item.	Section 6.3.2 presents the plan to gather additional information on potential groundwater effects.	RESOLVED.		
530	4055	Language check. Should "cone of depressurization" be "cone of depression?" Action requested: Confirm the usage and modify text as needed.	See Comment 509.	RESOLVED.		
531		Language check. Use "cone of depression." Action requested: Confirm the usage and modify text as needed.	See Comment 509.	RESOLVED.

532	4071	would not be expected. Aren't these "exposed surfaces" in part ore grade material in remaining in pillars or walls of stopes that one could infer might adversely affect water quality? Action requested: Answer question and	TMM agrees that potential groundwater quality effects of exposed surfaces in the underground mine should be evaluated and Section 6.3.2 states that future scope will evaluate potential impacts to groundwater quality from the flooded underground mine. Text has been edited to read "Given the very low hydraulic conductivity of the bedrock, any groundwater quality impacts would be expected to be limited to the immediate vicinity of the underground mine.	RESOLVED for purpose of scoping.		
533	4075	RGU note. It is premature to determine whether impacts to groundwater resources are not significant. More data and analysis is necessary. Action requested: Ensure Section 6.3 identifies this item as a future information need. DNR will use the information developed over the Scoping EAW to propose the treatment of the item in the EIS.	for impacts to groundwater resources.	RESOLVED for purpose of scoping. RGU notes any project-related changes to groundwater recharge at the DSF will likely be proposed to receive detailed analysis in the EIS.		
534	4083	Guidance. Consider adaptive management and BMP options to prevent direct and indirect impacts to wetlands, streams, and lakes. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
535	4084	Clarification. Based on the text at Line 1019, the non-	Section 6.3.3 addresses the need to complete wetland delineation for the project as a whole and evaluate the potential for direct and indirect impacts.	UNRESOLVED. DNR will engage TMM to better understand how the proposed diversion dikes and ditches route water for assessing potential direct and indirect wetland impacts to be described in the scoping documents. Better understanding is needed to develop text describing the methods used to determine the project area for wetland delineations to be conducted. DNR will engage TMM in developing the language necessary to address the issue.	TMM plans to resolve wetland delineation comments as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon langauge would be reflected in any subsquent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comments 164 and 454.
536	4096	has not yet been conducted, indicating total direct	Edited text and Table 6-31 through Table 6-46 to reflect that the direct impacts are estimated based on NWI data.	RESOLVED.		
537	4098	percentage of loss should be related to the small		, RESOLVED for purpose of scoping. RGU notes the scope will likely require some type of text or table detailing the subwatershed changes to allow comparison in assessing potential impacts for streams and wetlands.		
538		misleading. Providing proportional comparison of impacted wetlands to the greater Rainy River Headwaters is irrelevant since wetlands are protected by	Edited to remove this sentence "As shown on Table 6-17 these impacts are minimal relative to the proportion of these wetlands within the Rainy River Headwater watershed and would account for <0.03% reduction in	RESOLVED.		
539	4105	wetland hydrology remains to be determined. Any	Section 6.3.3 notes that modeling and monitoring indirect impacts to wetlands will be refined as the supplemental scopes related to surface water and groundwater are completed.	RESOLVED for purpose of scoping.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
540		Future discussion. How potential dust-related emissions could affect wetland resources requires consultation. No action requested. Future discussion item.		UNRESOLVED. DNR will engage TMM to better understand how potential dust-related emissions for assessing potential direct and indirect wetland impacts to be described in the scoping documents. DNR will engage TMM in developing the language necessary to address the issue.	TMM plans to resolve wetland delineation comments as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon langauge would be reflected in any subsquent revisions of the SEAW data submittal or the MDNR scoping EAW.	Deposition is discussed in the future scope and is identified as a source for potential effects. TMM encourages discussion on the development of the appropriate scope for inclusion within the DSDD. Note based on MDNR recommendation, text has been revised in Section 11.3.5 to read: "The EIS will review information on cross-media impacts, including deposition of metals and sulfate on nearby streams, lakes and wetlands."
541		Clarification. If crushing underground is a project element that would reduce dust emissions, then may be appropriate to add to the list. Action requested: Modify text to address the item as warranted.		RESOLVED.		
542	4119	Regulatory guidance. Type for type is important in water resources mitigation. The predominant wetland type listed is bog, which can be difficult to create or restore. The goal should be to replace bog with bog. If wetland/restoration is considered, note that preservation credits might not be considered adequate mitigation. No action requested. Future discussion item	engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
543	4126	Permit need. The 401 certification process will likely need to include an antidegradation assessment. Action requested: Modify text to address the item.	Comment is noted. Permitting-level analyses are not included in the SEAW data submittal unless they are also needed for the EIS. Because this was identified as a permit need, no change was made.	RESOLVED.		
544	4128	Available data. DNR notes the current wetland delineation is insufficient to assess potential impacts. Action requested: Ensure Section 6.3 identifies this item as a future information need.	Section 6.3.3 addresses the need for wetland delineation. TMM looks forward to continued	RESOLVED for purpose of scoping.		
545		Clarification. Potential mitigation needs to be identified for consideration in Scoping the EIS. Action requested: Ensure Section 6.3 includes information to address the item.			TMM plans to resolve regulatory classifications of water and Project water nomenclature as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	TMM agrees that the EIS scope should include a discussion and assessment of avoidance, minimization, and mitigation for the project. TMM has added the following bullet to Section 6.3.3.4: "A preliminary wetland replacement plan will be prepared for inclusion in the Draft EIS."
546	4143-4146	Clarification. This list should include a separate bullet referencing the potential for change to wetland water quality. Action requested: Add a wetland water quality bullet.	i.	RESOLVED for purpose of scoping. RGU notes Scoping EAW will identify need to assess potential impacts to wetland water quality to support the EIS analysis.		
547	4153-4154	Guidance. The plan for the collection of addition surface water monitoring data should be developed in coordination with the state to ensure that the sampling includes all necessary elements. No action requested. Future discussion item.	engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
548		Clarification. Surface water <u>quantity</u> should be included in the listing here. Action requested: Modify text to address the item.	Edited to include water quantity	RESOLVED for purpose of scoping.		
549	<i>4</i> 187		Edited to include Keeley and Nokomis Creeks	RESOLVED for purpose of scoping.		
550		Clarification. The bulleted item should read: "impacts to water quality in area streams, specifically Keeley and Nokomis Creeks, or Birch Lake, or the non-contact water ditch?" Action requested: Modify text to address the item.	·	RESOLVED for purpose of scoping.		

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
551	4194-4271	Guidance. This conceptual approach seems to be, in general, a reasonable one to work from. Given the complexity, the details should be developed in coordination with agencies' involvement and inputs. For example, an appropriate source and range of values inputted into the various models. No action requested.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
552		Future discussion item. Clarification. Please explain "grab samples" in the context of the flow regime of the creek. Action	point in space and time and are collected by sample	RESOLVED for purpose of scoping. The Scoping EAW will characterize what constitutes a "grab sample" to ensure understanding of how the sample is obtained.		
553	4202	Clarification. All users of water, and Birch Lake level manipulation, should also be included in the modeling. Action requested: Modify text to add this to the description for the Water Balance Model.		RESOLVED.		
554	4202	Advisory. Would recommend creating future climate data set that incorporates climate change projections from International Panel on Climate Change (IPCC) or other sources to account for potential changes to precipitation and other climate variables due to climate change. Action requested: Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping. The scoping document will require future climate scenarios to be modeled for the EIS to account for climate change. Future discussions will need to be had to determine appropriate scenarios that will be incorporated into models.		
555	4202	•	See Comment 74 for details on contact water onsite at start-up and Comment 282 for details on disposal of contact water at Project end.	RESOLVED for purpose of scoping. RGU notes the Scoping EAW will likely propose all water management to receive detailed analysis in the EIS.		
		Guidance. The text reads: "Phase 2 – Water Balance Model. The combined hydrologic regimeof conditions at the site, both current and projected into the future." With a few scattered exceptions, the background science on climate is fairly well unanimous in concluding that earth climate is changing and will continue to change, at a global, continental and regional/local level, in response to climatic forcing of greenhouse gas accumulations in the atmosphere. With almost no dissent, the science supports a continued climatic warming, persisting for hundreds to thousands of years, with cascading effects on most other climatological descriptors or parameters, and at all scales. Given the now central place of this understanding in the present body of scientific knowledge, the project consultant should base its modeling of the surface and ground water impacts of the project on an assumed continuation of human-forcing of climate. Regional and local output from advanced global and regionally down-scaled climate models is readily available for a range of forcing scenarios and terminal forecast years or decades. The output from the CMIP5 models developed to support the 2013 IPCC scientific assessment and the 2017 US National Climate	obtain additional data identified as lacking but able to be reasonably obtained. The future scope sections identify the following: Specific questions that need to be answered by the additional study; Which permits (if any) the scope of work would inform; The approach for the study; The study boundary under consideration; and The specific deliverables. Some of the key components of this are to develop the scopes of work in a manner that answers the fundamental questions, appropriately designed, and appropriately scaled to the questions. TMM is committed to developing a sound approach to future modeling and impact assessments. Choosing the appropriate climate information is an important component, but the data and modeling platforms used must be fit for purpose. We encourage further discussion on what additional questions may need to be answered		for scoping. The models and approach used should be considered preliminary. TMM plans to review necessary additional parameters as part of the future discussions identified within the MDNR comment submission dated	TMM is committed to utilizing future climate change projections to identify Project impacts. TMM will continue to work with MDNR to determine the appropriate phase of the Project for which future climate change projections should be applied to water modeling efforts. Additionally, TMM will use best available data for the phases of the Project requiring climate change considerations as it relates to water modeling efforts.

Comment	Line # Table #					
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
557	4202-4203 4207-4212 continued	Guidance. The assumption of a changing, nonstationary climate should be used to evaluate impacts to surface water and groundwater quality and quantity, both of which may be sensitive to future changes in regional climate. The discussion in the Scoping EAW submittal of available data sources for surface water and ground water quantity and quality is exclusively limited to historical data, typically dating from the period 2007-2013/2014 (lines 2855-2903 [data, surface water], lines 3045-3103 [data, surface water quality], lines 3130-3278 [data, groundwater water], lines 3517-3595 [data, ground water quality]). Regarding facility design, based on the project description, contact water ponds (plant site contact pond and tailing site management contact pond [lines 1280-1281, 1403-1404) and diversion dikes (tailing management site [lines 1469-1471]) are to be designed for the historical 100-year 24-hour storm event. Likewise, the noncontact water ditches in the tailing management are to be sized for the historical 10-year 24 hour storm event, while the process waste pond are to be sized to contain 'probable maximum precipitation' (lines 1471-1473, 1236-1241). The dry stack contact water pond is to be sized for the 100-year historical snow pack [lines 1405-1407]. In the analysis, the sensitivity of these ponds and dykes to overflow under future climatic normals, e.g., frequency and intensity of forecasted future extreme precipitation events, should be evaluated. Action requested: Ensure the Future Scope in the appropriate section(s) identifies this item as an information need.	See Comment 556.	UNRESOLVED. RGU notes need to ensure the appropriate length of climate record utilized in impact modeling for surface and groundwater quality and quantity for the Scoping EAW.	TMM acknowledges that climate change impacts will need to be considered as part of impact analysis and GoldSim modeling. TMM plans to resolve necessary climate considerations as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW or the MDNR scoping EAW.	TMM is committed to utilizing future climate change projections to identify Project impacts. TMM will continue to work with MDNR to determine the appropriate phase of the Project for which future climate change projections should be applied to water modeling efforts. Additionally, TMM will use best available data for the phases of the Project requiring climate change considerations as it relates to water modeling efforts.
558	4202-4203 4207-4212 continued	Guidance. For consistency, to the degree that this is practical, the assumption of persistent human-forced climatic change as background condition for the project should extend to all other environmental modeling, including the modeling of impacts to terrestrial and air resources. Fundamental processes like ozone formation or mercury methylation are temperature-sensitive, hence depend on what is assumed about future climate. Action requested: Ensure Future Scope of appropriate section(s) identifies this item as an information need.	See Comment 556.	ADDITIONAL GUIDANCE. RGU notes the scope of climate analysis may include requirements reflecting CEQ's "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews," memorundum, August 1, 2016, cited in project proposer's response to comment 710 (Section 14.0, Cumulative Effects). This guidance addresses the role of future climate change as a background condition in project-specific evaluation, including the effects of climate change on project resiliency and impacts of climate change on the natural and built environment.	TMM acknowledges that climate change impacts will need to be considered as part of impact analysis and GoldSim modeling. TMM plans to resolve necessary climate considerations as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	TMM is committed to utilizing future climate change projections to identify Project impacts. TMM will continue to work with MDNR to determine the appropriate phase of the Project for which future climate change projections should be applied to water modeling efforts. Additionally, TMM will use best available data for the phases of the Project requiring climate change considerations as it relates to water modeling efforts.

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
559		Guidance. In addition to its assessment of meteorologically- or climatically-dependent environmental impacts of the project, the project consultant also should evaluate alternatives to the proposed facility design against the assumptions of a changing climate. No action requested. Future discussion item.	Comment is noted. The proposed Project would emit greenhouse gases. As such climate change is correctly scoped as a cumulative potential effect. Analyzing alternatives within an assessment of cumulative effects is outside the scope of an EIS.	ADDITIONAL GUIDANCE. RGU notes the scope of climate analysis may include requirements reflecting CEQ's "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews," memorundum, August 1, 2016, cited in project proposer's response to comment 710 (Section 14.0, Cumulative Effects). This guidance addresses the role of future climate change as a background condition in a project-specific evaluation, which could also intersect the cumulative effects analysis. The Final Scoping Decision will dictate how the EIS will assess cumulative effects and alternatives. Future discussion item.	TMM acknowledges that climate change impacts will need to be considered as part of impact analysis and GoldSim modeling. TMM plans to resolve necessary climate considerations as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	TMM designs will consider a changing climate and climate resiliency as a key design element where practicable.
560	4207	Clarification. What data set is the climate generation model using? Action requested: Modify text to address item.	See Comment 556.	RESOLVED.		
561	4207	Clarification. Are there surface water models and groundwater models that are being used, which feed into the Goldsim model? Action requested: Modify text to address item.	development.	RESOLVED.		
562	4212-4215	Clarification. Will WGEN also be used to generate air temperature and solar radiation inputs in addition to precipitation? Action requested: Modify text to addres item.	See Comment 556.	record(s) will be used to generate climate datasets in WGEN for EIS. Clarification: Discuss whether WGEN will also be used to generate air temp and solar radiation inputs. Action requested: Provide a response to the	for scoping. The models and approach used should be considered preliminary. TMM plans to review necessary additional parameters as part of the future discussions identified within the MDNR comment submission dated 12/1/20 and the results of those discussions will be reflected in Water Resources - Volume 2.	TMM has developed a synthetic climate generator for the TMM project, based on historical data, in order to produce a GoldSim model that can perform Monte Carlo analysis in a probabilistic and dynamic nature. The climate generator for the SEAW data submittal utilized a Wakeby distribution and Markov chain method (similar to WGEN) to produce a random distribution of precipitation and temperature that mimics historical climate. TMM is still evaluating the future framework for the synthetic climate generator and may elect for another approach if it better captures variables that demonstrate the most sensitivity in modeling. TMM will collaborate with MDNR to use the best available data in the analysis.
563	4212-4215	Clarification. Where will the climate inputs needed for WGEN be sourced from? Action requested: Modify text to address item.	See Comment 556.	record(s) will be used to generate climate datasets in	•	For the SEAW data submittal, the synthetic climate generator utilized historic data. Climate inputs are still a topic of conversation with MDNR and TMM is committed to using the best available data.
564	4236	Note. The phrase "the project will not discharge any process water and is designed not to require a discharge of contact water" is used several times in the document and seems of curious wording. Why the distinction in wording between process water and contact water? Action requested: Modify text to address the item.	Comment is noted. The phrase " the project will not discharge any process water and is designed not to require a discharge of contact water " describes TMM's understanding at this stage of project design. Detailed water balance modeling described in Section 6.3.1 will evaluate the potential for process water or contact water discharge, and results will be provided during EIS development to satisfy EIS scope.	RESOLVED for purpose of scoping.		
565		Note. The concept of "no discharge" needs to be fully articulated and understood because it has direct bearing on what water quality permits may or may not be required, among other issues. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU

