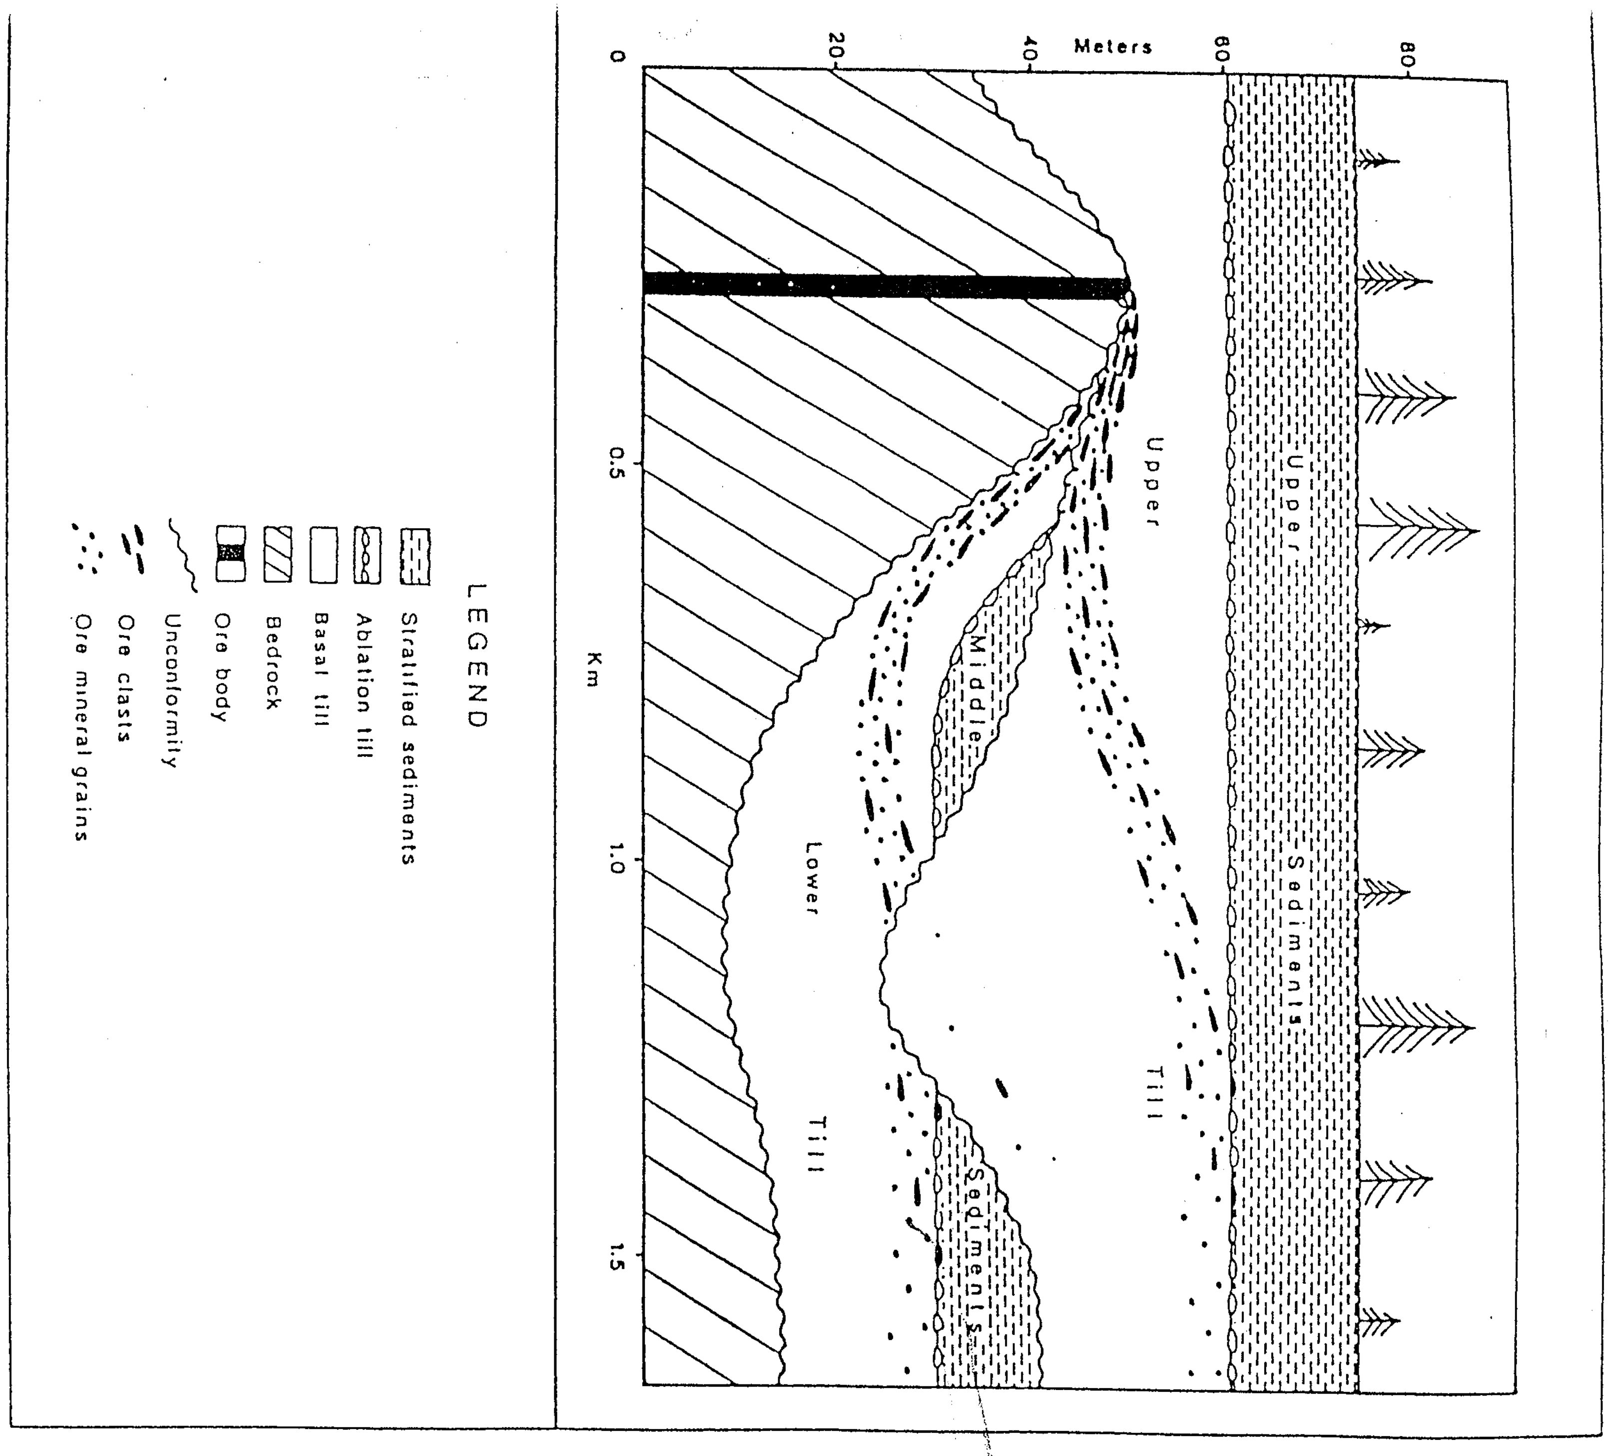

Figure 1. Dispersion pattern for two tills with gold source on a bedrock high (Developed by Overburden Drilling Management Ltd.).

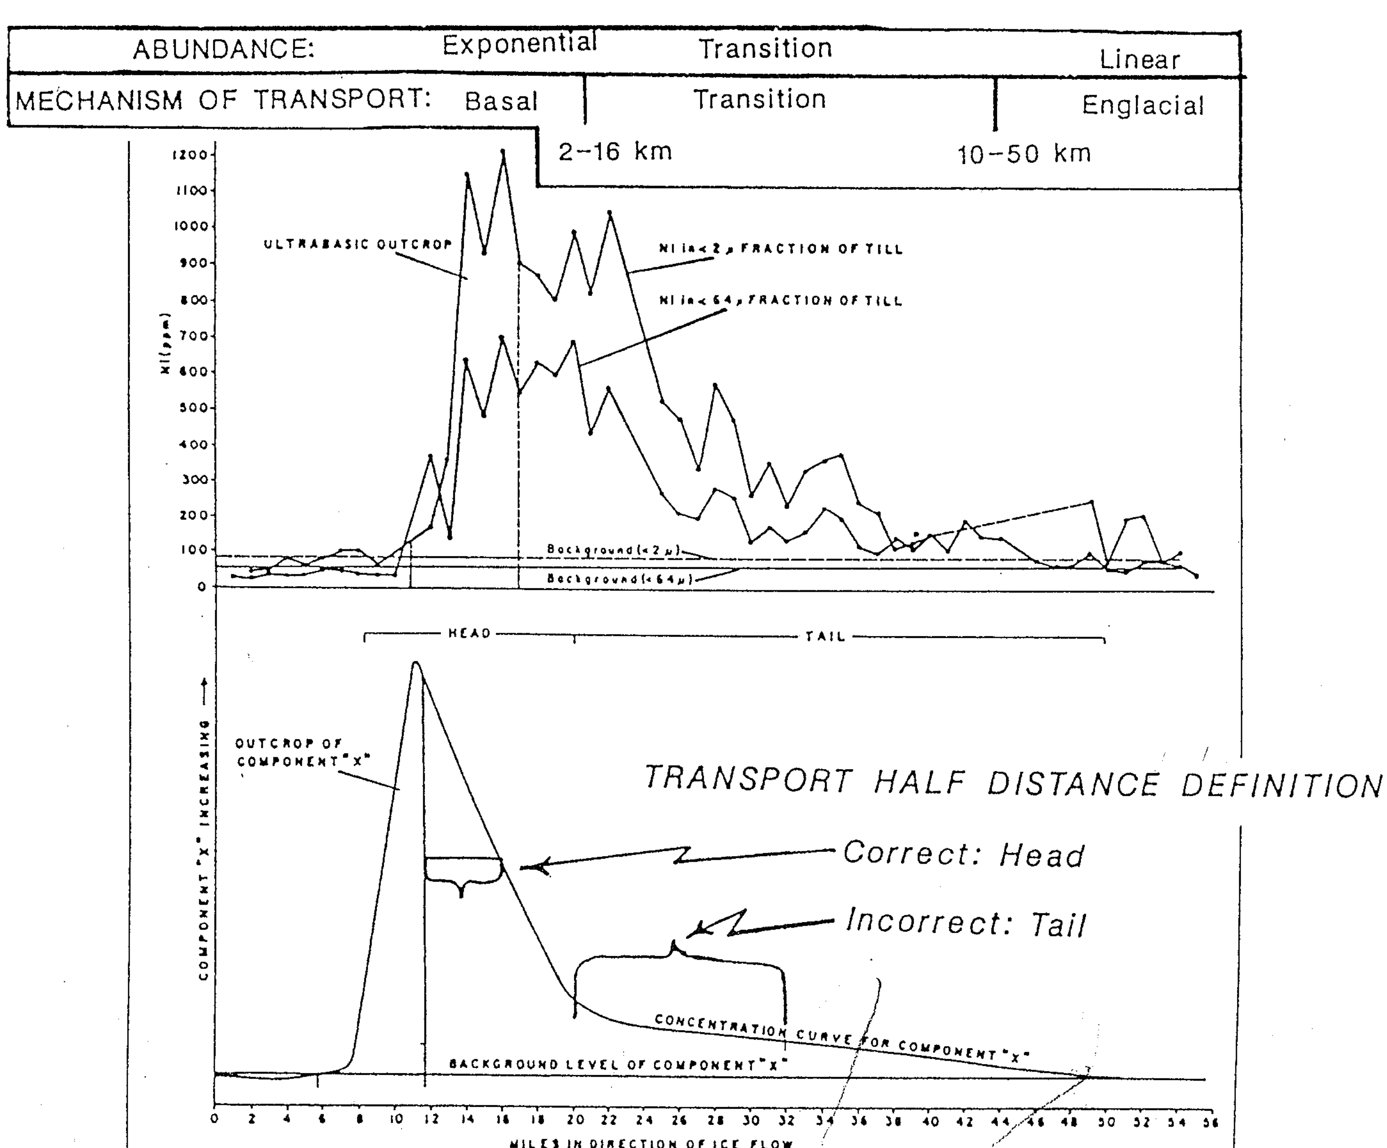
Figure 2. Example of actually found (upper graph) and idealized (lower graph) glacial dispersal curves. (Modified from Bolviken and Gleeson, 1979; after Shilts, 1976; and Strobel and Faure, 1987.)



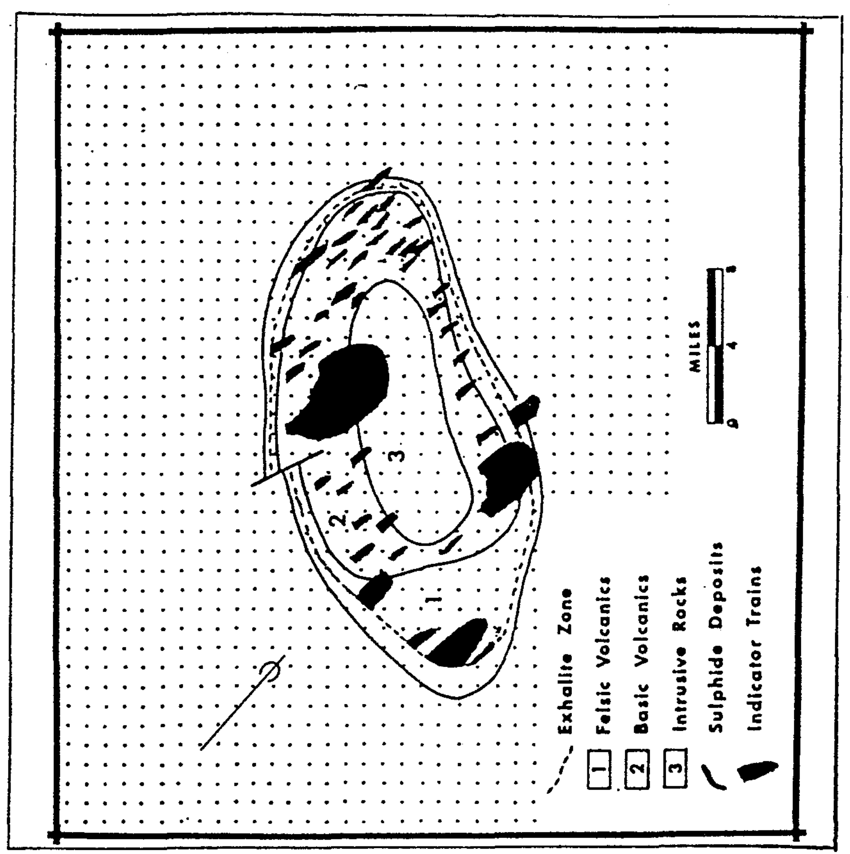


Figure 3. A cluster of dispersal trains of Cu-Ni showings in a regional survey in Archean terrane in the Rankin-Ennadai area, Canada (from Shilts, 1975).

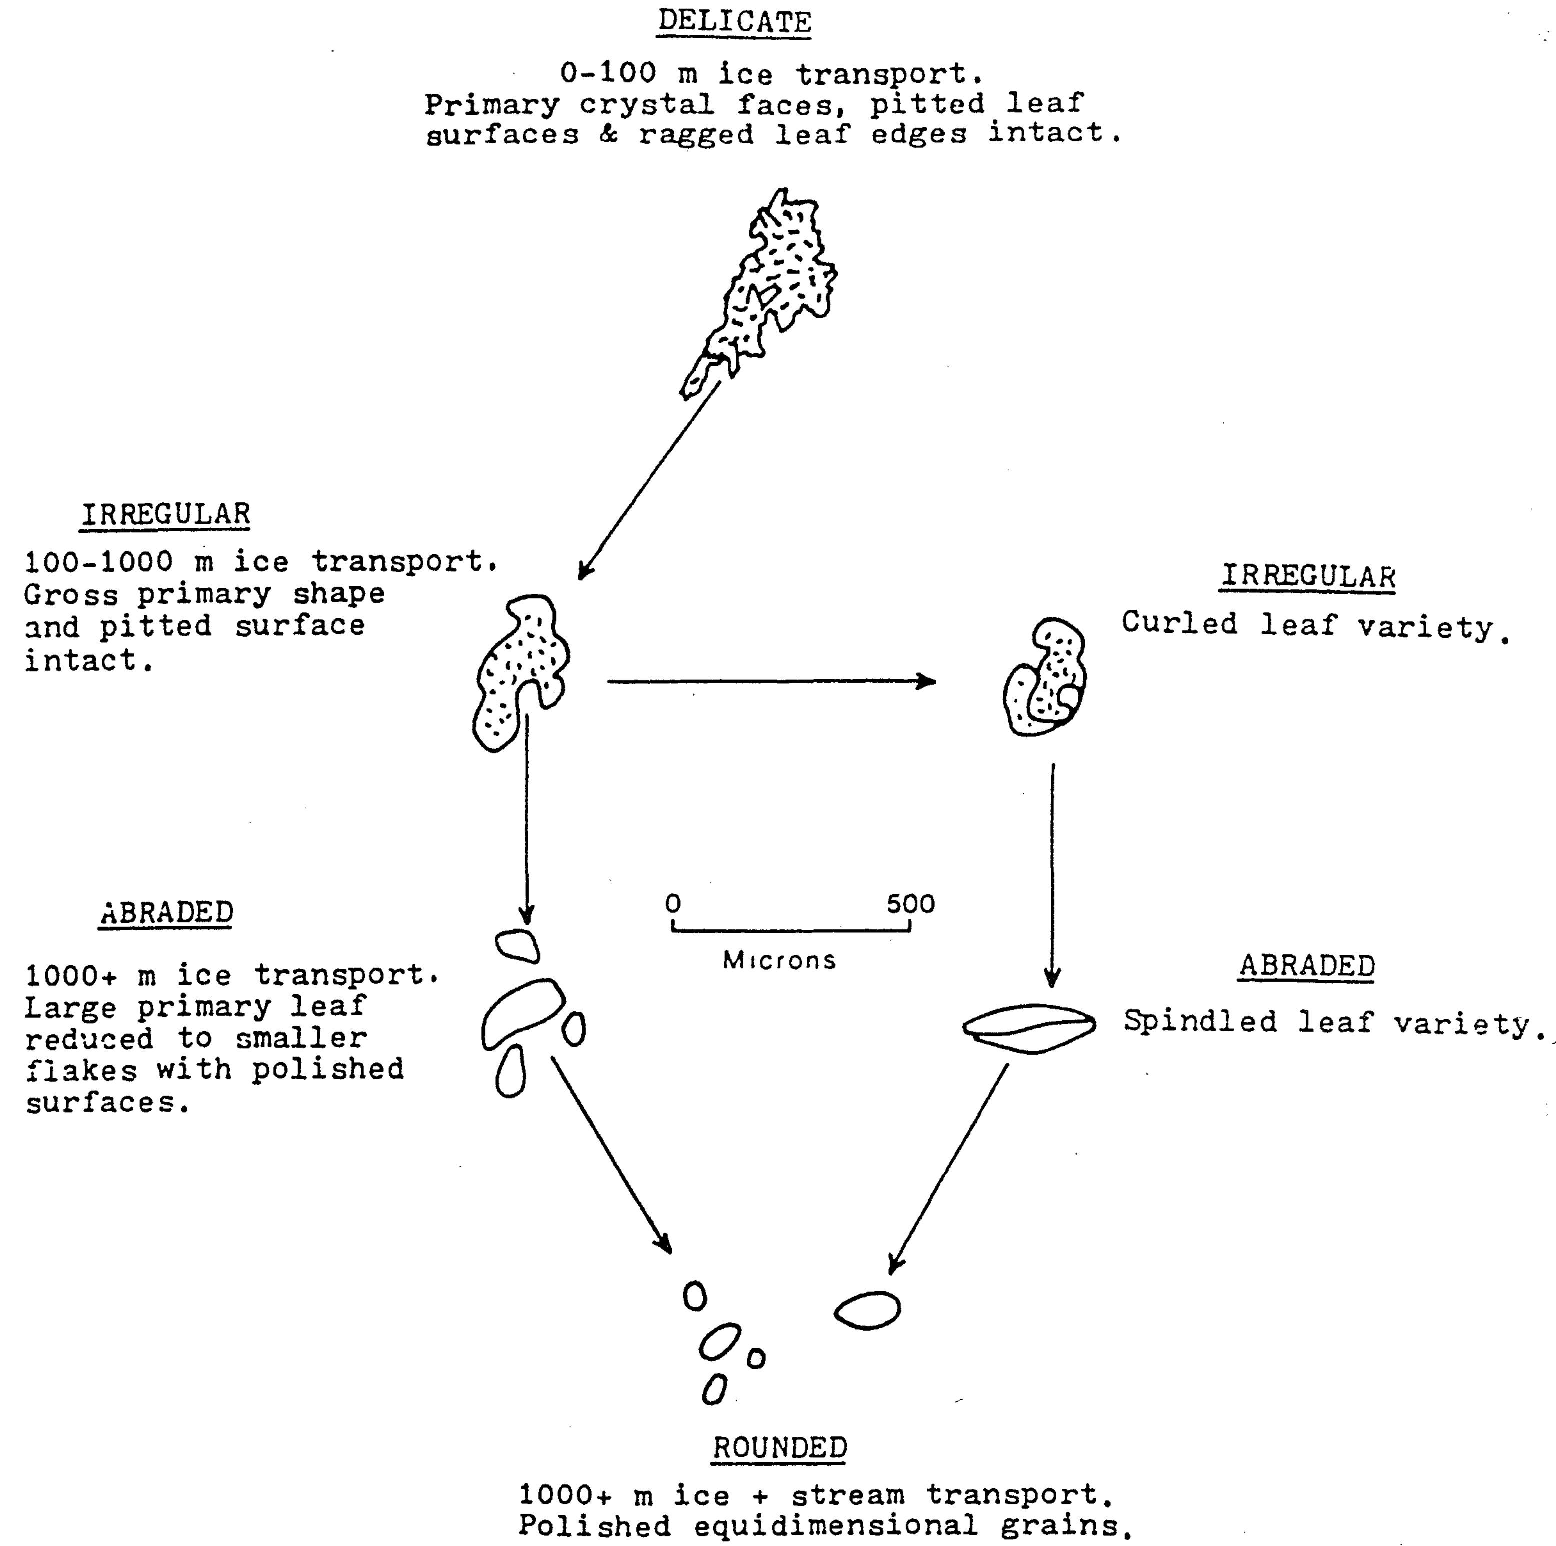

Figure 4. Effects of glacial transport on gold particle size and shape. (Developed by Overburden Drilling Management Ltd.)

Figure 5. Sample prep flowsheet.