					temporary rock storage facility, ore processing, paste	

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
					backfill tailings, blasted and exposed rock due to mining activities (e.g., underground damaged rock zone and rock backfill) and residuals from blasting. The MMCP static and kinetic testing data sets will be used to define mass release rates for each loading source (i.e. mass per unit of time). Development of mass release rates will consider factors which influence the scale-up of laboratory rates to field conditions (e.g., rock to water ratio, temperature, moisture content etc.). Geochemical modeling will be conducted in support of MMCP geochemical data interpretation, the development of mass release rates as well as the evaluation of possible geochemical controls (e.g., mineral solubility, sorption) on the fate and transport of constituents within the mine water system. Specific modeling software to be used is expected to include PHREEQC (an equilibrium speciation and mass transfer code developed by the United States Geological Survey) and PYROXTM (a sulfide oxidation modeling tool developed by the University of Waterloo, Waterloo, Canada).	
569	4252-4253	Information need. While screening level calculations are good, a more thorough (sophisticated) dynamic systems model will need to be conducted (potentially including additional baseline data). Action requested: Modify text to address the item. Future discussion item.	mixing calculations to identify any potential measurable impacts and if these are identified TMM could use more	RESOLVED for purpose of scoping. DNR notes the scoping document will likely include provisions for employing a dynamical systems model (or models) as part of the EIS impact assessments.		
570	4272	Guidance. For water resources, expect supporting information to be supplied as GIS layers, raw data, interpretations, and discussions with appropriate QAQC at the appropriate time. No action requested.	Comment is noted.	RESOLVED for purpose of scoping.		
571	4272-4276	Guidance. This conceptual approach seems to be, in general, a reasonable one to work from. Given the complexity the details should be developed in coordination with agencies' involvement and inputs. For example, an appropriate source and range of values inputted into the various models. No action requested. Future discussion item, including the 401 certification process will likely need to include an antidegradation assessment.	Comment is noted.	RESOLVED for purpose of scoping.		
572	4289	Answer the question and modify text as determined appropriate.	Phase 3 in Section 6.3.3 notes that modeling and monitoring indirect impacts to wetlands will be refined as the future work scope related to surface water and groundwater are completed.	RESOLVED.		
573	4289		Surface water analysis and modeling as outlined in Section 6.3.1 will define the hydrologic regime associated with the Project area and would include surface water flow and small scale stream watersheds if necessary to adequately establish the baseline conditions.	RESOLVED for purpose of scoping.		

Comment	Line # Table #					
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
574		Clarification. The list should include bullet stating that one of the "questions to be answered" is to provide sufficient information to be able to complete a groundwater non-degradation analysis, which may be required for MPCA permitting. Action requested: Amend text to address the item.	See Comment 543.	RESOLVED for purpose of scoping. Clarification: The comment is not referring to providing permit-level analysis during scoping, rather having Section 6.3.2 acknowledge the need to collect the necessary data such that the groundwater non-degradation analysis could be completed if required.		
575		Clarification. The list should add bullet asking what alternatives or mitigations are available to reduce potential impacts to groundwater quality? This would be information needed for a groundwater non-degradation analysis, if one is needed, as described in RGU Comment 566.	See Comment 543.	RESOLVED for purpose of scoping. Clarification: The comment is not referring to providing permit-level analysis during scoping, rather having Section 6.3.2 acknowledge the need to identify mitigation or alternatives such that the groundwater non-degradation analysis could be completed if required.		
576	4369-4424	Guidance. This conceptual approach seems to be, in general, a reasonable one to work from. Given the complexity, the details should be developed in coordination with agencies' involvement and inputs. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
577		Clarification. Presume monthly groundwater levels and "to be determined" water quality samples will be taken. Adjust parenthetic statements and rephrase for clarity. Action requested: Modify text to address the item.	Text has been edited to read: "generally monthly groundwater levels, and quarterly water quality samples" Exceptions are wells with pressure transducers (continuous water level monitoring), and wells that recharge extremely slowly (twice a year water quality sampling).	RESOLVED for purpose of scoping. The Scoping EAW will identify the examples provided to ensure understanding of the sampling schedule. DNR will engage TMM in developing the language around the issue.		
578	4375-4389	Clarification. This list should specifically include a statement that additional monitoring wells will be needed in and around the plant and tailings sites, where existing data is absent or limited. Action requested: Modify text to address the item.	TMM's hydrogeological dataset is more robust than any mining project TMM is aware of and is several orders of magnitude larger than any project the RGU has permitted. Nevertheless, data collection continues and language is included in Section 6.3.2 that TMM will "install new monitor wells at selected locations to supplement the current monitor well network." TMM looks forward to engaging the RGU on the topic of data adequacy during EIS development.		Please see the revised scope in Section 6.3.2. Text has been added that reads: "Install new monitor wells at selected locations to supplement the current monitor well network - including at the plant site and the tailings management site;"	
579		Figures. Please provide a figure that shows where additional monitoring wells will be installed. Action requested: Ensure Future Scope includes development of a new figure and provide in next data submittal.	During EIS development, TMM will provide updated documentation on the location of wells.	RESOLVED.		
580	44X J-44X4	Information need. DNR will be requesting all well logs and collected data for each well (existing and new monitoring wells). No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping . DNR notes all well logs and well testing data will need to be provided with the EIS.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
581	Ţ.	Clarification. This bullet should Include testing for submerged waste rock. Action requested: Modify text to address the item.	This has been accounted for in Section 5. See lines 2611-2621 and lines 2773-2778.	UNRESOLVED. DNR is unable to confirm the response. Action requested: Specify location in most recent track-changes version of document expected to accompany the next round of documents.	To evaluate the behavior of waste rock under submerged conditions, TMM plans to transition some of the humidity cell tests (HCTs) to submerged columns. This change to the ongoing kinetic testing program would be made in consultation with MDNR. Test details have yet to be scoped; however, a simple modification to the current testing procedure is anticipated. Instead of flushing the HCT cells with reagent water once a week, the cells would remain flooded for a defined period of time. For example, initially, the period of flooding may be a week (i.e. consistent with the current frequency of leachate collection); however, over time, the period of flooding could be increased to a month or possibly longer. Text has been added to the future scope Section 5.3.1 that identifies the future work on submerged waste rock: "•A work plan for the characterization of waste rock, submerged waste rock, development rock, ore, and tailings including data quality objectives, testing methods, sample selection rationale, laboratory selection, and data management;"	
582		Clarification. Surface water will have a no-action alternative (see lines 4314-4315). Groundwater section does not describe a no-action alternative. Action requested: Modify text to address the item or provide explanation for not pursuing a no-action alternative model run.	Groundwater modeling will include a no-action alternative. The baseline (current groundwater) conditions model, run over the same time period as the Project model, will represent the no-action alternative. Text has been edited to state "The numerical model will be capable of assessing changes to the groundwater system based on Project operations, specifically changes to the baseline conditions (represented by a no-action alternative simulation) due to underground mine operations and changes in land-use which can impact aquifer recharge."	RESOLVED.		
583	4422-4424	in 4426-4429? Action requested: Provide explanation and modify text if supported.		logs and well testing data will need to be provided with the EIS.		
584	4430	Clarification. Proposed/monitoring for direct and indirect impacts to wetland and stream hydrology from ditching, and other watershed alterations, are unclear in the supporting text, including but not limited to potential flow (or lack thereof) of water from one water body to another. Action requested: Consider the point and modify text as determined appropriate.	scoping before monitoring location and protocols can be established.	RESOLVED for purpose of scoping.		
585	4430	Guidance. Anticipate supplying information on wetland and stream avoidance, minimization, replacement, indirect effects (draw down, diversions, chemistry, flora and fauna, etc.), quality, and monitoring for the EIS analysis. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
586	4432	Future discussion. A larger area than the project area will need to be defined for wetland delineations in order to determine if indirect wetland impacts would occur. Likely an increased area requiring planning for delineation. No action requested. Future discussion item.	TMM notes that without an impact assessment there is no basis to expand the area for delineations beyond the Project area.	UNRESOLVED. DNR will engage TMM to better define the delineation protocols for assessing potential direct and indirect wetland impacts to be described in the scoping documents.	TMM plans to resolve wetland delineation comments as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon langauge would be reflected in any subsquent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 454.

Comment	Line # Table #	DCII Douad 1 Commont	Turin Metals Dound 1 Despoys	DCU Bound 2 Commont	Turin Motels Dound 2 Despoy	Twin Metals Despense After Additional Discussions with BOIL
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
587		Clarification. Presume the delineation work would also inform the 401 Certification process. Action requested: Modify text to address the item.	Text has been edited to read: "This work will also inform permit applications, including Minnesota WCA, U.S. Army Corps of Engineers (USACE) Section 404, and MPCA Section 401 Water Quality Certification."	RESOLVED.		
588		Clarification. Include avoid and mitigate in addition to "reduce." Action requested: Modify text to address the item.	Text has been edited to read: "Are there potential impacts to wetlands identified that are significant, and can Project EPMs or reduction methods be identified to avoid, minimize, or mitigate the significance of the impacts?"	RESOLVED.		
589	4470	Correction. The Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (Version 2.0) was published in January 2012, not 2011, as indicated in the text. Action requested: Make text correction.	Edited to correct the date of publication to 2012.	RESOLVED.		
590	4484-4485	Clarification. Further detail is needed regarding how wetlands may be grouped for functional assessment. Action requested: Modify text to address the item.	The intent is to develop a more detailed work plan. Sections on the future scope of work identify specific studies or data collection that would be conducted to obtain additional data identified as lacking but able to be reasonably obtained. The future scope of work sections are not comprehensive work plans and these full work plans will not be appended to the data submittal; however, TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	UNRESOLVED. DNR will engage TMM to better define the grouping protocols for the functional assessment to be described in the scoping documents.	TMM plans to resolve wetland delineation comments as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon langauge would be reflected in any subsquent revisions of the SEAW data submittal or the MDNR scoping EAW.	Section 6.3.3.3 identifies that functional assessments will be conducted using MnRAM. The text indicates that wetlands with similar characteristics may be grouped together for assessment purposes based on landscape and wetland characteristics. TMM encourages discussion on appropriate approaches for grouping wetlands within the functional assessment scope for inclusion in the DSDD.
591		Guidance. Consider Floristic Quality Index monitoring for comprehensive wetland quality. Action requested: Consider the recommendation and modify bulleted list as warranted.	Comment is noted. TMM considers this request/comment appropriate for consideration in the EIS development and suggests that it be addressed as part of the development of a future scope and/or the draft scoping decision document.	RESOLVED.		
592	4513	Addition. Presume need to add "how" before "the relevant areal extent" or clarify meaning. Action requested: Add the term "how" to the text or identify alternative language or edit.		RESOLVED.		

Round 2 Agencies NEW Comments [Date TBD]

Comment #	Line # Table #	nments [Date TBD] RGU Round 2 New Comment	Twin Metals Response	Twin Metals Response After Additional Discussions with RGU
827	v2 4575-4586	Question. Regarding the proposed stochastic weather generation model (WGEN), does it include a built-in capacity to model future climates, or a sequentially changing climate, different from the historical climate? Action requested: Provide a response and DNR will determine how to address the answer in the Scoping EAW.	Climate data and analysis within the SEAW data submittal was meant to provide sufficient information for scoping. The models and approach used should be considered preliminary. TMM plans to review necessary additional parameters as part of the future discussions identified within the MDNR comment submission received on 12/1/20 and the results of those discussions will be reflected in Water Resources - Volume 2.	TMM is committed to utilizing future climate change projections to identify the appropriate phase and climate conditions to apply to the Project. TMM will coordinate with MDNR in selecting the best available climate data for each phase of the project. Climate information is available at sufficient time steps to meet GoldSim requirements, the synthetic climate generator can be adjusted in order to model a future climate scenario. Climate inputs and how to model future climate scenarios are still a topic of conversation with MDNR.
828	v2 4575-4586	Question. Does WGEN stochastically model other climate parameters of interest other than daily precipitation, evaporation and temperature, for instance incident solar radiation and cloud cover, humidity, timing and rapidity of snowmelt, drought frequency, wind speed, and/or growing season length? Action requested: Provide a response and DNR will determine how to address the answer in the Scoping EAW.	Climate data and analysis within the SEAW data submittal was meant to provide sufficient information for scoping. The models and approach used should be considered preliminary. TMM plans to review necessary additional parameters as part of the future discussions identified within the MDNR comment submission received on 12/2/20 and the results of those discussions will be reflected in Water Resources - Volume 2.	TMM is committed to utilizing future climate change projections to identify the appropriate phase and climate conditions to apply to the project. TMM will coordinate with MDNR in selecting the best available climate data for each phase of the project. The synthetic climate generator used for the SEAW data submittal currently produces precipitation, temperature, solar radiation, wind speed, and humidity stochastically. The values that are generated stochastically can be used as inputs to calculate other values listed, such as evaporation. The variables the stochastic model produces have been selected as those the model is expected to be the most sensitive.
829		Question. Can exogenously input data for the forecast climate future be input to WGEN and accepted within its calculative regimes; potential related references include Wilks (1992), and Semonov and Barrow (1997), that indicate this is the case? Action requested: Provide a response and DNR will determine how to address the answer in the Scoping EAW.	models and approach used should be considered preliminary.	TMM is committed to utilizing future climate change projections to identify the appropriate phase and climate conditions to apply to the project. TMM will coordinate with MDNR in selecting the best available climate data for each phase of the Project. TMM can run additional climate scenarios in GoldSim and will continue discussions with MDNR to help inform which of those scenarios will be appropriate.

Comment #	Line # Table # Figure #	RGU Round 2 New Comment	Twin Metals Response	Twin Metals Response After Additional Discussions with RGU
830		assumed? Action requested: Provide a response and DNR will determine how to address the answer in the Scoping EAW.	Climate data and analysis within the SEAW data submittal was meant to provide sufficient information for scoping. The models and approach used should be considered preliminary. TMM plans to review necessary additional parameters as part of the future discussions identified within the MDNR comment	TMM is committed to utilizing future climate change projections to identify the appropriate phase and climate conditions to apply to the project and will coordinate with MDNR in selecting the best available climate data for each phase of the Project. TMM will consider climate change impacts on the Project and will continue to work with MDNR to identify the appropriate phase of the project for which these considerations should be applied to water modeling efforts. Additionally, TMM will use best available data for the phases of the Project requiring climate change considerations as it relates to water modeling efforts.
831		distant into the future? Action requested: Provide a response and DNR will determine how to address the answer in the Scoping EAW.	Climate data and analysis within the SEAW data submittal was meant to provide sufficient information for scoping. The models and approach used should be considered preliminary. TMM plans to review necessary additional parameters as part of the future discussions identified within the MDNR comment submission received on 12/2/20 and the results of those discussions will be reflected in Water Resources - Volume 2.	Climate change will be considered as it relates to water modeling during the closure period. Initial conversations regarding best available data indicates 100 years is an appropriate timeframe for future considerations.

Round 1 - RGU's Review of Proposer's Initial Data Submittal [12/18/19] COMPLETED 06/15/20

Round 2 - RGU's Review of Proposer's Intermediate Data Submittal #1 [07/24/20] COMPLETED 12/01/20

MASTER Comment Tracking Table - Section 7.0 Contaminants, Hazardous Materials, Waste

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
593	4577	requested: Modify text accordingly.	Text has been edited to read: "Solid industrial waste – tires, scrap metal, concrete, construction waste, non-salvageable demolition debris, and office waste (paper, utensils, etc.). Solid industrial waste generated by the Project would be taken off-site to be treated by a third party and recycled when available"	RESOLVED.	
594	4594	include in discussion; could require consultation with	Instrumentation needs for the Project have not been developed extensively enough to determine if detectors involving radioactive elements or mercury are needed. Table 3-8 identifies the potential need for a Hazardous Materials - Radioactive Material License from the Minnesota Department of Health. Any use and disposal of detectors involving radioactive elements or mercury would follow the appropriate state and federal regulatory requirements.		
595	4667	details/estimates on quantities and types of hazardous materials that are expected to be on site over the proposed 25 year mine life. Action requested: Provide	Tables 7-1 and 7-2 outline estimates of Fuel Storage and Consumption and Process Reagents. Table 7-3 has been added that outlines Approximate Emulsion Quantities. These annual estimates can be extrapolated for the 25 year mine life. Additional assessment of hazardous materials are anticipated to be part of the EIS development.	RESOLVED.	

Round 1 - RGU's Review of Proposer's Initial Data Submittal [12/18/19] COMPLETED 06/15/20

Round 2 - RGU's Review of Proposer's Intermediate Data Submittal #1 [07/24/20] COMPLETED 12/01/20

MASTER Comment Tracking Table - Section 8.0 Terrestrial & Aquatic Resources

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
# 596	4743-4744	correct the RSG provides good quality information, but it by no means can be used as a stand-alone source for	Guide was used to further refine the selected habitats and sensitive species for inclusion in the analysis. The habitats described by the MDNR Rare Species Guide are those commonly used by a species but are not inclusive	RESOLVED for purpose of scoping. The scoping documents will identify the survey/assessment requirements necessary to support the EIS analyses. DNR will engage TMM in the development of text that appropriately captures this process need.	
597	4887-4888	Guidance. The text indicates that approximately 650 acres associated with the Transmission Corridor have not been mapped within the DNR Native Plant Database. A plan should be provided to address this data deficiency. Action requested: Identify how similar-level information will be provided for these acres. One option is for this area to be surveyed and mapped as per DNR recommendations.	This work is identified in the Section 8.3 Future Scope - specifically lines 5533-5557. Phase 2 – Terrestrial vegetation baseline surveys.	RESOLVED for purpose of scoping. The scoping documents will identify the survey/assessment requirements necessary to support the EIS analyses. DNR will engage TMM in the development of text that appropriately captures this process need.	
598	4895-4902	"bad." However, based on Table 8-5, much of these disturbed forests may be upwards of 50-60 years of age. Ecologically and in terms of habitat, in many of these cases they are aspen stands and could be quite large (DBH), thus offering quality habitat for forest interior	The text does not equate disturbed is "bad". Specifically the text reads: "The MBS data files include raw candidate data that has been mapped by MDNR's Ecological and Water Resources division but not certified for inclusion in the NPC database. Much of this candidate data shows disturbed features not part of the NPC classification and are tracked for future NPC mapping purposes. By definition these disturbed areas would not contain NPC."	RESOLVED for the purpose of scoping. It will be necessary for the EIS analysis to appropriately characterize potentially-affected habitats, including distinguishing the present condition versus potential future condition where significant regeneration has occurred relative to NPC classifications. The scoping documents will provide guidance on this issue.	
599	4995	3	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for the purpose of scoping. DNR is providing the referenced report with this response. Also note most recent DNR Fisheries survey was done in 2020, and survey data will be analyzed winter 2020-21; DNR will make this information available to the Proposer when complete. DNR will incorporate the information as relevant into the Scoping EAW.	

Comment	Line # Table #				
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
600	5005	sunfish. Action requested: Modify text.	Text has been edited to read: "The rusty crayfish is of concern for disrupting ecosystems due to its greater destruction of submerged vegetation than native species, which negatively impacts fish habitat, particularly for sunfish."	RESOLVED for purpose of scoping.	
601	5012	address the item.	No data on the individual species is available for the genus notropis from the 2014 MPCA assessment. The assessment counted 5 total genus notropis with a length 75-89 mm.	RESOLVED.	
602	5016	- ,	See Comment 412. Impairments are listed in the Surface Water Quality Baseline section.	RESOLVED for purpose of scoping.	
603		Denley Creek. List the species in each case for consistency and information (could include in table form). Action requested: Provide sentence listing the eight fish species.	Text has been edited to read for Stony River: "MPCA documented the following fish species in the 2014 assessment: burbot, mottled sculpin, tadpole madtom, Johnny darter, central mudminnow, rock bass, northern pike, and longnose dace." For Denley Creek: "MPCA documented the following fish species in the 2014 assessment: northern redbelly dace, blacknose dace, creek chub, blacknose shiner, common shiner, central mudminnow, white sucker, pearl dace, fathead minnow, finescale dace, and brook stickleback."	RESOLVED for the purpose of scoping. For the Scoping EAW it will be necessary for DNR to independently verify the accuracy of the listing.	
604	5020	Clarification. The 8 species found should be listed out the same way it was done for Keeley Creek. Action requested: Modify text to address the item.	See Comment 603.	RESOLVED.	
605	5030	Clarification. The 11 species found in Denley Creek should be listed out the same way it was done for Keeley Creek. Action requested: Modify text to address the item.	See Comment 603.	RESOLVED.	
606		requested: Modify text to address the item.	Text has been edited to read: "In addition, MPCA documented a diverse invertebrate community including: amphipods, balloon flies, beetles, black flies, broadwinged damselflies, chiggers, darners, epitheca, gastropods, hirudinea, large caddisflies, long-horn caddis, mayflies, micro-caddisflies, midges, net-spinning caddisflies, northern caddisflies, oligochaeta, and orconectes."		
607	5078	mentioned in subsequent reports. Action requested:	Text has been edited to read: "Wild rice is specifically identified in the Lake Survey Reports for 1954, 1975, and 1997. MDNR Fisheries discontinued wild rice surveys after 1997."	RESOLVED.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
608	5080	Stony River, and Denley Creek not mentioned. Make reference for those waters in addition to Birch Lake and	Given the Project design, no impacts to wild rice are expected in Unnamed Creek, Stony River, and Denley Creek therefore no baseline information has been provided.	RESOLVED for purpose of scoping. The scoping document will identify the need to assess the project's potential to impact any wild rice resources in Unnamed Creek, Stony River, and Denley Creek.	
609	5080	Information source. Keeley Creek data is available from the DNR Finland Area Fisheries Office. Action requested: Contact this office to arrange for inspection.	Comment is noted.	RESOLVED for the purpose of scoping . DNR will supply the document for Twin Metals reference purposes.	
610	5082-5083	not contain" leads to the question of what was contained). Action requested: Modify text to provide	The full complement of wild rice data will be provided during EIS development. If there are data gaps that are necessary to inform baseline conditions, additional data can be sought. TMM will offer conclusions about the density and geographic extent of wild rice at that time.	RESOLVED for the purpose of scoping. The scoping document will require assessment of potential project-related impacts to wild rice resources. As TMM notes, this may require acquisition of additional site-level data for any data gaps.	
611	5100	Clarification: DNR notes that there are few areas where wild rice is extensive on Birch Lake due to the reservoir's morphology, thus the areas where wild rice is present are ecologically valuable. Rice is found mainly in less than ten shallow bays on the lake. Three areas are adjacent or nearly adjacent to the Project: north and south of the water pipeline and pumphouse, and the bay which the non-contact water ditch is to discharge to. Action requested: Modify text to address the item.		RESOLVED for purpose of scoping. The Scoping EAW will likely propose impacts to wild rice as receiving detailed analysis in the EIS.	
612	5106	in Birch Lake Reservoir. Action requested: Modify text to address the item.	Text has been edited to read: "In 2018, 31 water samples were collected from water bodies near wild rice stands. Macrophyte species observed include, but are not limited to: common spikerush, Canadian waterweed, small floating mannagrass, yellow pond-lily, American white waterlily, pickerelweed, long-leaf pondweed, broadleaf arrowhead, and floating bur-reed."		
613	5124		Text has been edited to read: "During the Project operation phase habitat would not be re-established on these sites."	RESOLVED.	

0	the autoba				
Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
614	Figure # 5141	Clarification. The text asserts habitat effects "would be temporary." Although the intent of site reclamation into closure is to restore natural and other resource values, by definition the post-project habitat would not likely be the same as the pre-project condition, which is one way of viewing temporary. Removal of the term is a more factual statement. Action requested: Revise sentence to read: "Habitat impacts due to the Project would be of limited duration and at closure the habitats would be reclaimed to restore affected habitats" or similar.	Text has been edited to read: Habitat impacts due to the Project would be of limited duration and at closure the habitats would be reclaimed to restore affected habitats.	RESOLVED for the purpose of scoping. RGU note: TMM should be clear in the use of "restoration" vs "reclamation," which should not imply that complete restoration to previous habitat is the plan, if it is not. Future use of the land may be different from that prior to a project. This would influence whether actual restoration is achievable even if desirable.	
615	5142-5145	Clarification. This sentence not relevant here. Remove as it is duplicative and not particularly accurate as not all areas of the project would be returned to like vegetation or habitat. Requested action: Remove sentence.	Text has been edited - sentence has been removed.	RESOLVED.	
616	5185-5190	· · ·	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
617	5185-5190	DNR notes this text lays the foundation for the Future Scope on the issue detailed in Section 8.3.1.	Comment is noted.	RESOLVED for the purpose of scoping. DNR will engage TMM to clarify future assessments related to NPC classes for the scoping documents.	
618	5209	Clarification. Stating that the project has a "temporary" nature is misleading. Project operations are expected for 25 years, and even with reclamation and closure, effects would last on the landscape long after mining operations cease. Action requested: Modify text to address the item.	See Comment 467.	RESOLVED for the purpose of scoping. Future environmental documents will attempt to reasonably convey the context where use of the term "temporary" occurs.	
619	5210-5212	Clarification. The text offers a somewhat circular argument because the project area itself has land with restricted use and is proposed for development (with this action). Stating that surrounding lands are "use restricted" is less relevant because those lands could be proposed for development as well. Action requested: Remove last sentence from the paragraph. Expect DNR to provide technical input later in the SEAW process in characterizing the potential habitat fragmentation effects of the Project.		RESOLVED.	

Comment	Line # Table #				
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
620	5217-5220	Clarification. Absent specific detail on the reclamation plan, it is premature to claim potential negative effects to the landscape would be reversed. An example of the type of detail necessary to support the assertion would be what specific tree species plantings would be proposed, or other mitigation plans. No action requested. DNR will assess the potential treatment of the item in the EIS during development of the Scoping EAW.	responsive to inquiries and requests.	RESOLVED for the purpose of scoping. DNR will engage TMM to clarify how the EIS assessment considers potential reclamation features for the scoping documents.	
621	5228-5230	were these footprints? Action requested: Modify text to address the item.	Text has been edited to read: "The size of the surface features and the scale of their respective impacts described in those reports are orders of magnitude greater than the Project's potential ground disturbance. For example, the Barr (2009) report cited MDNR data that "mining features cover 118,315 acres along the Iron Range, including 36,962 acres of open mine pits, 78,620 acres of stockpiles and tailings basins, and 212 acres of facilities and infrastructure.""	unresolved. The new text at v2 Lines 5623-5626 provides insight into the size and scale of the surface features being cited. The total number of mining operations being represented in the numbers is also relevant. This should be added to the text.	Text has been edited to read: ""mining features cover 118,315 acres along the Iron Range, including 36,962 acres of open mine pits, 78,620 acres of stockpiles and tailings basins, and 212 acres of facilities and infrastructure." Currently, there are six active permitted operations in addition to several other inactive permitted operations."
622		be impeded by these water bodies. Action requested: Either better define what is meant by "wildlife corridor"	Text has been changed to read: "The Project is in an area that has physical limits in providing a wildlife corridor. The Project area is bounded to the north and the west by Birch Lake which could present a physical or behavioral impediment to terrestrial species of wildlife. Recreation use of Birch Lake during spring, summer, and fall months may deter species that would typically cross bodies of water and previous and current disturbances, including existing forest roads and rural residential roads, intersect the Project area and influence the movement of wildlife."	UNRESOLVED. DNR notes the text at v2 Lines 5631-5633 stating "[r]ecreation use of Birch Lake during spring, summer, and fall months may deter species that would typically cross bodies of water" may be misleading. For this to be considered, for example, boat traffic data (as a source of disturbance) should be included to gauge the level of "use" during these months. This data may not exist though, which would have to be addressed in the scoping documents. It can be speculated that recreational use on this lake in the Superior National Forest is likely not high enough to significantly alter large mammal movement patterns across water during those seasons. Data will be needed to assess the assertion at v2 Lines 5631-5633, which will be a consideration in developing the scoping documents.	Part of the revised future scope of Section 12.3 includes additional baseline data collection and reads: "Baseline data collection will include characterizing the regional setting and Project location including: • the Ely Municipal Airport; • traffic on nearby roads and highways, nearby snowmobile and ATV trails; • motorboat traffic; and • traffic related to the Kasota Stone quarry." This baseline data will help inform the future scope related to biology and will be used to assess the baseline conditions of wildlife corridors and large mammal movement patterns across Birch Lake. The baseline data will be provided during EIS development to satisfy the EIS scope.
623	5231-5233	to terrestrial wildlife only. At a minimum the text should be modified to account for bird species, specifically waterfowl, and potential access to the several	No text has been edited. As outlined in Section 8.1, terrestrial species encompass bird species in the data submittal. Section 8.2 discusses potential impacts to terrestrial species and lists birds as one of the species considered in this designation.	RESOLVED.	