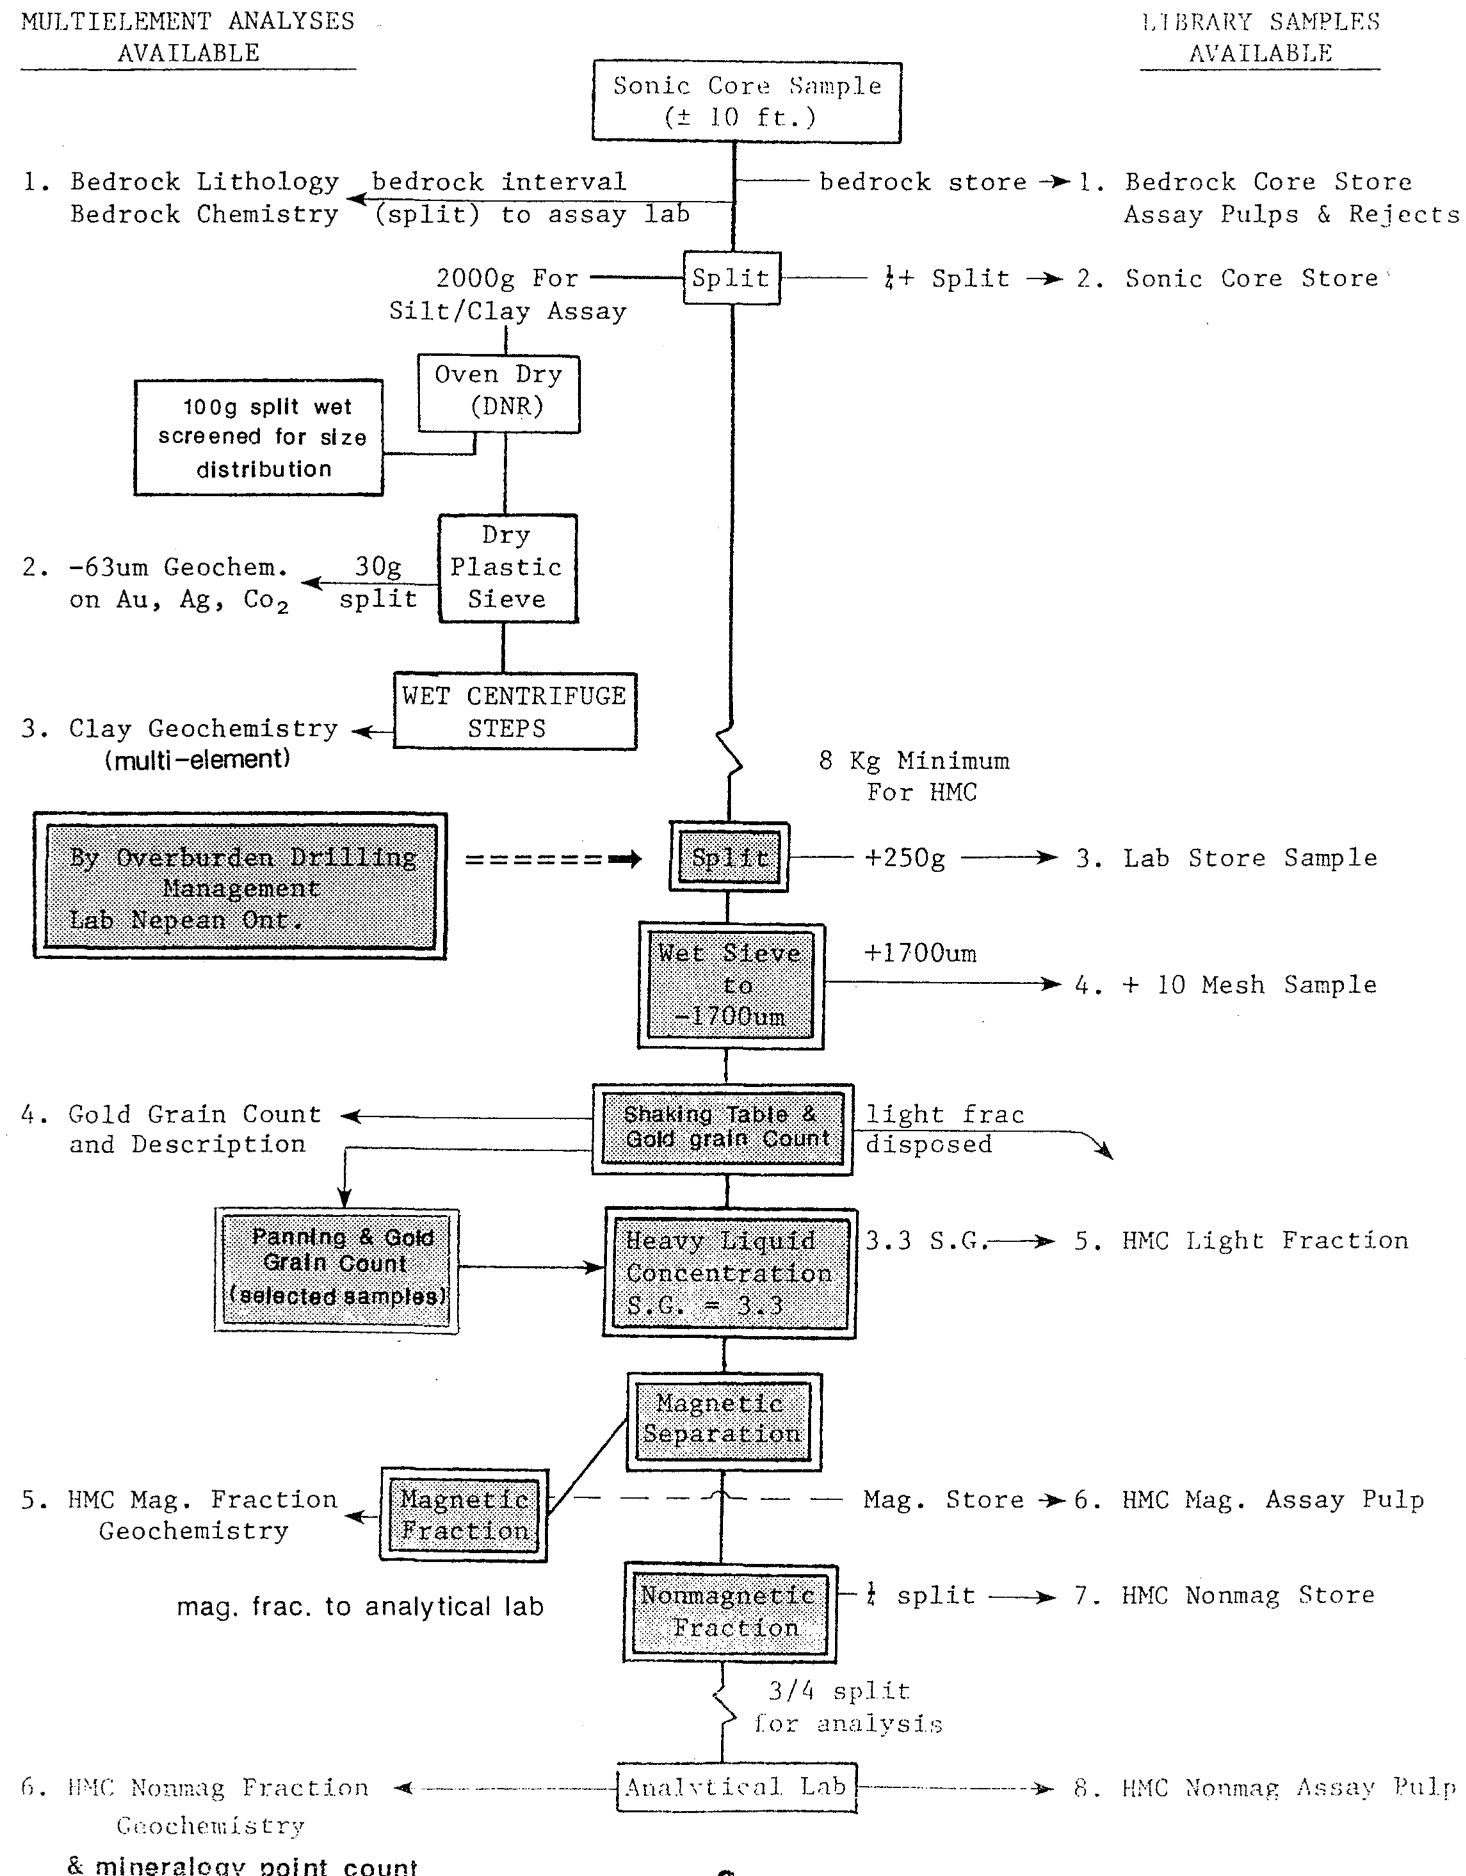

Figure 6. EFFIE AREA GOLD PARTICLE SIZE vs. FREQUENCY DISTRIBUTION

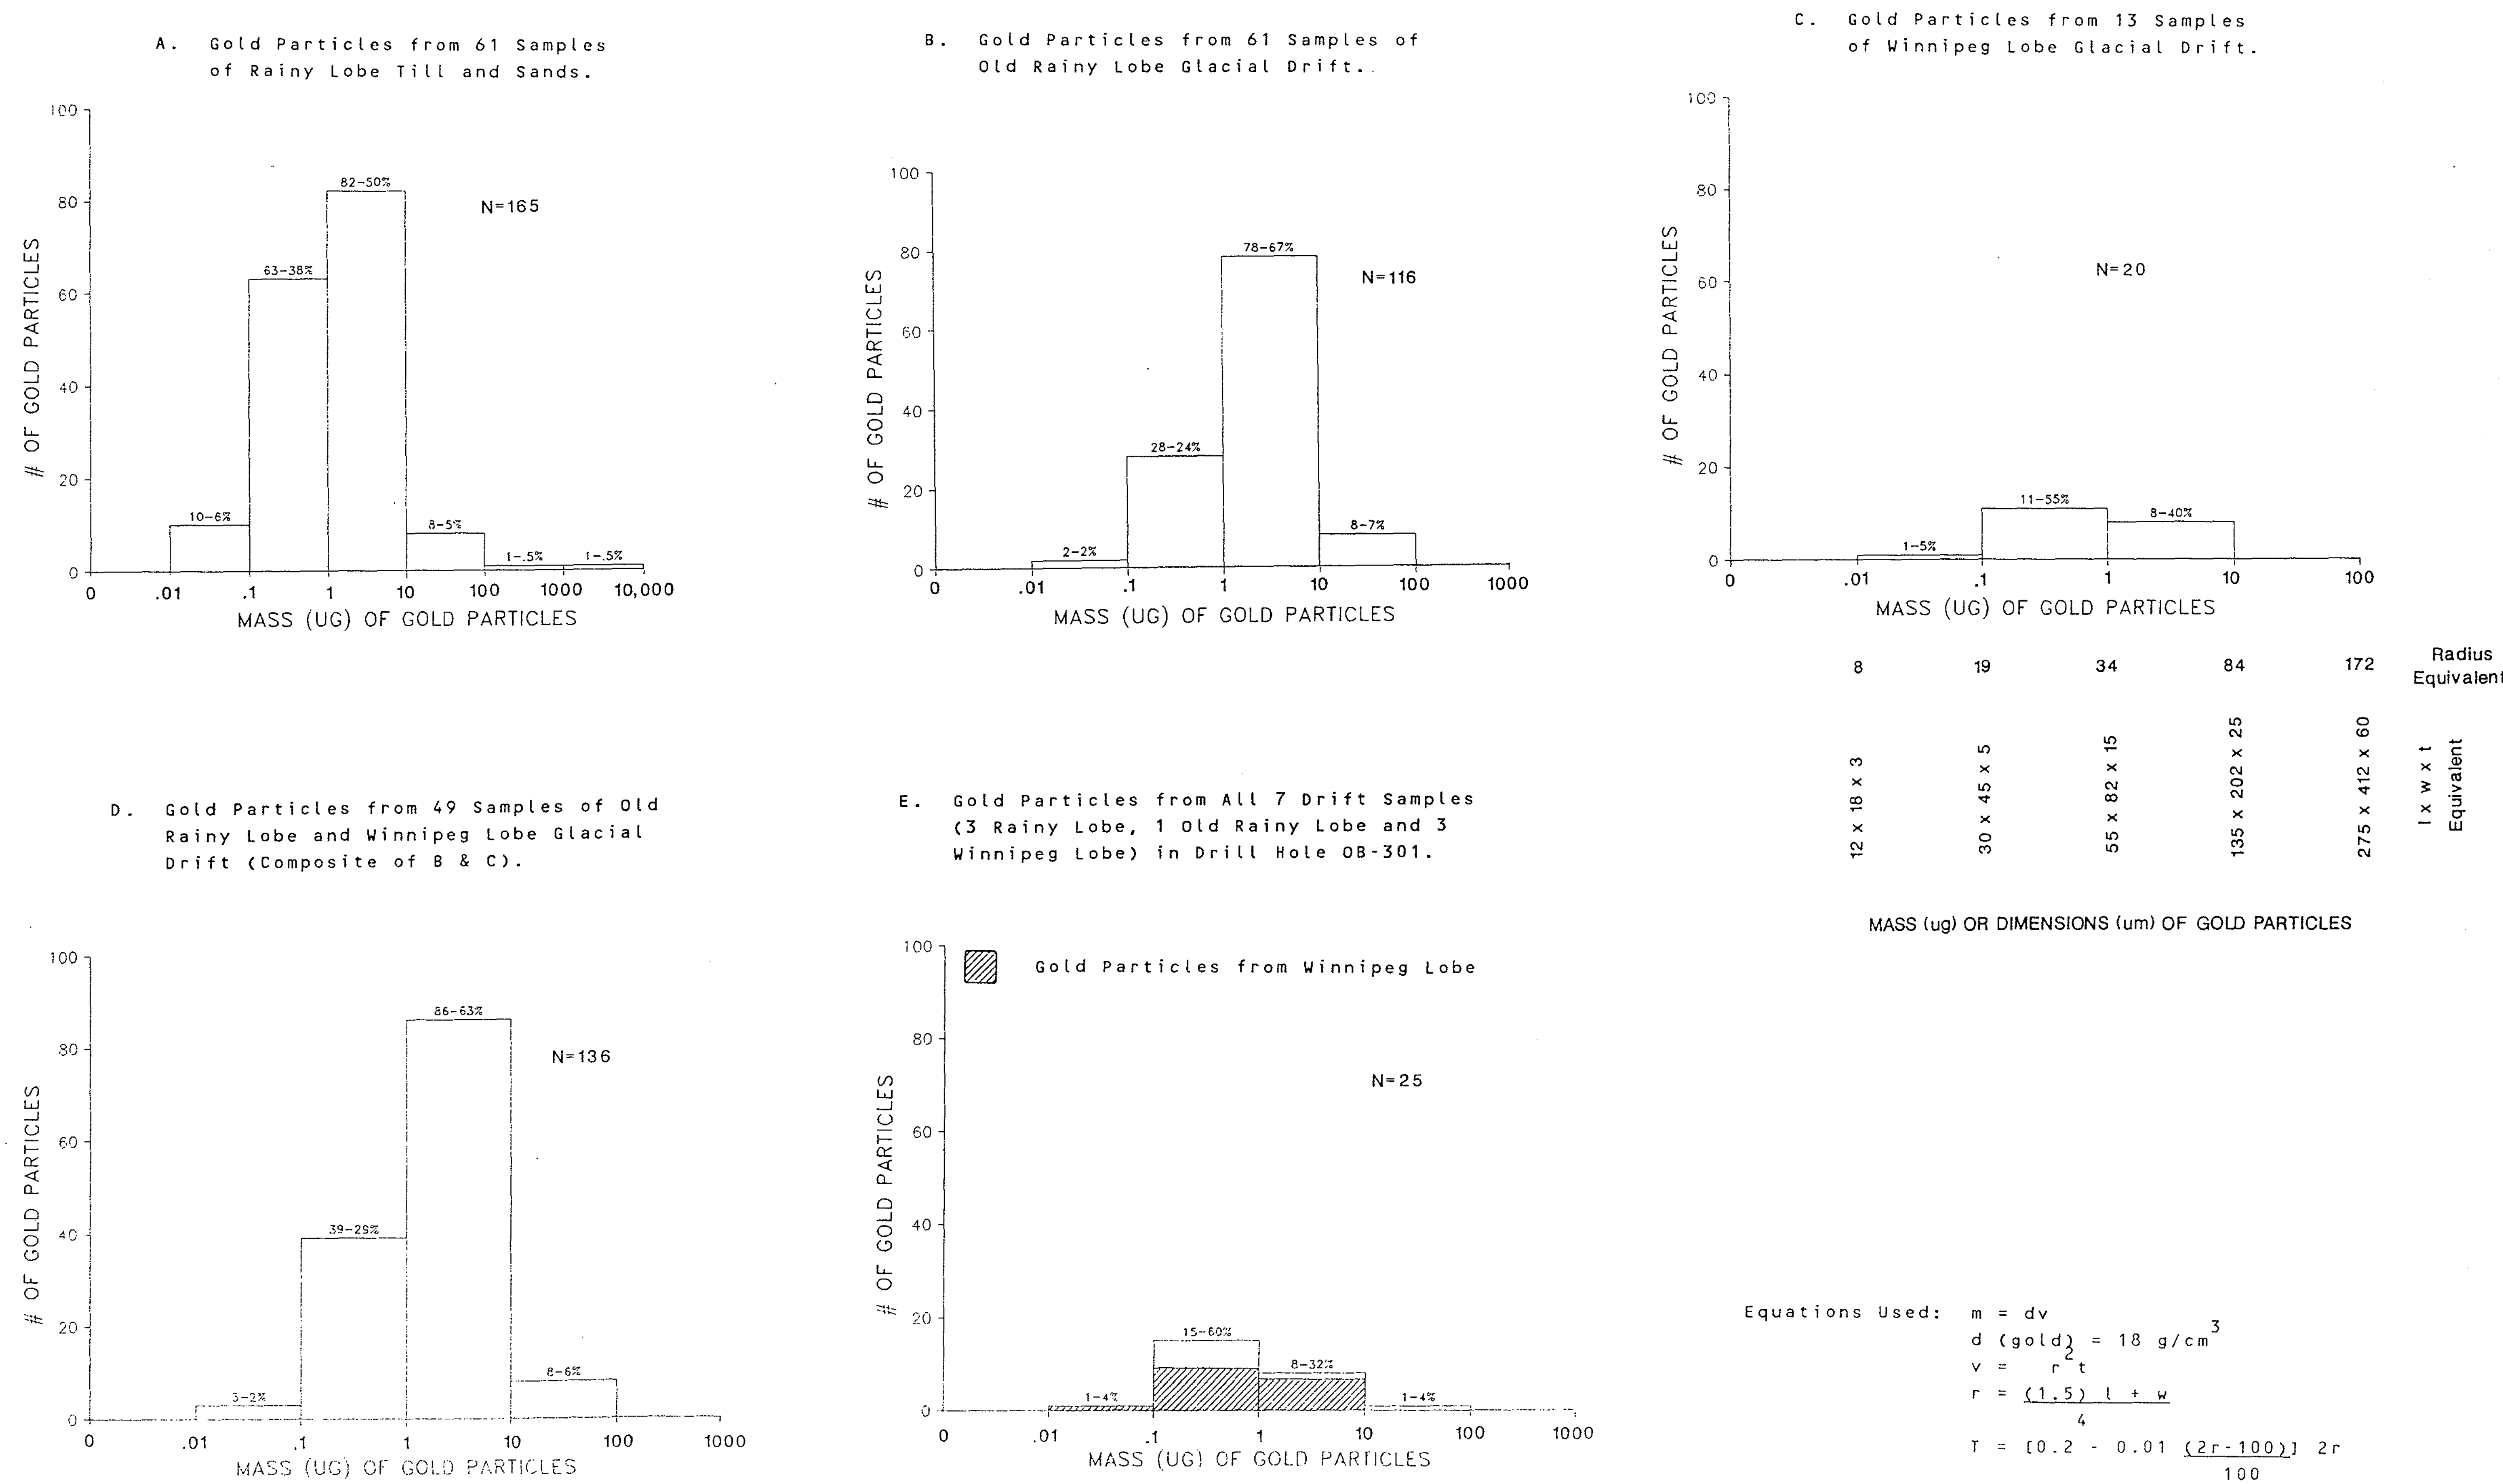


Equations Used:

$m = dv$

$d\ (gold) = 18\ g/cm^3$

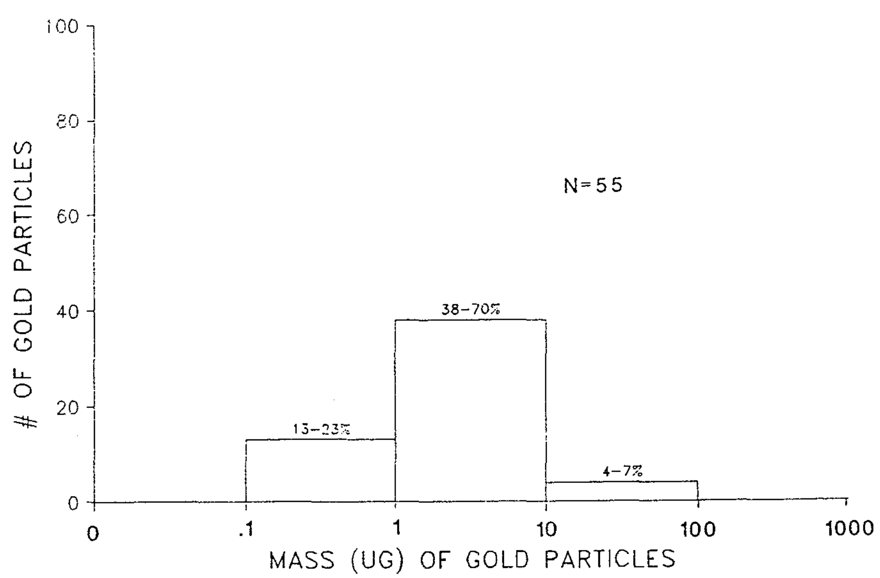
$v = r^2 t$

$r = \frac{(1.5)\ l + w}{4}$

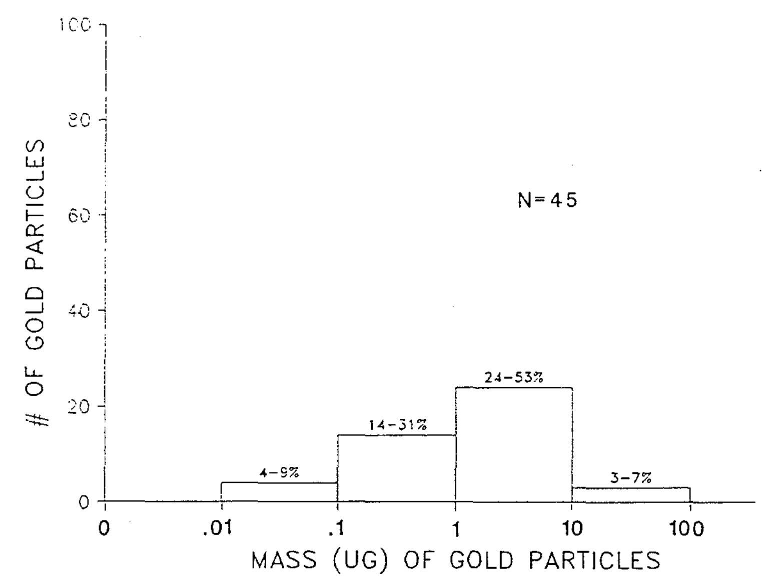
$T = [0.2 - 0.01 \frac{(2r-100)}{100}]\ 2r$

Figure 6. EFFIE AREA GOLD PARTICLE SIZE vs. FREQUENCY DISTRIBUTION

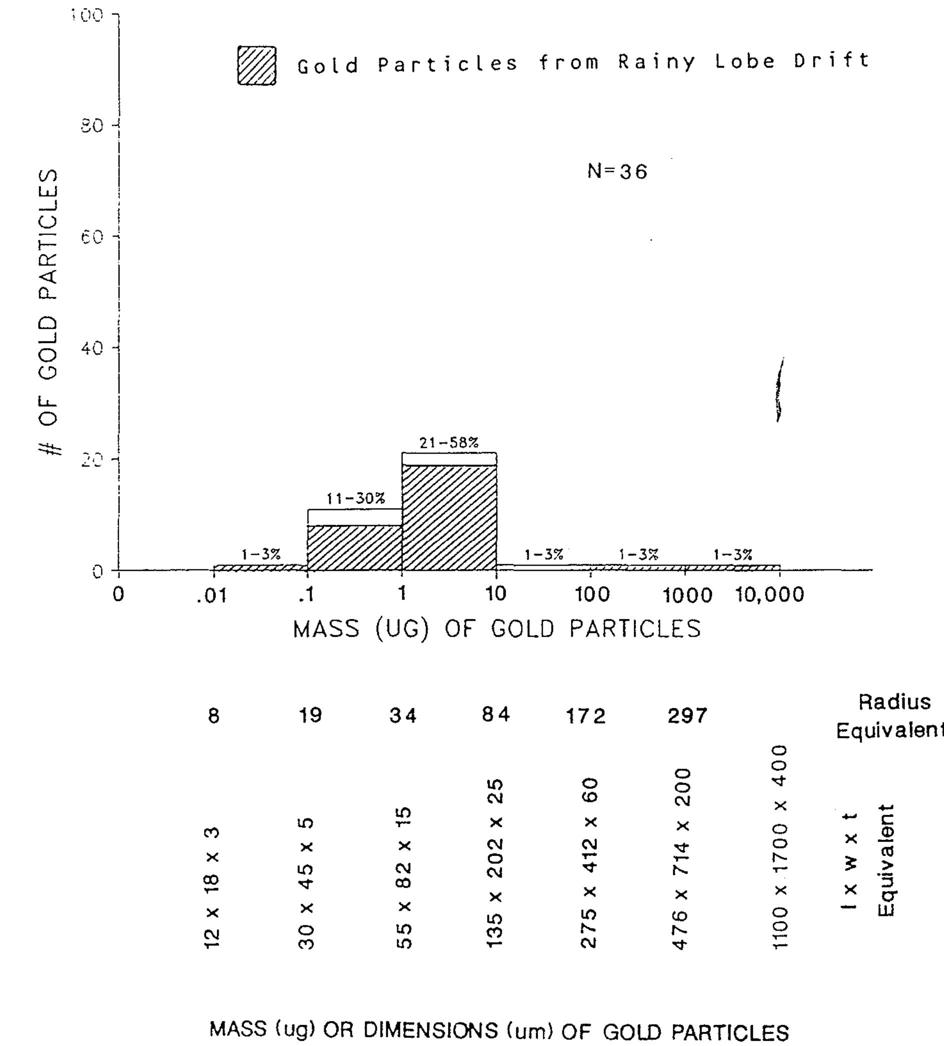
F. Gold Particles from All 6 Drift Samples (6 Old Rainy Lobe) in Drill Hole OB-321.



G. Gold Particles from All 10 Till Samples (9 Rainy Lobe and 1 Old Rainy Lobe) in Drill Hole OB-315.

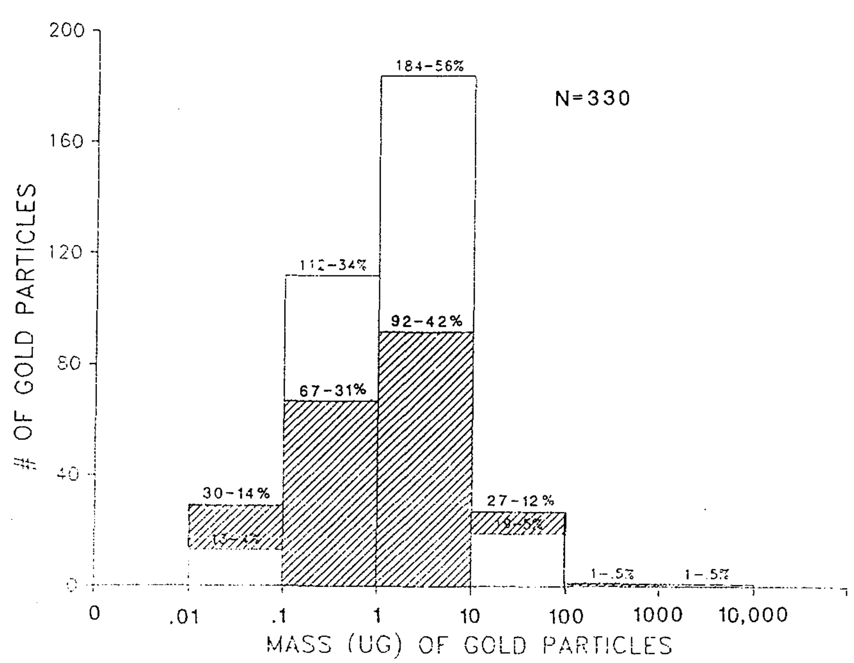


H. Gold Particles from All 5 Drift Samples (1 Koochiching Lobe and 4 Rainy Lobe) in Drill Hole OB-318.



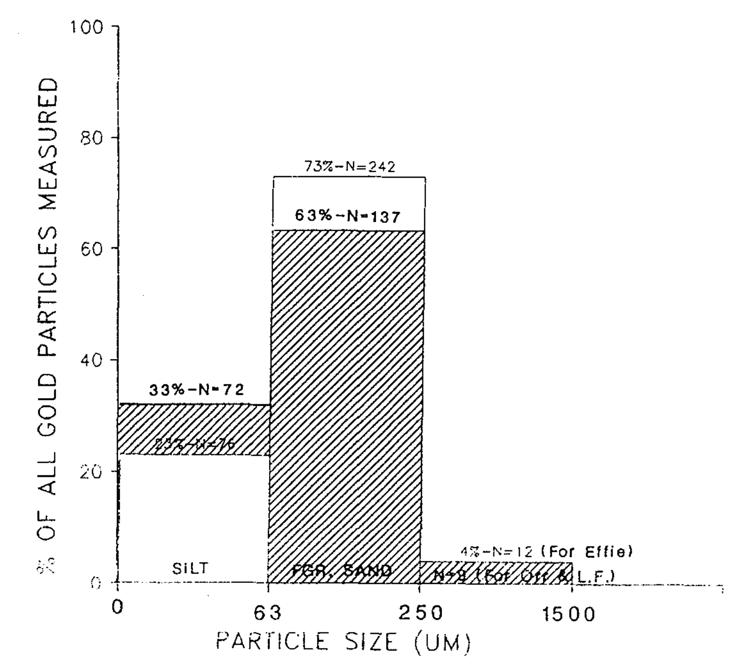
I. Total Gold Particles from 154 Different Samples from All Effie Drill Holes. All Sample Types (i.e., K, R, OR, W and Saprolite).

Total Gold Particles from the Orr and Littlefork Areas (1985-87 DNR Survey Areas)



J. Total Presented by Maximum Dimension of Gold Grain Size to Show Relative Abundance Available to HMC and Silt/Clay Sample Media (N = 330).

Results from Comparable Gold Particle Data from the Orr and Littlefork Areas (1985-87 DNR Survey Areas, N = 218)



Equations Used:

$m = dv$

$d\ (\text{gold}) = 18\ g/cm^3$

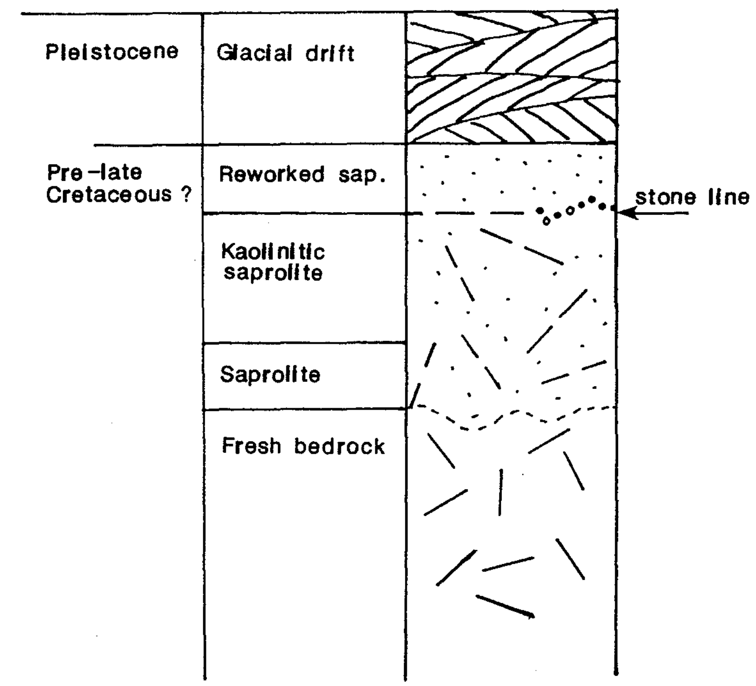
$v = r^2 t$

$r = \frac{(1.5)(l + w)}{4}$

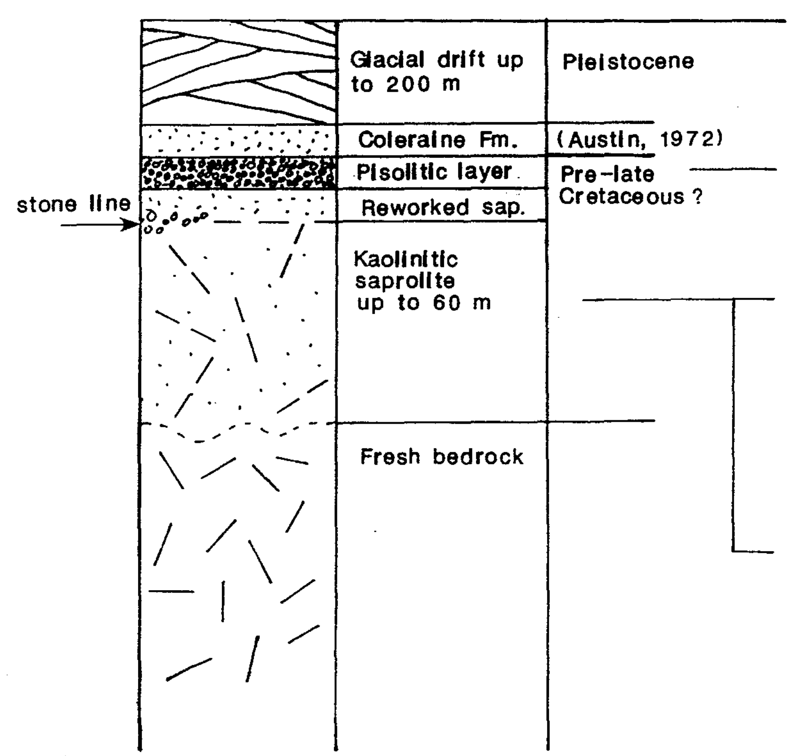
$T = [0.2 - 0.01 \frac{(2r-100)}{100}]\ 2r$

Figure 7. Generalized stratigraphy within saprolite in the Effie area and northern Minnesota.

A. Effie Area - Minnesota - units found in Rotasonic core (modified from Smith, 1987).



B. Northern Minnesota - Generalized - from the literature (Parham, 1970, as cited in Smith, 1987).



Examples of Trace Element Distribution
<u>in Laterite from Literature Examples</u>

For Duricrust anomalies over massive sulfide occurrences in Australia (Smith & Perdrix, 1983) Bi-Sn-Sb-As-Mo-In-Cu-Au enrichment.

For Boddington Gold Deposit, Australia (Davy & El-Ansary, 1986) Generalization of: Elements <u>Leached</u>: Ba, Co, La, Mn, Ni, Rb, Sr, Ta, Zn, Y, CaO, K_2O, MgO, Na_2O; Elements <u>Reprecipitated</u>: Au, Ce, Cr, Cu, Mo, Fe_2O_3; Elements <u>Residual</u>: Sn, Nb, Th, V, W, Zr, Al_2O_3, TiO_2.

Saprolite Accumulations: Fe, Mn, Ni, Co, Si, CO_3 (relating to nickel sulfide exploration in Australia; Smith, B.H., 1984).