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
624	Figure # 5268-5271	feature and thus would have permanent impacts.	Comment is noted. TMM considers this request/comment appropriate for consideration in the EIS development and suggests that it be addressed as part of the development of a future scope and/or the draft scoping decision document.	RESOLVED for purpose of scoping. DNR concurs the scoping document should account for the phrasing around permanent project features, especially in terms of potential permanent effects to the landscape.	
625	5356-5360	Note. The RGU notes it is premature to determine potential significance of this issue. No action requested. DNR will use information developed over the course of the Scoping EAW to propose how the issue will be addressed in the EIS.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for the purpose of scoping. DNR will engage TMM to clarify how the EIS assessment considers the project's potential to impact regional populations of terrestrial wildlife species for the scoping documents.	
626	5370	Section 12.2 does not specifically address back up alarms.	Text has been edited to read: "These sudden, infrequent impulse noises such as back up alarms on mobile equipment or material handling at the plant site and tailings management site, could displace a variety of wildlife found in and around the Project area, including mammals and birds many of which could successfully relocate into adjacent habitats. The Project would aim to reduce the impact of both sudden, infrequent impulse noises and steady or continuous to receptors outside the Project footprint by ensuring noise levels remain below the NAC-1 nighttime limit of 50 dBA. At this level, impacts would be limited to sensitive receptors proximal to the plant site, tailings management site and the potential significance of the impacts of noise on wildlife would be reduced."		
627	5387-5396	habitat associations of the sensitive wildlife species? Only	See line 4743-4751. "The MDNR Rare Species Guide was used to further refine the selected habitats and sensitive species for inclusion in the analysis"	RESOLVED for the purpose of scoping. Future discussion need to occur to determine whether more data besides the RSGs should be used for species habitat associations. While RSGs offer good baseline information, they should not be used in as a sole source. DNR will engage TMM to propose appropriate text for the scoping documents.	
628	5420	aquatic resources. Action requested: Address in Version 2.	Comment is noted. The modeling efforts necessary to characterize changes in baseflow, streamflow, or water levels are outlined as part of the surface water and groundwater supplemental scopes outlined in Sections 6.3.1 and 6.3.2.	RESOLVED.	
629	5428		The access road is not within the Lake County Shoreland Zoning Ordinances or any shoreland management area.	RESOLVED for the purpose of scoping . DNR will confirm during Scoping EAW development whether any project activity occurs within the shore impact zone and address accordingly.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
630	5434-5435	·	Text has been edited in Section 3.6.2 Transmission Corridor to read: "The transmission corridor would include a two-track, unpaved maintenance road and the power transmission line, which would originate from an off-site electrical substation and terminate at the plant site electrical substation. The two-track maintenance road would be accessed from existing local roads and would not require culverts or bridges. The two-track maintenance road would be accessed from existing local roads and it is anticipated that it would not require culverts or bridges. "	RESOLVED.	
631	5438	Keeley Creek would be expected to affect flow, both during the project and after reclamation. Impacts to aquatic habitat may resulf from any flow-related or other	Text has been edited to read: "The tailings management site would be sufficiently set back with design and EPMs to avoid impacts to Keeley Creek related to surface disturbance. Consideration for changes to groundwater or surface water flow to Keeley Creek are included in Section 6.3."	RESOLVED for the purpose of scoping. DNR will confirm during Scoping EAW development whether any project activity occurs could potentially result in erosion or sediment control issues and address accordingly.	
632	5441	·	Comment is noted. The SEAW was prepared using the best available data and did not use provisional data. This has been identified as a future need - lines 5470-5473.	RESOLVED for purpose of scoping.	
633	5441	·	Lines 5467-5469 preliminarily identifies that impacts associated with the water intake pipe are expected to be insignificant but additional work is necessary. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data will be furnished during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
634	5458	Additional impact. If any wild rice bay receives water collected from a non-contact water ditch, then any potential impacts should be assessed. Action requested: Add text to address the item.	This has been identified as a future need - lines 5470-5473.	RESOLVED for purpose of scoping. The Scoping EAW will likely propose impacts to wild rice as receiving detailed analysis in the EIS.	
635	5470	Note. DNR concurs that analysis of potential project impacts to surface water quantity and quality has applicability to aquatic resources and biota. No action requested.	Comment is noted.	RESOLVED for purpose of scoping.	
636	5474-5476	RGU note. The potential significance and subsequent	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
637	5486-5487	natural or human disturbances (also lines 5544-5547). Action requested: Modify text to address the item.	The purpose of this work would be to account for any previous disturbances to habitat, vegetation, and wildlife. Text has been edited to read: "•Creating a plant community map and recording evidence of natural or anthropogenic disturbances to document previous impacts to habitats, vegetation, and wildlife;"	RESOLVED . DNR notes underlying data will be reviewed as part of EIS process.	
638	5512		Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
639	5523	more detailed work plan for these efforts? Action requested: Provide response. As part of work plan development DNR will identify if it would be preferred for the agency reviewers for the sequential aspects were delivered upon completion (rather than as one report at the end). Future discussion item.	The intent is to develop a more detailed work plan. Sections on the future scope of work identify specific studies or data collection that would be conducted to obtain additional data identified as lacking but able to be reasonably obtained. The future scope of work sections are not comprehensive work plans and these full work plans will not be appended to the data submittal; however, TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping. RGU notes that it is desirable to conduct data collection under agency-reviewed and -approved work plans to avoid data gaps. It is understood that this is not always possible for every type of data need. However, proposer incurs the risk of future data or information needs later in the process.	
640	5569-5571	Information need. DNR will need more detail regarding these surveys (timing, number of locations, methodology) to ensure a robust and useful data set. Action requested: Modify text as information is now known to address the item. Future discussion item.	See Comment 639.	RESOLVED for the purpose of scoping. TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
641	5572-5575	Data note. Although this is a source of information, typically this is not a rigorous survey but instead the documentation of incidental observations. No major conclusions on game bird populations can be made from this type of data. Action requested: Ensure that any use of this information is appropriately qualified in future data submissions.	Comment is noted. This will be considered in developing future scope for terrestrial wildlife baseline surveys.	RESOLVED for the purpose of scoping. TMM response noted. Future discussions needed pertaining to a more detailed work plan.

#	Figure #		·		Twin Metals Round 2 Response
642	5576-5579	Clarification. For this bullet, what will the survey methodology be here? Observer based? Acoustic detectors? Action requested: Answer the question and modify text as appropriate.	See Comment 639.	RESOLVED for the purpose of scoping . TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
643	5584	, , , ,	See Comment 639.	RESOLVED for the purpose of scoping. TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
644	5585-5586	Clarification. The text should identify when will these three weeklong periods occur? Action requested: Modify the text to address the item.	See Comment 639.	RESOLVED for the purpose of scoping . TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
645	5587-5588	Clarification. When will these surveys occur? What conclusions will be made from the acoustic data? If a species is present acoustically within the project area, then will it be assumed this means that breeding (maternity colonies) is occurring within the project area? If not, how will breeding presence be determined (by mist netting/telemetry)? Who will be reviewing the calls files collected by the acoustic detectors? Action requested: Modify text to address the item.	See Comment 639.	RESOLVED for the purpose of scoping. TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
646	5589-5590	Clarification. More details are needed in the survey methodology here. How will visual meander surveys be done? What time of the year and by who? Where and when will trapping occur? Action requested: Modify text to address the item.	See Comment 639.	RESOLVED for the purpose of scoping . TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
647	5591-5597	Clarification. Will this be done using acoustic detectors or by trained staff? Action requested: Answer the question and modify the text to address the item.	See Comment 639.	RESOLVED for the purpose of scoping . TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
648	5596-5599	Data collection. The statistical validity of using only 10 camera traps to survey 1156 acres is questionable? This will likely result in the project area being insufficiently surveyed for any statistically valid results. What time of year will surveys be done? Timing will have to be different to target certain species (i.e., Canada lynx vs. black bears). More detail is necessary to support the proposed methodology. Action requested: Modify text to address the item. Future discussion item.	See Comment 639.	RESOLVED for the purpose of scoping. TMM response noted. Future discussions needed pertaining to a more detailed work plan.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
649	5600-5601	Clarification. More details are needed to describe the small mammal surveys. When will surveys occur, what trap types/sizes will be used, what habitats will be targeted, etc.? How does the methodology account for the fact that often rare small mammals are notoriously difficult to catch using live traps? Action requested: Modify text to address the item.	See Comment 639.	RESOLVED for the purpose of scoping . TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
650	5568-5603	Question. What conclusions will be made from these surveys? It is important to note that lack of presence during surveys does not equal the ability to conclude a specific species does not occur within the project boundary. Action requested: Provide an answer to the question, which will be considered in the proposed EIS scope over development of the Scoping EAW. Future discussion item.	See Comment 639.	RESOLVED for the purpose of scoping . TMM response noted. Future discussions needed pertaining to a more detailed work plan.	
651	5605-5610	Clarification. Compare deliverable report described on lines 5605-5610 with that listed on lines 4504-4521. Are these separate reports or the same? Action requested: Provide clarification and modify text to provide clear distinction across the two items.	The Future Scope Section has been corrected to read: "The result of this work will be combined with the results from the Wetlands Baseline work outlined in Section 6.3.3" The work accomplished in the 8.3.1 will be combined with the first two volumes of the wetland work outlined in 6.3.3 as this work will inform the baseline and existing conditions of wetlands, habitats, vegetation, and wildlife.	UNRESOLVED. Seeking confirmation at v2 Line 6013. Strikeout text is same as inserted text (i.e., reads: "in Section 6.3.16.3.1 and will"). Should the new text be "6.3.3?"	Correct. The text has been revised to read: "The result of this work will be combined with the results from the Wetlands Baseline work outlined in Section 6.3.3."

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
654	5820	intersection of Hwy 1 and the Kawishiwi River should be	line of sight from the South Kawishiwi Campground to the Project. Future work to inform the assessment of potential visual impacts related to plumes is outlined in Section 11.3.6. Additional effects to recreation will be	RESOLVED for the purpose of scoping. The scoping documents will identify the South Kawishiwi Campground as a resource to be assessed for potential visual impacts.		
655	5831		This section encompasses more than just a "Landscape Visual Simulation" assessing all potential project impacts to visual resources.	RESOLVED.		
656	5884		The text notes that the viewshed analysis is a preliminary "direct line of sight" viewshed analysis.	RESOLVED.		
657	5832	Affected resource. The potential for the South Kawishiwi Campground to be affected from infrastructure visibility, light visibility at night, and visibility of plumes should be assessed. Action requested: Modify text to address the item.	See Comment 654.	RESOLVED for the purpose of scoping. The scoping documents will identify the South Kawishiwi Campground as a resource to be assessed for potential visual impacts.		
658	5931	Clarification. The first paragraph calls the impact being addressed light "pollution." To be more precise consider modifying the title to read: "Light Pollution." Action requested: Modify text.	For consistency with Project nomenclature references to light pollution have been edited to light visibility.	RESOLVED.		
659	5949		Consistent with Comment 63 - there are no temporary or permanent waste rock stockpiles.	UNRESOLVED. Agencies will engage TMM to identify language to be used in scoping and EIS. Further discussion required.	TMM is revising nomenclature related to material handling and management to better align with the Mine Materials Characterization Program and recent discussions with the MDNR. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.	See Comment 20.
660		facility or other access features at the end of project? Action requested: Modify text to match the answer.	Text has been edited in Section 10.2.4 to read: "Lighting would be removed during reclamation and post-closure maintenance and monitoring phases unless a future use is identified and approved."	RESOLVED.		
661	5987-5989	the reclaimed tailings facility compared to the operational facility? If not, is it known that the viewshed	The viewshed analysis represents the scale of the dry stack facility at full development after 25 years of operation. Viewshed analysis was not done for the reclaimed dry stack facility.	RESOLVED for purpose of scoping. DNR will engage TMM on purpose of viewshed analysis with special emphasis on the 3 operational phases followed by the progressive reclamation activities, all of which going into closure. This will be presented in the scoping document that will guide the EIS analyses.		

Comment	Line # Table #					
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response	Twin Metals Response After Additional Discussions with RGU
662		revegetation" as the principle measures to partially reverse visual impacts. Describe the closure of the dry stack in greater detail to better support the assertion. Action requested: Modify text.	See lines 1424-1425 for discussion on revegetation at the dry stack facility. "Cover soil would be sourced from the reclamation material stockpile and seeded to establish grasslands." See lines 1563-1568 for discussion on grading at the dry stack facility. "The post-closure surface of the dry stack facility would be graded to drain toward the perimeter of the dry stack facility. Reclamation design would aim to create conditions where runoff rates and volumes are similar to runoff reaching downstream surface water receptors for pre-Project site conditions. When the dry stack facility surface is fully revegetated and vegetation growth is dense and well established, runoff may no longer require suspended solids removal to meet water quality standards."	document will provide guidance on the level of detail needed for the EIS analysis to assess potential visual impacts.		
663	6005-6007	noted in the text. Action requested: Modify text if potential plume visibility is not proposed for future study and provide the rationale for not doing so.	Section 11.3.6 added to clarify that potential visibility impacts of plumes is part of future scope. Text has been added that reads: "The specific requirements for a visual impact analysis will be negotiated and discussed with the RGU as part of the visual impact analysis process. This process will be conducted to satisfy environmental review requirements. Associated tasks could include assessing the potential for physical changes to the visual environment at surrounding receptors, assessment of visible plumes or fogging at selected receptors, and simulation of changes to particular scenic vistas."			

Round 1 - RGU's Review of Proposer's Initial Data Submittal [12/18/19] COMPLETED 06/15/20

#	Figure #	RGO Round 1 Comment	Twin Metals Round 1 Response	RGO Round 2 Comment	Twin Metals Round 2 Response
664	General	Information request. Section 11.1 should identify all Federal and State rules that may be applicable to the proposed project. Action requested: Review the existing text to ensure all applicable regulations have been identified. Modify text for any omissions.	Text in Section 11.1.2 has been edited to identify potentially applicable Federal and State rules.	RESOLVED.	
665	6022	Guidance. Follow the MPCA Air Dispersion Modeling Practices Manual guidelines for developing PM10 background concentrations based on ambient monitoring data. Action requested: Modify text to reflect item.	developing the air future scope.	RESOLVED.	
666	6025-6027	Future Action. The treatment of the two monitoring sites to represent "background" will require confirmation. DNR understands these sites were established as part of the required monitoring program for existing mining and processing operations. It will have to be determined whether impacts from this operation can be appropriately considered as background. No action requested. Future discussion item in consultation with MPCA.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
667	6065	Guidance. All assumed control efficiencies will need to be reviewed in order for emission totals to be verified	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 11.3.1, including data on emissions calculations including activities and equipment will be provided during EIS development to satisfy the EIS scope.		
668	6068	diagram detailing emissions sources should be provided for the next data submittal. Action requested: Modify text to address item. Provide a figure for next data submittal.	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data, as outlined in Section 11.3.1, including data on emissions calculations including activities and equipment will be provided during EIS development to satisfy the EIS scope.		

Commont	Line # Table #				
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
669	6069-6071	Clarification. The text correctly assumes that additional stationary sources identified as the project design is refined would need to be included as part of evaluation for potential significant effects. A possible way to better capture this might to simply read: "Table 11-2 would be updated to reflect any additional sources included in the Project design and used" Action requested: Modify text.	Text has been edited to read: "Table 11-2 through Table 11-9 would be updated to reflect any additional sources included in the Project design and used in the additional modeling work discussed in Section 11.3."	RESOLVED.	
670	6074	DNR notes the Project defines drilling and blasting as emission sources. Emission sources must be qualified and quantified with drilling and blasting plan details. Action requested: Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for the purpose of scoping . It is understood that TMM will provide drilling and blasting plan details during the EIS development.	
671	6074	during the development of the declines during the	Comment is noted. As outlined in Section 11.3.1, all Project operations (which includes construction) will be included in the emissions calculations. This additional data will be provided during EIS development to satisfy the EIS scope.	RESOLVED.	
672	6078-6087	Applicability review. The applicability of ventilation shafts as point sources for air quality emissions should be considered. Action requested: Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
673		add temporal dimension and account for both activities.	Text has been edited to more clearly reference the construction and operation phases defined in Section 3.6.2. Above-ground crushing of development rock will occur during the construction phase which is defined in Section 3.6.2 as a "30-month period from Q3 Year -3 to Q4 Year -1." Above-ground crushing of ore will occur during the first two years of the operation phase defined in Section 3.6.2 as beginning "with the commissioning of the concentrator." Operation of the crusher during the construction phase is expected to be more intermittent and at a lower throughput.	RESOLVED for purpose of scoping. Scoping document will require assessment of potential air impacts due to surface crushing activities for the EIS.	
674		Clarification. What happens to the <0.5' blasted rock? Action requested: Clarify and revise accordingly.	The ore stored at the temporary rock storage facility would primarily be 0.5 to 1 ft in diameter, this is the target from blasting. However, when looking at a full PSD of these ore, there would be pieces smaller than 0.5ft in diameter (as well as some pieces larger than 1ft in diameter). Text changed to the following to clarify: "Ore stored at the temporary rock storage facility would nominally between 6 to 12 inches(10 to 30 cm) in diameter."	RESOLVED.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
675	6125-6128; Table 11-3	Guidance. "In addition to gaseous criteria pollutants such as NO2, SO2 and CO, greenhouse gas (GHG) emissions are anticipated from mine heaters and underground blasting activities. Table 11-3 provides an estimate for preliminary GHGs for the project." For the project carbon footprint, all GHG emissions should be estimated from the following sources: Scope 1, direct emissions - stationary combustion sources, mobile combustion sources, stationary or area industrial process sources, permanent land-clearing [aboveground biomass carbon], and GHG emissions from stockpiled stored peats and soils; Scope 2, indirect emissions - emissions associated with purchased electricity. In estimating CO2 emissions from permanent land-clearing, emissions should be estimated for CO2 losses from removed and marketed or combusted woody biomass and lost sequestration potential from cleared acres. Mobile combustion sources would include all mobile above and below ground mining equipment plus aboveground trucks, front end-loaders, dozers and the like. In developing the project footprint, this should use projected actual hours of operation, rather than potential maximum hours of operation. Action requested: Modify text as appropriate in the GHG section. Modify text as	See Comment 556.	ADDITIONAL GUIDANCE. RGU notes the scope of climate analysis may include requirements reflecting CEQ's "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews," memorandum, August 1, 2016, cited in project proposer's response to comment 710 (Section 14.0, Cumulative Effects). This guidance addresses the role of future climate change as a background condition in project-specific evaluation. In the estimation project emissions, the CEQ memo requires the estimation of direct and indirect emissions (CEQ, op cit., pg 15), and the estimation of emissions from connected actions (CEQ, op cit., pg 13). An indirect emission is a "reasonably foreseeable" upstream or downstream emission resulting from the project. (CEQ, lp cit., footnote 42) For resource extraction projects, like TMM, this would include emissions from connected actions associated with the "various phases in the process, such as clearing land for the project, building access roads, extraction, transport, refining, processing, using the resource, disassembly, disposal, and reclamation. (CEQ, op cit., 13-14) In Section C, the CEQ memo implicitly also includes the treatment of terrestrial carbon sequestration (and biogenic CO2 emissions) in its required treatment of direct and indirect emissions sources. Action requested: Consider the guidance and modify the text as appropriate to address	TMM acknowledges that climate change impacts will need to be considered as part of impact analysis and GoldSim modeling. TMM plans to resolve necessary climate considerations as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.

	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
		Guidance. "Preliminary GHG emission calculations show	Comment is noted. TMM looks forward to continued	RESOLVED. Further discussion will be required to	
		carbon dioxide equivalent emissions would be 58,072	engagement during the EIS development and will be	determine how the EIS estimation of projected project	
		tons per year (tpy), which is well below the threshold for	responsive to inquiries and requests.	GHG emissions and presentation in the EIS.	
		a major source of air emissions of 100,000 tpy in			
		Minnesota." For PSD determination (Prevention of			
		Significant Deterioration), a more limited carbon			
		footprint should be developed than discussed above in			
		comment 664. This should be similar to what is found in			
		Table 11-3, but also include emissions associated with the			
		above-ground biomass removed from the site during land			
		clearing, should that biomass be marketed as fuelwood.			
		Under USEPA guidance, biogenic emitted to the			
		atmosphere as a result of permanent forest clearance			
		should be included in GHG emission totals in the			
		determination of which facilities need or need not			
		undergo a BACT (best available control technology)			
6	3132-6134 and	analysis. Emission totals used for PSD determinations			
,		normally do not include GHG emissions from mobile			
		sources or biogenic area sources not related to			
		permanent forest-clearing. They also do not include			
		indirect GHG emissions associated with the generation of			
		purchased electricity, and are calculated on a maximum			
		potential-to-emit basis. The emission threshold for GHGs			
		for a facility that otherwise must undergo a criteria			
		pollutant-related BACT analysis is 75,000 short CO2-			
		equivalent tons. Action requested: Modify text as			
		appropriate in the GHG section. Modify text as			
		appropriate in section 11.3.2. Future discussion item.			

	Line # Table #				
#		RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
677	Figure # 6138-6144	Guidance. "The impact of GHG emissions would be further reviewed with respect to direct and indirect impacts from a regional and global perspective. Total GHG emissions from the project would be compared against GHG emissions emitted globally, nationally, and within Minnesota. GHG emissions from the Project could then be assessed against the overall contribution from each of these sectors as total emissions and as a percentage." In addition to these baseline metrics (used for comparative purposes), the assessment should compare the estimated average annual emissions of the facility (full facility carbon footprint, both direct and indirect sources, projected facility capacity factor) to the net incremental state-level GHG reduction found in the Minnesota Next Generation Energy Act for the proposed facility's initial year of operation. The Minnesota Next Generation Energy requires an GHG emission reduction from 148 to 122 million CO2-equivalent tons between 2015 and 2025 (or at an annual rate of -2.62 million CO2-equivalent tons between 2025 and 2050 (annual rate of -3.49 CO2-equivalent short tons). This is based on the most recent Minnesota Pollution Control Agency estimate of 2005 state-level baseline emissions. If the facility begins operation between 2020 and 2025, estimated total facility emissions should be compared to an incremental state-level reduction in the initial years of the facility's operation of -2.62 million CO2-equivalent tons, and, if it begins operation between 2025 and 2050, to an incremental state-level reduction in the initial years of the facility's operation of -3.49 million CO2-equivalent tons. Action requested: Modify text as appropriate in the GHG section. Modify text as appropriate in section 11.3.2. Future discussion item.	See Comment 556.	RESOLVED. Further discussion will be required for the EIS for locating the scale of projected TMM GHG emissions in the larger framework of state-level GHG policy and reductions targets, as well as in context of present-day emissions levels.	Twin Metals Round 2 Response

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
		Guidance. In addition to the pieces of analysis outlined in	See Comment 556.	RESOLVED for the purpose of scoping. Further	
		lines 6124-6147 with respect to GHGs, the assessment		discussion will be required for the EIS for locating the	
		should estimate the incremental impact of the proposed		scale of projected TMM GHG emissions in the larger	
		facility on the natural and built environment through its		framework environmental and social impact.	
		incremental contribution to global climatic change. In the			
		past, it has been a common practice to conclude that the			
		estimation of the incremental impacts of any single			
		facility were not (or are not) amenable to estimation or			
		analysis. With the development this last roughly 10 years			
		of social cost of carbon estimates, this is no longer true.			
		Social cost of carbon relates emission of the next or			
		marginal ton of GHGs to their damages via formal			
		modeling of GHG atmospheric retention, the response to			
		climate of the next ton of GHG accumulation in the			
		atmosphere for each forecast year modeled, roughly the			
		present out to 2100, and damages from the accumulation			
		of GHGs in the atmosphere. The modeling relies on			
		relationships found in the scientific literature relating			
		climate change to impacts to: agricultural production,			
		forestry, human health, sea level and coastal settlement,			
		labor productivity, tourism, amenities, natural species			
		and habitat and other resources or activities. Damages in			
		this construct are monetized damages, discounted using			
		various discount rates. In 2016, the Minnesota Public			
		Utilities Commission (MPUC) formally adopted a damage			
		cost value for incremental GHG emissions from power			

mment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
		generation using as a base estimates of the social cost of			
		carbon from national analyses. Adjusted by GWP, the			
		MPUC damage cost value can be used to estimate the			
		stream of future damages from the emission of any			
678	lines 6124-	greenhouse gas. These damage cost estimates (CO2			
	6147	externality values) should be used in evaluating the			
		incremental average annual and lifetime environmental			
		impacts or damages resulting from the proposed project.			
		The damage-cost estimate that presently is in use			
		(calendar year 2020) by the MPUC in its proceedings is			
		\$9.05 to \$42.46 per ton of emitted CO2, with a mid-point			
		of \$25.76 per ton. Under MPUC order, this will rise to			
		\$11.16 to \$51.47 per ton of emitted CO2 by 2030 (2015			
		dollars). As in the case of climate forecasts, it is			
		permissible to opt out of the use of these values with a			
		clear demonstration, based on the criteria given in			
		Environmental Quality Board rules for nonavailability of			
		information, that the MPUC-generated values do not			
		adequately represent the stream of likely marginal			
		damages from the next ton of emissions or that the			
		modeling on which the those values were generated was			
		flawed or too uncertain for use. Action requested:			
		Modify text as appropriate in the GHG section. Modify			
		text as appropriate in section 11.3.2. Future discussion			
		item.			

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Round 1 Comment Twin Metals Round 1 Response RGU Round 2 Comment		Twin Metals Round 2 Response	
679	lines 6148- 6317	Guidance. For consistency, to the degree that this is practical, the assumption of persistent human-forced climatic change as background condition for the project should extend to all other environmental modeling, including the modeling of impacts to terrestrial and air resources. Fundamental processes like ozone formation or mercury methylation are temperature-sensitive, hence depend on what is assumed about future climate. Action requested: Modify text as appropriate in the GHG section. Modify text as appropriate in section 11.3.2. Future discussion item.	See Comment 556.	ADDITIONAL GUIDANCE. RGU notes the scope of climate analysis may include requirements reflecting CEQ's "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews," memorundum, August 1, 2016, cited in project proposer's response to comment 710 (Section 14.0, Cumulative Effects). This guidance addresses the role of future climate change as a background condition in project-specific evaluation, including modeling of impacts to terrestrial and air resources. Action requested: Consider the guidance and modify the text as appropriate to address the issue.	need to be considered as part of impact analysis and GoldSim modeling. TMM plans to resolve necessary climate considerations as part of future discussions identified within the MDNR comment submission dated	
680	6162	underground blasting activities that may exhaust from the ventilation raises. Action requested: Modify text to address item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		
681	6165	Note. All emission factors used for blasting assumptions will need to be verified before conclusions can be drawn. No action requested.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping.		

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
682	6225	Guidance. The Federal Regional Haze rule 40 CFR \$51.308, establishes a goal of attaining natural visibility conditions by the year 2064. Generally, States submit State Implementation Plans (SIP) to show progress toward attaining this goal every 10 years, although the originally scheduled 2018 SIP revision submittal deadline was extended to 2021. The next scheduled full SIP revision is due 2028, and every 10 years thereafter. In developing its long-term strategy for each 10-year SIP, the State must consider the anticipated net effect on visibility due to projected changes in point, area, and mobile emissions over the period. The State must include sources or groups of sources selected for consideration to evaluate the feasibility for controls. In developing the current SIP submittal (due 2021) for regional haze, Minnesota selected an emissions/distance threshold for sources to evaluate emissions controls. Using the criteriaif the proposed project existed today-Minnesota would require the proposed facility to evaluate the feasibility of emissions controls. The regional haze program requirements specify four factors to evaluate the feasibility of emissions controls: Cost of compliance, time necessary for compliance, the energy and non-air quality environmental impacts of compliance, and the remaining useful life of any potentially affected anthropogenic source of visibility impairment. Project proposers should address these four factors to evaluate potential controls as part of the project scope in an attempt to avoid the prospect of potential retrofits soon after. Project proposers should consult with the MPCA air quality team on carrying out this course of action. Action requested: Add to Sections 11.2.3 and 11.3.4 as warranted. Future discussion item.		RESOLVED.	
683	6251	Clarification. This section needs additional content on vehicle emissions and "other aboveground mobile equipment," including identification of the categories of impacts possible from these sources. Action requested: Add the specified content. Ensure that Section 11.3 addresses any future information needs.	Text has been edited to include examples of "other above ground equipment" and identify categories of impacts possible from vehicle tailpipe emissions.	RESOLVED for purpose of scoping . The scoping document will address any noise impacts due to operations of above ground mobile equipment.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
684	6242-6246	increased traffic in general, be included as project emission sources? May require consultation with MPCA.	Comment is noted. Emissions from mobile sources such as personal vehicles, busing, etc. are not considered part of "project emission sources'" when evaluating stationary source permitting. These kinds of emissions are however considered when evaluating GHG impacts. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping. DNR will engage TMM in concert with MPCA on appropriate project emission sources to include in the impact assessment.	
685	6247	Guidance. The potential to emit from all tailpipe source above and below ground needs additional supporting information prior to conclusions can be drawn for project impacts as well as modeled emission rates. Action requested: Ensure Section 11.3.1 identifies data needs as listed. Future discussion item.	Lines 6323-6324 in Section 11.3.1 acknowledge the need to further refine emission calculations. Additional data, as outlined in Section 11.3, including emissions inventories and calculations will be provided during EIS development	RESOLVED.	
686		Question: Will there be odor and dust monitoring/modeling/data collection, etc.? The text does not identify any future actions. RGU will need to review available information regarding the potential for dust and odor effects before identifying the treatment of the issue in the EIS. Action requested: Future discussion item.	modeling. For dust, see information on air quality. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and	RESOLVED for purpose of scoping. DNR will engage TMM on issues of odor and dust.	
687	6264	phase of the project. Action requested: Ensure Section 11.3 addresses likely AERA needs. Future discussion item.	outlined in Section 11.3, including a cumulative AERA will be provided during EIS development to satisfy the EIS scope.	RESOLVED.	
688	6308-6310	·	Text has been edited to read: "Revegetation practices associated with reclamation would reduce fugitive dust emissions during the reclamation and closure phase. Fugitive dust emissions would be mitigated in the post-closure phase."	RESOLVED for purpose of scoping. DNR notes that scoping documents will avoid using language that may be understood that closure mitigates fugitive emissions, or reads as if fugitive emissions during operations is mitigated at closure. This is incorrect.	

Comment	Line # Table #				
#	Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
689	6314	Clarification. Engineering controls and fugitive dust management practices need to occur during construction and closure and not only during operations. Action requested: Modify text to address item.	Text has been edited to clarify fugitive dust management practices will occur during construction, operation, and reclamation and closure phases of the Project. Text has been edited to read: "Engineering controls and fugitive dust management practices would be employed throughout the construction, the operational life and reclamation and closure phases of the Project;"	RESOLVED. See Comment 834.	
690	6319	Future scope. The section does not address the potential visibility impacts of plumes originating from the two exhaust ventilation raises as identified in Section 10.3. Action requested: Modify text to address the item or provide a rationale for why no assessment is deemed necessary.	Section 11.3.6 added to clarify that potential visibility impacts of plumes is part of future scope.	RESOLVED.	
691	6338-6339	RGU note. The EIS may also review potential alternative methods to reduce the impacts. No action requested.	Comment is noted.	RESOLVED.	
692	6340	·	Lines 6343-6344 establish that refinement of the site boundary and or modification of the receptor grid will be necessary. Additional data, as outlined in Section 11.3, including refinement of the site boundary and or modification of the receptor grid will be provided during EIS development to satisfy the EIS scope.	RESOLVED.	
693		Guidance. Modeling should follow guidance in the MPCA Air Dispersion Modeling Practices Manual guidelines related to Class I and Class II modeling. No action requested. Future work plans should reflect the cited guidance.	Comment is noted.	RESOLVED.	
694	6345	Guidance. The project should address baseline ambient visibility conditions in the Class I areas: Boundary Waters Canoe Area Wilderness and Voyageurs National Park. Baseline ambient visibility conditions are determined from Interagency Monitoring of Protected Visual Environments (IMPROVE) network monitoring stations BOWA1 and VOYA2 located within Class I area boundaries. The MPCA calculates the baseline ambient visibility conditions from these monitors, which are based on the most recent 5-years of speciated particulate matter less than or equal to five microns in size. Project proposers should consult with the MPCA air quality team on obtaining and incorporating the data. Action requested: Modify text to incorporate this guidance into section. Future disucssion item.	Comment is noted. Section 11.3.4 identifies the need to conduct Class I area impact analysis to satisfy environmental review requirements. Text has been edited to include, "visibility impacts analysis of haze." TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.

Comment	Line # Table #	RGU Round 2 New Comment	Twin Metals Response
#	Figure #	RGO Roulid 2 New Collillelit	i will ivietals kesponse
834	v2 6774-6775	Clarification. Section 11.2.7 implies that "based on preliminary modeling," coupled with engineering controls and management practices, there is no need to propose future assessment of the type and extent of potential dust generation during operations is proposed. While construction-related fugitive dust generation would be limited to the initial stages of project development, operational sources of fugitive dust generation would be possible over the 25-year life of the facility, especially at the tailings management site. As such the Future Scope at 11.3.1 should explicitly address potential fugitive dust generation during the 25-years of anticipated facility operations. Action requested: Modify the introductory sentence at Section 11.3.1 to read: "Preliminary emission calculations for the Project will be further refined to include all operations, including equipment and activities and emissions associated with sources generating fugitive dust not included to date." RGU notes review of the updated emissions calculations may lead to identification other potential impact areas not yet known.