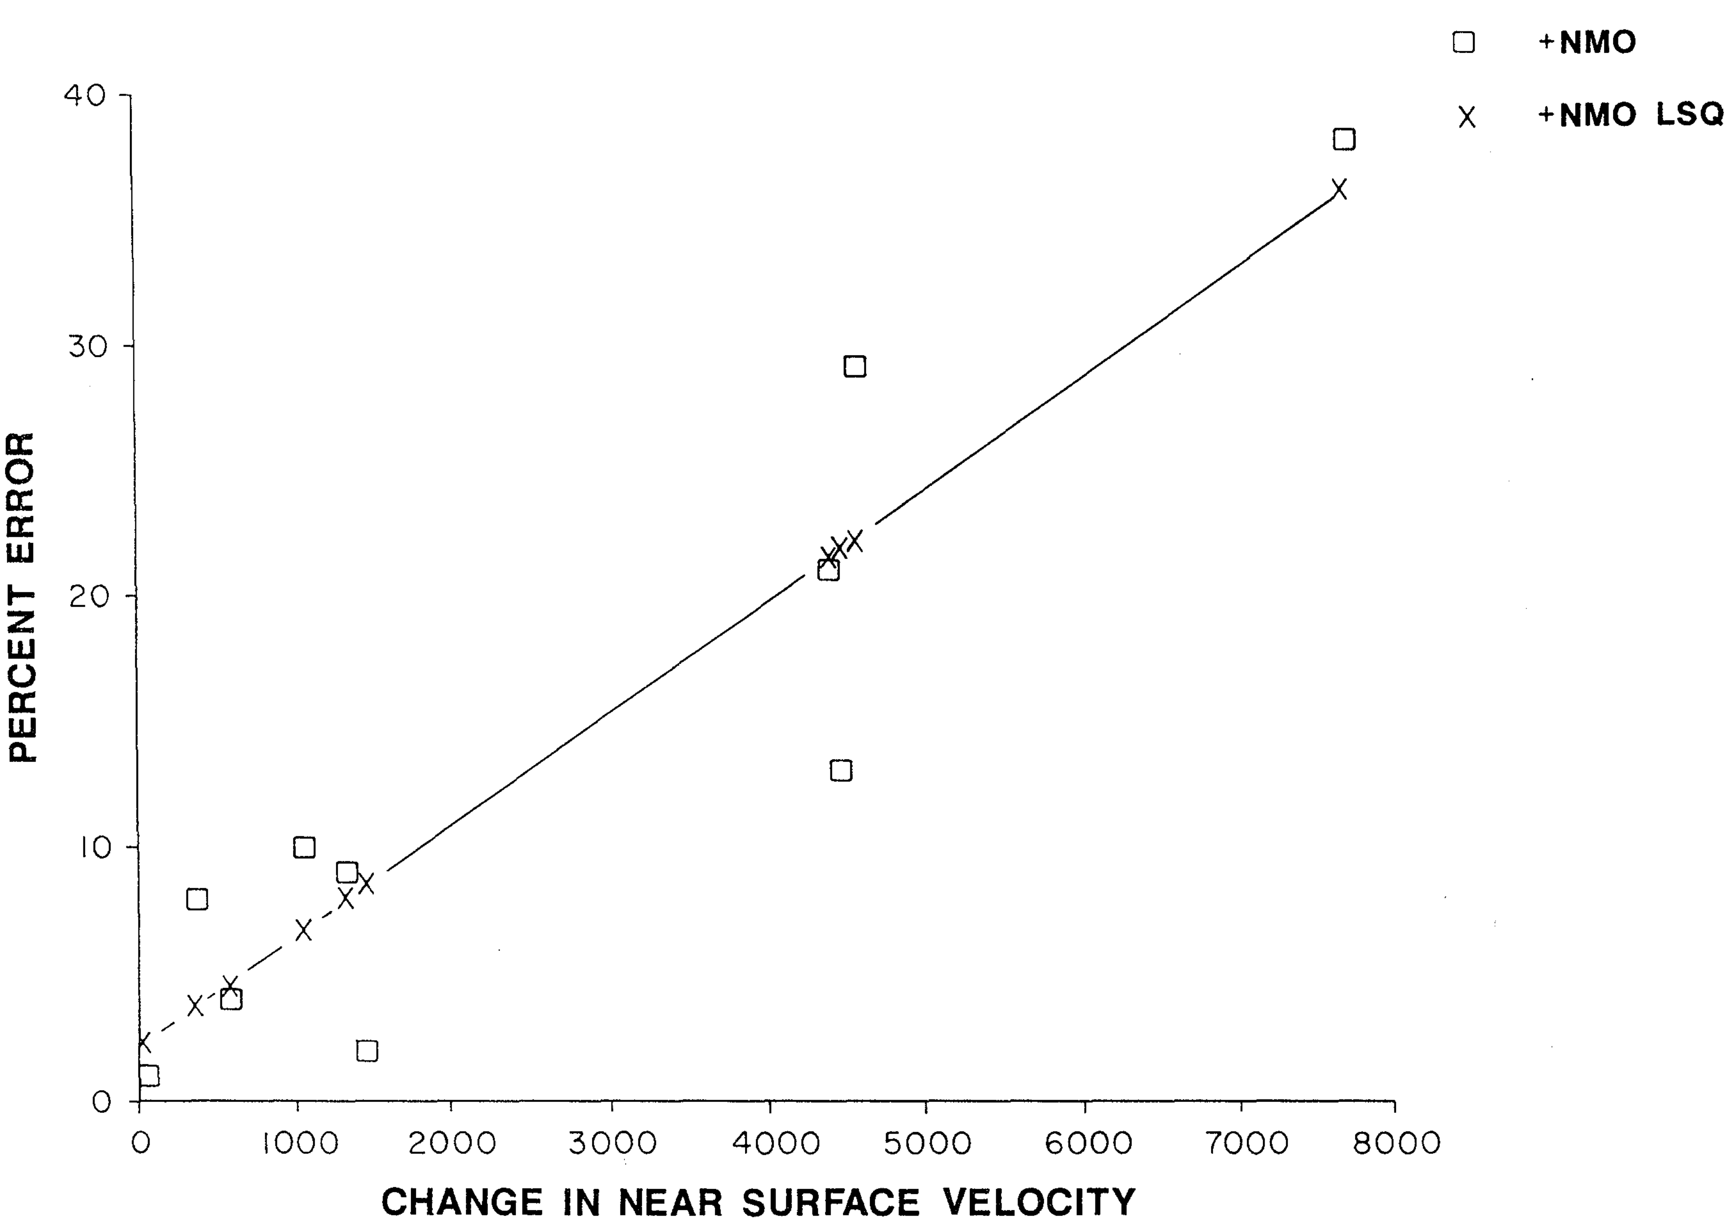

FIG. 8-3: NEAR SURFACE PERCENT ERROR/CHANGE IN VELOCITY WITHOUT A NORMAL MOVE OUT CORRECTION

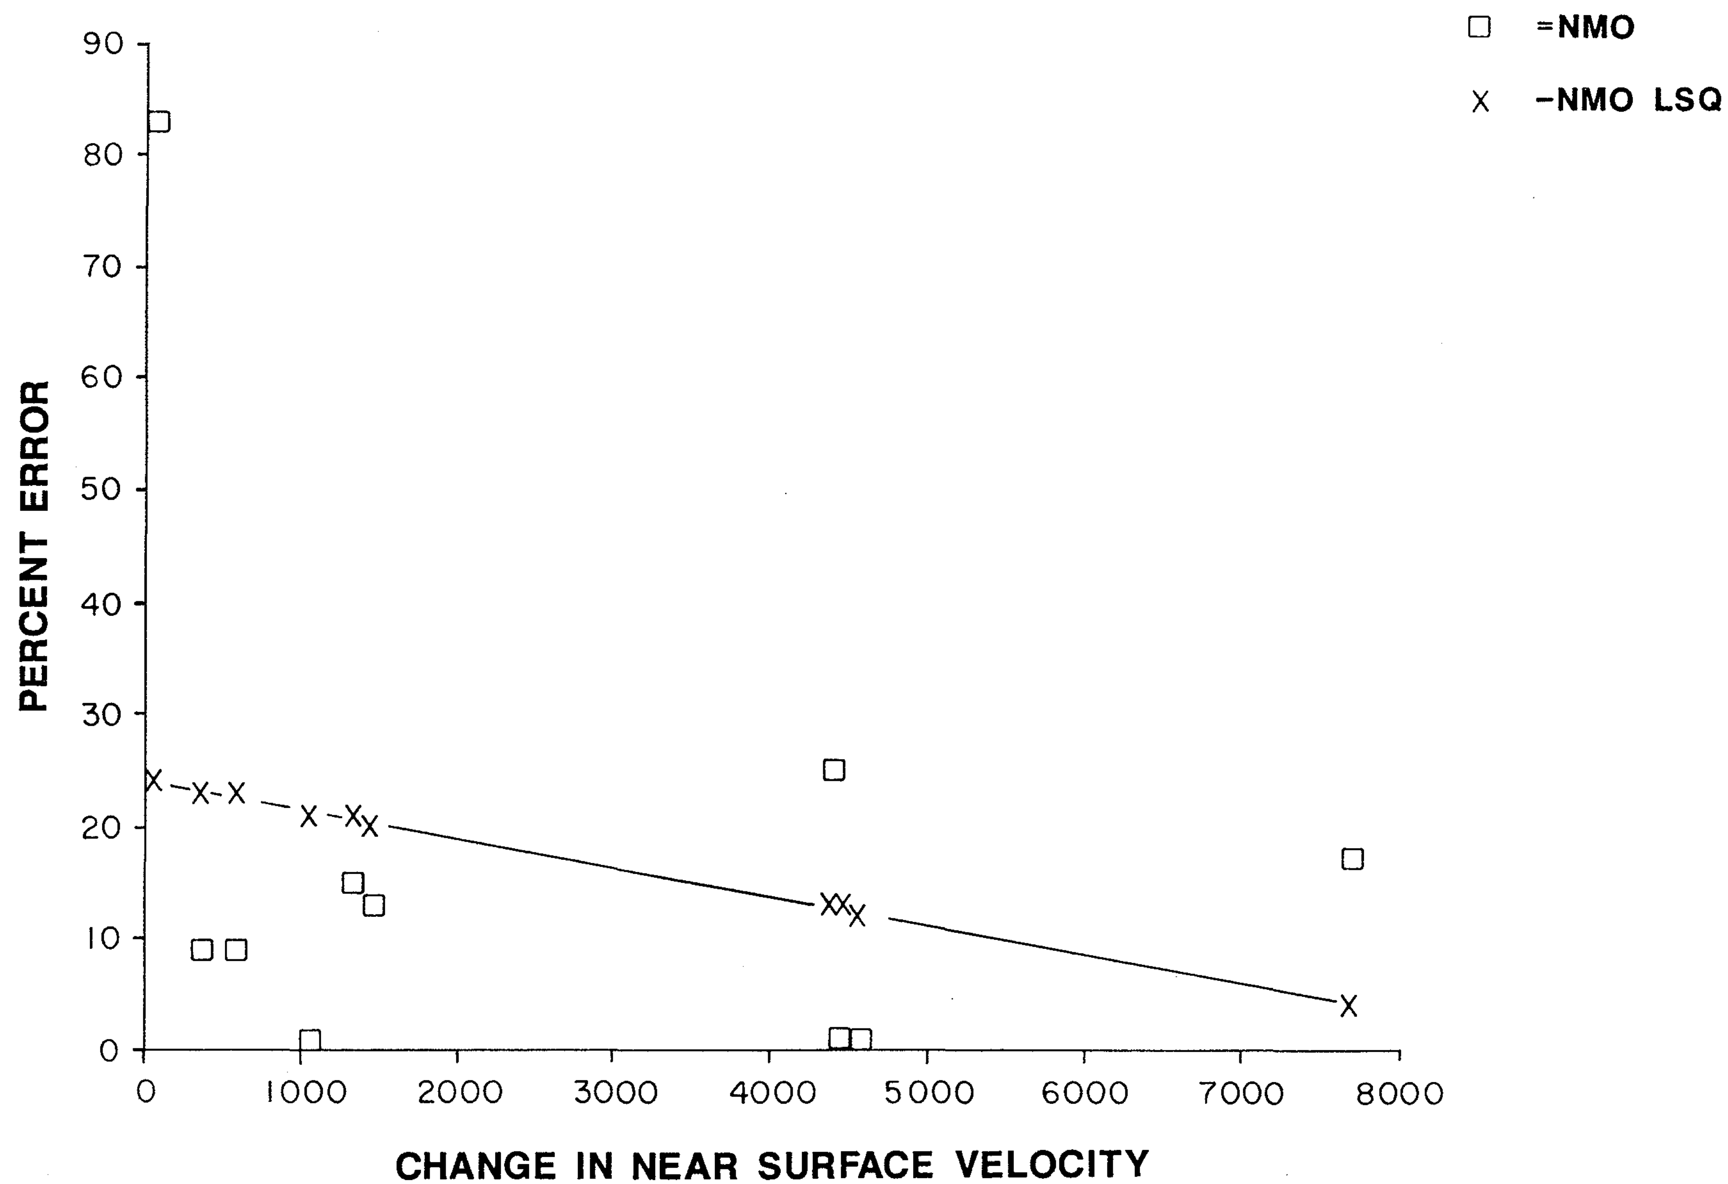

A

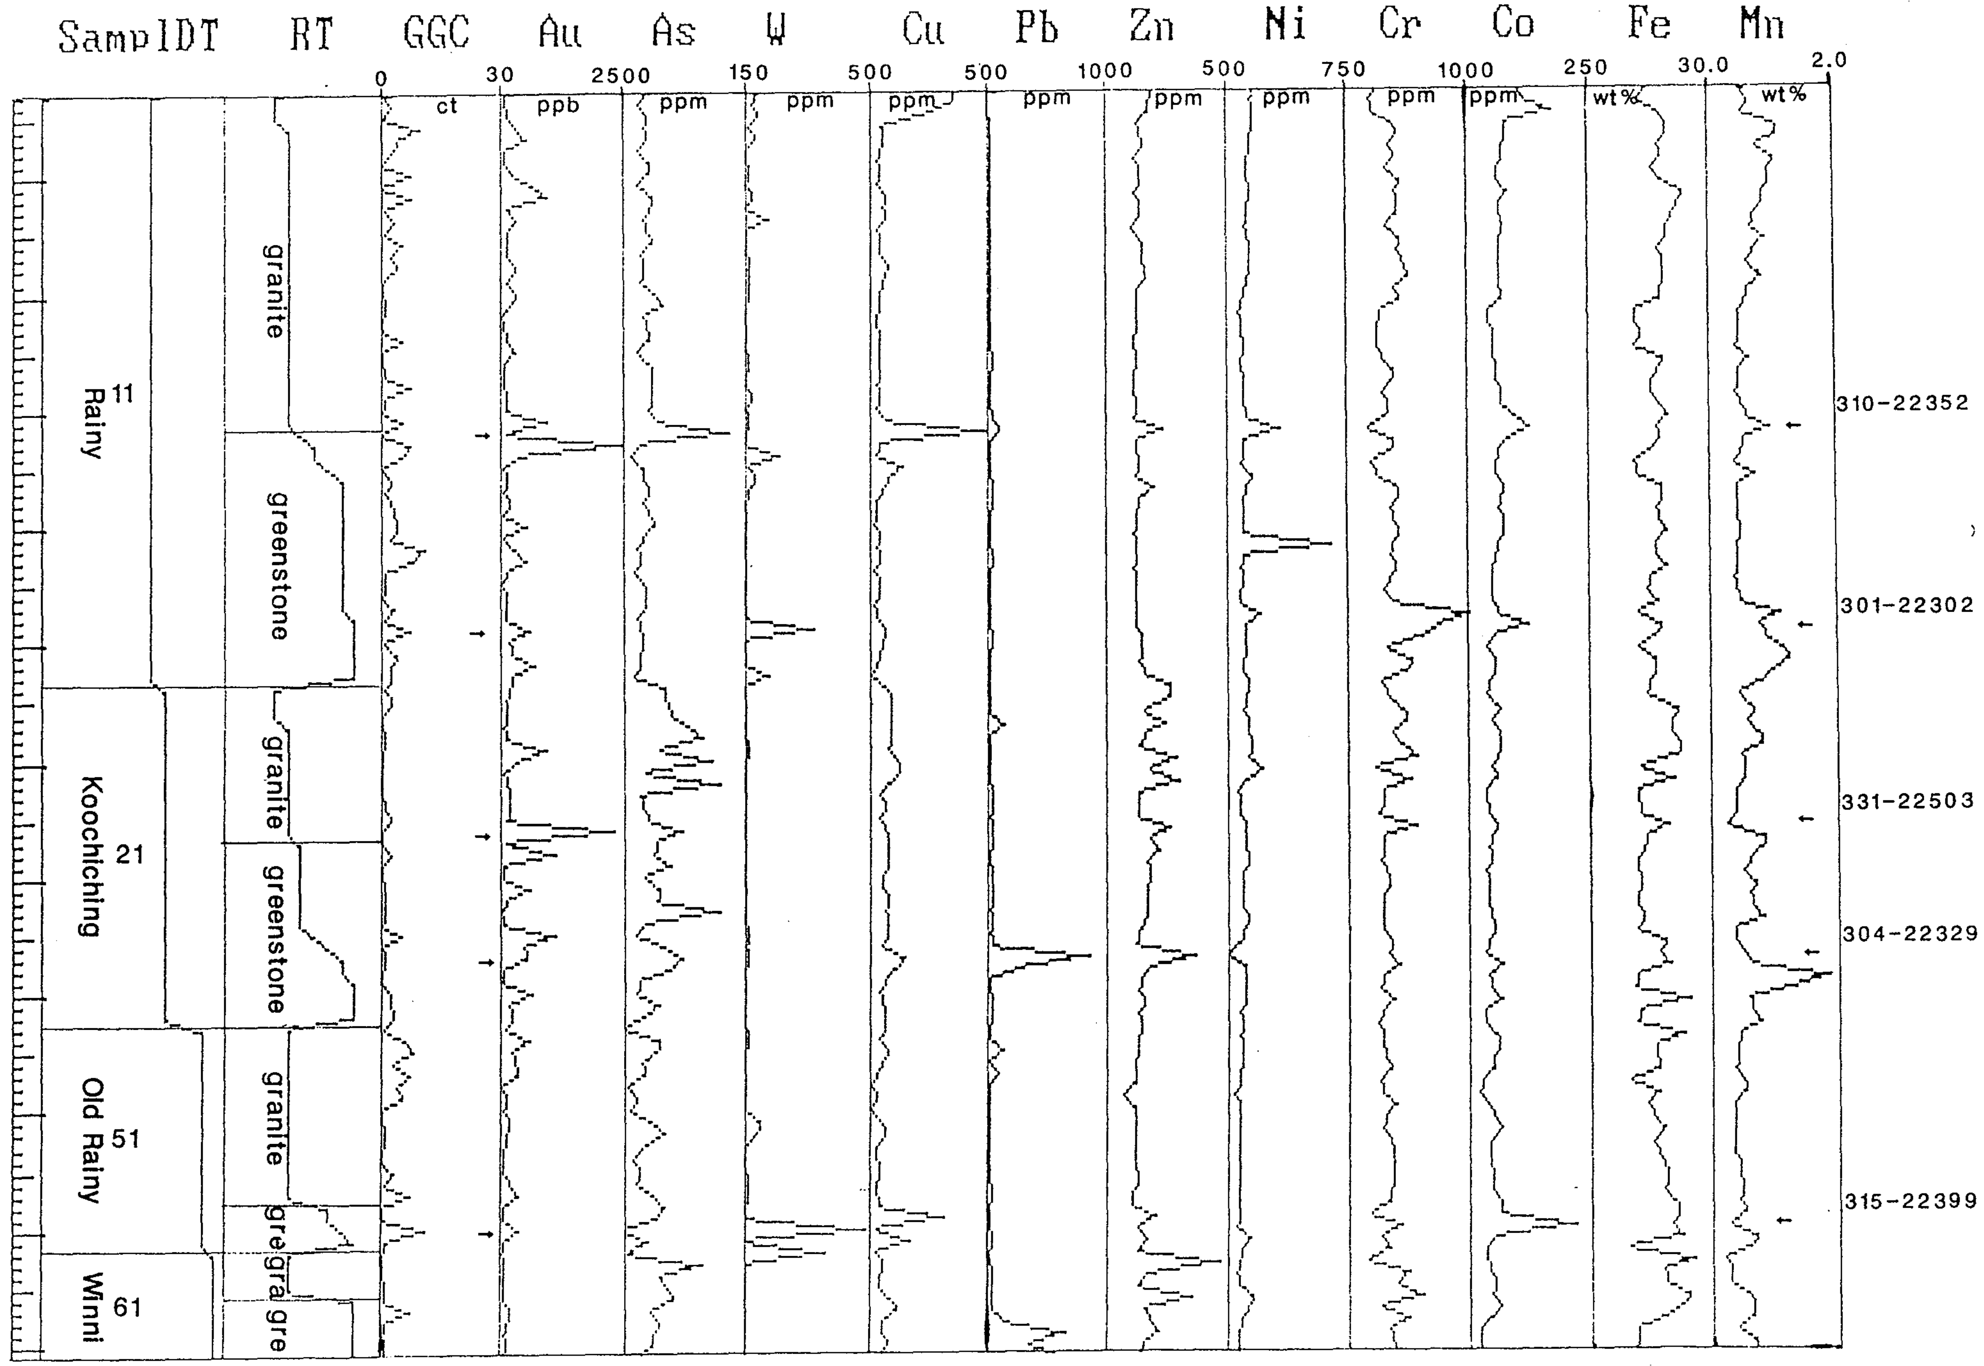

Figure 10-1. Assay results versus sample number for a) nonmagnetic HMC, and b) silt/clay fractions from till samples. Element scales are arithmetic. Samples are sorted primarily by drift type, with secondary and tertiary sorts by underlying bedrock type and sample number (drill hole), respectively. Several samples exhibit multi-element spikes, though not all spikes exceed a [3 x median] estimated threshhold (for examples see samples labeled on the nonmagnetic HMC plot and compare with Summary Map 3-2). The results for the nonmagnetic HMC and silt/clay components of the till samples show little correlation, the exception being sample 22352 from drill hole 310. Coincident high assay values could indicate a source area within a few hundred meters of the drill hole (see section 12.5). Lack of correlation between the assay results for the two components suggest that the nonmagnetic HMC and silt/clay components of the till samples are derived from different sources and/or have different transport distances. Whether this inhomogeneity reflects variable mechanical resistance of different mineral varieties from the same location, or are a function of property, local, or regional (ie. transport) variations in drift type, underlying bedrock, or saprolite contribution is difficult to assess. Interestingly, Koochiching lobe till samples (drift type=21) exhibit uniformly low assays for tungsten and higher than average arsenic assays, seemingly independent of analytical bias, drill hole location, and underlying bedrock type. This uniformity supports the contention by Martin, et al. (1988) that the Koochiching lobe till has undergone longer distance transport and homogenization. In the Effie study area, assay results for the tills do not exhibit noticeable background effects due to variations in underlying bedrock lithology.

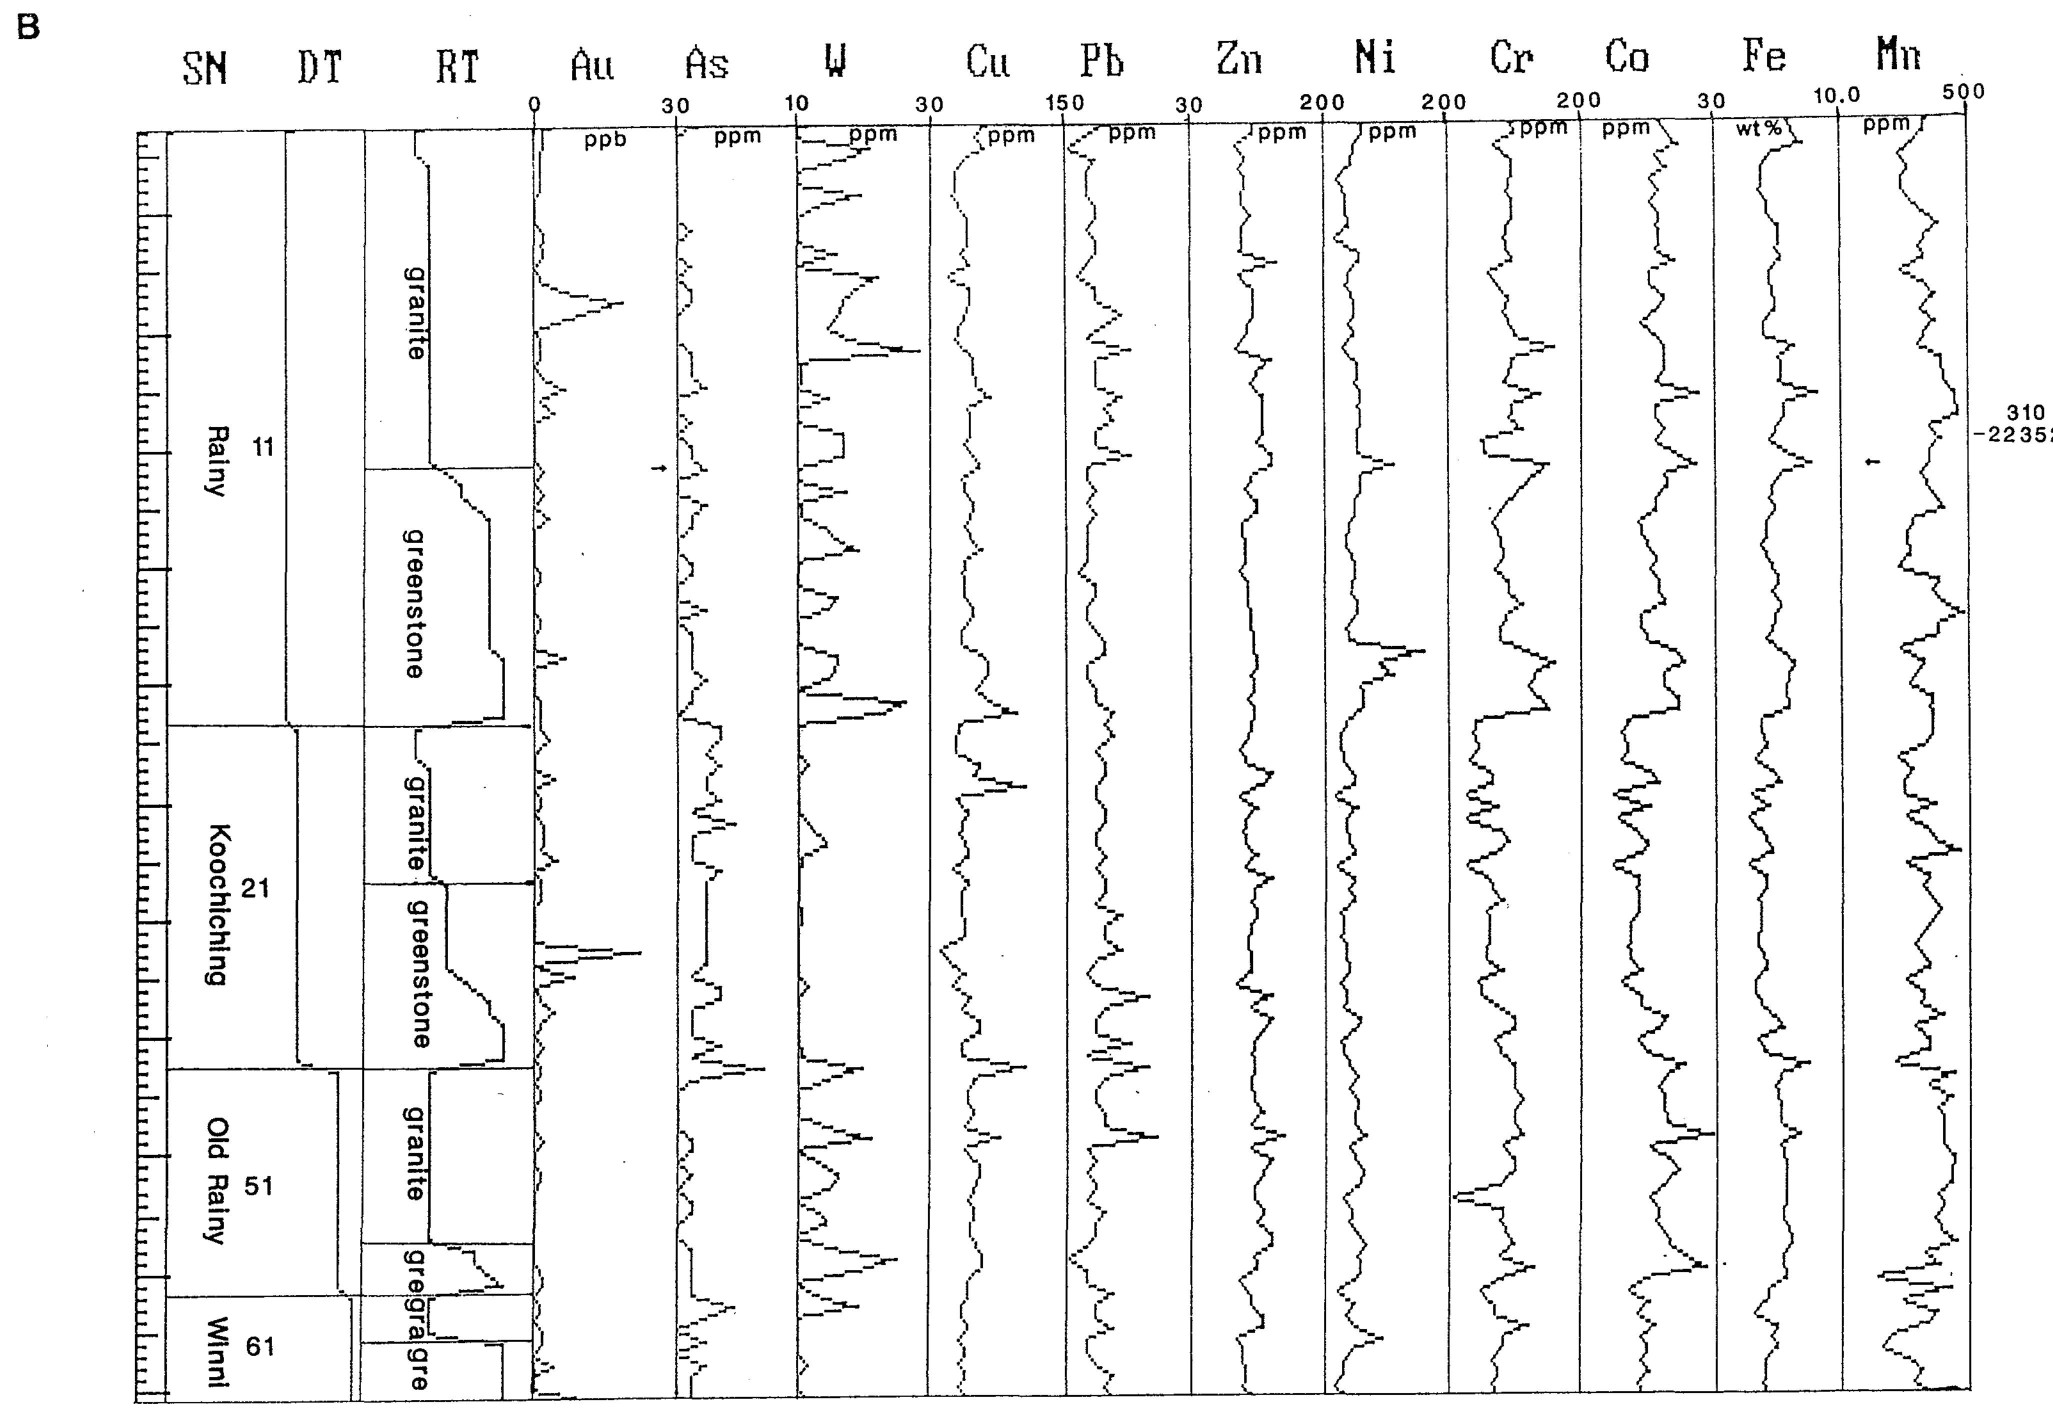

Figure 10-1 continued

Figure 11-1. Plot of nonmag HMC gold grain counts vs. -63um gold assays for 36 old till samples and 15 saprolite samples. No correlation is observed.

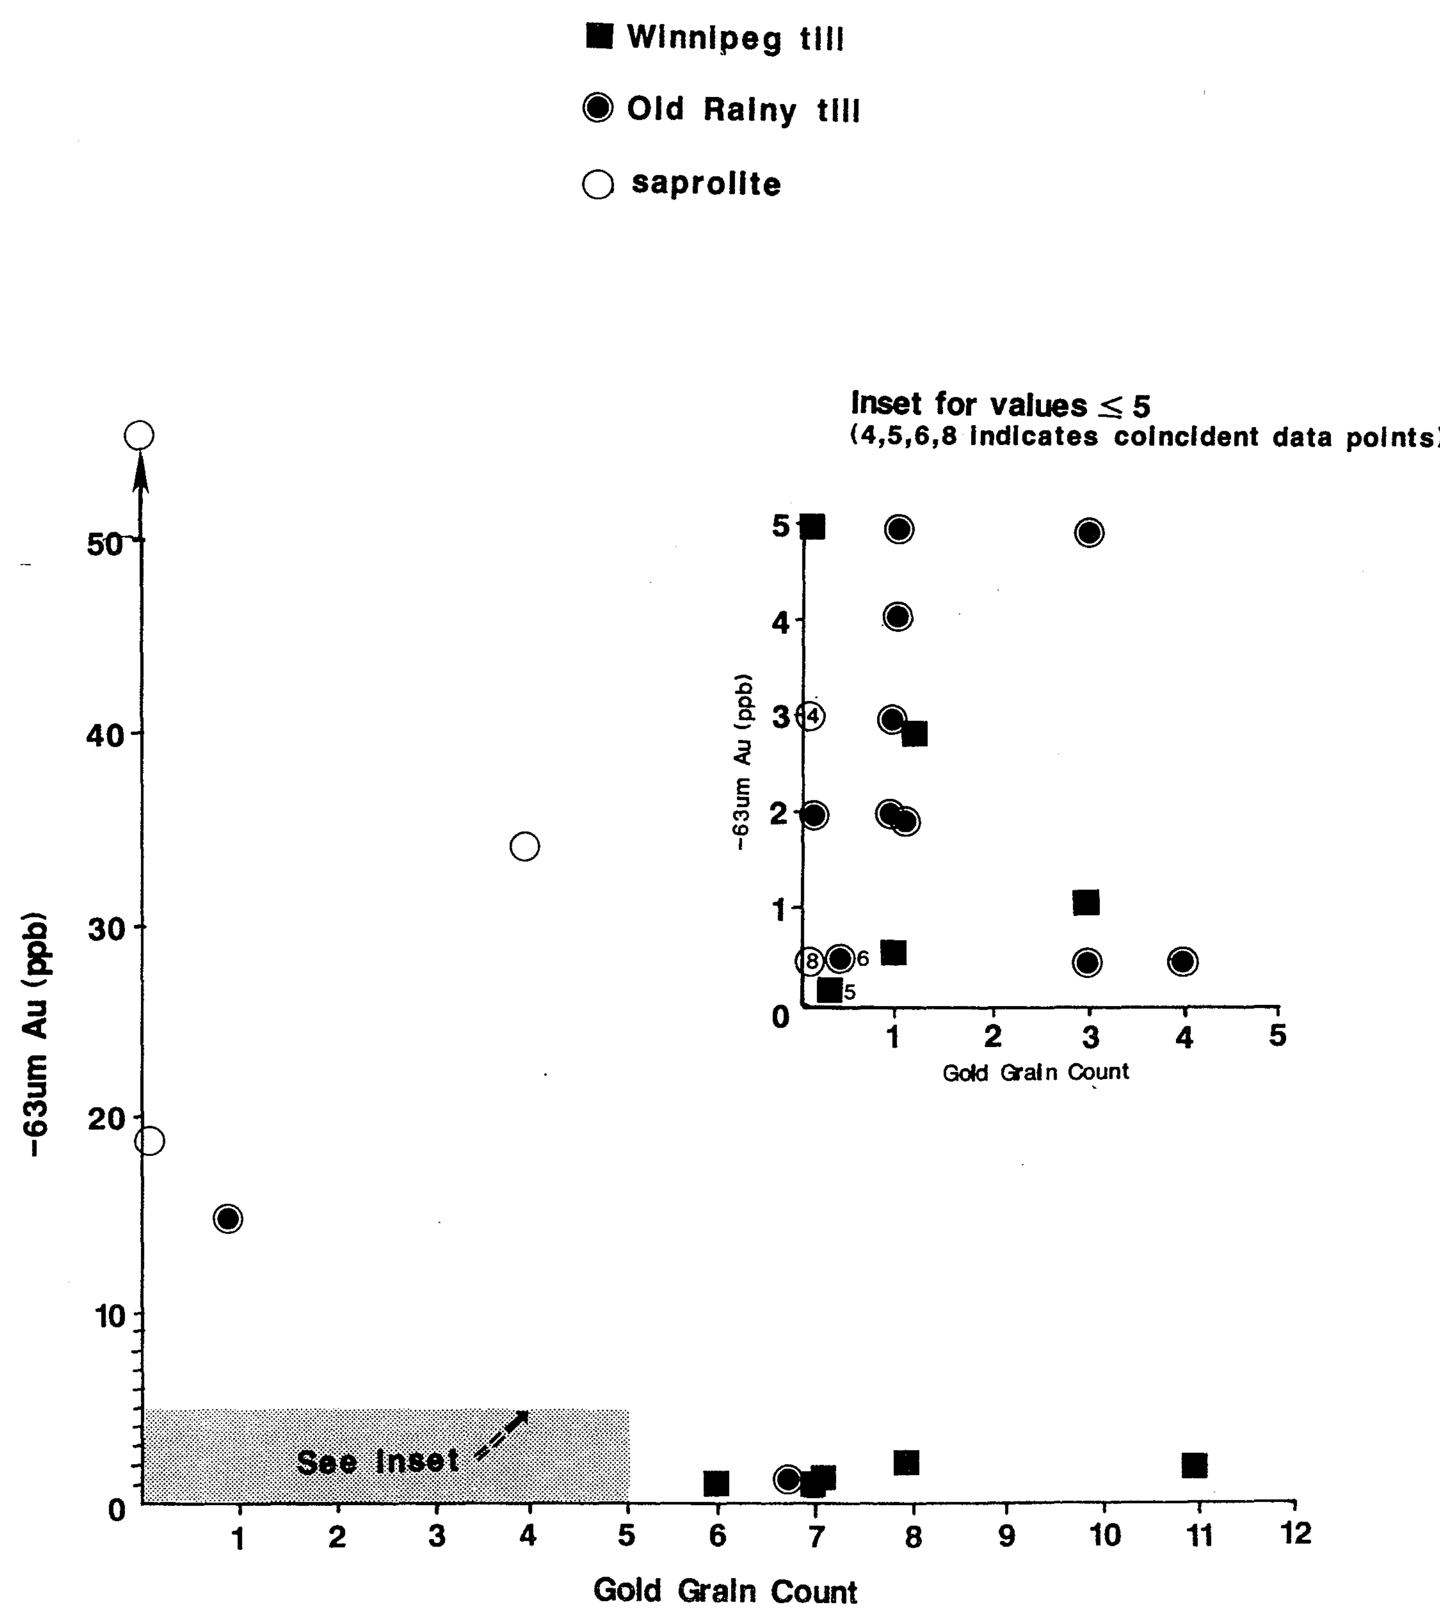

Table 1. The geochemical data is presented in the following ways:

A. Raw Data
   1. By Drill Hole
      a) Information Summary Sheet for each drill hole
      b) Listing of All Samples & Sample Media (= Master Sample List)
      c) All Assay Results within each drill hole
      d) Glacial Drift Descriptive Log and Columnar Section (of Genetic Interpretation)
      e) Selected Data plotted on the Columnar Section
      f) Heavy Mineral Concentrate Report w/Gold Grain Data and Gold Description
   2. By Sample Number
      a) Appendix: Master Sample List
      b) Appendix: Standards & Replicates
      c) Appendix: Saprolites - "wholerock", nonmag, & silt/clay
      d) Appendix: Bedrock

B. Statistical Data
   1. Distribution Statistics Table, Grouped by Drift Type and Underlying Bedrock Type, with Suggested Thresholds
   2. Histograms for Selected Elements and Drift Types for Nonmag HMC and Silt/Clay Fractions
   3. Spectrograms for Two Media, Silt/Clay, and Nonmag (Plots of Element vs. Sample Number Grouped by Drift Type and Underlying Bedrock Type)
   4. Table of HMC Data Averaged by Drift Type
   5. Appendix Lists by Sample Media: Sorted by Drift Type
   6. Precision Calculations
   7. Accuracy Calculations

C. Geochemical Maps
   1. By element within sample media: avg. of each till type within each drill hole (approx. 10 maps)
   2. Overall summary map

Table 2. Drilling Statistics and Field Operations Data Summary.

	Effie Area	Ironton Area	Overall	Average Per Hole
# of Holes	23	3	26	
Total Footage	4232	578	4810	185
% Recovery Glacial Drift	85.2	68.9	83.4

Estimated Down Time (Hours)	9	1	10	

	Effie Area	Ironton Area	Overall	Average Per Hole
Estimated Time for Loading/Unloading Core (Hours)	17.3	2.3	19.6	.8
Time Driving Core to Drop Off Location (Hours)	34.5	4.5	39	1.5
# of Boxes	1244	103	1347	
# of Pallets	40	4	44	
Average # of Boxes per 200 Foot Hole	70.8	51	69.2	
Average # of Pallets per Hole	1.8	1.3	3	
# of Samples	194	37	231	
# of Holes Completed to Bedrock	16	2	18	
# of Holes Completed to Saprolite	3	0	3	
% Success to Bedrock	69.5	66.6	69.2	
# of holes greater than 300 feet stopped by choice/cost	6	1	7	

Notes

1. Estimated water consumption for one day is 4000 gallons.
2. Estimated number of DNR sampling crew mandays is 100.
3. DNR Field Crew: D. Martin, T. Pastika, D. Cartwright, and P. Geiselman
4. Drilling Contractor: North Star Drilling, Little Falls, Minnesota
5. Contracted Drilling Costs: $ 136,360 total - $28.35 per foot overall (including all bonding, drilling, abandonments, and mobilization)

Table 3. A list of the geologic units encountered in the Effie area Rotasonic drill cores, and also the sample media we used. At the bottom of the table is an example of how the data can be divided into the subpopulations necessary for interpretation. The computer data is designed to permit this type of review.

	No. of Samples Analyzed	Footage Drilled
I. Glacial Drift		
A. Stratigraphic Packages of Glacial Drift		
1. Late-Wisconsin		
a) Koochiching lobe: Keewatin source from W-NW		
1) till	29	1368
2) outwash, lake sediments, etc.	0	622.5
b) Rainy lobe: Labradorean source from NE		
1) till	51	411.5
2) outwash, lake sediments, etc.	10	631
2. Interglacial Sediments	0	30
3. Pre-Late Wisconsin, Undivided		
a) Winnipeg lobe: Keewatin source from W-NW		
1) till	10	111.5
2) outwash, lake sediments, etc.	3	138.5
b) Old Rainy lobe: Labradorean source from NE		
1) till	19	177.5
2) outwash, lake sediments, etc.	17	392
Subtotal	139	3882.5
B. Weathered Bedrock from Cretaceous(?)		
1. Pisolitic Laterite - observed in Becker County DDH1-2	0	5
2. Reworked Saprolite - observed in Effie samples	4	15
3. Kaolinitic Saprolite - observed in Effie samples	7	26
4. Saprolite	21	167.5
Subtotal	32	208.5
C. Fresh Bedrock		
1. Metasedimentary rocks (1 core or DH)	2	-
2. Granite, granodiorite (7 cores or DH's)	9	-
3. Schist-rich migmatite (1 core or DH)	1	-
4. Mixed volcanic/clastic rocks (2 cores or DH's)	4	-
5. Ultramafic-intermediate volcanic rocks (3 cores or DH's)	4	-
6. Volcaniclastic rocks (3 cores or DH's)	5	-
Subtotal	25	141
Total	179	4232

	No. of Samples Analyzed	
II. Sample Media		
A. Glacial Drift		
1. Heavy mineral concentrates (greater than 3.3 specific gravity) from 7-11 kg of composite drill core sample		
a) Nonmagnetic fraction		
[1] assays	146	
[2] gold grain counts & descriptions	152	
[3] mineral point counts	72	
[4] replicates	14	
b) Magnetic fraction		
[1] assays	75	
2. Silt/Clay fraction from 2 kg composite drill core sample that is same footage as above HMC		
a) Minus 63 micron fraction for Au, Ag and Co assays	154	(24:
b) Clay fraction for Cu, Pb, Zn, As, Sb and other elements	154	
c) Analytical variability test samples		
[1] analytical reference standards	80	
[2] replicate samples	11	
[3] clean quartz blank samples	5	
B. Weathered Bedrock		
1. Nonmagnetic HMC		
[1] assays	17	
[2] gold grain counts	17	
[3] mineral point counts	14	
2. Magnetic HMC	13	
3. Silt/Clay fraction	16	
4. "Wholerock" or total sample analysis	8	
5. Mineralogy of selected intervals by x-ray diffraction	20	
C. Bedrock		
1. Total sample wholerock analysis of interval composites	20	
2. Special vein samples	5	

III. Example of Review of Subpopulation

1. All nonmag HMC gold assays (located within computer datafile 263.Nonmag).
2. Find the subpopulation from the above list of only those from Old Rainy lobe tills (sort on drift type number for Old Rainy till, only DT = 51).
3. Find the smaller list of only those from underlying bedrock types of metasediments and mixed volcanic/clastic rocks (sort on underlying bedrock type for RT = 1 & 4).
4. Within this small population, a threshold can be estimated or the median value can be calculated for any element.

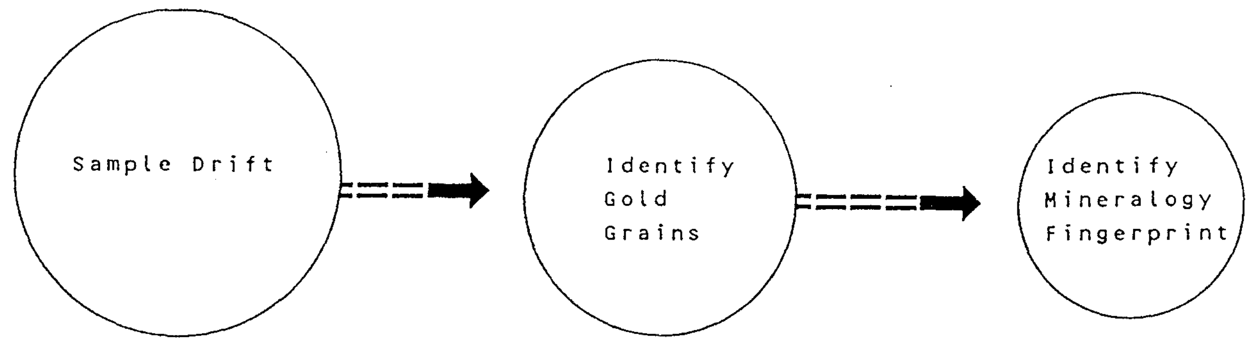
Table 4.

A. A list of types of data available for review, manipulation, and interpretation. This data has been set up on computer files to be sorted by drill hole, drift type, sample fraction, or underlying bedrock type to contrast and compare the following items.

	Data Description	Discussion
1.	Gold grain count normalized to 10 kg till sample.	Can compare to other samples of same population.
2.	Description of gold grain size and abrasion.	Check for short distance of glacial transport. Averill (1988) suggest +10 gold grains/10 kg, delicate or irregular, most less than 50 ums, and reproducible HMC assays near 1000 ppb Au.
3.	Calculated Nonmag HMC gold assay based upon the gold grain sizes in a theoretical 15 gm HMC.	3. & 4. If the actual assay of gold is much higher than predicted, other possible explanations or uncounted gold grains should be considered. Three most common pathfinders are #1 = As, #2 = Cu, #3 = Pb (Averills, 1988).
4.	The nonmag HMC assays.	
5.	The nonmag HMC wt.	Unusual accumulations of sulfides or other heavy minerals are indicated. Can calculate the original bulk sample equivalent metal value to normalize for variations in weight of original sample and in concentrate.
6.	The bulk sample gold content calculated from the nonmag HMC weight and assay.	The calculated bulk sample assay removes the variation due to HMC weight, but does not account for losses during drilling and concentration. The calculation normalizes the data to permit quick recognition of real patterns.
7.	The silt/clay assays.	Probably indicate anomalies within a few hundred meters of source (Lehmuspelto, 1987), or maybe complex hydromorphic anomaly.
8.	The magnetic fraction HMC wt. and the ratio of nonmag wt./mag wt.	Unusual accumulations of magnetite may indicate iron formation nearby or a placer-effect. Unusual depletion could indicate magnetite-destructive alteration such as carbonatization or of weathering.
9.	Description of glacial drift sample.	Does it have indications of subglacial vs. supraglacial origin?
10.	The wt.% of sand, silt, and clay.	Is an occurrence being diluted more (or less) than comparative samples? The heavy minerals come primarily from the -250 micron fraction. Thus, if more of this size fraction is present, one expects more heavy minerals to be available. Similarly, a higher percentage of silt in the silt/clay fraction could dilute an otherwise anomalous gold content. Further, contrast each till sample within the hole, between holes, and to other drift types to interpret the content of local bedrock (or saprolite) in the drift sample.
11.	The Columnar section has 8 graphs accompanying it.	Seek trace element fingerprints that could further subdivide the stratigraphy to help narrow down the correlation to bedrock in up-ice direction.
12.	Saprolite assays, including nonmag HMC, mag HMC, silt/clay, and total sample.	Has the till incorporated underlying or up-ice saprolite that raises (or lowers) the trace element content? Note the unusual HMC magnetic fraction trace element content for saprolite that could be useful to estimate the saprolite presence.
13.	The wt. % of +10 mesh rock chips and the lithologies (see HMC Reports).	Examine the rock chips under a binocular microscope to classify them. Look for alteration. Assay some if appropriate.
14.	Selected special mineralogy examinations.	Seek evidence of hydrous iron oxides of saprolite origin that may be scavenging trace metals.

Table 4.

B. Summary of a suggested approach to follow-up work in this area directed at gold exploration.



1. Drilling of selected targets.
   Collection of till samples from lower 100 feet of drill hole.
   Identification and separation of samples by drift type.

2. Composite till samples (greater than 8 kg) processed for heavy mineral separation, gold grain count & description, and limited analyses. Magnetic fraction and rock fragments saved.

3. Mineralogy is the key to source identification and the process of tracing dispersal trains back to a source. Limited to those samples with a significant number of gold grains or unexplainable high gold assays.
   a) Perform a series of microscopic examinations of rock type and mineralogy.
      1) Examine the +10 M rock fragments to identify lithologies and alteration, or clues for saprolite.
      2) Fingerprint the dispersal train in the glacial drift and the bedrock source by unusual metal ratios or more likely unusual minerals present.
      3) Examine the magnetic fraction and assay it to seek clues to mineralization event and to fingerprint both source and till layer.
      4) If necessary, microprobe selected minerals to verify that the anomalous till samples match to the bedrock source when it is found.
      5) Assay the silt/clay fraction since this anomaly is usually within a few hundred meters of source (Lehmuspelto, 1987). Fine-grained laterite gold may be present.
      6) Other indicators such as native copper or marcasite or microconglomeratic gold grains (Maurice, 1987) can be used in this interpretation. Laterite gold may be directly over the source or maybe downslope or a long distance placer.
   b) Submit adjacent samples (example - gravels) for HMC and gold grain counts, if not previously analyzed.

Table 5. Summary arithmetic averages of gold grains, nonmagnetic heavy mineral concentrate (HMC) weight and magnetic HMC weight. The data is sorted by drift type and has been normalized to a 10 kilogram total sample weight.

Drift Type No.	Drift Type	No. of Samples Anal.	Total No. Gold Grains	Median Number Gold Grains per Sample	Avg. Gold Grains per 10 kg	Nonmag (g)per 10 kg	Mag(g) per 10 kg	Ratio wt. non-mag:wt. mag

-1 = not analyzed
<1 = less than detection limit of 1

Table 8. Test of total variability as reflected by 11 pairs of separate core splits. These were processed to separate the silt/clay and the nonmagnetic HMC fractions and analyzed with the same methods as all the other samples. Calculated precision values are for the 95% confidence interval (adapted from Garrett, 1969).

Table 9. Means to distinguish between stratigraphic units.

	Matrix Composition	Clast Lithologies	Average Nonmag HMC(g) per 10 kg	Nonmag Heavy Mineral Mineralogy	Color	Avg. Magnetic Susceptibility
Koochiching Till	clayey calcareous	shale carbonate	15.5	probably identifiable suite, but exotic	light gray to medium gray	$.09 \times 10^{-3}$ cm/gm/sec
Rainy Till	sandy, silty slightly calcareous to noncalcareous	metavolcanic granite metasediment migmatite (local material)	28.1	probably identifiable to local sources	brownish gray to greenish gray	$.12 \times 10^{-3}$ cm/gm/sec
Winnipeg Till	clayey, often well indurated and compact, calcareous	shale carbonate cretaceous limestone	22.4	probably identifiable mix of exotic + local suite	medium gray to dark gray	$.09 \times 10^{-3}$ cm/gm/sec
Old Rainy Till	sandy and rocky, more indurated than Rainy till, slightly calcareous to noncalcareous	metavolcanic granite metasediment migmatite (local material)	32.3	probably identifiable to local sources	brownish gray to greenish gray	$.13 \times 10^{-3}$ cm/gm/sec
Saprolite	clayey, calcareous to noncalcareous	bedrock	11.1	probably identifiable supergene minerals	grayish green to reddish brown	$.04 \times 10^{-3}$ cm/gm/sec

Table 10. List of Drill Core Available Within the Effie Area. See current Division of Minerals Drill Core Library Samples Index for more information about the core intervals available for inspection. To summarize, there are 26 drill cores from 6 different townships. These are in addition to DNR drilling described in this report and recent MGS drilling.

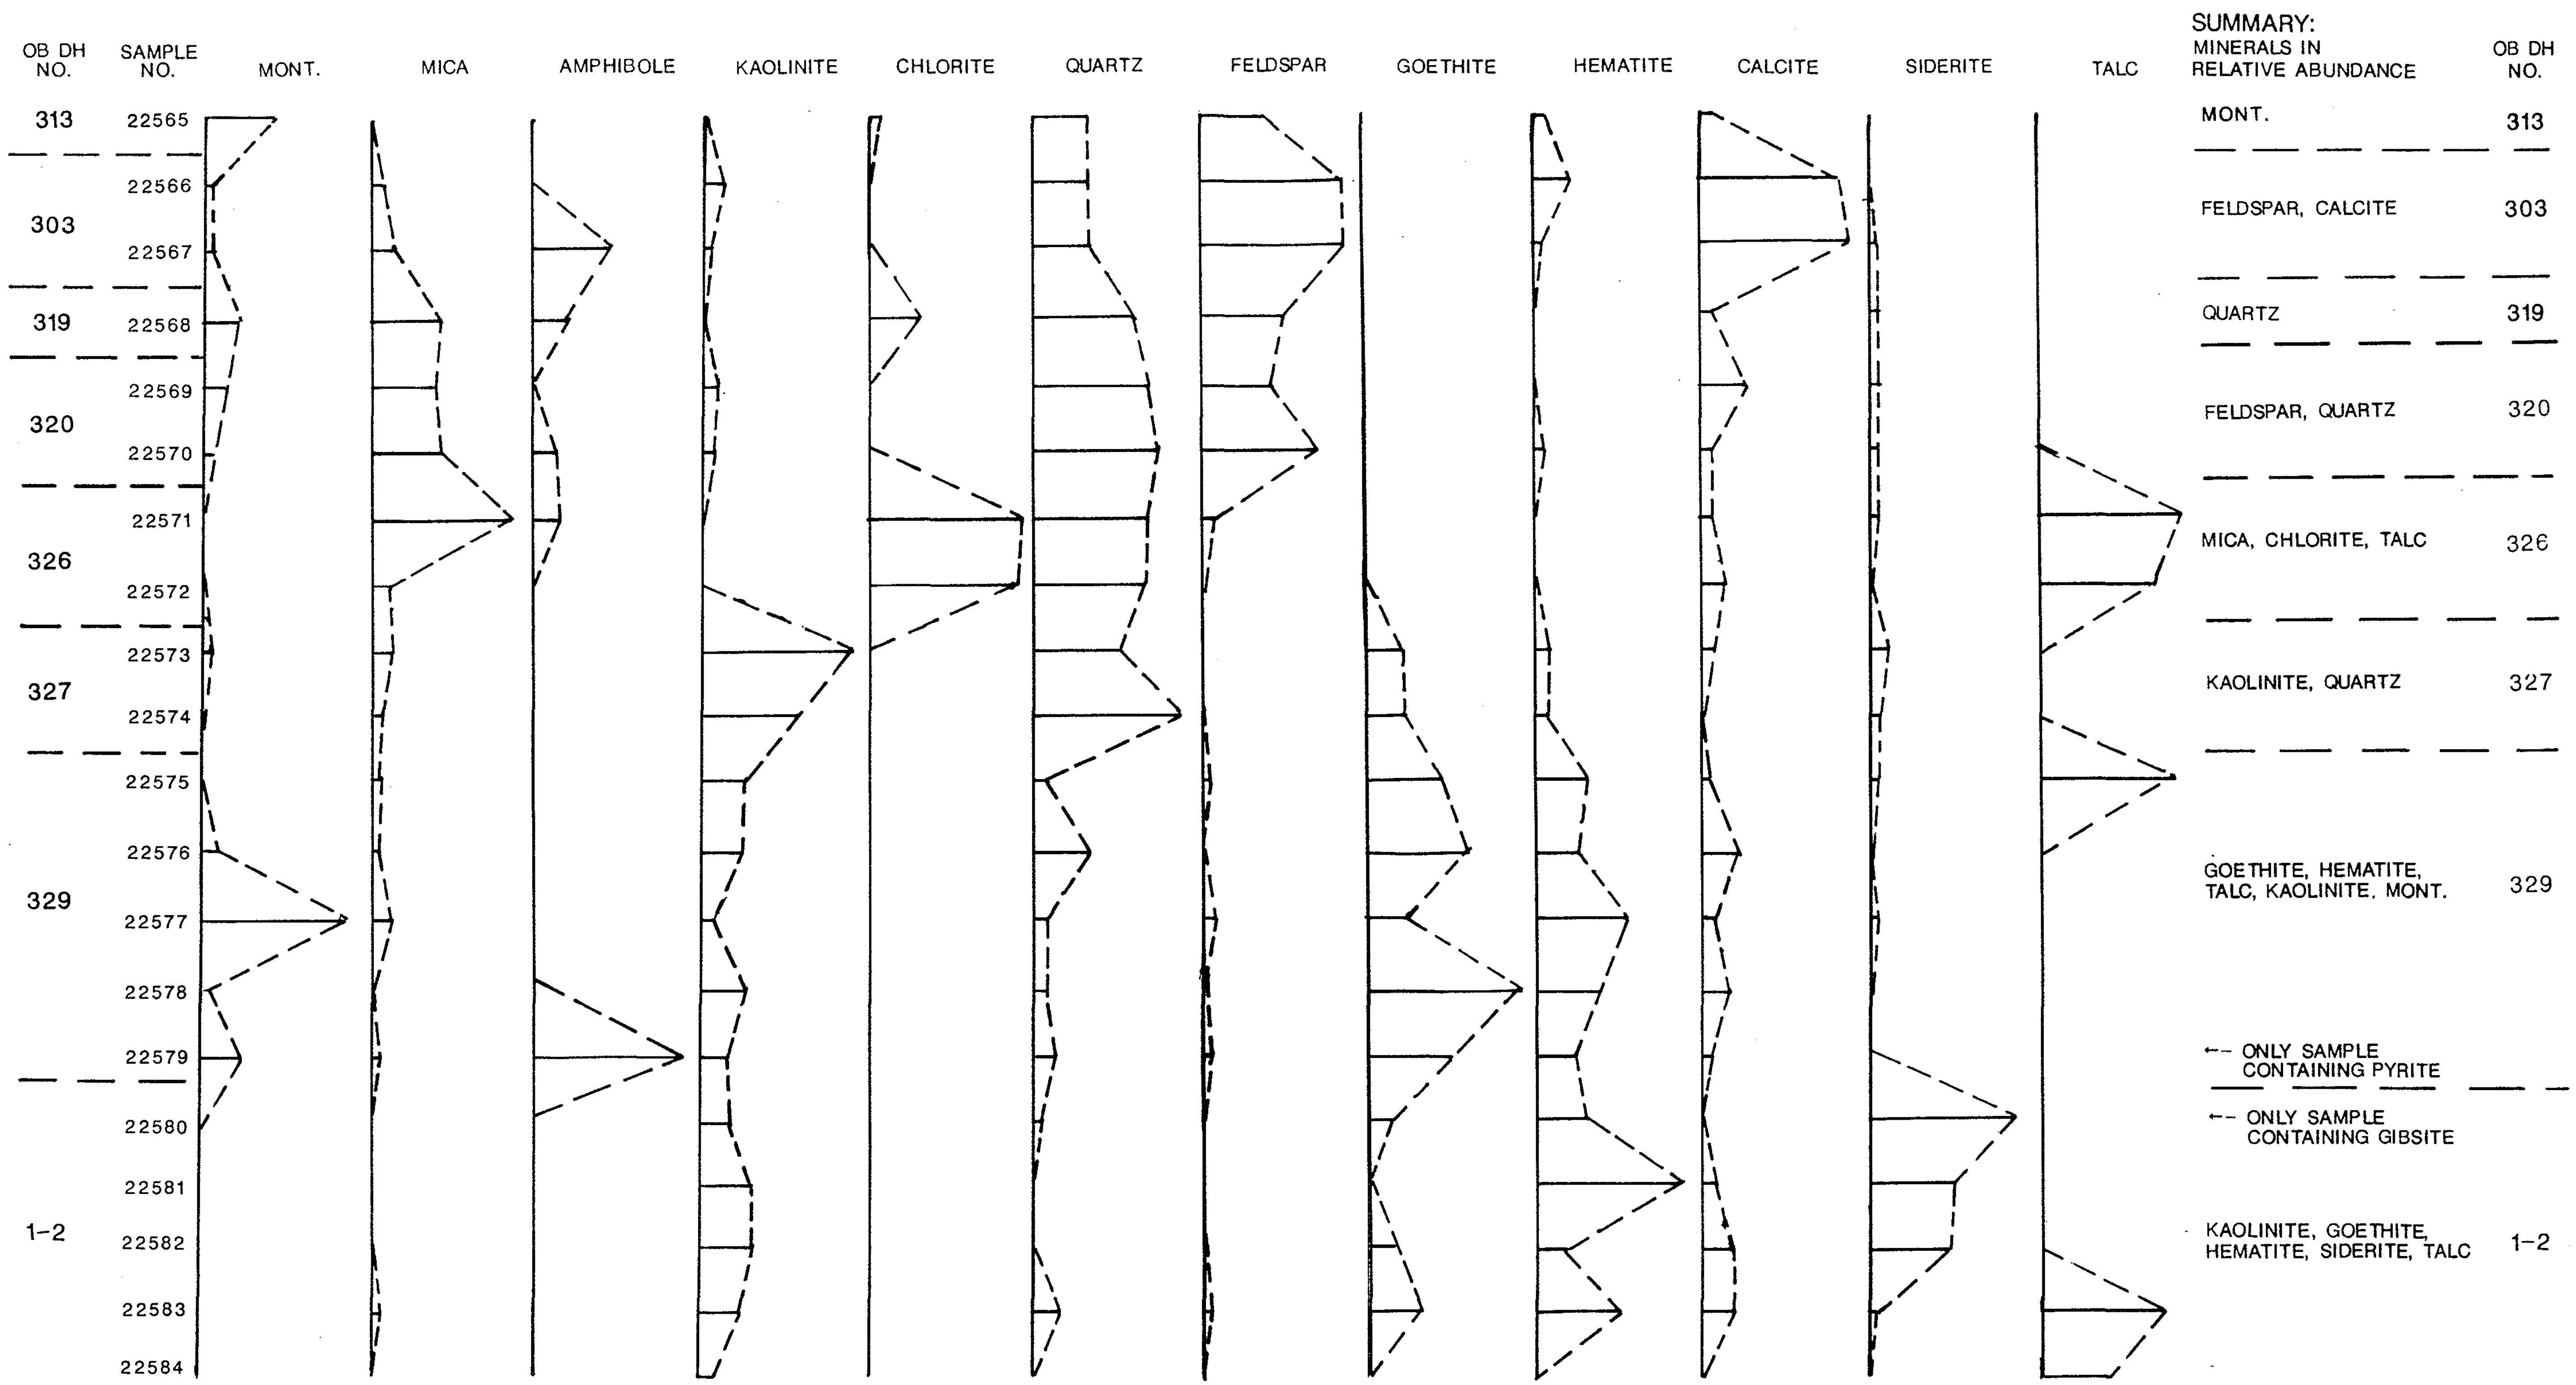
Table 11. This table shows the variation in mineralogy of selected saprolite samples.



Note: An x-ray diffraction pattern was run on each sample with identical instrument parameters and the results graphed to compare the relative amounts of each mineral between samples. For each mineral, a specific peak is selected and the sample with that highest peak is assigned 100%. Every other sample is compared to that peak height. The results are semi-quantitative. For each mineral, relative variations between samples (and thus between drill holes) are shown by looking down columns. The mineralogy of each sample is shown by looking across rows.