MASTER Comment Tracking Table - Section 12.0 Noise

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
698	General	modeling results were provided within Section 12. There is a placeholder Appendix for noise in the document, so the assumption is that the relevant studies will be provided, but it would be beneficial to have early review of those studies for more thorough examination before	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. If additional data is required for assessing noise impacts - including monitoring and modeling - data will be provided during EIS development to satisfy the EIS scope.		See Comment 835.
699	6370-6372			RESOLVED for the purpose of scoping. DNR will work with the Superior National Forest to identify the basis of monitoring conducted between 2014 and 2016.	
700	6380-6388	ambient noise conditions at the Project area. Action	The other eight sites were not inapplicable but as discussed in lines 6380-6388 these three sites were chosen to represent seasonal variability and cover important noise-sensitive receptors.	UNRESOLVED. Clarification. The explanation of what the three selected sites offer makes sense, but does not account for the other two sites (of the five identified as proximal to the project area). If representing variability was desired, why were only three sites selected? What, specifically, made the other two either less desirable or irrelevant? (v2 Lines 6841-6843). Action requested: Provide the clarification and modify text as appropriate based on the response. See Comment 835.	Three sites were chosen to provide an initial screening model and TMM acknowledges the need to provide additional baseline information during EIS development as described in the revised future scope Section 12.3. This additional data will be provided during EIS development to satisfy the EIS scope.

mment Line # Tab	I RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
# Figure #	Clarification. The averaging time for the values provided in Table 12-1 is unclear - do the columns represent averaged/aggregated hourly averages over the course of the monitoring seasons? In order to best (and most accurately) assess ambient noise conditions in comparison to the state noise standards, the form of the provided statistics need to match the forms in Minn. Rules part 7030.0040; L _{eq} is not directly relatable to the hourly L ₁₀ and L ₅₀ standards. Further, the statistics need to reflect single hours of monitoring that are not averaged over a given season. Action requested: Address the item and modify text as appropriate.	Lines 6389-6399 identify that these measurements reflect single hour averages of monitoring calculated from one-second measurements in accordance with Minn. R. part 7030.0040. Those single hour averages were then used to calculate an Leq minimum, average, and maximum for both daytime and nighttime.	UNRESOLVED. Clarification. The cited text is still unclear. Is data for each of these locations from just one, single hour of monitoring? Or was monitoring conducted for	·

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
702	FIG 12	identified in figure 12-2, but it is unclear how exactly those receptors figured into the noise modeling efforts outlined in section 12.2.1. Each of the identified receptors fall under the NAC 1 (strictest) category. There may be a concern about noise at these receptors, particularly for those identified along the western shore of Birch Lake (receptors R01 through R12), as well as the campsites identified on the eastern edge of Birch Lake (R54 and R55). We would like to see the outcome of modeling on these receptors, particularly knowing how sound can carry over water (see comment 5, below). This may be less of an issue as the dry tailings area is filled and	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. If additional data is required for assessing noise impacts - including monitoring and modeling - data will be provided during EIS development to satisfy the EIS scope.	UNRESOLVED. See Comment 835.	See Comment 835.
703	6403		•	RESOLVED.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
704	6425	alarms. Action requested: Add text to address back up alarms. Cross-reference to RGU Comment 626.	Text has been edited in Section 8.2.1 to read: "These sudden, infrequent impulse noises such as back up alarms on mobile equipment or material handling at the plant site and tailings management site, could displace a variety of wildlife found in and around the Project area, including mammals and birds many of which could successfully relocate into adjacent habitats. The Project would aim to reduce the impact of both sudden, infrequent impulse noises and steady or continuous to receptors outside the Project footprint by ensuring noise levels remain below the NAC-1 nighttime limit of 50 dBA. At this level, impacts would be limited to sensitive receptors proximal to the plant site, tailings management sit and the potential significance of the impacts of noise on wildlife would be reduced."	RESOLVED.	
705	6448	Clarification. Aboveground crushing needs to be addressed for noise. Action requested: Add to list of bulleted items or provide explanation why not applicable.	This list of sources of noise is specific to the operation phase of the Project and no above ground crushing will occur during this stage.	UNRESOLVED. Clarification. The sources of noise assessed in the Noise Study apparently only focus on the operations phase of the project. A similar listing should be provided for the construction phase of the project, including the mobile jaw crusher located at the preoperational ore stockpile. Action requested: Provide a listing for the construction phase of the project. Based on the response, DNR will determine the future treatment of noise issues due to these project components for the EIS. See Comment 835.	The future scope Section 12.3 has been revised and will include an inventory of Project generated sounds, specifically "Impact assessment will include determining the maximum sound power levels of Project equipment during all phases of the Project and modeling the transmission of sound through the environment."

Comment #	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
706	6469-6474 6475-6482	mine operations, and excluded data collected regarding ambient (baseline or background) noise levels or modeled background noise. The MPCA interprets the noise standards in Minn. Rules Chapter 7030 as total standards,	provided that TMM believes are adequate to scope analyses for the EIS. Once the MDNR publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. If additional data is required for assessing noise impacts - including monitoring and modeling - data will be provided during EIS development to satisfy the EIS scope.	UNRESOLVED. See Comment 835.	See Comment 835.
707	6475	project-related changes in noise levels would be perceptible from the current condition at the three sites? Action requested: Modify text to address the item.	dBA) regardless of site, season, or time of day. Similarly, it can get louder at all locations, day or night, winter or summer, with maximum one-hour levels reaching 50 to 60 dBA. A change of 1-2 dBA would not be perceptible to barely perceptible. Only at >5 dBA would you consistently hear an audible difference. Therefore perceptibility of Project impacts could vary based site, season, or time of	information provided in the Noise Analysis, and accepting the premise that noise during operations is unlikely to be above state standards, DNR may determine the need to include in the Scoping EAW: 1) a demonstration of noise contours in the area, particularly where NAC 1 receptors are located; 2) a table listing hourly noise levels in L10	See Comment 835.

Comment #	Line # Table # Figure #	RGU Round 2 New Comment	Twin Metals Response
835	v2 6889-6892	Study Request. Section 12.2.1 identifies availability of an analysis of potential noise emissions due to the project. Later text at v2 Lines 6932-6937 summarizes the results of this analysis being "noise levels at sensitive receptors ranged from 0-42 dBA, which are well below the NAC-1 nighttime standard of 50 dBA." Action requested: If TMM intends base the assessment of potential project-related noise effects to this study, then DNR as RGU requests to be provided with this analysis to confirm the results reported in the data submittal, which will be used to inform future treatment of noise in the EIS. Otherwise, modify Sections 12.1 and 12.2 to identify where the current assessment is not relevant as well as update Section 12.3 to provide the proposed scope of future analysis.	The discussion included in this data submittal is still relevant as an initial screening model and TMM acknowledges the need to continue refining modeling and impact analysis related to noise generated by the Project during EIS development. The future scope related to noise has been revised, see Section 12.3. The purpose of this future scope will be to build off the baseline conditions and impact analysis presented in this data submittal to satisfy the data requirements of the MDNR. This additional data will be provided during EIS development to satisfy the EIS scope.
836	v2 6970	RGU notes the future treatment of noise issues in the EIS will reflect review of the Noise Analysis. See Comment 835.	See Comment 835.

Comment	Line # Table #		
#	Figure #	RGU Round 2 New Comment	Twin Metals Response
839	v2 7021	New Section. A new section should be added titled "Impacts to Local Roads / State Forest Roads and Minimum Maintenance Roads." This section should identify the elimination of MMR 1492 and any other impacts to DNR-Forestry administered roads affected by the project, including MMR 1494. Action requested: Add the section and address the comment as appropriate.	A section has been added that reads: "13.2.4 Impacts to Local Roads / National Forest Roads and State Forest Roads Initial construction access to the Project area would be from NFR 1900 and NFR 1901, via TH 1 while the Project access road is being built. Access to the ventilation raise sites would be from NFR 1900 and other existing roads. Surface ownership of the access roads is a mixture of state, federal, and private and any necessary access rights will be obtained prior to usage or construction. During construction, access to areas would need to be restricted to ensure the safety to the public and staff. While all areas that will require exclusion of the public has not yet been determined, it is anticipated that the plant site, ventilation raises, and tailings management site would require restricted access and fencing. Current National and State Forest Roads within the areas of potential ground disturbance of the plant site and tailings management site would be removed. The Project access road would be a private road constructed and maintained by TMM. It is anticipated that the access road would be accessible by the public and would provide access to existing surface roads which could be used to access both state and federal surface. The Project may require upgrading roads in the area, e.g. access to the ventilation raise sites. TMM has not proposed exclusive use to the National or State Forest system roads and proposes to pay for and develop any of the improvements required to meet safety requirements for the mine and the public, own the maintenance responsibility for the improvements during the operations, and conduct required reclamation at project closure. In addition, TMM would ensure that warning, and directional traffic signs would be installed and used as necessary."
840	v2 7021	New Section. A new section should be added titled "Impacts to Local Roads / National Forest Roads." This section should identify the estimated uses of NFR 1900 during construction, operations, and through reclamation and closure. Action requested: Add the section and address the comment as appropriate.	See Comment 839.

MASTER Comment Tracking Table - Section 14.0 Cumulative Effects

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
710	6625-6749	cumulative impact to mean "the impact on the environment that results from incremental effects of the project in addition to other past, present, and reasonably foreseeable future projects regardless of what person undertakes the other projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time." Working from that definition, it is necessary to evaluate the	to address this comment. The cumulative potential effects analysis will be focused on climate change impacts on natural sources, the built environment and human health primarily related to resiliency to these projected	Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews," memorandum, August 1, 2016, cited in TMM's response to comment 710 (Section 14.0, Cumulative Effects). This guidance addresses the role of	TMM acknowledges that climate change impacts will need to be considered as part of impact analysis and GoldSim modeling. TMM plans to resolve necessary climate considerations as part of future discussions identified within the MDNR comment submission dated 12/1/20. TMM anticipates agreed upon language would be reflected in any subsequent revisions of the SEAW data submittal or the MDNR scoping EAW.
711	6711	RGU note. Consideration will be given to existing dimension stone mining operations in defining potential existing and future projects whose impacts may intersect with the Project. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
712	6729	Clarification. "Area" is not defined. Define the radius used in this context and revise for consistency. Note that "area" used to name human disturbances appears to be wide, whereas "area" used to analyze project impacts is often smaller. Action requested: Provide qualifying text in summary to match treatment of geographic scale in the earlier sections.	Text has been edited to read: "Within the vicinity of the Project area (~10 miles [16 km]) there are many past human disturbances, which include:"	RESOLVED.	

Comment	Line # Table #	DOUB LONG .	
#	Figure #	RGU Round 2 New Comment	Twin Metals Response
841	v2 7116	RGU note. A determination will be required as to whether two other mining projects located within the same watershed have impacts with the potential to interact with the proposed project. These are the Northshore Mining Peter Mitchell Pit (active) and Dunka Mine Pit (closed). Both these pits contribute water to Birch Lake. Potential impacts of interest could include water quality of Birch Lake. No action requested.	TMM has reviewed the guidance provided and will consider the guidance in future work products.
842	v2 7167-7192	and forest management activity as a reasonably foreseeable future action in the project vicinity. DNR knows of several stands selected for examination and possible appraisal within the 10 year SFRMP being located in the project area. It is possible other timber harvest and forest management is known for Federal ownerships at the underground mine site, plant site, and transmission corridor. Project-specific potential effects that might interact with these actions include: habitat loss or changes; NPCs, rare natural communities, and sensitive vegetative species loss or change; sensitive terrestrial species loss or change; and noise related to mining and processing. Action requested: Update Table 14-1 to address this type of	Future scope for cumulative effects would include: •Characterization and analysis of existing and authorized land uses, e.g. all leases, licenses, easements and permits. This analysis would identify possible timber harvest and forest management directives which would could result in habitat loss or changes; NPCs, rare natural communities, and sensitive vegetative species loss or change; or sensitive terrestrial species loss or change. If any of these are identified as a potential effects they would be combined with the effects characterized in the biology future scope outlined in Section 8.3.1 to assess cumulative potential effects. Table 14-1 has been modified to account for the need for future work scopes for these resources.

725	Figure # Table 3-7	Action requested: Please revise with this consideration in	See Comment 175. The future use of the power infrastructure could require the transmission corridor to	RESOLVED for the purpose of scoping. DNR recognizes that greater specificity will be available over the course of EIS development. The Scoping EAW will identify that subsequent uses of the corridor would be determined during deactivation, but will engage TMM in estimating potential covertype acreages that account for removal of all auxillary facilities. DNR also notes that preliminary cost estimates would be required to support the EIS's treatment of financial assurance requirements. See Comment 860 regarding recommendations for all covertype tables.	
726		impervious surface in the "after" condition. Footnote 2 states the values are based on "planned post-closure	The 43.6 acres is based on the access road corridor being all impervious surface and leaving it in place. This is a simplification - the entire corridor would not be impervious and it assumes that future use/need is found for the road and it is approved pursuant to Minn. R. 6132.	RESOLVED for the purpose of scoping. DNR recognizes that greater specificity will be available over the course of EIS development. The Scoping EAW will identify that remaining impervious surface in the access road corridor would be determined during deactivation, but will engage TMM in providing a more refined estimate if deemed necessary. DNR also notes that preliminary cost estimates would be required to support the EIS's treatment of financial assurance requirements. See Comment 860 regarding recommendations for all covertype tables.	
727	Lable 3-8	are many structure that could meet the definition of a dam. Action requested: Add the potential need for a DNR dam safety permit to the table. Identify status as "if needed."	Table has been edited to include the potential need for a MDNR dam safety permit. A dam safety permit should not be required for the dry stack facility based on design however ponds used to captured and retain water that may meet the definition of dam in Minn. R., chapter 6115.	RESOLVED.	
728		Request height and storage volume of all such structures, including water ponds, contact water ditch embankment, etc.	Project descriptions have been provided that TMM	RESOLVED.	
729	Table 3-8	•	No jurisdictional determination has been made. Permit need would be pending any jurisdictional determination.	RESOLVED.	
730	table 3-8	Note. Any lease for use of state lands includes various provisions related to timber management, including requirements for timber damages. These are a provision of any lease that may be issued for the project. No action necessary.	Comment is noted.	RESOLVED for purpose of scoping. The Scoping EAW will note any lease issued for the project would include various provisions related to timber management.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
731	Table 3-8	Clarification. Include Public Water Permits for new culverts or replacement culverts. Action requested: Modify text to read: Permit to Work in Public Waters (water intake and outfall; new culverts and replacement culverts).	Table has been edited to read: "Permit for Work in Public Waters (water intake, outfall, new culverts, and replacement culverts)"	RESOLVED.	
732	Table 3-8	Clarification. Additional MPCA permits that should be added to this table include: "Individual NPDES/SDS or SDS permit" and "Solid Waste permit." It is likely that even without a point source discharge that at least an SDS permit will be needed for the project (ponds, treatment systems, etc. And, given the uniqueness of the DSF component to the project, MPCA will need to assess on a case-specific basis the potential need for a Solid Waste permit. The consideration of the need for these two permits will be coordinated to reduce duplicity of permits. Action requested: Modify the table to address the item.	See Comment 177 for details on NPDES/SDS permitting and Comment 276 for details on Solid Waste permitting.	RESOLVED for purpose of scoping. RGU Note: The Scoping EAW's permits and approvals table will identify that an MPCA Individual NPDES/SDS Permit, and a Solid Waste Permit, could be required for the project. The status column will read: "To be applied for, if needed."	
733	Table 6-1	Clarification. Is "unknown" watershed the same as Unnamed Creek in text? Action requested: Modify text to clarify.	No change made. The watershed is the: MDNR Minor watershed #: 72131. It is not the same as Unnamed Creek.	RESOLVED.	
734	Table 6-1	Addition. Requested action: Add column with the total watershed size.	Total watershed size has been added to the table.	RESOLVED.	
735	table 6-4	Clarification. Define "government controlled stations." Action requested: Add text or table endnote with a listing of governmental units control the stations listed.	Footnote added to table: "Government controlled stations are any station that is controlled by the MDNR, USGS, or by both."	RESOLVED.	
736	Table 6-5	Clarification. At Line 2929, Keeley Creek is mentioned here but not listed as stated in Table 6-5. Action requested: Modify Table 6-5 to address the item.	See Comment 402.	RESOLVED.	
737	Table 6-6	Question. How was the Mean Daily Baseflow derived on this table? Action requested: Add footnote to identify the method used for this.	Method for deriving mean daily baseflow is described on lines 2930-2937.	RESOLVED.	
738	Table 6-6	Clarification. The table should list number of samples at	Table updated to add a footer indicating there were 1,826 mean streamflow values for each station.	RESOLVED.	
739	Table 6-7	Note. Ensure that mercury is included in future analysis and modeling as appropriate. Action requested: Future discussion item.	Mercury is included in the analytical sampling of surface and groundwater (as shown in Table 6-9 through Table 6-10 and Table 6-26 through Table 6-28).	RESOLVED for purpose of scoping. The scoping document will identify the specific parameters of interest to be provided for the EIS impact assessments.	
740	Table 6-7	Clarification. Waterbody names should be included with Site IDs in the table. Action requested: Modify text to address the item.	Table has been modified to include waterbody and watercourse names.	RESOLVED.	