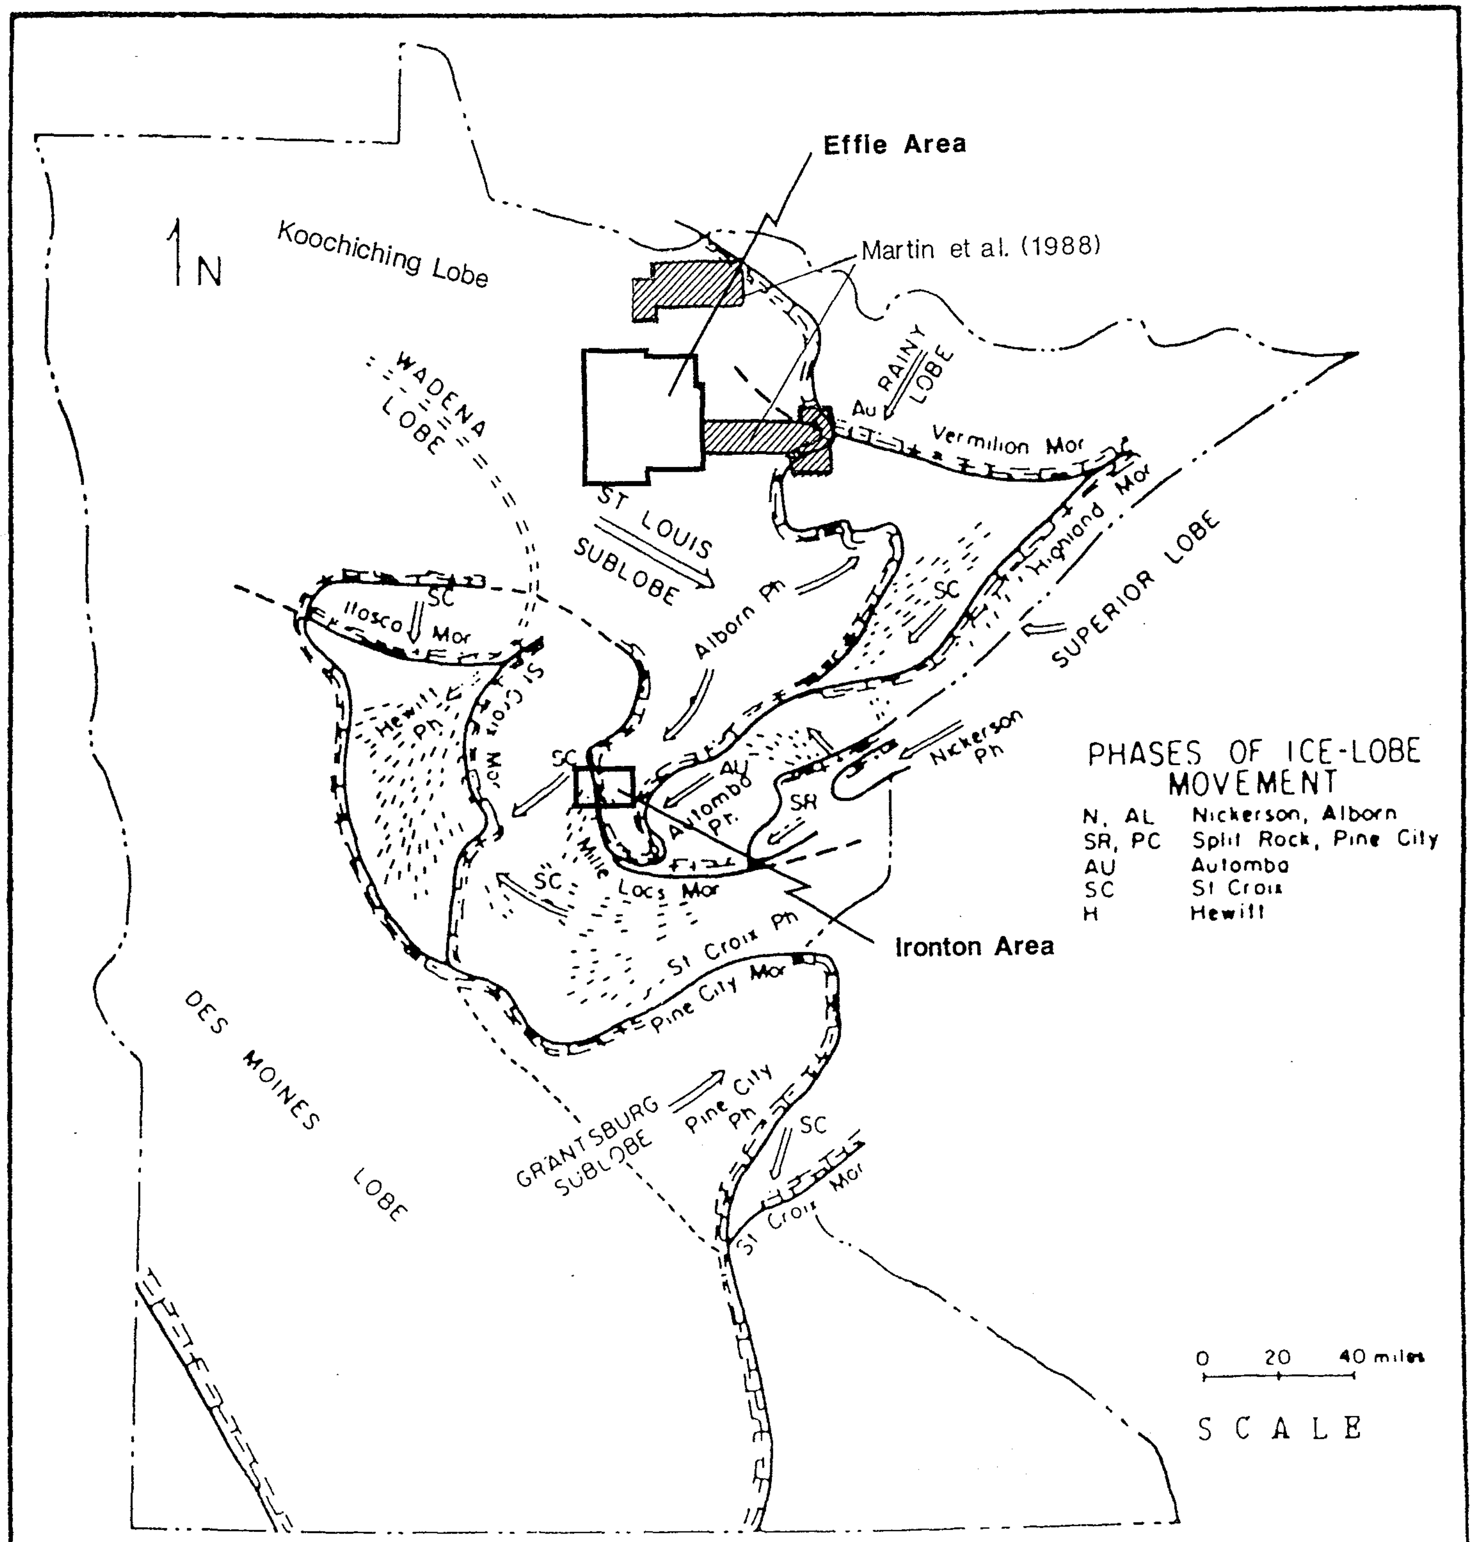
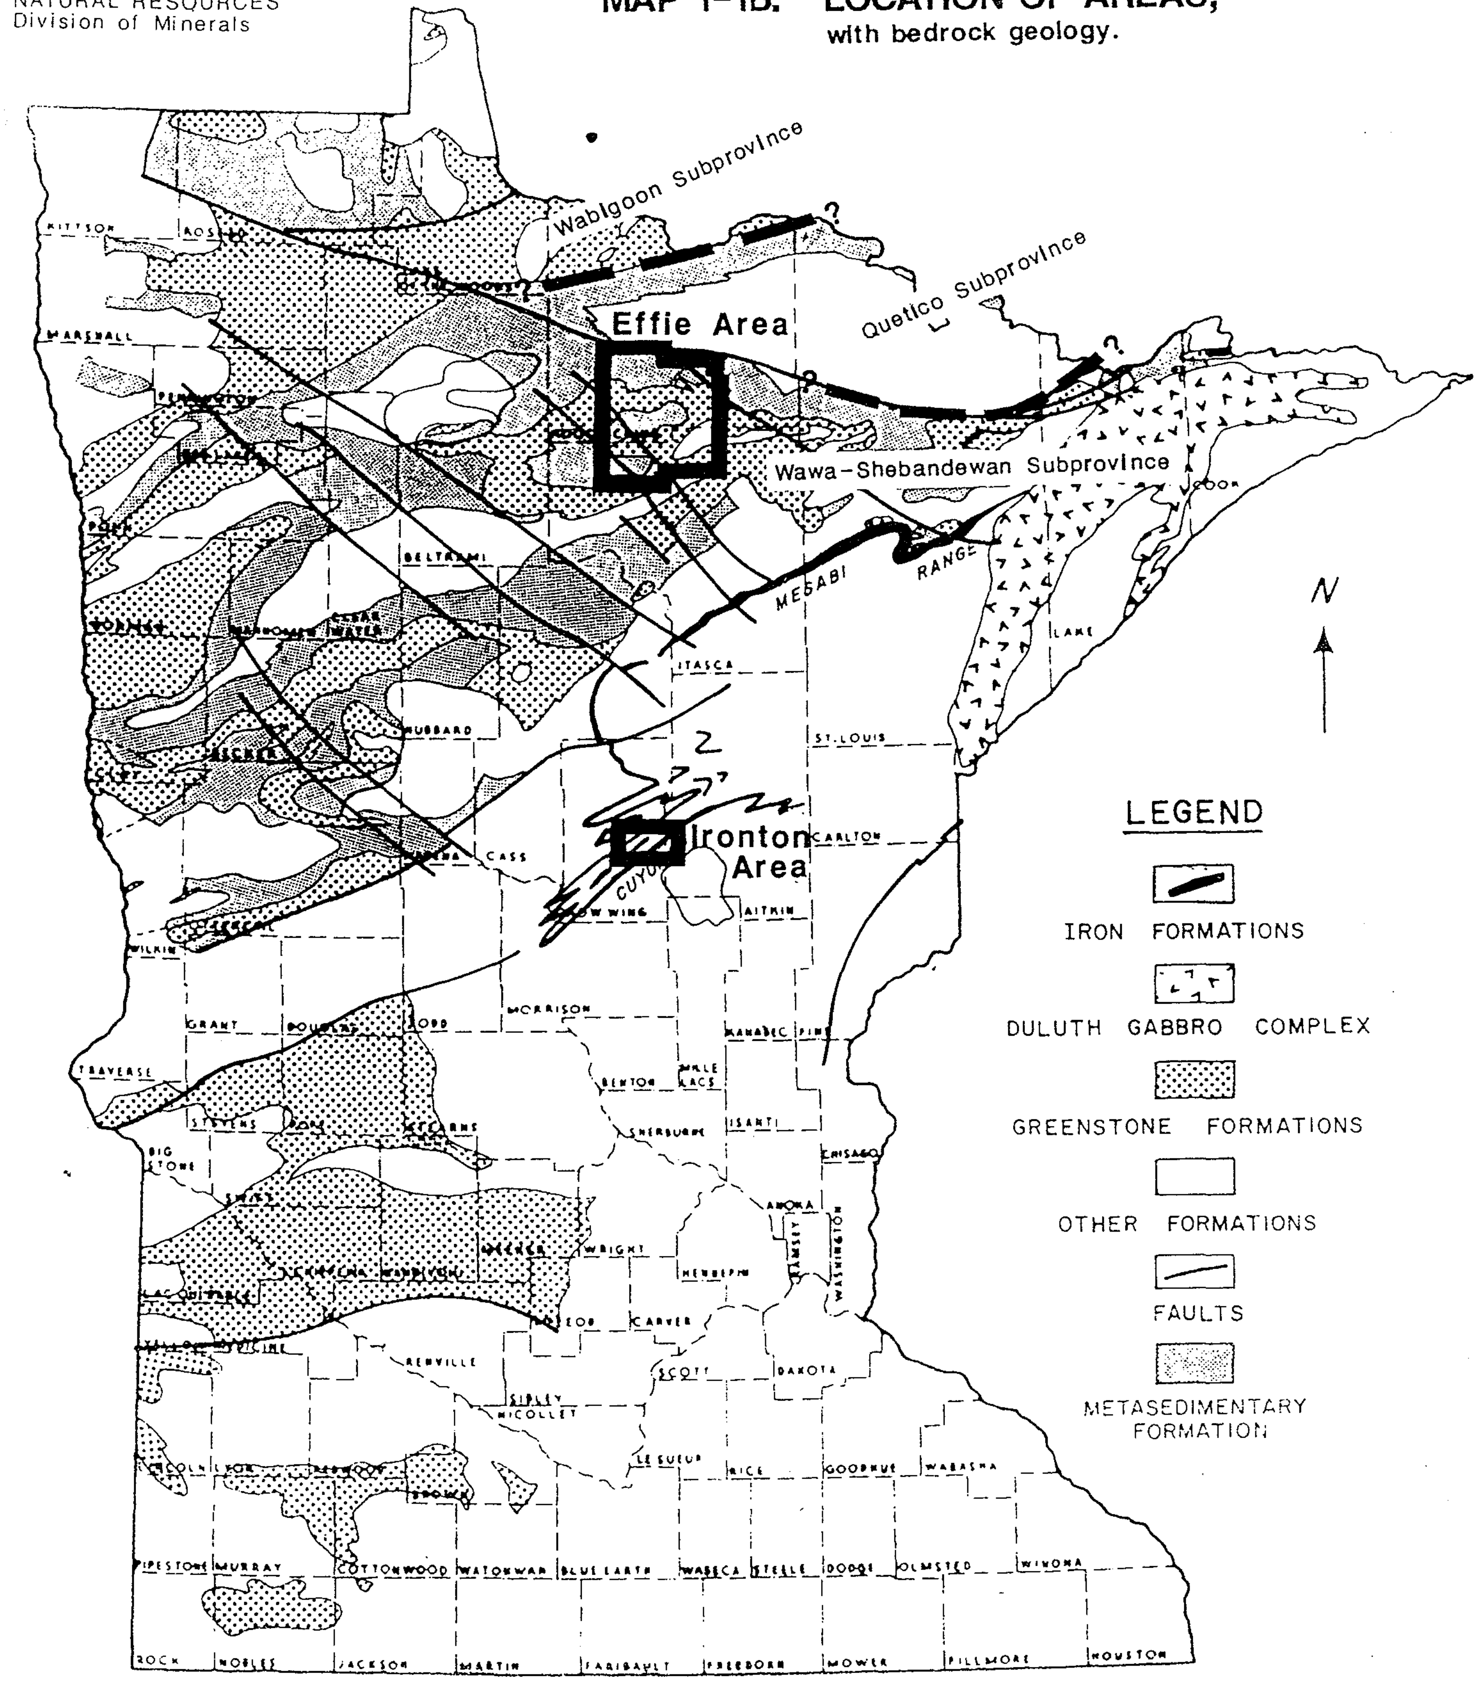
MAP 1-1A. LOCATION OF AREAS, with glacial geology. See Figure 2 and section on Glacial Drift Stratigraphy by Gary Meyer for explanation of new lobe name, Koochiching Lobe (modified from Wright, 1972).



MINNESOTA DEPARTMENT OF NATURAL RESOURCES
Division of Minerals

MAP 1-1B. LOCATION OF AREAS, with bedrock geology.



Note: Greenstone areas north of the fault passing from Bigstone County northeastward to Morrison County are adapted from G. B. Morey et al, Map S-13, 1982. Protolith for the areas south of this fault are probably older mafic to intermediate greenstones as adapted from P. K. Sims, Geologic Map of Minnesota, 1970.

Note: Subprovince boundaries uncertain.

Map 1-6. The gray tone on this map indicates the fault zones and granitic bedrock types from the bedrock base (Map 1-7). It is an attempt to organize and understand the observations from deeply weathered shear zones and probable differential weathering of the granitic vs. greenstone rocks. It also clearly shows the overwhelming volumes of granitic saprolite materials that may have been available to the earliest Pleistocene ice lobes.

(1) Special Sample Type: R = Replicate; SS = Special Sample, see Remarks.
(2) in feet
(3) See legend on preceding page of Summary Sheet for: A=silt/clay fraction, etc.
(4) Township-Range-Section location. T61N-R26W.
(5) 40 acre parcel (e.g., SE¼ of SW¼).
(6) I = Itasca, K = Koochiching
(7) includes saprolite or bedrock
(8) database abbreviation for drift type
(9) lithologic type from Bedrock Map 1-7
(10) database abbreviation for bedrock type
(11) HMC = Heavy Mineral Concentrate; all HMC data from O.D.M. lab
(12) in grams
(13) feed weight = 100 gram split. See Sample Prep Flowsheet.
(14) VCGR sand + MGR sand = +250 um fraction. VCGR sand wt. % comes from the +10 mesh data on HMC Report.
(15) HMC sample results are normalized to 10 kg bulk sample.
(16) Estimate from O.D.M. lab, prior to assay, based on gold grain sizes. See HMC Report.
(17) Represents $\frac{\text{[Nonmag HMC Au assay (ppb) x Nonmag HMC wt. (gms)]}}{\text{Bulk Sample Wt. (gms)}}$
Estimates bulk sample gold content from only that gold recovered and assayed in the Nonmag HMC.
Normalizes variations in original bulk sample size and Nonmag HMC weight.

(18) Wt. in grams of the Nonmag HMC assayed. Is a 3/4 split of Nonmag HMC. 1/4 split permanently saved in Hibbing.

(19) in grams

(20) Note Au, Ag, & CO_2 assayed on -63 um screen fraction, whereas other elements are on clay fraction that was separated by centrifuge. See Sample Prep Flowsheet.

(21) Magnetic fraction wt. in grams, reported by ODM lab (see HMC Report). Includes minor drill steel. Steel removed before assay by fine grinding, then screening at 150 ums. Most malleable steel flakes remain on the screen, thus excluded from the assays.

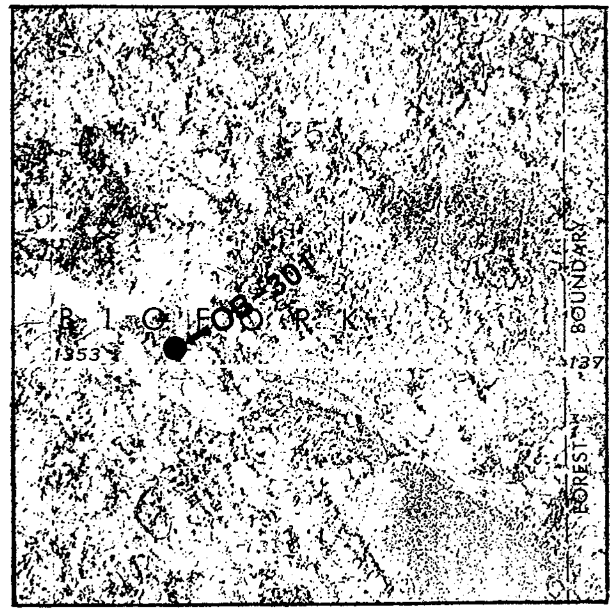
(22) These are "wholerock" or for saprolite "total bulk sample" analyses. Note some intervals are small and represent selected vein-rich material, as indicated in the remarks.

(23) See Methodology Section 9.3. Performed by ODM lab.

(24) A measure of impurities in HMC. ODM convention is to exclude this from 100% total.

DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-301
Drilling Completion Date: 5/20/88



LOCATION (see map at right)
S-T-R: SE¼-SW¼ - S25 - T61N - R26W
County: Itasca
Quadrangle: Coon Lake 7.5
Regional Survey Area: Effie
UTM Coordinates: 453,980mE; 5287380mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1367 ± 3 ft.
Total Depth: 95 ft.
Elevation, Top of Precambrian Bedrock: 1276 ft.
Elevation, Top of Saprolite: 1280 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

SEE FOLLOWING PAGES
Sample Types, Intervals, Chemical Data, Gold Grain Counts, Graphic Summary Log

INFORMATION SUMMARY

Interval (ft.)	Interpretation	Library Samples Available	Subsamples Tested	Geochem Assays Worthy of Further Review
0-14	Kooch. lobe gl. drift	G		
14-50	Rainy lobe gl. drift	B,C,G	A,B,C	A=Ni B=Au,W,Co,Sb, C=Cr,Zn,Mo
50-78	Winnipeg lobe gl. drift	B,C,G	A,B,C	B=Sb,Se,Ni C=Cr,Zn

C = Heavy Minerals, Mag
G = Core

H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

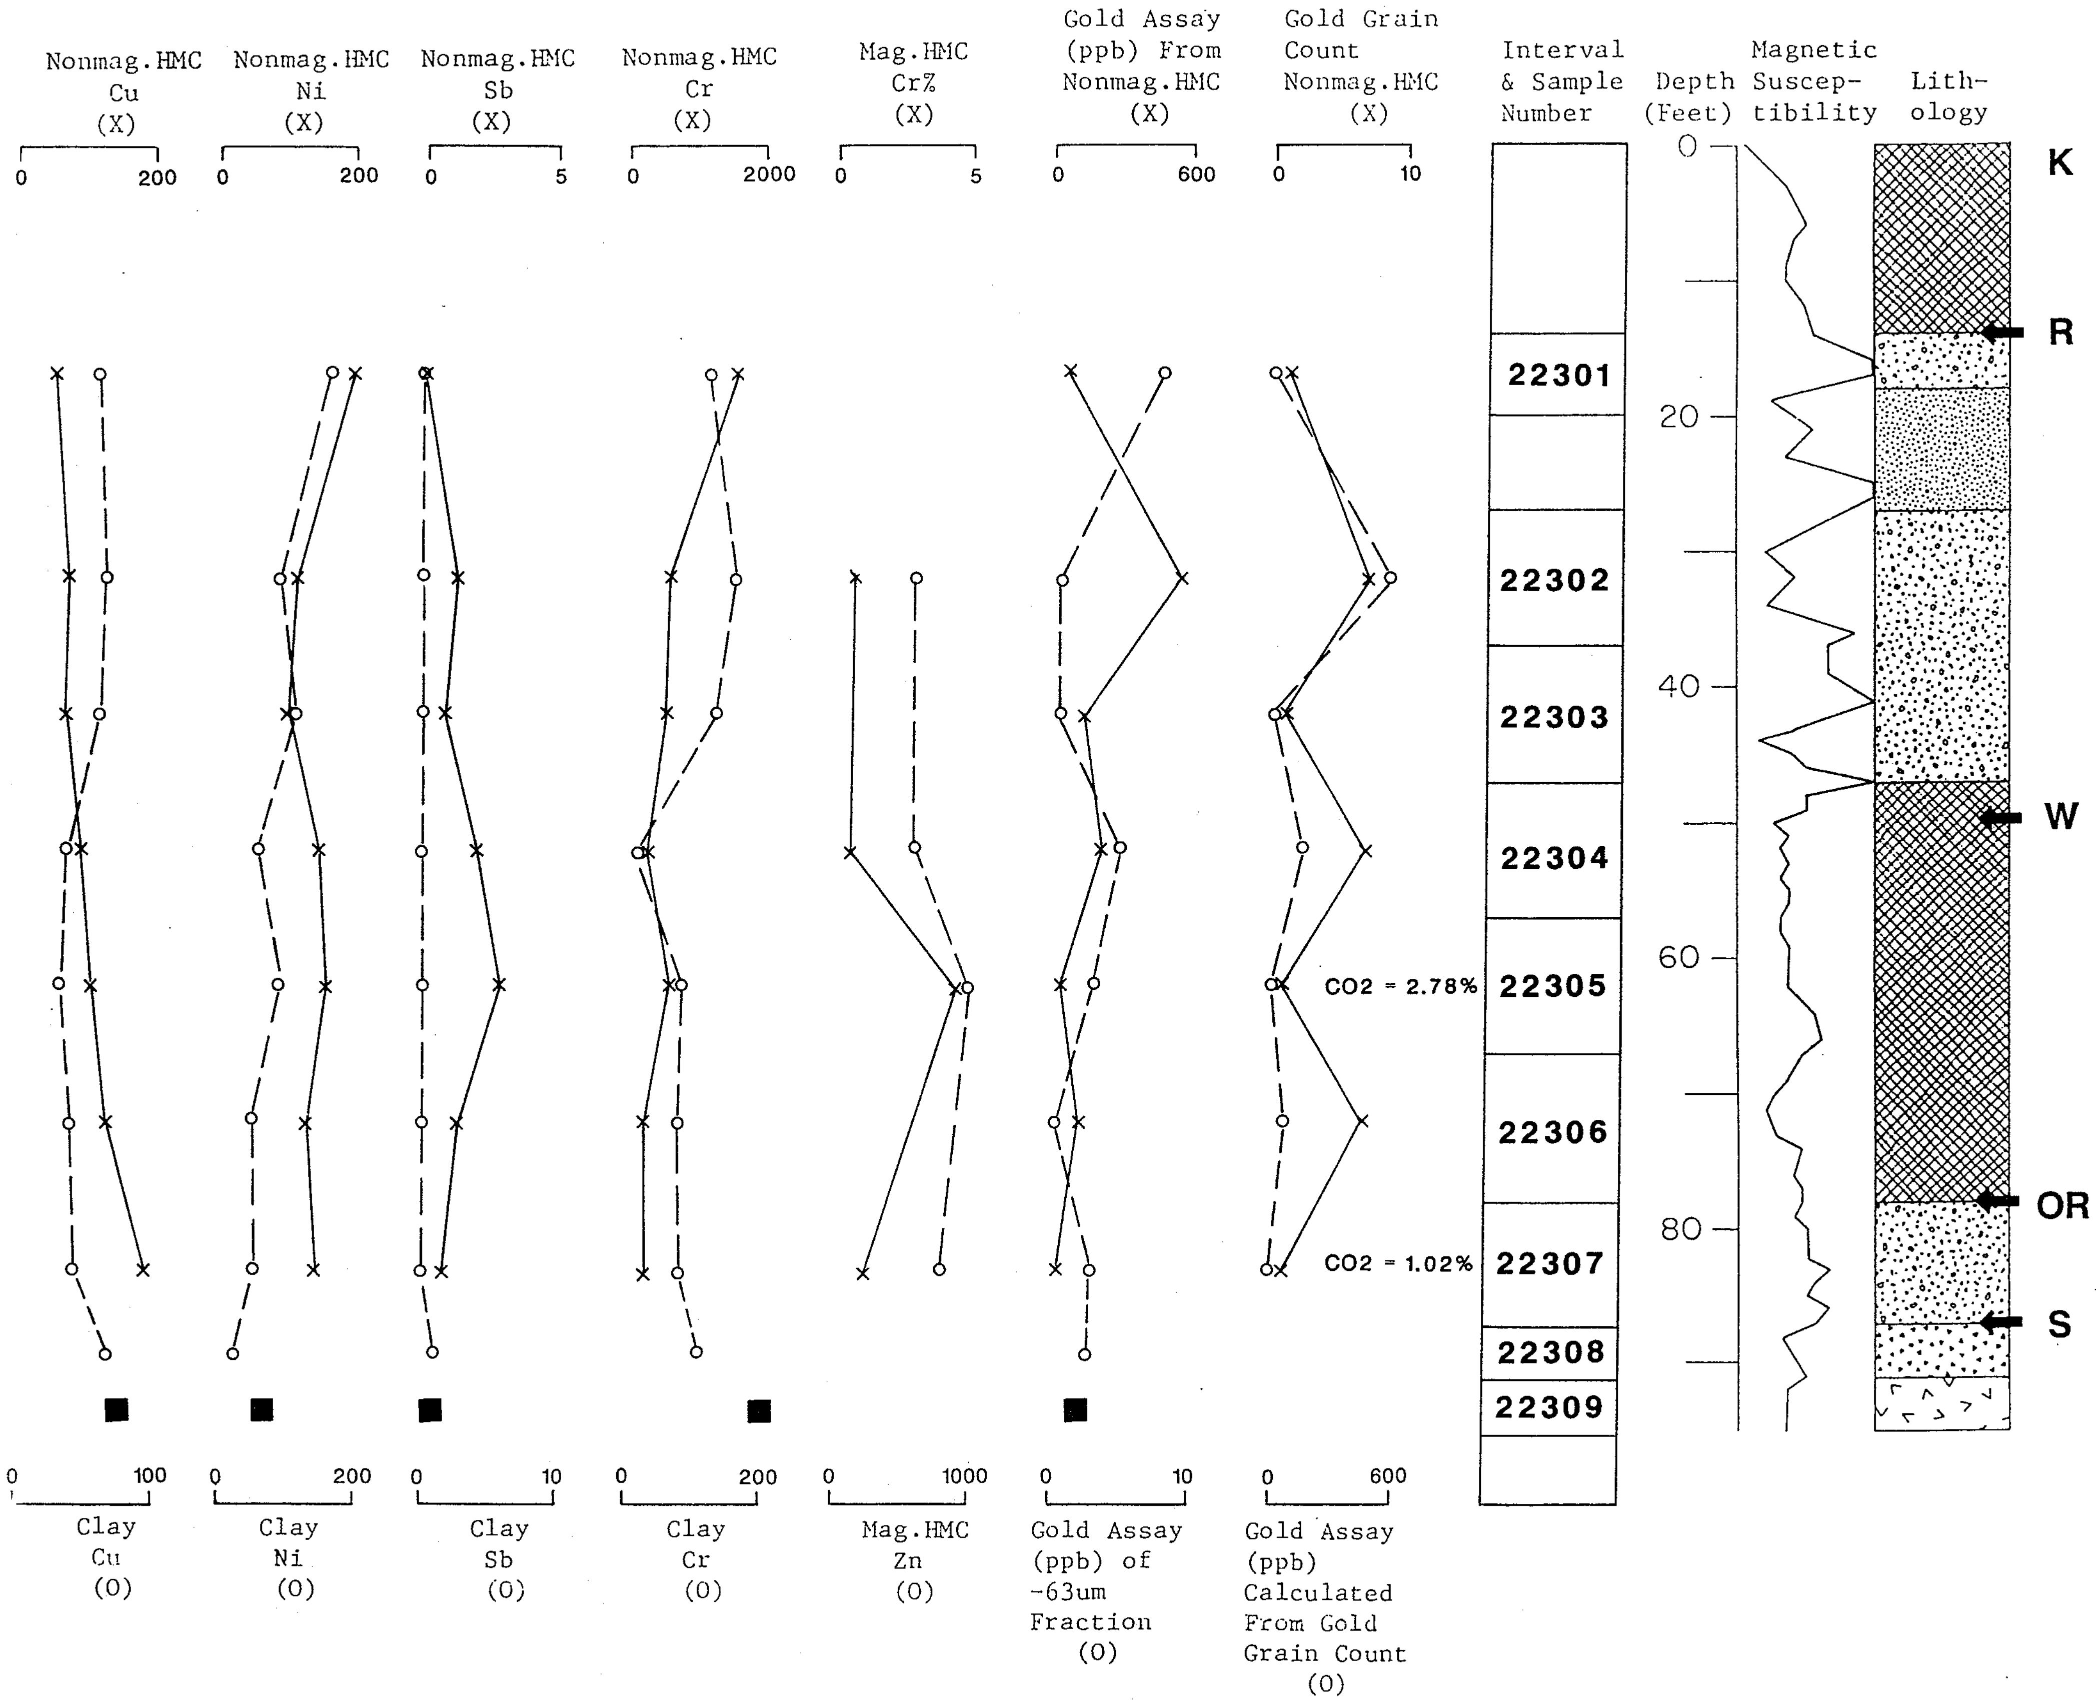
Core Description: Dark green, massive metabasalt or fine-grained metadiabase. Trace % disseminated pyrite. Thin section is representative of bulk of core. Magnetic susceptibility; 0.03 x 10-3 CGS units.

Thin Section Description: OB-301, 92 ft. Fine- to medium-grained, massive meta-basalt or diabase. Estimated mode (volume %): Amphibole (dominantly actinolite) 45; Plagioclase (including saussurite) 49; Quartz 3; Opaque Fe-Ti Oxides 3; Chlorite Tr. Non-foliated amphibole-rich rock which has undergone extensive retrograde metamorphism. Initial prograde metamorphism produced 0.3 to 0.5 mm prisms and 2 to 3 mm poikiloblasts of hornblende in a groundmass of plagioclase and minor quartz. Subsequent retrograde metamorphism has thoroughly saussuritized the plagioclase and altered the hornblende to fibrous, matted actinolite and minor chlorite. A fine-grained, white, fibrous or micaceous mineral is also present as an alteration product of hornblende and along fractures; this mineral may be talc or tremolite (?). Rock is transected by a few brittle, open fractures which are non-mineralized and have slightly broken the rock.

Scintillometer Reading (cps): 85-95

OB-301

Appendix 1-1B.



Geologic Descriptions

(0 - 14) LOAM TILL; OXIDIZED; mod calc by 3 ft, calc by 10; top 1 1/2 ft silty, mgr sand; most pebs small, carb common; unox by 13 1/2; cob at base.

(14 - 18) COBBLY SANDY LOAM TILL; UNOXIDIZED; sl calc.

(18 - 27) GRAVELLY MEDIUM - COARSE SAND; UNOXIDIZED; sl calc; compact; cobbly zone at 22 ft, possibly till; clayey silt bed below; grades to cobbly, sandy loam till at 23 1/2; 25 - 26 mgr to cgr sand; 26 - 27 silty gvl.

(27 - 50) COBBLY, SANDY LOAM TILL; UNOXIDIZED; sl calc; inc generally thin beds of somewhat sorted material; iron stained in places; 47 - 50 ft mixed w/calc clay loam till, mostly clayey till below 47 1/2.

(50 - 78) LOAM - CLAY LOAM TILL; UNOXIDIZED; calc; carb common; few sh grains, Cretaceous limestone pebs; 64 - 67 ft more rocky w/smears of grnish saprolite, only mod calc in places; 67 - 76 1/2 mod calc to calc, carb almost uncommon, couple cobs 73 - 73 1/2, loamy from 76; 76 1/2 - 78 common Precambrian cobs, mod calc to calc.

(78 - 87) LOAM TILL; UNOXIDIZED; mod calc; rocky; hard & compact as above; carb pebs small.

(87 - 91) SAPROLITE; apar sl reworked rock & saprolite to 90 1/2 ft.

(91 - 95) BEDROCK; METABASALT; fgr to mgr; massive.

Appendix 1-1C.

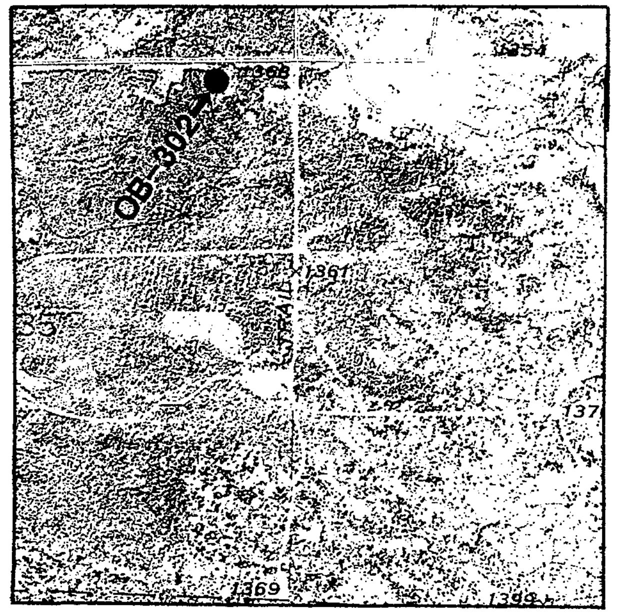
DRILL HOLE SUMMARY SHEET



IDENTIFICATION
DNR Drill Hole Number: OB-302
Drilling Completion Date: 5/21/88

LOCATION (see map at right)
S-T-R: NE¼-NE¼ - S35 - T62N - R25W
County: Itasca
Quadrangle: Deer Lake W 7.5
Regional Survey Area: Effie
UTM Coordinates: 463,230mE; 5296760mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1366 ± 2 ft.
Total Depth: 86 ft.
Elevation, Top of Precambrian Bedrock: 1287 ft.
Elevation, Top of Saprolite: 1290 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

C = Heavy Minerals, Mag
G = Core
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

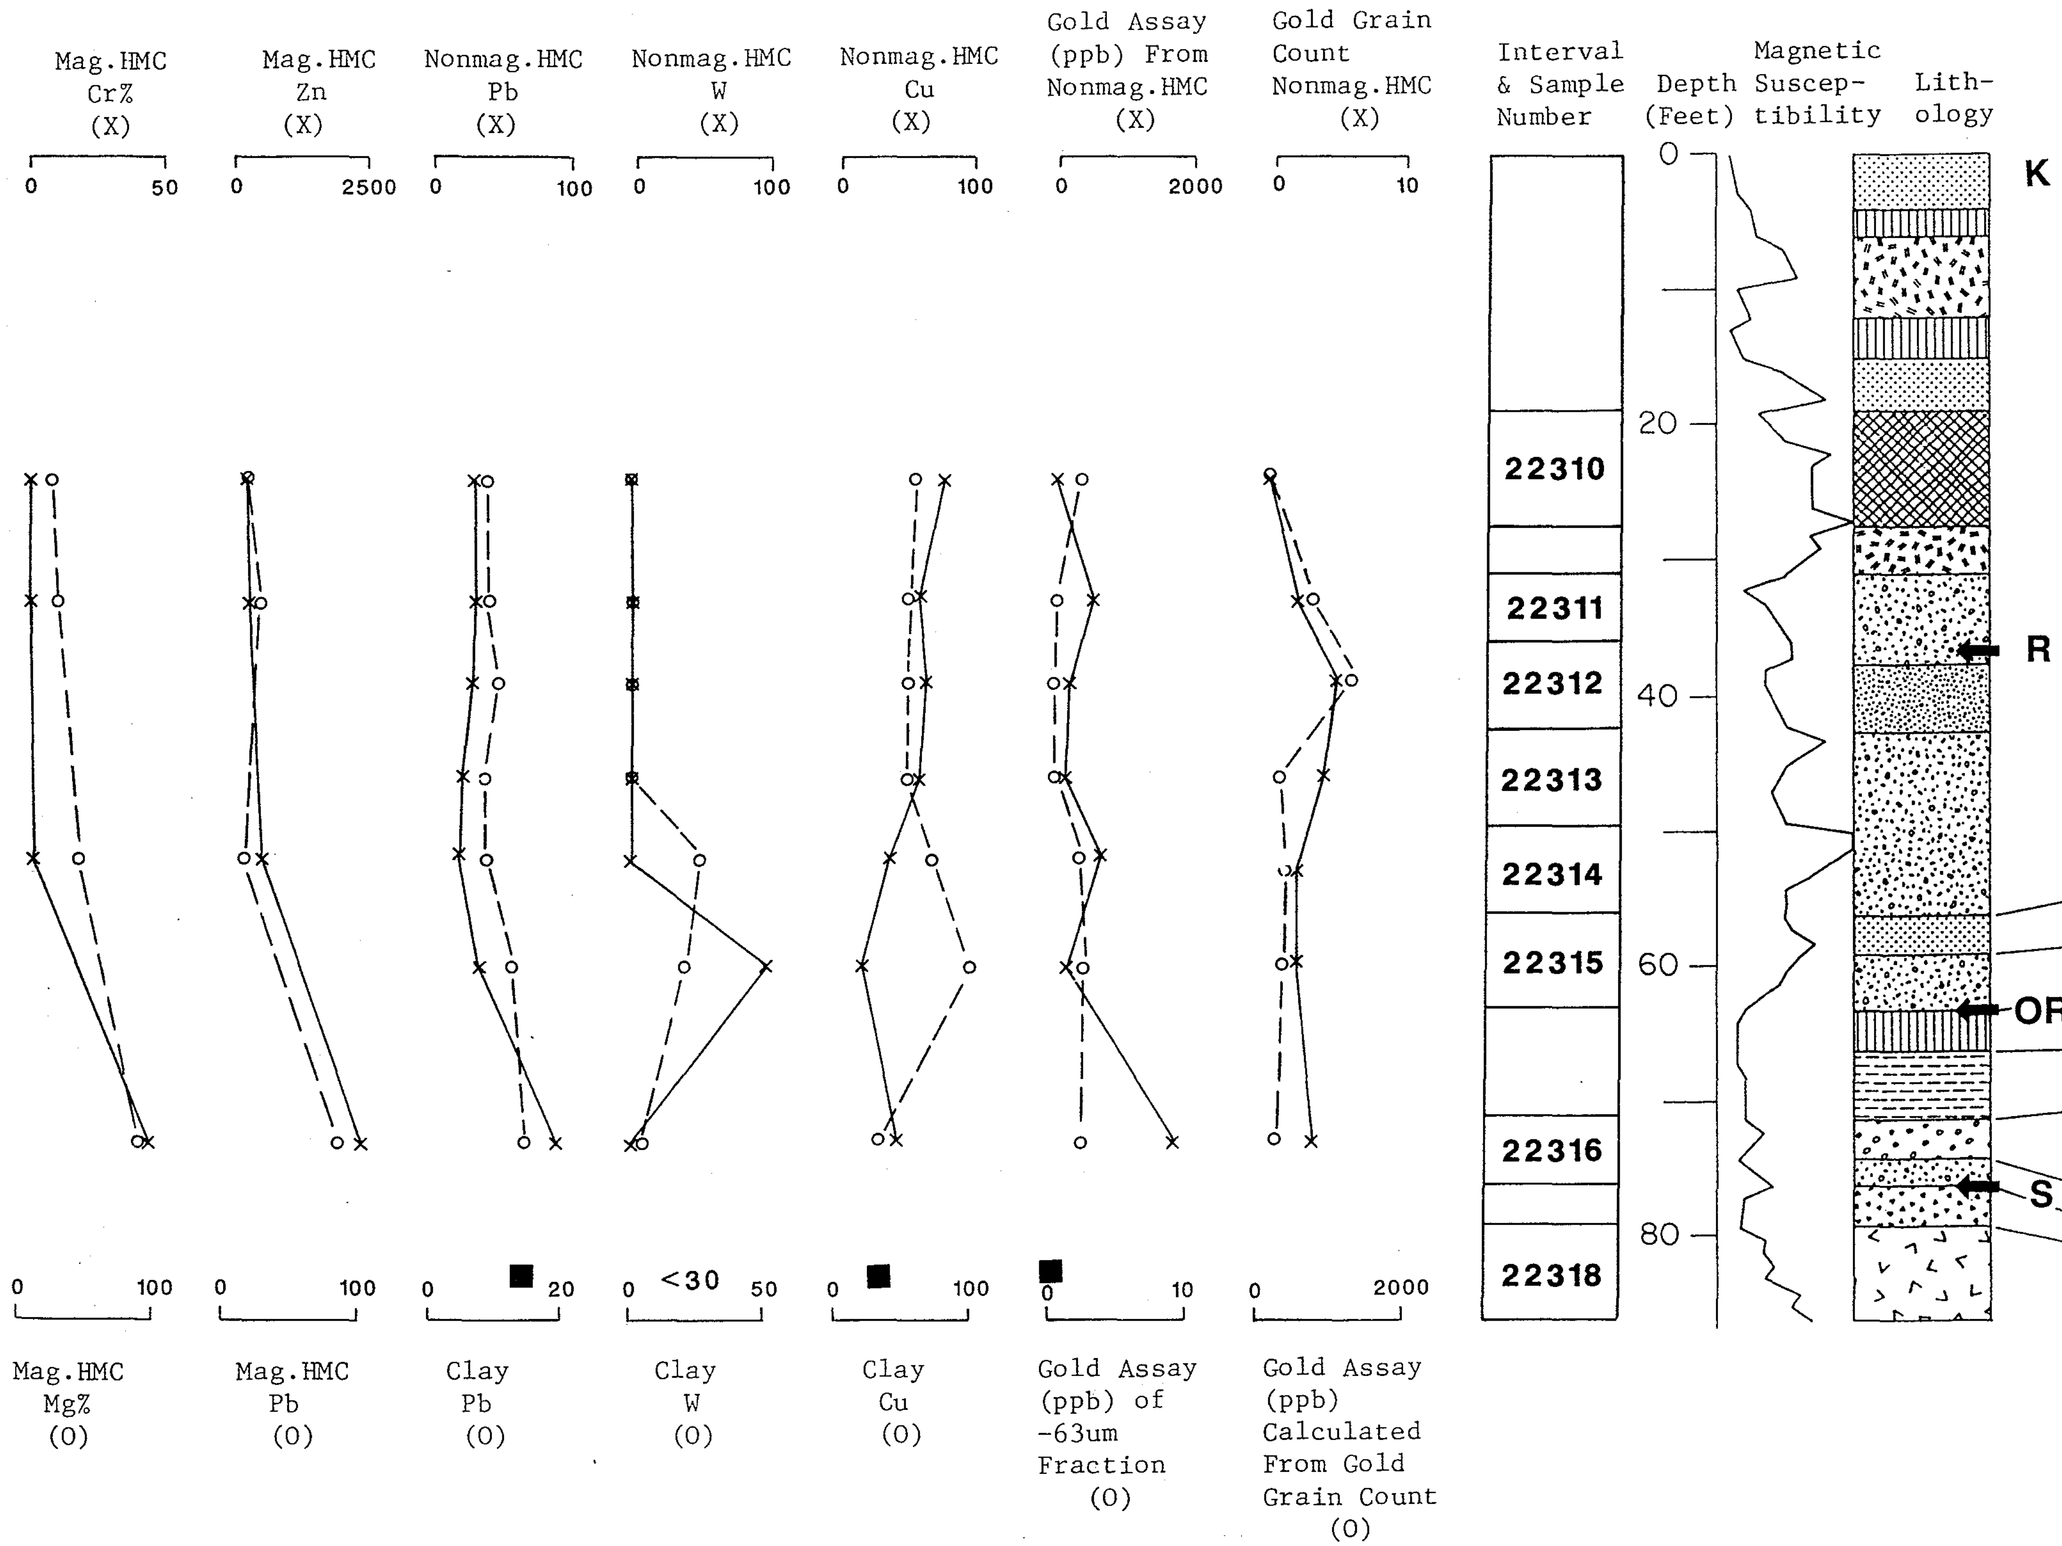
Core Description: Fine-grained, dark to medium greenish-gray meta-andesite. Relatively pristine-textured but weakly lineated at about 80° (degrees from horizontal). Minor disseminated pyrite and unmineralized fractures. Thin section is representative of core.

Thin Section Description: OB-302, 83 ft. Fine-grained, weakly foliated meta-andesite/basalt. Estimated mode (volume %): Hornblende plus actinolite 20; Epidote 7; Sphene (?) 6; Quartz 24 (Quartz to feldspar ratio uncertain); Feldspar 18; Chlorite 15; Clinozoisite (?) 10. Rock consists of subhedral prismatic hornblende (up to 0.5 mm long), clots of subhedral epidote, and clots of scaly chlorite in a groundmass of very fine-grained quartz, feldspar, sphene (altered to leucoxene), and Ca-(Fe)-Al silicate (possibly clinozoisite, occurs in somewhat tabular clots, has anomalous blue birefringence). Feldspar is recognizable but very heavily recrystallized and sausuritized. Rare elliptical 0.5 mm clots of sutured quartz are present, one of which has a crude outline of possibly euhedral volcanic quartz. Foliation is defined by elongate chlorite masses and a weak preferred orientation of hornblende. Relict textures imply a protolith of flow rock. Rock is transected by a 'vein' in which Fe-mg silicates have been removed; this'vein' is oriented approximately 50° to the foliation.

Scintillometer Reading (cps): 80-90

OB-302

Appendix 1-2B.



Geologic Descriptions

(0 - 4) FINE - MEDIUM SAND; OXIDIZED; silty from 2 ft, mgr to cgr from 3.

(4 - 6) CLAY; OXIDIZED; calc by 4 1/2 ft; fine clay loam 4 - 4 1/2.

(6 - 12) CLAY LOAM TILL; UNOXIDIXED; calc, ox silty sand & fine gvl lenses at 8 ft, 9 - 10, & couple from 10 - 10 1/2; much carb, little sh.

(12 - 16) CLAY; UNOXIDIZED; calc; mottled; few pebs; 15 - 16 ft pebbly loam to sandy loam flow deposit, most pebs carb.

(16 - 19) MEDIUM - COARSE SAND; UNOXIDIZED; interbedded w/calc silt from 18 1/2 ft, few sm pebs.

(19 - 27 1/2) LOAM TILL; UNOXIDIZED; calc; sandy side of loam; carb pebs sm & uncommon, Precambrian dominant; two cobs at base.

(27 1/2 - 31) CLAY LOAM TILL; UNOXIDIXED; calc; lith similar to above, carb possibly less common; cob at 30 ft, till more loamy below.

(31 - 37 1/2) SANDY LOAM TILL; UNOXIDIZED; sl to mod calc; little more rocky than above; 36 - 36 1/2 ft noncalc to sl calc pebbly sand w/layer mod calc sandy till, no carb noted in sand; 36 1/2 - 37 1/2 v sl calc, grnish gray, sandy loam till.

(37 1/2 - 42 1/2) GRAVELLY SAND; UNOXIDIXED; large cob near top; pebbly cgr sand to 38 1/2 ft;.cobbly cgr sand & gvl to 39; pebbly cgr sand to 39 1/2; silty, pebbly fgr to cgr sand to 40 1/2; cobbly, silty, cgr sand to base.

(42 1/2 - 56) SANDY LOAM TILL; UNOXIDIZED; sl calc; large cob at top, also fairly loamy; occ carb grains; more fgr, less pebs from 47 ft, mottled; rocky & more sandy by 50; large cob at 54, not many pebs below.

(56 - 59) MEDIUM - COARSE SAND; UNOXIDIZED; sev inches of sl calc sandy till at 57 1/2 ft; silty and pebbly below till bed.

(59 - 63) SANDY LOAM TILL; UNOXIDIZED; sl calc; cobbly in upper foot, apar 'washed,' v abrupt basal contact.

(63 - 66) SILTY CLAY; UNOXIDIZED; noncalc; greenish gray; few sand grains; silty fgr sand bed w/coarse grains at 64 1/2 ft; silty fgr sand lens near base, cgr sand lens at base.

(66 - 71) SILT; UNOXIDIZED; 66 - 68 1/2 ft silt to clayey silt, silty sand bed w/few sm pebs at 68, little silty clay to 68 1/2 couple inches silty sand, then v fgr sandy silt to 71.

(71 - 74) COBBLY GRAVEL; UNOXIDIZED; couple inches silty, cgr sand over foot thick boulder, couple more inches pebbly cgr sand over boulder 72 1/2 - 73 ft; gvlly cgr sand to 73 1/2, mgr sand to base.

(74 - 76) COBBLY, SANDY LOAM TILL; UNOXIDIZED; grnish gray; noncalc; no carb.

(76 - 79) SAPROLITE; rocky clay; possibly reworked in upper foot.

(79 - 86) BEDROCK; BASALTIC ANDESITE; fgr; weakly foliated.

Appendix 1-2C.

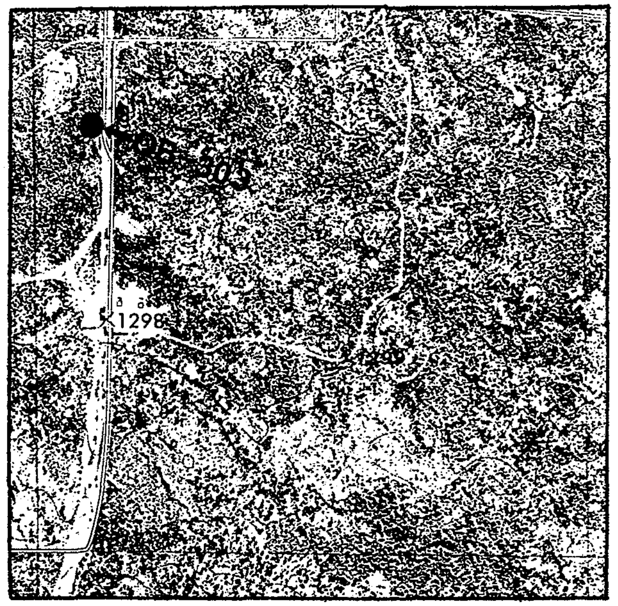
DRILL HOLE SUMMARY SHEET



IDENTIFICATION

DNR Drill Hole Number: OB-303
Drilling Completion Date: 5/22/88

LOCATION (see map at right)

S-T-R: NW¼-NW¼ - S19 - T63N - R25W
County: Koochiching
Quadrangle: Craigville 7.5
Regional Survey Area: Effie
UTM Coordinates: 455,600mE; 5309430mN; 15,N.

HOLE PARAMETERS

Surface Elevation: 1285 ± 4 ft.
Total Depth: 171 ft.
Elevation, Top of Precambrian Bedrock: <1124 ft.
Elevation, Top of Saprolite: 1146 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

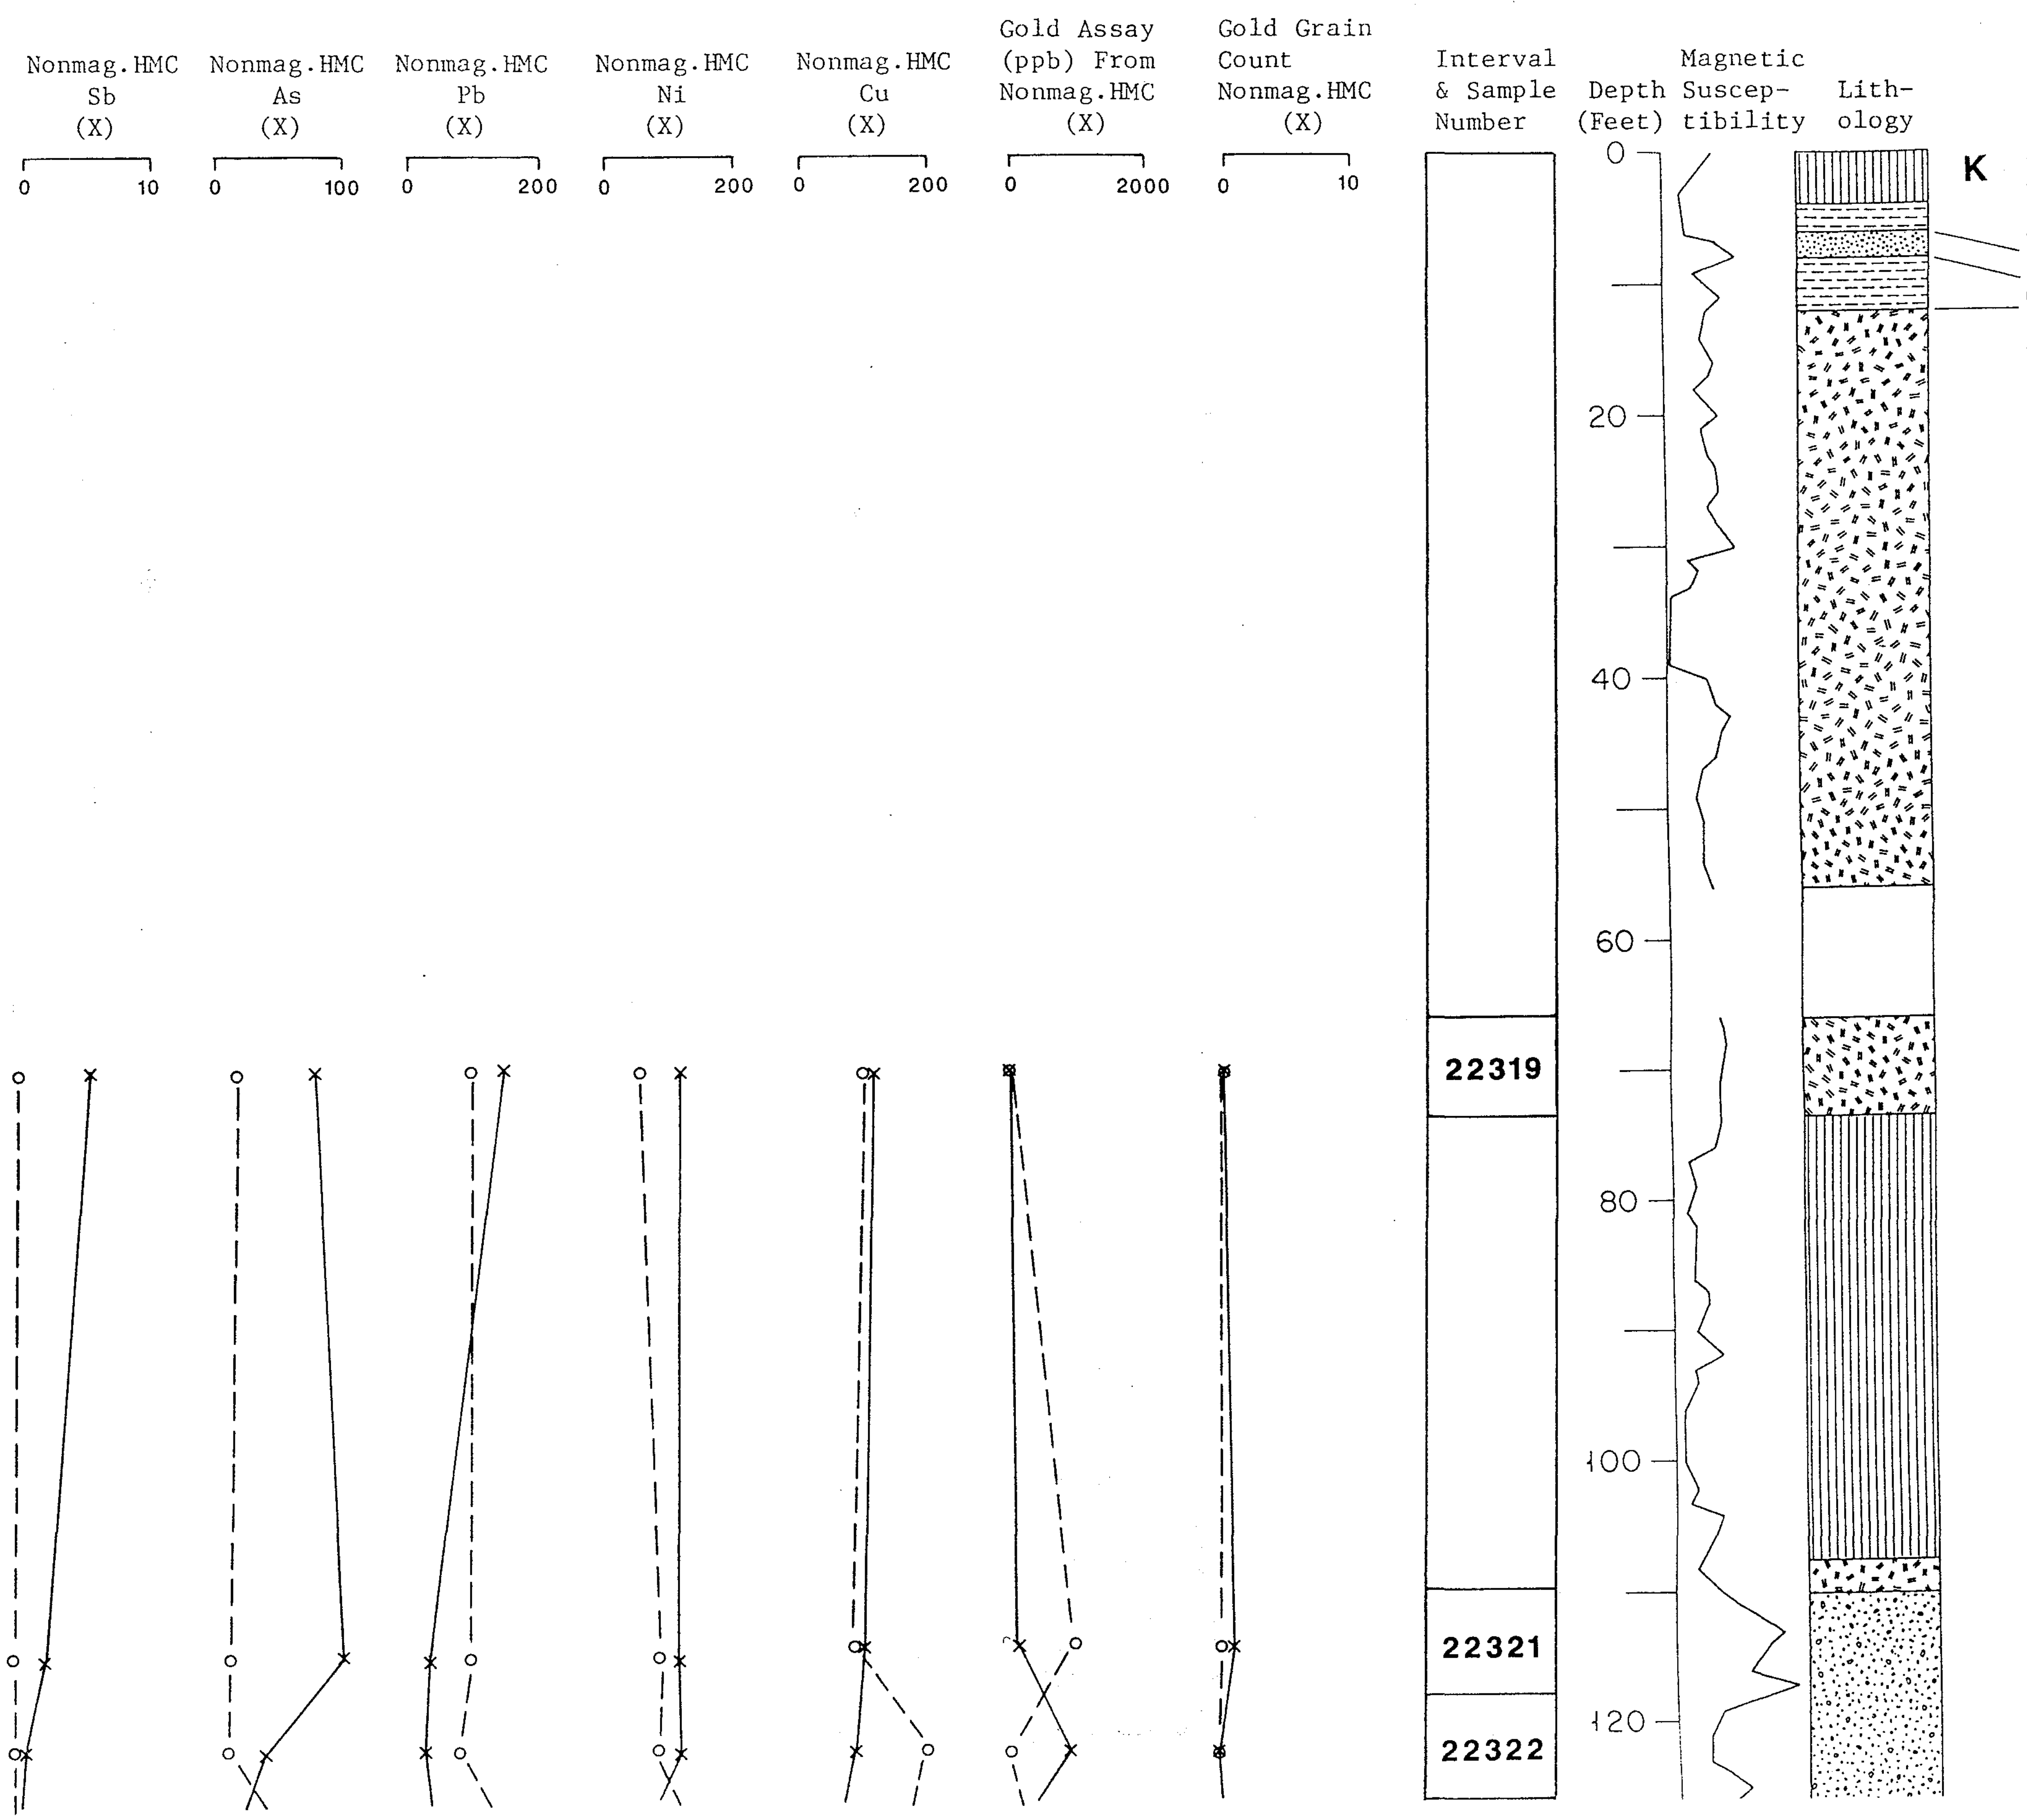
Core Description: Saprolite and fragmental fresh rock. Saprolite consists of varied colors of green clay with scattered 2.0 mm quartz grains. Freshest rock is weathered granodiorite. Granodiorite is unlineated and equigranular, with 1-2 mm, euhedral, light pink to white kspar; white powdery clay which presumably was plagioclase; minor fresh biotite quartz and green clayey Fe-Mg minerals (actinolite-chlorite after hornblende is likely). Approximode: Quartz 10%; Fe-Mg (weathered) 30%; Plag. 20%; Biotite 5%; Kspar 35%. Magnetic susceptibility = 0.00 x 10-3 CGS-10. No thin sections.

Thin Section Description:

Scintillometer Reading (cps):

BLANK PAGE

0B-303



<u>Geologic Descriptions</u>

(0 - 4) SILTY CLAY; OXIDIZED; calc by 3 ft; few sand grains; 0 - 1 road gravel,1 - 1 1/2 peat.

(4 - 6) SILT - SILT LOAM; OXIDIZED; more pebs w/depth; 5 1/2 - 6 ft pebbly clay (flow ti. w/silt lam; carb pebs dominate.

(6 - 8) LOAMY GRAVELLY SAND; carb rich; may be slump from road gravel above.

(8 - 12) SILT - CLAYEY SILT; OXIDIZED; much sand & pebs (drop stones); highly calc.

(12 - 56) CLAY - SILTY CLAY TILL; UNOXIDIZED by 16 ft; may be till by 9; carb rich, highly calc; sh peb at 31.

(56 - 66) NO CORE

(66 - 73 1/2) CLAY TILL; UNOXIDIZED; as above.

(73 1/2 - 107 1/2) CLAY & SILTY CLAY; UNOXIDIZED; obscurely laminated; gradational upper contact; v few sand grains, more from about 88 ft; few silt lam, increasing below 103; 106 - 107 1/2 trans zone, laminated silt, clay, clayey till.

(107 1/2 - 110) CLAY LOAM TILL; UNOXIDIZED; calc.

(110 - 126) SANDY LOAM TILL; UNOXIDIZED; calc, carb common; sev sh grains noted; 110 1/2 - 111 ft loamy, pebbly sand; fine gvl layer at 113 1/2; cobs at 110 1/2, 115, 117, 119 1/2, 123 1/2, 125; mod calc from 117; no carb in sand lens from 120 1/2 - 121 1/2, may be inclusion; possibly till is reworked Rainy lobe; sev layers of clayey till at about 119; gradational contact w/sand below.

(126 - 130) GRAVELLY SAND; OXIDIZED; loamy cgr to v cgr sand w/sev cobs to 128 ft, then v cgr pebbly sand; little or no carb; unox by 129.
(130 - 136 1/2) SAND & GRAVEL; UNOXIDIZED; cobs to 134 ft, then fine gvl; carb peb at 131.
(136 1/2 - 139) SAND; OXIDIZED; cgr to v cgr; unox by 137 1/2 ft except at base.
(139 - 144) LOAMY SAND & GRAVEL; UNOXIDIZED; v cobbly, poorly sorted, could be till; noncalc; boulder 143 - 144 ft.
(144 - 149) SAPROLITE & TILL; calc; obvious carb pebs, but bulk is saprolite; cobs from 147 ft; sl to mod calc towards base.
(149 - 171) GRANODIORITE SAPROLITE; 149 - 156 ft hard rock cores w/gritty clay rinds, possibly sorted towards top; 156 - 159 1/2 punky rock w/thin bands of silt; 159 1/2 - 161 1/2 as above but darker, finer xyline; 161 1/2 - 165 punky rock w/horizontal, wider silt bands, layered; 165 - 169 sandy clay loam, more decomposed; 169-171 punky rock.

Appendix 1-3C.