Comment	Line # Table #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
#	Figure #				
741		Action requested: Include moose or provide a rationale for not including moose in the table.	Moose are not identified in the Table due to the screening methodology used - see lines 4743-4751. Specifically the screening used the Minnesota Rare Species Guide. While the moose has habitats that are within the Project area the moose is not listed because its range as defined by the MDNR does not fall within the Border Lakes Subsection. The MDNR updates these range maps based on their biotics database, but some species like the moose are not defined because the biotics database does not have any records.	inclusion, habitat associations, and similar), which has the potential to exclude a species due to lack of information, in this case moose. It is a known issue that the range map is completely blank for the moose RSG, but this is	include moose.
742	Table 8-7	1 '	described by the MDNR Rare Species Guide are those commonly used by a species but are not inclusive of all	RESOLVED.	
743	Table 8-7	Footnote. The statement that the project is not expected to have an impact on northern bog lemmings is overreaching. The RSG states that large tracts of peatlands should be protected, but it states that they are found elsewhere including conifer forests, black spruce swamps, shrubswamps, or similar. This statement below the table should be removed and the column "potentially present in areas of potential ground disturbance" should be changed to an "X." Action requested: Modify text to address the item or provide explanation as to why not appropriate.		RESOLVED.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
744		•	No change made. Only habitats that were identified as being present - using the methodology described on lines 4743-4751 - in the Project Area are listed.		The footnote for Table 8-17 (revised numbering) has been edited to read: "[1]The habitats described by the MDNR Rare Species Guide are those commonly used by a species but are not
745	Table 8-8	Clarification. The column "potentially present in areas of potential ground disturbance" for Blanding's turtle should be marked with an X. Action requested: Modify table to address the item. Ensure any potential project impacts are adequately identified in other section(s) as appropriate.		RESOLVED.	
746	Tables 11-1 thru 11-5		Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
747	Table 11-2	sources should clearly define drilling and blasting emissions for construction of raises and declines. Same table should also define those constructed features as emission sources once constructed. Action requested: Address issue.	See Comment 671. Lines 6323-6324 in Section 11.3.1 acknowledge the need to further refine emission calculations. Additional data, as outlined in Section 11.3, including emissions inventory and calculation will be provided during EIS development to satisfy the EIS scope.	RESOLVED for purpose of scoping. DNR understands TMM will further define drilling and blasting emissions in developing the EIS.	

	Round 2 Agencies NEW Comments [Date TBD]					
Comment #	Line # Table # Figure #	RGU Round 2 New Comment	Twin Metals Response			
818	v2 3-18	Regulatory Guidance. Table 3-18 correctly acknowledges the potential need for a DNR Burning Permit. If issued, it will reflect burning policies at the time as well as current fire danger conditions. No action requested.	TMM has reviewed the guidance provided and will consider the guidance in future work products.			
819	v2 1984- 1991 Tables 3-8 to 3-16	Information Need. The cover types estimates provided in Tables 3-8 to 3-16 are limited to the pre-project and post-project (i.e., reclamation) conditions. This cited text acknowledges this by noting "[d]uring the construction and operation phases these land covers would be converted to accommodate the Project facilities." To fully account for project impacts, especially detailing impervious surface creation due to the project, estimates should be provided for each land cover type during operations for each of the tables. This could be accomplished by inserting a new column titled "Operations" in each table to accomplish this. Action requested: Modify the cited tables to include land cover changes attributable to operations.	that estimates the land cover type during operations.			
845	v2 5-2	Clarification. Are the site units and slope qualifiers on a map? Action requested: Provide a response.	The site units and slope qualifiers are shown on the map. See Comment 853.			
846	v2 6-9	Table Expansion. Note #1 states: "Average concentrations of five sampling events in 2017 and 2018; DMSW20 averages only four sampling events because it was not sampled in May 2018." Because providing only the average values is not particularly meaningful, Table 6-9 should be expanded to provide columns to individually list the sampling date and value for each of the events per site. It is probably best to expand the table horizontally, shifting the four Birch Lake sites to the last four columns (opposed to being the first four columns now). Action requested: Add each of the sampling dates/values for all locations to the table.	For the purposes of scoping, within the SEAW data submittal the intent of characterizing water quality data in average values was meant to provide a baseline understanding of wate quality. TMM acknowledges additional data and analysis will be required as part of the supporting impact studies within the EIS scope, which TMM will provide through the Water Resources Data Package.

847	v2 6-10	Table Expansion. Note #1 states: "Average concentrations of five sampling events in 2017 and 2018; DMSW20 averages only four sampling events because it was not sampled in May 2018." Because providing only the average values is not particularly meaningful, Table 6-10 should be expanded to provide columns to individually list the sampling date and value for each of the events per site. It is probably best to expand the table horizontally, shifting the four Birch Lake sites to the last four columns (opposed to being the first four columns now). Action requested: Add each of the sampling dates/values for all locations to the table.	For the purposes of scoping, within the SEAW data submittal the intent of characterizing water quality data in average values was meant to provide a baseline understanding of water quality. TMM acknowledges additional data and analysis will be required as part of the supporting impact studies within the EIS scope, which TMM will provide through the Water Resources Data Package.
848	v2 6-26	Table Expansion. Note #1 states: "Average concentrations of ground from three sampling events (with only two samples are available for MN-503B4)." Because providing only the average values is not particularly meaningful, Table 6-26 should be expanded to provide columns to individually list the sampling date and value for each of the events per site. It is probably best to expand the table horizontally. The depth at which the sample was taken should also be listed. Action requested: Add each of the sampling dates/values for all locations to the table.	For the purposes of scoping, within the SEAW data submittal the intent of characterizing water quality data in average values was meant to provide a baseline understanding of water quality. TMM acknowledges additional data and analysis will be required as part of the supporting impact studies within the EIS scope, which TMM will provide through the Water Resources Data Package.
849	v2 6-27	Table Expansion. Note #1 states: "Average concentrations of ground from three sampling events (with only two samples are available for MN-503B4)." Because providing only the average values is not particularly meaningful, Table 6-27 should be expanded to provide columns to individually list the sampling date and value for each of the events per site. It is probably best to expand the table horizontally. The depth at which the sample was taken should also be listed. Action requested: Add each of the sampling dates/values for all locations to the table.	For the purposes of scoping, within the SEAW data submittal the intent of characterizing water quality data in average values was meant to provide a baseline understanding of water quality. TMM acknowledges additional data and analysis will be required as part of the supporting impact studies within the EIS scope, which TMM will provide through the Water Resources Data Package.

Comment	Line # Table #	DCU Reund 3 New Comment	Turin Mattela Despense	
# Figure #		RGU Round 2 New Comment	Twin Metals Response	
850	v2 6-28	Table Expansion. Note #1 states: "Average concentrations of ground from three sampling events (with only two samples are available for MN-503B4)." Because providing only the average values is not particularly meaningful, Table 6-28 should be expanded to provide columns to individually list the sampling date and value for each of the events per site. It is probably best to expand the table horizontally. The depth at which the sample was taken should also be listed. Action requested: Add each of the sampling dates/values for all locations to the table.	For the purposes of scoping, within the SEAW data submittal the intent of characterizing water quality data in average values was meant to provide a baseline understanding of water quality. TMM acknowledges additional data and analysis will be required as part of the supporting impact studies within the EIS scope, which TMM will provide through the Water Resources Data Package.	
851	v2 8-15	Table addition. The Minnesota State Wildlife Action Plan includes two other rare species that could be found in the area: the woodland jumping mouse and the water shrew. Neither have a state status, because so little is known about their status in the state. Action requested: Add these two species to the table with a description of why.	Table has been edited to include the American water shrew (Sorex palustris) and the woodland jumping mouse (Napaeozapus insignis). A note has been added that reads: "[2] The American water shrew and the woodland jumping mouse are included as "Species for which data were insufficient to determine if it met [Species of Greatest Conservation Need] criteria" in the 2015 - 2025 Minnesota State Wildlife Action Plan and are included in this table due to the unknown nature of their status in Minnesota. The American water shrew commonly inhabit hardwood swamps, mesic forests and around lakes and streams. The woodland jumping mouse commonly inhabit hardwood mesic habitats of coniferous forests and boreal swamps and also hardwood forests"	
860	v2 All Land Cover Tables	v2 Tables 3-8 through 3-16 provide before and after land cover conditions for the project. As Note [1] for each indicates, the acreages are "based on planned post-closure usage and reclamation types." Reporting the after condition in this respect is appropriate given end-use reclamation requirements under the Permit to Mine. However, this is incomplete for assessing potential project-related impacts over the full life of the project, especially for impervious surface creation. Action requested: Add a column that captures the maximum land cover change from the "before" condition over the life of the project. It is understood these values may be refined over the EIS.		

Round 1 - RGU's Review of Proposer's Initial Data Submittal [12/18/19] COMPLETED 06/15/20

Round 2 - RGU's Review of Proposer's Intermediate Data Submittal #1 [07/24/20] COMPLETED 12/01/20

MASTER Comment Tracking Table - Figures

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
748	Figure 1-1	Addition. The figure should include concentrate hauling to Duluth along the primary path. This can be added on the scale as offered. No need for an insert, just showing corridor leaving the site. Action requested: Edit figure.	Figure modified to show concentrate haulage to Duluth.	RESOLVED.	
749	Figure 1-1		Footnote added. "This layer was received in email from the MDNR Division of Lands and Minerals. The metadata is for: Mine Features (minefeatures.shp) Originator: Minnesota Department of Natural Resources (MN DNR) Division of Lands and Minerals. " Abstract: The Range Mining Features data layer contains detailed information regarding disturbed mining areas within the Mesabi Iron Range. Use Constraints: Credit given to MN DNR Division of Lands and Minerals	RESOLVED.	
750	Figure 2-1	Discussion. Need to consider environmental setting boundary from Minn. Rules Chapter 6132. No action requested. Future discussion item.	Comment is noted. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
751		Clarification. Based on the text at Line 526, it would be useful and improve clarity for figure 3-1 to include a box labeled "tailings management site" surrounding the tailings dewatering, engineered tailings backfill, and the	The tailings management site would only include the tailings dewatering plant and the dry stack facility. The tailings dewatering plant would include the infrastructure to produce the engineered tailings backfill - however it is not part of the tailings management site as it would be pumped from the tailings management site through pipelines to the underground mine for permanent storage.	RESOLVED.	
752	Figure 3-1	Future figure development. Consider more diagrams/figures like these to assist with understanding, providing a more detailed focus on any given step. Action requested: Provide additional figures in next information submittal.	Please clarify the request	UNRESOLVED. DNR will engage TMM to develop a limited set of additional schematics that can assist with general understanding of the proposed project.	TMM plans to resolve MDNR data needs as part of future discussions identified within the MDNR comment submission dated 12/1/20.

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
753	Figure 3-3	Addition. Include stormwater and non-contact water on this diagram or another. Action requested: Edit figure or add new figure.	Figure 3-3 has been revised. See Comment 71 for information concerning water definitions.	UNRESOLVED. As requested Figure 3-3 was revised to add a precipitation pathway for both the plant site and tailings management site. The figure then shows precipitation in "contact areas" being directed to contact area ponds, all of which contributing to the process water pond. The figure however does not provide a pathway for precipitation that falls on "non-contact areas," which is directed to non-contact ponds and eventually drain to Birch Lake. It would seem such a non-contact water pathway could be added to the figure to clarify the fate of precipitation falling on the non-contact areas. Action requested: Consider the comment, and unless there's a reason why this would not meet the purpose of the comment, add the requested non-contact water pathway to the figure.	
754	Figure 3-3	Recommendation. Spell out DSF for ease of understanding. Action requested: Provide full term.	Figure 3-3 has been revised.	RESOLVED.	
755	Figure 3-3	Future figure development. A more in-depth water movement figure is needed. Action requested: Consult with DNR on what should be included in the next level of figure detail for the process water flow dynamic.	Project descriptions have been provided that TMM believes are adequate to scope analyses for the EIS. Project descriptions are expected to be updated during EIS development to satisfy the EIS scope. Text has been added to Section 2.0 to outline additional details that may be provided in updated project descriptions including details on water management and water definitions.	RESOLVED.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
756		Clarification. Route from Site 2 to Site 3 is not indicated as a route for the project. Note that text states that forest road 1900 only used during construction. Would there not need to be access during operations? Action requested: Respond to the query. Modify figure as appropriate.	National Forest Road 1900 will also be used during operations. Ventilation raise access is discussed in the glossary: "An existing drill road would be upgraded in order to access ventilation raise site 1 and 2. Ventilation raise site 3 would be accessed via the existing USFS road, National Forest Road 1900. A portion of National Forest Road 1900 would also be used to access the upgraded drill road," and line 418.	UNRESOLVED. The cited text distinguishes that the existing drill road will be upgraded to serve as the Ventilation Raise Access Road between Sites 1 and 2, with the upgrade serving as the reason for the color outline along it on the figure. However, even though NFR 1900 is proposed to be used for the project too during operations, it is not color outlined presumably because it is not being upgraded (like the drill road). To clearly identify how the three ventilation raise sites will be accessed over the life of the project, the line depicting NRF 1900 and the upgraded drill road should be colored and added to the legend with an appropriate label (such as Ventilation Raises Access Route or similar). This makes how these site will be accessed during operations clear while distinguishing that construction is planned only for the drill road from the intersection with NFR 1900 to the Ventilation Raise Site 1. Action requested: Modify the figure as requested.	The Project features are meant to show anywhere that the Project would potentially have ground disturbing activities which is why National Forest Road 1900 is not included in the Project feature. To provide the clarification requested a feature has been added to this map that shows the "Ventilation Raises Access Route."
757	Figure 3-9	Question. Does the plant site layout extend out into the stream channel? No action requested unless explanation is available. Future discussion item.	Plant site extends approximately 30 feet past the stream. These are preliminary construction grading limits.	RESOLVED.	
758	Figure 3-13	•	See lines 1442-1476 for discussion on the Non-contact Water Diversion area. Based on comment unsure what is specifically being asked but TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED.	
759		Clarification. On the east side, how are contact and non-contact waters kept separate? Appears to be a berm/dike. Would these meet the criteria of a dam? Action requested: Clarify and revise accordingly.	Contact and non-contact waters are separated by the diversion dikes. See lines 1453-1463. See Comment 727.	RESOLVED for purpose of scoping. As offered in TMM's response to comment 727, DNR concurs that the ponds used to captured and retain water, including the associated berms and/or dikes, require a determination as to whether they may meet the definition of dam in Minn. Rules Chapter 6115.	
760	Figure 3-13	Addition. What are the dark blue thick lines? Action requested: Define and add to legend.	Thick blue lines are ditches. Legend has been modified to add this feature.	RESOLVED.	
761	Figure 3-13	Question. What is the shape of magenta (non-contact diversion area) on the east side (near pond 5)? Action requested: Respond to question.	The non-contact water diversion area is defined to encompass all necessary infrastructure and impacts that could result from non-contact water management. The non-contact water ponds on Figure 3-13 are shown as the size pond that would form from a 100-year, 24-hour storm event.	RESOLVED.

762	Figure 3-13	Clarification. Based on the text at Lines 821-823, the tailings dewatering plant seems to be a series of buildings as in Figure 3-13. Consider labeling the figure to coincide with the text or alter definitions. Action requested: Modify the figure to provide the requested clarity.		RESOLVED for purpose of scoping.				
763	Figure 3-13	Clarification. Fig. 3-13 does not identify all components of water management infrastructure such as the contact water ditch (as provided at Lines 880, 1099). It also shows a culvert from the dry stack facility to an area that does not have a contact water pond. On Fig 3-31, this culvert is shown between the label for "E-house Switchyard" and the label for "Emergency Pond." Action requested: Because this text specifically summarizes the content on Figure 3-13 (the correct reference), modify figure to address the item. Action requested: Modify figure to provide clarity.	Figure has been modified to show the extent of the contact water ditches. Culverts in question are positioned to drain stormwater towards the contact water ditch.	RESOLVED.				
764	Figure 3-13	Clarification. In concert with text at Lines 1452 and 1462, the non-contact ditches are not clear on Figure 3-13 (e.g., thickness correct?). Recommend add legend or label as needed. Action requested: Modify figure to provide clarity.	Legend has been modified to account for ditches. All ditches within the non-contact water area are non-contact water ditches. See lines 1442-1476. The non-contact diversion dikes intercept and divert water around the tailings management site. The non-contact water ditch is shown as a cross-section in Figure 3-20.	RESOLVED.				
765	Figure 3-14	Clarification. Please elaborate on why stages 1-3 do not appear to incorporate benching construction? All other stockpiles are built in layers bottom to top. Is this not how construction is proposed for the dry stack? Action requested: Respond to question.	The dry stack facility does incorporate benching. Benching is shown on Figures 3-14 and 3-19. See lines 941 942. "The exterior side slopes of the dry stack facility would have 16 ft (5 m) wide benches at 46 ft (14 m) vertical intervals."	RESOLVED.				