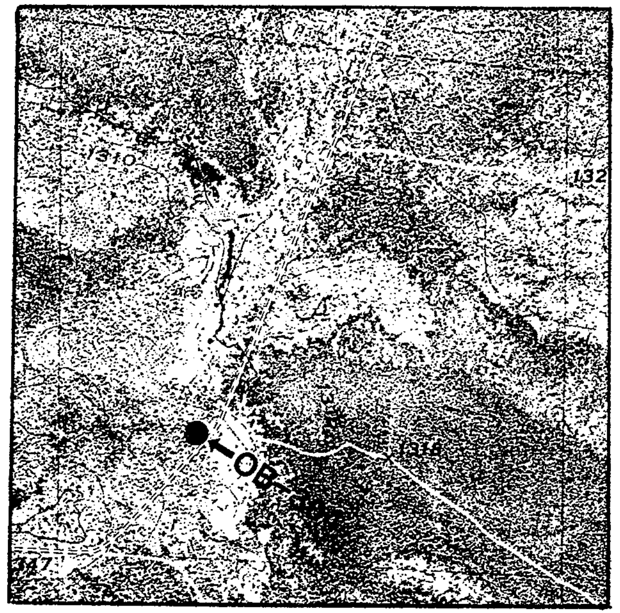
Appendix 1-4A. DRILL HOLE SUMMARY SHEET



IDENTIFICATION
DNR Drill Hole Number: OB-304
Drilling Completion Date: 5/22/88

LOCATION (see map at right)
S-T-R: SE¼-SW¼ - S4 - T63N - R25W
County: Koochiching
Quadrangle: Craigville 7.5
Regional Survey Area: Effie
UTM Coordinates: 459,150mE; 5313170mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1322 ± 3 ft.
Total Depth: 60 ft.
Elevation, Top of Precambrian Bedrock: 1267 ft.
Elevation, Top of Saprolite:
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

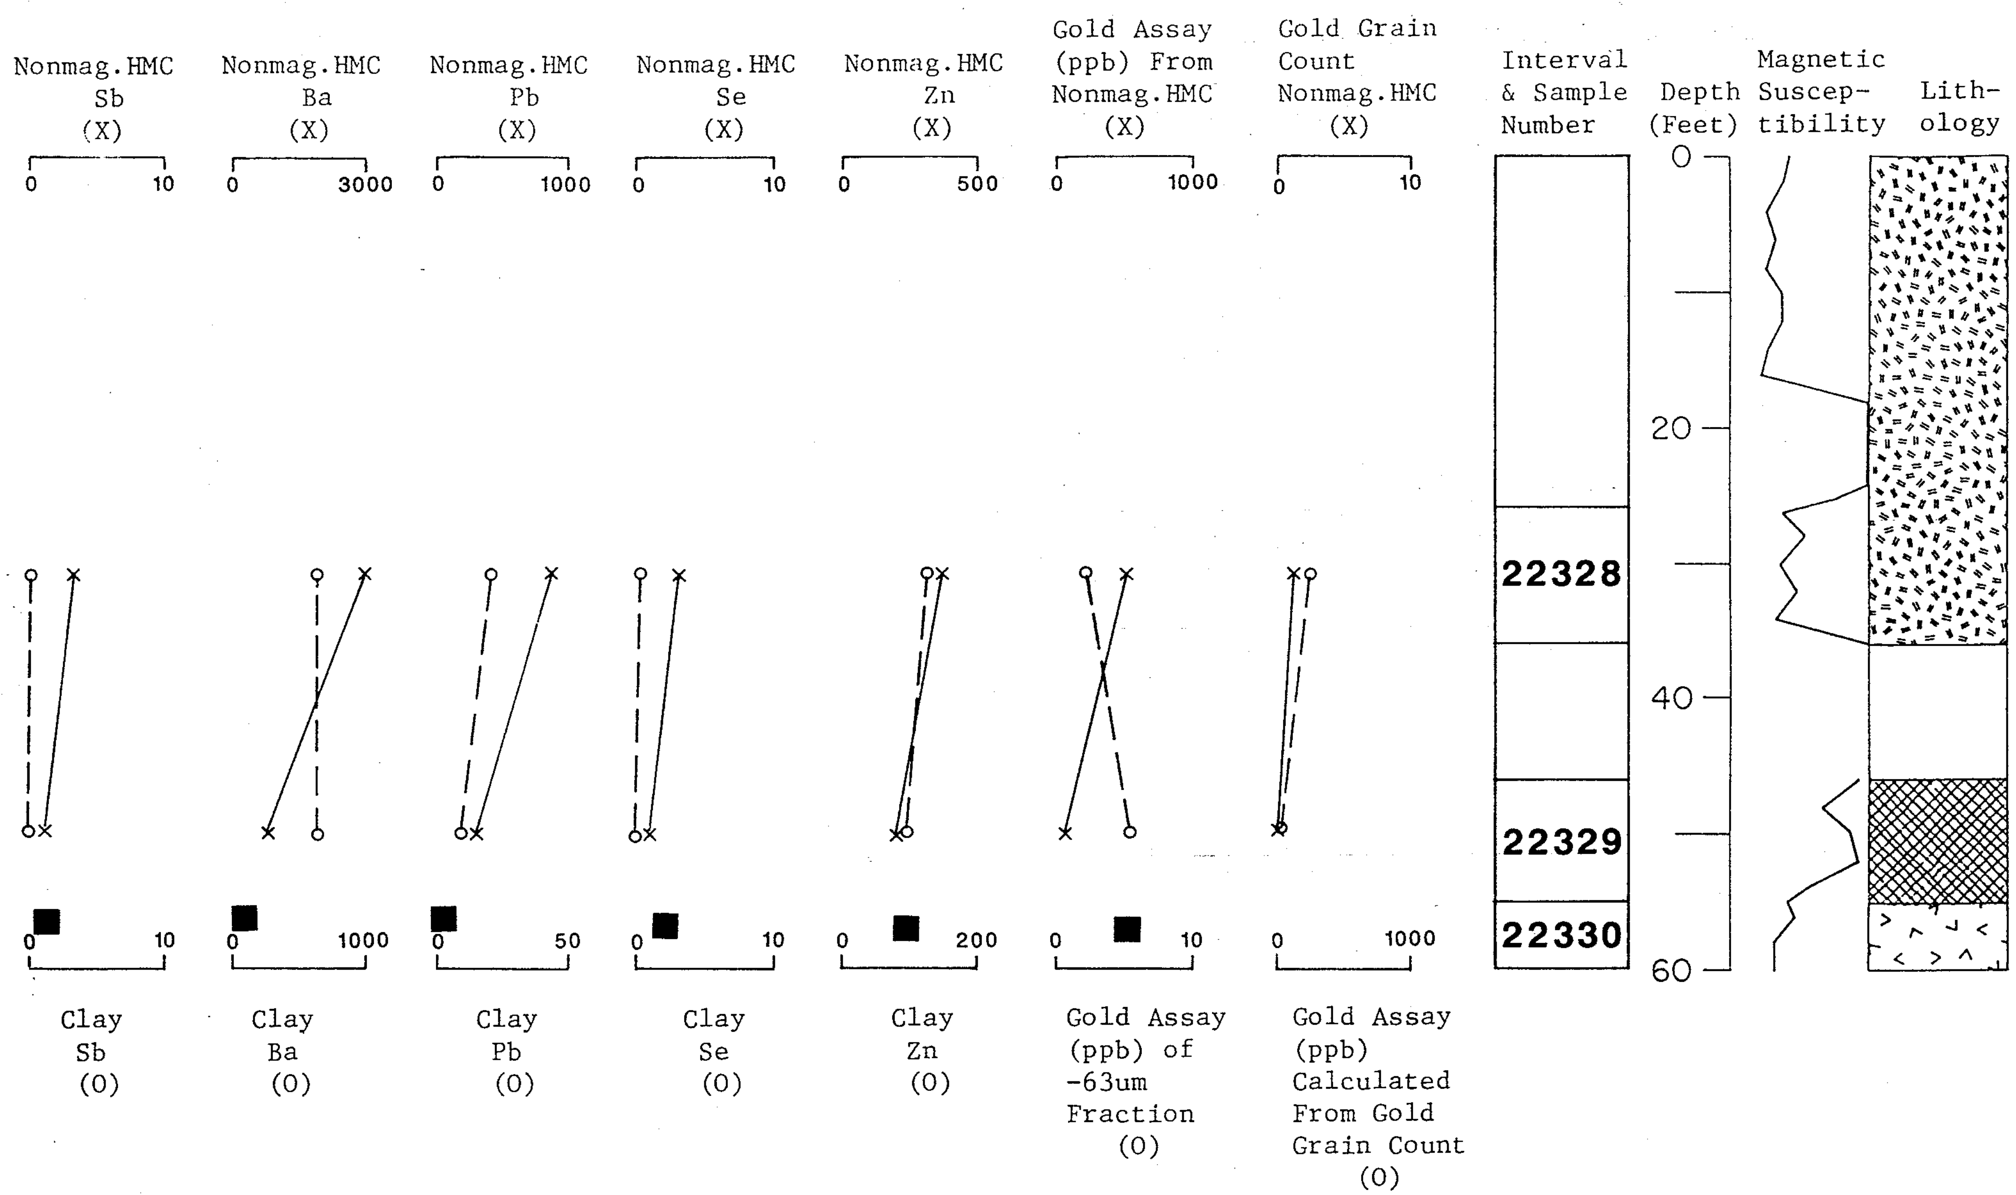
A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Black to dark green, fine-grained amphibolitic schist, probably of basaltic protolith. Outcrops about mile west of drill hole are an assemblage of mafic flows and tuffs with interbedded dacitic clastic rocks. All are strongly schistose and metamorphosed (amphibolite facies?) and intruded by a myriad of granodioritic rocks creating local migmatite. Foliation defined by elongate hornblende and plagioclase and is oriented about 75-80°. Rock is multiply veined with white calcite and quartz with a trace % of epidote and pyrite. Veins generally are brittle and unfolded (post-foliation), and dip less steeply than the foliation. Magnetic susc. 0.02-0.04 x 10-3 CGS. Thin-section is representative.

Thin Section Description: OB-304, 56 ft. Strongly foliated amphibolite. Estimated mode (volume %): Hornblende 74; Plagioclase (plus alteration products) 19; Quartz 4; Opaques 3; Calcite Tr; Epidote Tr. Fresh, well-foliated amphibolite is cut by late brittle, calcite-filled fractures at a high angle to foliation; these fractures are up to 1 mm wide. Hornblende forms subhedral 0.2 to 1.0 mm prisms and contains abundant tiny quartz inclusions. Plagioclase is heavily altered to sericite and fine, dusty epidote or zoisite; a few grains of plagioclase retain polysynthetic twinning. Fine-grained blocky Fe-Ti oxides are disseminated throughout in clotted aggregates and are also included within hornblende. In addition to calcite, the fractures contain a small amount of a colorless, moderately birefringent, anhedral mineral of unknown composition, and minor quartz and epidote are present near the fracture margins.

Scintillometer Reading (cps): 60-70



OB-304

Appendix 1-4B.

Geologic Descriptions

K

(0 - 15 1/2) CLAY TILL; OXIDIZED TO 12 ft; leached to 2, carb pebs common below; sh peb at 14.

(15 1/2 - 25) CLAY TILL; UNOXIDIZED; interbedded w/ox silty, pebbly sand; two cobs at about 18 ft, prob much sand below, lost from core.

(25 - 36) CLAY LOAM TILL; UNOXIDIZED; sl more grn in color than above; sh & carb pebs; large cob at 30 - 36 plugged barrel so little core.

(36 - 46) NO CORE

(46 - 53 1/2) LOAM TILL; UNOXIDIZED; calc, carb pebs common; sm cob at 49 ft, but most pebs not large.
(53 1/2 - 55) CLAY LOAM TILL; UNOXIDIZED; mixed w/saprolite, could be older till; calc w/carb pebs.

(55 - 60) BEDROCK; AMPHIBOLITE; strongly foliated, mgr.

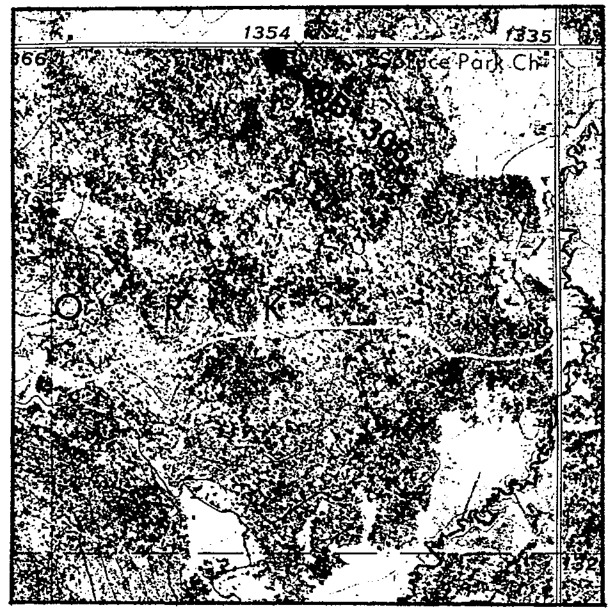
Appendix 1-5A. DRILL HOLE SUMMARY SHEET



IDENTIFICATION
DNR Drill Hole Number: OB-306
Drilling Completion Date: 5/19/88

LOCATION (see map at right)
S-T-R: NE¼-NW¼ - S16 - T61N - R26W
County: Itasca
Quadrangle: Effie 7.5
Regional Survey Area: Effie
UTM Coordinates: 449,500mE; 5292140mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1352 ± 2 ft.
Total Depth: 136.5 ft.
Elevation, Top of Precambrian Bedrock: 1223 ft.
Elevation, Top of Saprolite:
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

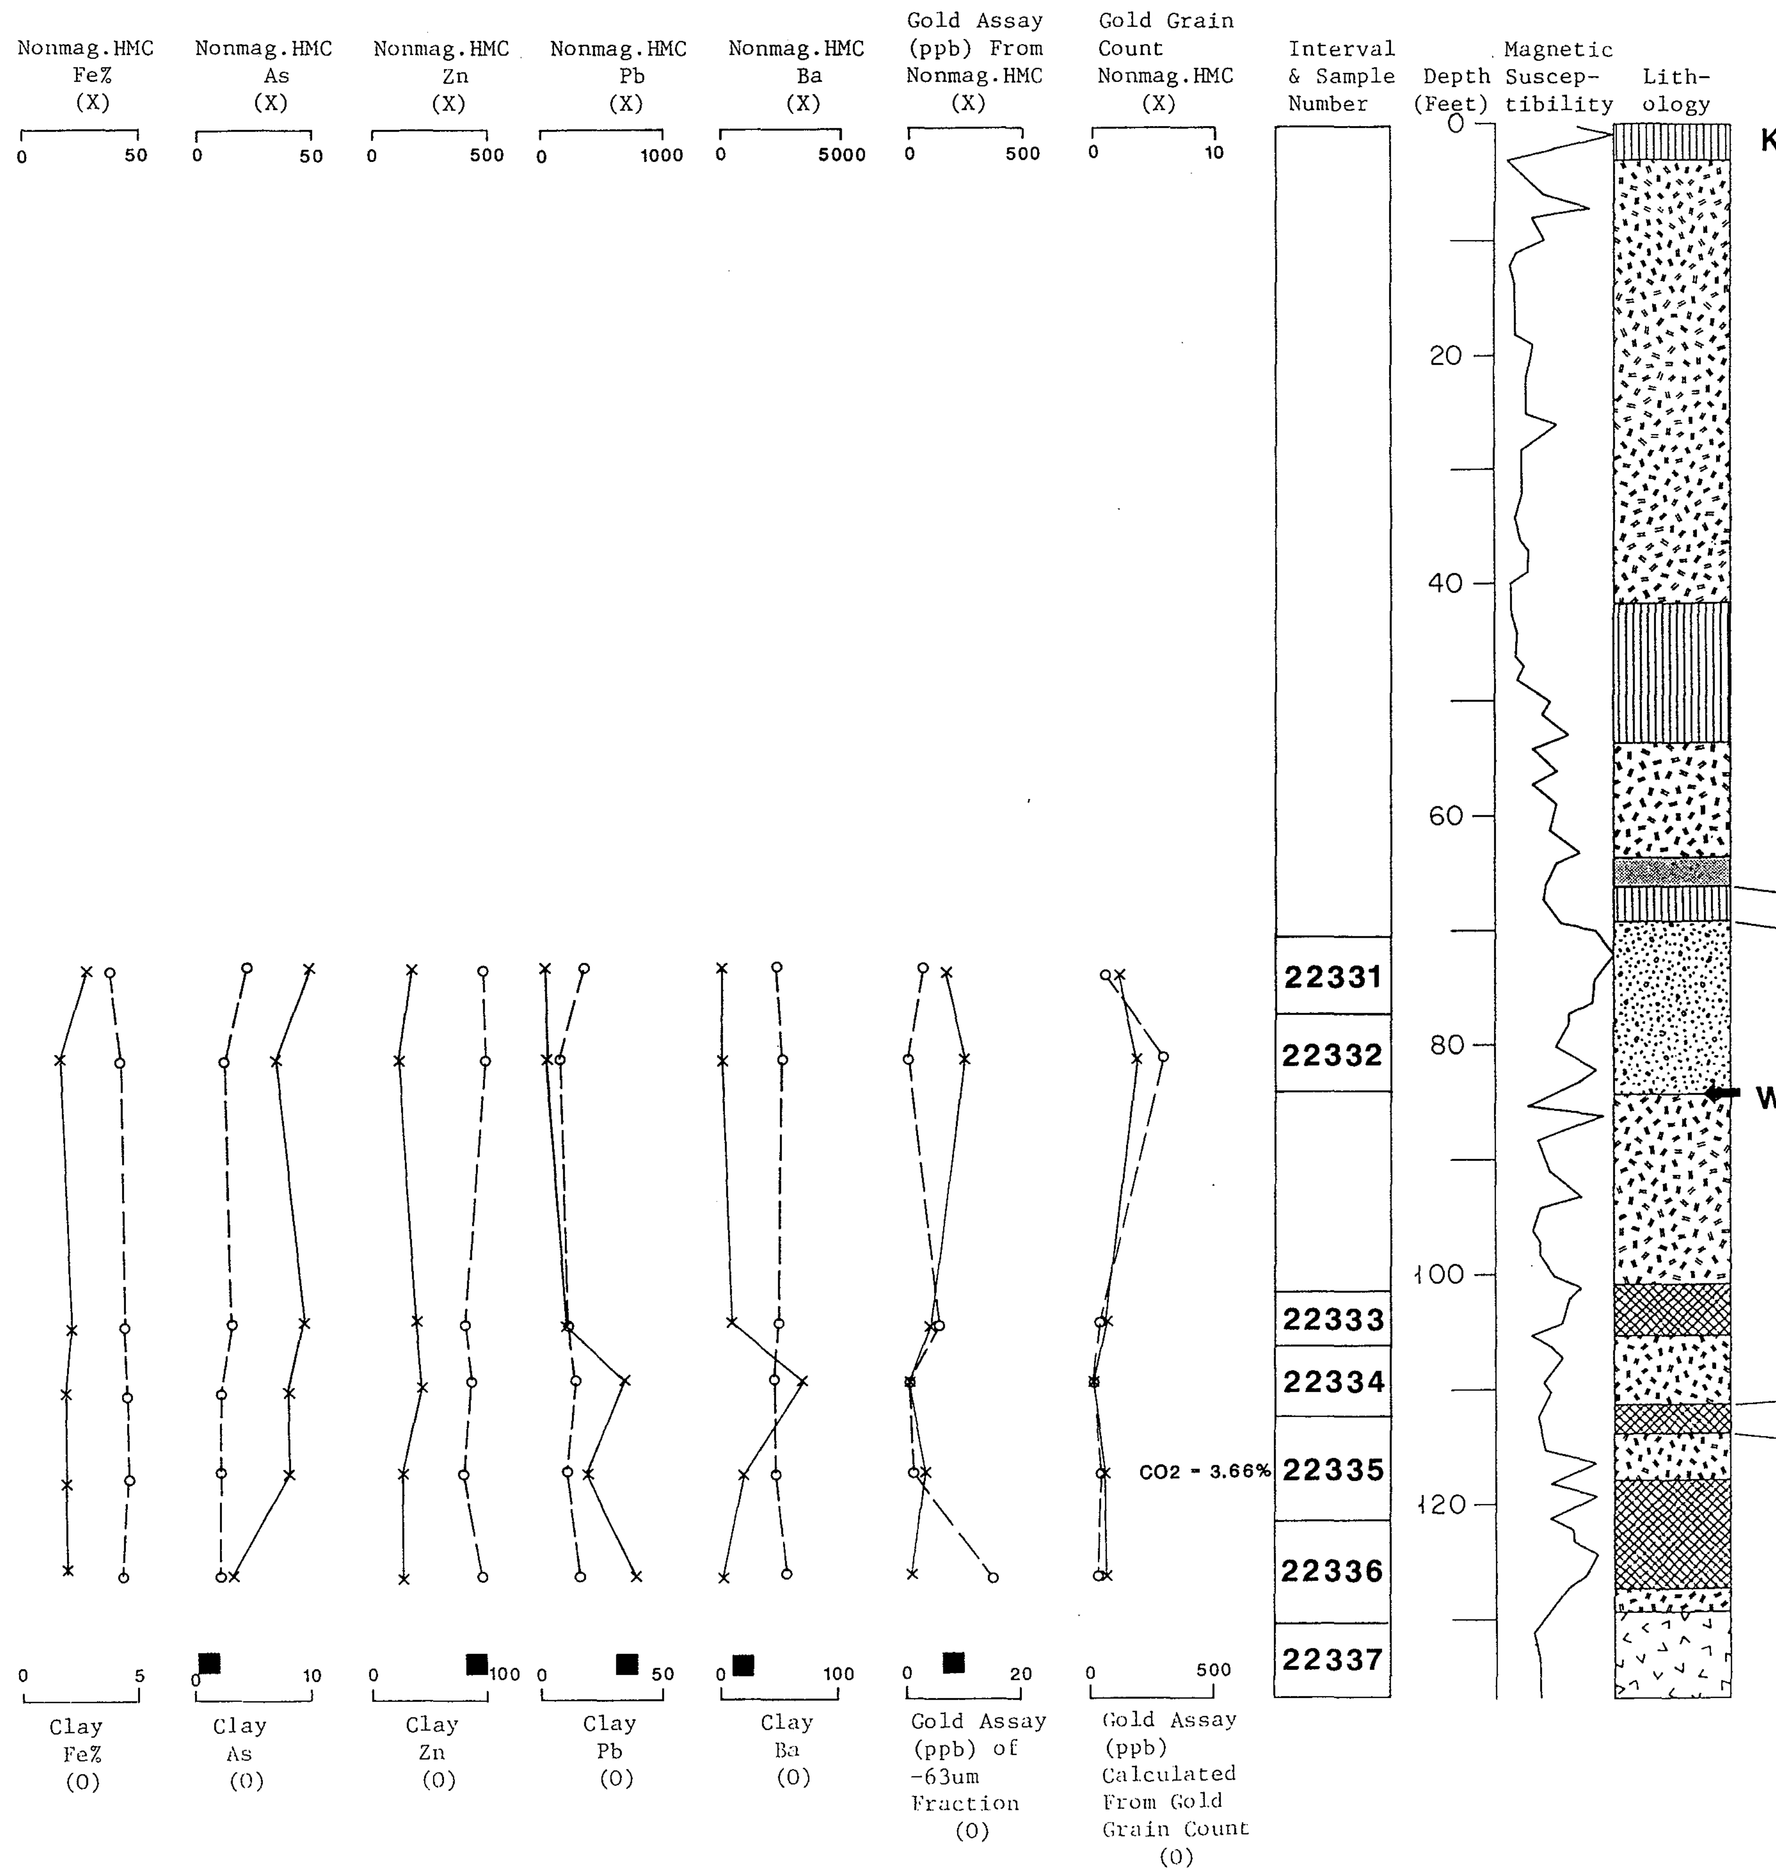
Core Description: Medium greenish-gray, aphanitic to fine grained, felsic to intermediate volcanic rock. Locally it is clearly volcaniclastic and appears to be crystal tuff, but much is too fine-grained to elucidate. Near 136' is thin unit of darker gray, porphyritic andesite with 2.0 - 4.0 mm altered plagioclase laths in aphanitic groundmass. Elongation of minerals defines a vague lineation oriented 70-80°. Rock is cut by calcite and quartz veins at 60-70° dip. Several interesting sulfides, including clots of chalcopyrite surrounding quartz grains or amygdules, and vague zones of disseminated pyrrhotite. Magnetic suscept. 0.01 x 10-3 CGS. Thin section (@ 134 ft.) is from portion of core which is more felsic-looking than the bulk of core.

Thin Section Description: OB-306, 134 ft. Reworked felsic crystal tuff. Quartz-rich rock contains abundant 0.5 mm (monocrystalline) to 3.0 mm (polycrystalline) quartz grains and minor euhedral plagioclase set in a foliated matrix of fine-grained, felty feldspar, actinolite(?), chlorite, and epidote or zoisite(?). The larger quartz grains are typically very round or oval and do not show volcanic quartz habit, and become progressively more stretched and elongate across the width of the slide. The smaller silt- and sand-sized unit quartz grains have irregular boundaries due to infringing actinolite in the groundmass. Minor amounts of equant to tabular plagioclase crystals are present, these range in size from 0.5 mm phenocrysts down to microlites in the groundmass which form a trachytic flow texture. A 3mm-wide, finer-grained and more quartz-poor layer cross-cuts foliation; this layer apparently represents a volcanic clast as another smaller, angular clast of similar lithology is also present elsewhere in the slide. The layer contains relatively large aggregates of epidote and quartz which may represent amygdules, and also smaller epidote-rich clots which have sharp boundaries and appear to pseudomorph a primary mafic mineral. Thin, straight, brittle quartz veins transect the length of the slide, oblique to the foliation, and minor chalcopyrite and pyrite are concentrated around the fine-grained layer or clast.

Scintillometer Reading (cps): 80-90

Appendix 1-5B.

OB-306



Geologic Descriptions

(0 - 3) CLAY; OXIDIZED; calc by 1 1/2 ft; few sand grains, could be till.

(3 - 41 1/2) CLAY TILL; UNOXIDIZED by 26 ft; calc; apar no concentration of grains, no bedding, but mostly clay; gypsum crystals at 28; tougher w/depth.

(41 1/2 - 53 1/2) CLAY; UNOXIDIZED; calc; silt lam at top, occ below; more sand grains by 49 ft, many are sh; about as many clasts as above but grouped, bedded.

(53 1/2 - 63 1/2) CLAY LOAM TILL; UNOXIDIZED; calc; pebs common but carb not dominant; sm cob at 58 1/2 ft; incorporated lenses of silty, v fgr sand from 61 increase to base.

(63 1/2 - 66) FINE SAND; UNOXIDIZED; top 1/2 foot silty, v fgr sand; sev clay loam till beds 65 - 65 1/2 ft.

(66 - 69) CLAY; calc; large peb at 67 ft; few concentrated clasts; laminated silt & clay from 67 1/2.

(69 - 84) SANDY LOAM TILL; UNOXIDIZED; calc; reddish brown clay smears from 69 - 72 ft, then grnish gray to 74; 70 - 71 mgr sand; carb pebs common; sand lam at 73 1/2; more loamy w/depth; sev inches pebbly, cgr sand at 77; ox, pebbly, cgr sand bed at 80; 83 - 84 boulder.

(84 - 100 1/2) CLAY TILL; UNOXIDIZED; highly calc; ox spot at 92 ft; harder w/depth; apar more clasts from 93; clay loam till by 96; sandy gvl lenses at 96, 96 1/2.

(100 1/2 - 105) LOAM TILL; UNOXIDIZED; calc; lenses & lam of fgr sand, sev inches silty, fgr sand at top; carb pebs common; thin ox zones along horizontal joints; pebbly fgr sand lens at 104 ft, & from 104 1/2 - 105.

(105 - 111) CLAY TILL; UNOXIDIZED; calc; carb common; laminated silt & clay at 109 ft, possibly inclusion; hard, tough; abrupt basal contact.

(111 - 113 1/2) LOAM TILL; UNOXIDIZED; many more pebs than above; cobbly from 112 ft, inc carb cob.

(113 1/2 - 129) CLAY LOAM - LOAM TILL; UNOXIDIZED; clay till to 114 ft; saprolite smears from 117 1/2 - 121; sandy silt lam at 122 1/2 & 123, more beds of sandy silt to silty, v fgr sand below; laminated clay, silty clay, and silt from 128 1/2, possibly thicker.

(129 - 136 1/2) BEDROCK; FELSIC TUFFACEOUS GRAYWACKE; fgr to mgr; quartz rich; mod foliated.

Appendix 1-5C.

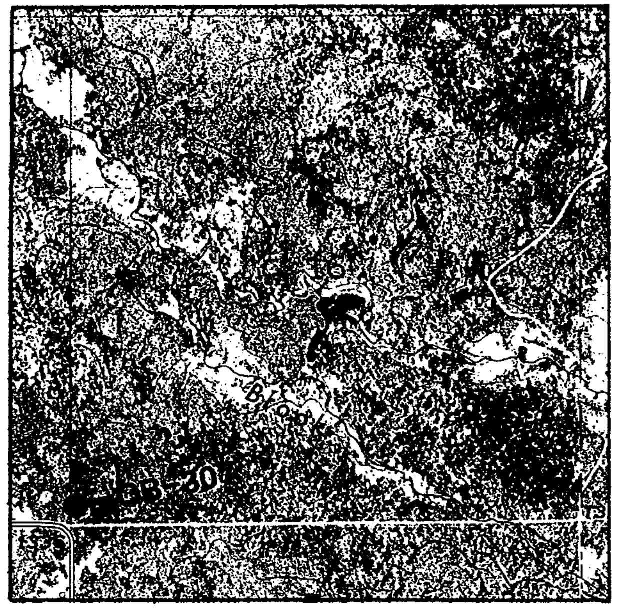
Appendix 1-6A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-307
Drilling Completion Date: 6/26/88

LOCATION (see map at right)
S-T-R: SW¼-SW¼ - S16 - T62N - R26W
County: Itasca
Quadrangle: Effie 7.5
Regional Survey Area: Effie
UTM Coordinates: 449,030mE; 5300200mN; 15,N.