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
766	Figure 3-14		This figure does not depict reclamation - i.e. the coloring/shading does not depict reclamation. The coloring/shading only depicts the different construction stages. See lines 1007-1009. "The dry stack facility would be concurrently reclaimed throughout the Project operation phase. As portions of the slope and crest of the dry stack facility are constructed, the completed surfaces would be concurrently reclaimed with a cover. "		The figure is appropriate in showing the phased construction of the dry stack facility and is not meant to represent reclamation of the dry stack facility. By maximizing the vertical extent of the dry stack facility the footprint could be expanded in phases over time. This staged approach would limit the amount of exposed tailings at any point in time which aids in the water management strategy as well as the dust management strategy. Additionally, the stage approach would minimize the footprint of the dry stack facility for as long as practical to delay impacts related to clearing and grubbing.
					Descriptions related to the construction of the dry stack facility and reclamation exist several places in the text, e.g. Section 3.6.2.6 Tailings Management Site - Tailings Management Site Construction Phase and Tailings Management Site Reclamation, Closure, and Post-closure Maintenance.
767	Figure 3-13 Figure 3-14	Recommendation. Consistent with text at 1413-1419, there would be benefit with development of new figures with the various stages (i.e., stages for figure 3-13 or 3-14). This would include location of interim ponds, for example. Action requested: Consider how this may be accomplished and apply if possible in next data submittal.	See Comment 244.	RESOLVED for purpose of scoping.	
768	Figure 3-19 or Page 26 (933- 1000)	placed on the dry stack and where is it sourced? The text implies this is to be coarse tails. Peat is mentioned as an	•	RESOLVED for purpose of scoping . Future inquiry into the subject likely during EIS preparation.	
769	_	Clarification. At Line 85 it is unclear what is intended by use of the term "structural zone." Action requested: Explain what this represents with the facility and modify text to clarify. Consider how might be depicted (if relevant) on Figure 3-19.	See Comment 159.	RESOLVED for purpose of scoping.	
770	Figure 3-20	Clarification. Detail 3 in 411 is referred to in diagram and does not seem to be in document. Clarify what would be included on that inset. Action requested: Respond to comment.	Please clarify the request	UNRESOLVED . There is a note that states "see detail 3 in figure 411," with an arrow pointing to the "drainage structure" on figure 3-20 near the right center of figure 3-20. To what does that note refer? Action requested: Provide a response.	said "see Blanket Toe Drain Detail in Figure 3-19." Figure
771	Figure 4-2	Addition. Label inset map with 1854 Treaty for clarity. Action requested: Modify inset.	Figure has been modified.	RESOLVED.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
772	Figure 4-3	Additional information. Please supply surface and mineral ownership maps. Also indicate if "control" has been obtained or is pending. Action requested: Coordinate with DNR on supplying this information.	Please clarify the deliverable required for the scoping process. TMM looks forward to continued engagement during the EIS development and will be responsive to inquiries and requests.	RESOLVED for purpose of scoping . DNR will provide a specific request for this information.	
773	Figure 4-3	Clarification. It appears the pale gray grid represents sections under the Legal Land Survey. Why is the grid discontinuous? Action requested: Respond and modify figure as warranted.	The pale gray grid represents general ownership classes that were used to create the zoning legend.	UNRESOLVED . The purpose of depicting the "general ownership classes" gridline is unclear. Is it a GIS artifact necessary to create the zoning legend? Can it be removed from the figure, or is there a note that can be added to describe what it is? Action requested: Implement any changes to Figure 4-3 consistent with the answer to the question.	The grids show the outlines of property parcels as shown in the v2 legend. To avoid any further confusion the figure has been edited to remove the borders of the land parcels.
774	Figure 4-3	Clarification. The difference between figures 4-3 and 4-4 is unclear? Private vs what type of land? Is Figure 4-3 more appropriately a land use figure than zoning? Action requested: Address and modify figure as warranted.	See lines 1880-1883. "A comprehensive map of local zoning and management areas can be found on Figure 4-3. Figure 4-4 shows private parcels of land within Lake and St. Louis Counties subject to local land or water management plans. Additionally, Figure 4-4 identifies the nearest residences, which are associated with the South Kawishiwi Association." Figure 4-4 displays only private (no state or federal) land where local zoning would be applicable.	RESOLVED.	
775	Figure 4-3	Recommendation. The project boundary should be moved out of the shoreland management area wherever possible. Structures and access roads should be kept out of the shoreland management area. Action requested: Revise as necessary. May be a future discussion item.	TMM acknowledges that the RGU may identify alternatives and disclose them in the scoping decision document.	RESOLVED.	

Comment #	Line # Table # Figure #	RGU Round 1 Comment	Twin Metals Round 1 Response	RGU Round 2 Comment	Twin Metals Round 2 Response
776		are residences on the west shore of Birch Lake that are very close (appears to be less than a mile) from the project and within Residential Recreational zoning classification. Action requested: Provide inset into Figure 4-4 that should include the tailings site and private lands	The purpose of this map is to show all Private Lands Zoning within the Project area. As these properties and their zoning is outside the Project area they are not shown. The data is part of two maps: zoning for these properties is shown on Figure 4-3 - Zoning and Land Use Map and the residences are shown in Figure 12-2 - Sensitive Receptors.	UNRESOLVED. As Figure 4-4 is currently presented, the figure shows all Private Land Zoning immediately adjacent to the Project area. DNR as RGU acknowledges what constitutes "existing land use of the site as well as areas adjacent and near the site" is subject to interpretation. It is noteworthy that the assessment of project impacts for visual resources in Figure 10-1 includes areas with private property on the west bank of Birch Lake. Similarly, private properties identified as sensitive receptors for the noise assessment include the west bank of Birch Lake and areas on the north bank of the South Kawishiwi River, both areas across from the Project Area. DNR believes it is appropriate to identify Private Land Zoning for potentially-affected private residences on the figure. DNR will continue to engage TMM, and will also coordinate with the respective local governmental units, to fully account for potentially affected land uses and existing zoning, to address this EAW item for scoping purposes. Action requested: Add the private residences identified as potentially subject to visual and noise impacts to the figure, while retaining the private residences adjacent to the Project area currently on the figure.	Figure 4-4 has been revised to include the private properties and zoning for the properties identified as sensitive receptors for the noise assessment on the west bank of Birch Lake and areas on the north bank of the South Kawishiwi River.
777	Figure 5-10	present a fair amount of detail for the wells depicted. Is there other data? How was the depth to bedrock determined? Action requested: Provide additional detail	Baseline data and impact assessments have been provided that TMM believes are adequate to scope analyses for the EIS. Once the RGU publishes the SEAW, and the draft and final scoping decision documents, TMM will review the required analysis and the data needs necessary to support the EIS. Additional data will be furnished during EIS development to satisfy the EIS scope.	RESOLVED.	
778	Figure 5-8	Several other maps, such as 5-9, 6-19, and 6-20 would benefit from this as well. Action requested: Implement in the next data submittal.	To help with readability Figures 5-8, 5-10, 6-19, 6-21, 8-2, 8-4, and 8-6 have been modified to show the information in the "Project area north" which includes the plant site, tailings management site, underground mine area, water intake corridor, ventilation raise sites and access corridor, and access road corridor Additionally, Figures 5-9, 5-11, 6-20, 6-22, 8-3, 8-5, and 8-7 have been added to show the information in the transmission corridor.		
779		Action requested: Modify figure.	These purple areas (e.g. directly northeast of Birch Lake reservoir) are waterbodies in the aerial photo. The other lakes are PWI Basins and appear as such, however, the South Kawishiwi River is a PWI watercourse represented by a polyline and not a polygon so the aerial photo shows.	UNRESOLVED. The explanation makes sense. DNR requests that a new legend feature be added for the "purple shaded" areas with the simple title: Non-Public Waters. Action requested: Modify the figure as noted.	The figure has been edited to include a "non-public waters" polygon. Note that while the South Kawishiwi River is a designated public watercourse the riverine areas to the northeast and north of Birch Lake have not been delineated as a public water basin and displays as a "non-public waters."

780	Figure 6-4	Clarification. Watershed names differ from figures 6-1 and 6-2. Confirm and revise if needed. Action requested: Confirm and modify as needed.	Figure 6-1 shows the USGS Hydrological Unit Code Watershed name and Figure 6-2 displays the MDNR Watershed name.	be used for modeling? Action requested: Provide a	TMM has developed Project-specific watersheds using LiDAR. For assessing impacts associated with the tranmission corridor TMM plans to use MDNR Stony River and Denley Creek watersheds as applicable.
781	Figure 6-6	Data Need. Streamflow should be monitoring on Keeley Creek in order to better determine watershed impacts from the tailings basin. Action requested: Ensure addressed in Section 5.3.	See Comments 391 and 397.	RESOLVED.	
782	Figure 6-8	Addition. Provide a definition for corehole. Action requested: Add definition to the notes.	See Comment 16.	RESOLVED.	
783	Figure 6-8	Question. Why is the B4 label in the BMZ? Action requested: Verify and revise if needed.	Deep Bedrock HGU – B4 monitor wells are discussed starting on Line 3200. "B4 Wells – 2-inch or 5-inchstainless steel wells installed by setting a cemented surface casing into the bedrock and then coring into the bedrock to the approximate bottom of the BMZ (approximately 300 ft to 2,200 ft [91.4 m to 670.6 m] depending on location) and isolating the well in the BMZ (approximately 200 ft (61 m) of screen)."	RESOLVED.	
784	Figure 6-13	Clarification. This figure needs more explanation. Action requested: Provide notes to explain what the figure is showing.	Figure is explained in the text. See lines 3409-3418.	RESOLVED.	
785	Figures 6-14, 6 15, and 6-16	Future data need. Additional wells should be installed to confirm potentiometric surface within the project boundary. No action requested. Future discussion item.	See Comment 578.	RESOLVED for purpose of scoping. DNR notes most groundwater monitoring for the project has been focused on the area where the underground mine will be located. Monitoring wells will need to be installed on other areas of the proposed mine site that currently have no groundwater monitoring to ensure baseline groundwater conditions are characterized for the entire project site. The locations for new monitoring wells will be discussed during EIS development.	
786	Figure 6-19	Scale. This map needs to be zoomed in to show more details. At its current scale, smaller-sized wetlands/types are not clear. This impacts understanding potential project impacts to wetland plant and animal species. Action requested: Consider a higher resolution figure for the next data submittal.	See Comment 778.	RESOLVED.	
787	Figure 8-5	Clarification. What are the orange shaded areas on the map? Does this mean the polygon represents the habitat appropriate to the NHIS feature? Action requested: Provide response and include in legend as appropriate.	Added footnote. The orange polygon shows the approximate location of the Eastern Heather Vole. This observation was made in 1940 without the aid of GPS and represents the likely area that it was documented.		The note "7. Eastern Heather Vole and Eastern Candlewax Lichen polygons shown to display extent/uncertainty of location." is only applicable to Eastern Heather Vole and Eastern Candlewax Lichen.

7 88	Figure 8-5	This way they can be more easily compared to the landcover types in the figures above 8-5. Also, species occurrences in the areas surrounding the project site	NHIS species locations outside the Project area are included. Due to data license restrictions, mapping has been done in two ways. Outside the Project area locations of the sensitive species are shown, but species are not identified by name. Within the Project area species are identified however the location is obscured.	RESOLVED for purpose of scoping. Rare species data sharing limitations are noted. Future discussions may be warranted.	
789	Figure 8-7	Addition. Indicate on map area over which survey was conducted. Presume it would depict areas that were surveyed but no rice found (or lower density than 1). Action requested: Modify figure.	Figure has been modified.	RESOLVED for purpose of scoping. DNR notes verification of survey area will be needed and expects to engage TMM on future data collection, especially areas going upstream from Birch Lake, (into streams or rivers). This will be addressed in the scoping documents.	
790	Figure 10-2	(across river from dry stack) also be included on this figure? Action requested: Consider the question and modify as appropriate.	The visualization simulation point is shown in Figure 10-1 represented by the camera on the west side of Birch Lake reservoir. Figure 10-2 shows the different viewshed analysis locations. These analyses are distinct and should be kept separate.		
791	Figure 12-1		Figure has been corrected.	RESOLVED.	
792	Figure 12-2	Addition. Include all mine features on this map. Action requested: Modify figure.	Figure has been modified.	RESOLVED.	
793	Figure 13-1	Requirement. Public Waters Work Permits will be required for any new or modifications of existing public waters crossings along the new Tomahawk Road. Include on figure and ensure discussed in text. Action requested:	•	RESOLVED.	
794	Figure 13-1	Confirmation. Does this figure represents roads for all time periods, including construction, operations, and closure. Action requested: Provide confirmation.	The figure shows roads for all time periods.	RESOLVED.

795		and peak wind speeds and direction, would be informative for reviewers. Action requested: Add a new figure.			

	Round 2 Agencies NEW Comments [Date TBD]					
Comment #	Line # Table # Figure #	RGU Round 2 New Comment	Twin Metals Response			
852	v2 4-1	Regulatory note. Several stands selected for examination and possible appraisal within the 10 year SFRMP are in the project area at the dry stack facility. Merchantable timber resources would need to appraised and charged for damages or appraised and sold prior to construction activity. Twin Metals would need to give notice to the DNR Forestry regarding construction timelines, and possibly compensate loggers for timber that they may have already purchased the stumpage for, but would not be able to harvest, prior to construction, if approved.	TMM has reviewed the guidance provided and will consider the guidance in future work products.			
853	v2 5-10 & 5-11	Clarification. It is unclear if the site units and slope qualifiers are depicted on the revised figures? Action requested: Provide response and if no, then see if they can be added to the figures.	Previously, select site units and slope qualifiers were shown. To provide additional data the figures have been revised to include all site units and slope qualifiers.			
854	v2 6-2	Clarification. Add a one-mile buffer around the Project Area to identify the watersheds that occur within one mile of the project. Action requested: Add the buffer and label as such on the legend.	The watershed boundaries adjacent to the Project area are shown in Figures 6-1 through 6-4. A one-mile buffer for the purposes of watershed analysis is arbitrary. Section 6 discusses potential surface water impacts and references relevant watershed boundaries.			
855	v2 6-3	Clarification. Add a one-mile buffer around the Project Area to identify Public Waters that occur within one mile of the project. Action requested: Add the buffer and label as such on the legend.	See Comment 854.			
856		Clarification. Why was the geometric mean used to calculate the averages in figure 6-12 and not the arithmetic mean? The geometric generally is smaller than the arithmetic mean. Action requested: Modify the figure to plot the arithmetic mean unless it can be demonstrated that the geometric mean is a more appropriate statistic to use with the type of data. Appropriate transformations should be applied to the data to normalize it before calculating the arithmetic mean if the data is not normally distributed.	Figure 6-12 was produced to be illustrative of baseline data for the purposes of contextualizing baseline characteristics within the SEAW data submittal. Future water resource data packages will provide the full data sets and methodologies for evaluating data.			
857	v2 10-1	Figure enhancement. The horizon view of the sky above the Dry Stack Facility and Plant Site appears to simulate overcast conditions in moderately-dark gray, which makes it difficult to distinguish the similarly gray-shaded Dry Stack Facility. Action requested: Modify figure to allow better definition between the skyscape and the two project features over the treeline. Consider using a partly-cloudy, cumulus-type of clouded sky that might be expected in spring or summer months.	I I IVINI has noted this and will take it into consideration for