HOLE PARAMETERS
Surface Elevation: 1335 ± 2 ft.
Total Depth: 226 ft.
Elevation, Top of Precambrian Bedrock: <1109 ft.
Elevation, Top of Saprolite: Unknown
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

SEE FOLLOWING PAGES
Sample Types, Intervals, Chemical Data, Gold Grain Counts, Graphic Summary Log

INFORMATION SUMMARY

Interval (ft.)	Interpretation	Library Samples Available	Subsamples Subsamples Tested	Geochem Assays Worthy of Further Review
0-98.5	Kooch. lobe gl. drift	G		
98-226	Rainy lobe gl. drift	B,C,G	A,B,C	B=Au,Sb,Ba,W

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core

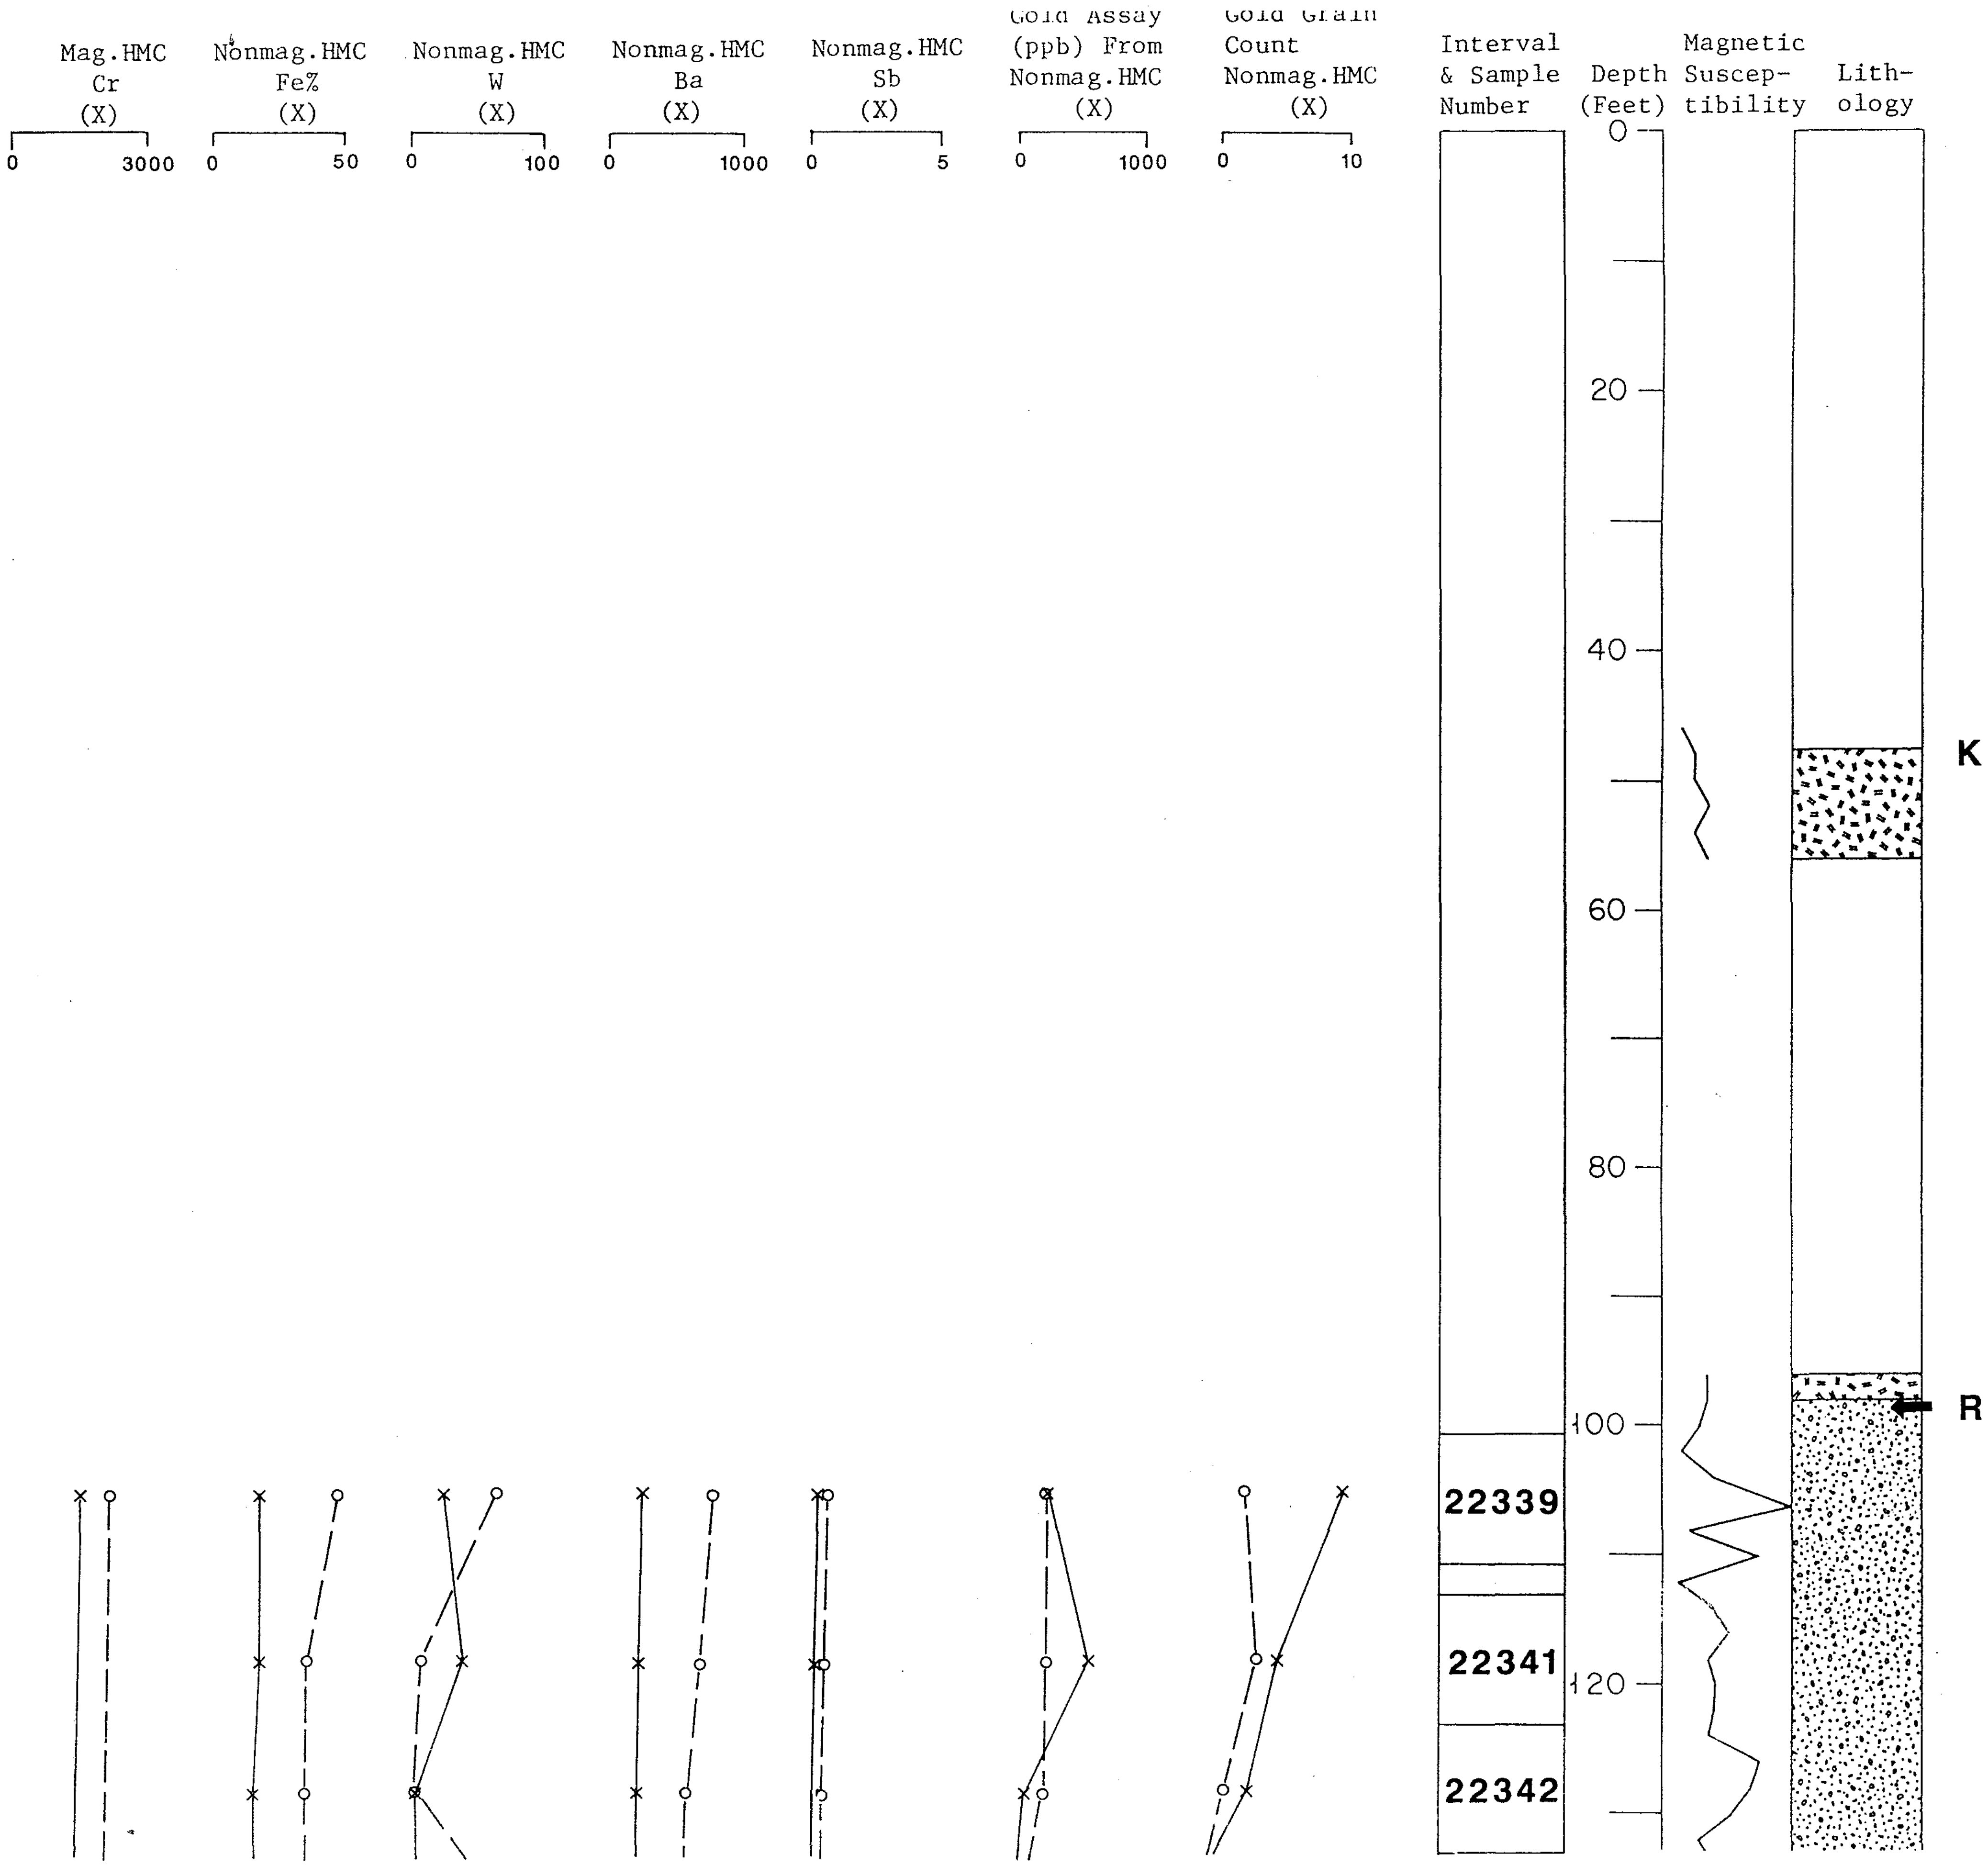
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK
No bedrock reached in this hole.

BLANK PAGE

Appendix 1-6B.

OB-307



Geologic Descriptions

(0 - 46) NO CORE

(46 - 56) CLAY TILL; UNOXIDIZED; calc; carb pebs common; little more grit from about 50 1/2 ft.

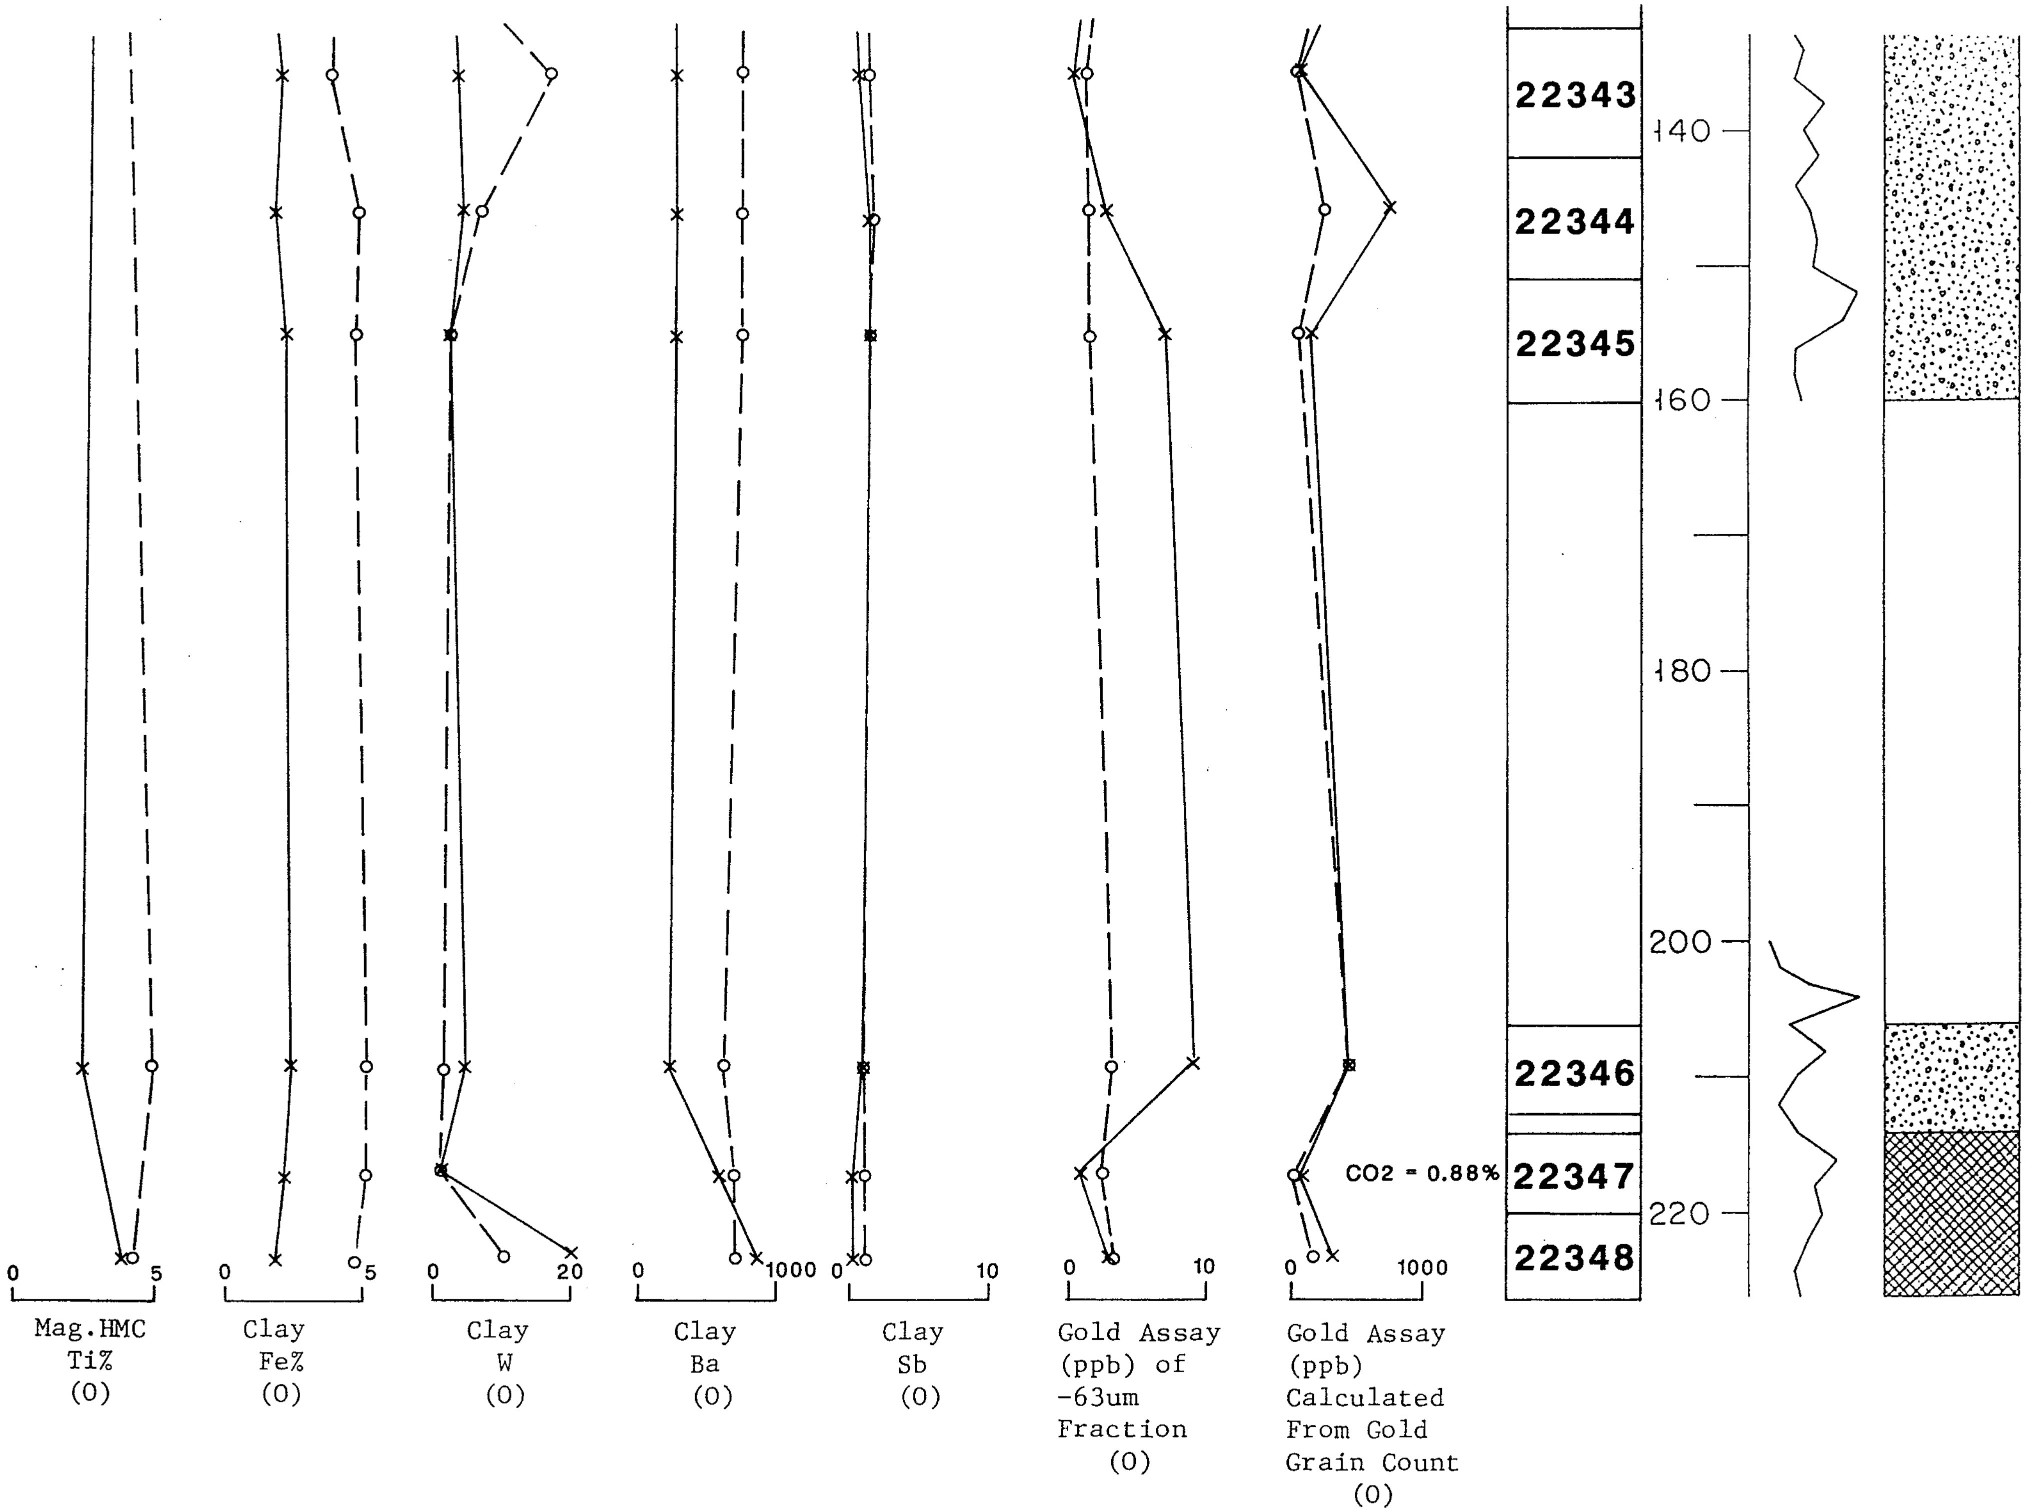
(56-96) NO CORE

(96 - 98) CLAY LOAM TILL; UNOXIDIZED; sand lam; only mod calc from 97 ft; cobs at 97 1/2, 98.

(98 - 110 1/2) LOAMY SAND TILL; UNOXIDIZED; v sl calc to noncalc; carb rare; 98 - 98 1/2 ft v fine sandy silt w/sand lam, mod calc; grnish gray by 108; occ cobs; pebbly coarse sand bed at 105 1/2, cleaner sand lam in spots; sl calc at 108 1/2

(110 1/2 - 113) SCHIST BOULDER

(113 - 160) LOAMY SAND - SANDY LOAM TILL; UNOXIDIZED; harder than above; sl calc; cobs fairly common; boulder 122 1/2 - 123 1/2, more compact below; carb pebs present; grnish gray to 128; sandy loam till from 141; mottled from 140; fewer pebs, no cobs from 142 - 145 1/2; mod calc by 156; sm cobs 155 - 156.



(160 - 206) NO CORE; driller indicates till to 183 ft, sand to 200, then hard stony till.

(206 - 214) COBBLY SANDY LOAM TILL; UNOXIDIZED; sl calc; loamy sand till in upper part; grnish gray to 212 1/2 ft; more silty from 212 1/2; sl to mod calc by 210.

(214 - 226) LOAM TILL; UNOXIDIZED; silty side of loam (sandy silt); mod calc, sl calc in places; not much carb; upper contact gradational over sev ft; no large pebs, cobs; more sandy w/depth w/sandy intervals, sandy loam from 225, cob at 225 1/2.

Appendix 1-6C.

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Medium gray to greenish-gray tuff, tuffaceous siltstone and argillite. Sedimentary breccia occurs locally with angular clasts of aphanitic tuff/argillite in darker-colored matrix. Rock is moderately well foliated with pristine-looking bedding defined by grain size and color variations. Siltstone beds contain 0.8 mm quartz grains lineated parallel to bedding. Aphanitic units have a phyllitic sheen. Bedding and primary cleavage dip about 75°. A vague crenulation dips about 30°. Pyrite is ubiquitous; some beds contain as much as 15%. Pyrite occurs as disseminated small crystals, along bedding and cleavage planes, and in fractures. Much of the rock apparently is impregnated with calcite which now are voids in surface of core. Veins of calcite, quartz and pyrite dip 45-55° and are not folded. Magnetic Susc. = 0.01 x 10-3 CGS. Thin sections represent both the coarser tuffaceous siltstone(310A) and the aphanitic argillite (310B).

Thin Section Descriptions: OB-310A, 228 ft. Felsic crystal tuff (reworked). Estimated mode (volume %): Quartz crystals 12%; Plagioclase crystals 12%; Quartzofeldspathic matrix 60%; Calcite 8%; Chlorite 4%; Sericite 3%; Sphene 1%; Pyrite, chalcopyrite Tr-1%; Zircon Tr. Well-foliated rock consisting of abundant (25%) sand-sized, subangular quartz and feldspar crystals in a fine-grained matrix of chlorite, sericite, and cherty-appearing quartz plus feldspar. A vague foliation-parallel bedding is defined by variations in size and amount of sandy grains. Quartz crystals are dominantly monocrystalline undulose, plagioclase crystals are fresh and well twinned. Both crystaltypes are variably rounded and modified in shape by recrystallization and possible mechanical rounding. Calcite is disseminated throughoutin elongate blebs and in a thin vein which is slightly oblique to foliation. Pyrite and chalcopyrite occur as disseminated clotted masses of irregular to blocky grains, and also in the calcite vein.
OB-310B, 231 ft. Fine-grained, reworked felsic tuff or argillite. Similar to 310B except much finer grained and more sericitic. Bulk of thin section consists of a fine-grained, strongly foliated sericite schist with 6-8% sand-sized subangular quartz and feldspar crystals. This is in sharp contact with a very fine-grained sericitic bed which is at least 2 mm thick. This finer bed contains flattened 0.2 to 0.3mm long clots of recrystallized quartz plus feldspar, of obscure origin. A weak crenulation cleavage at 40° to the primary cleavage wraps assymetrically around these feldspathic clots, which appear to have been slightly rotated. The rock is cut by thin, irregular quartz veins, at a high angle to foliation. The volume of calcite is very low, in contrast to OB-310A.

Scintillometer Reading (cps): 50-60

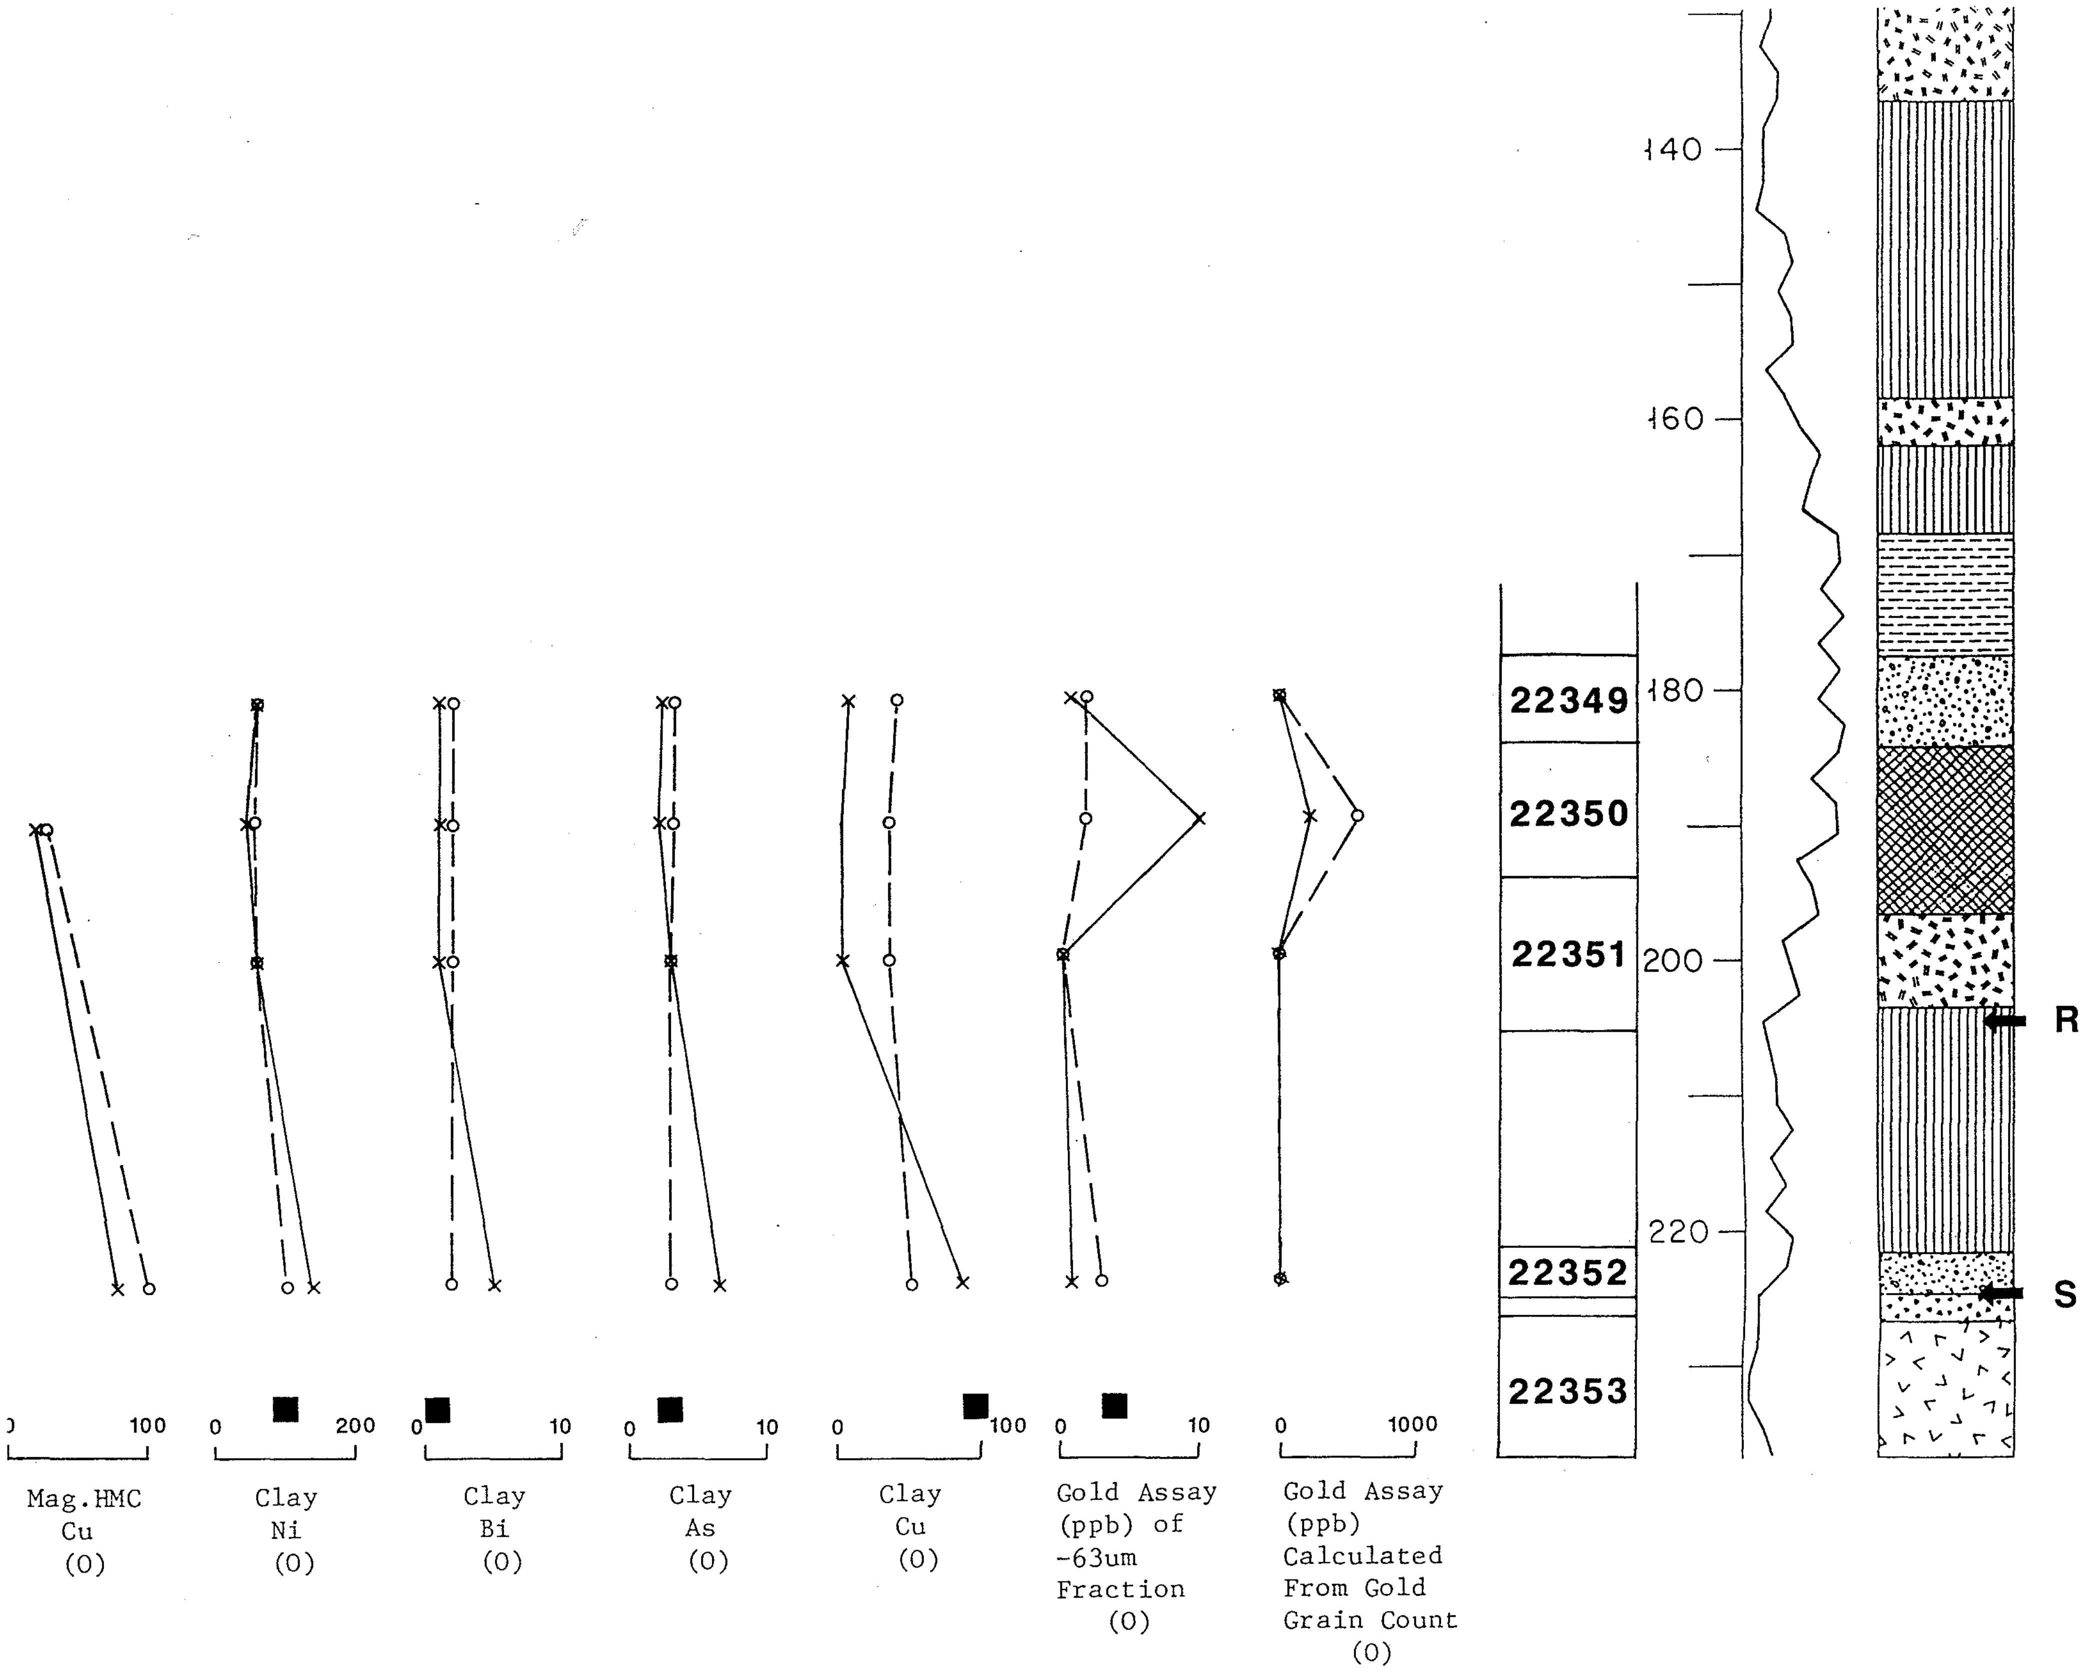
K

Geologic Descriptions

(0 - 35) CLAY LOAM TILL; UNOXIDIZED by 16 1/2 ft; calc by 1 1/2; carb pebs dominate, sh prob fairly common.

(36 - 136) CLAY TILL; UNOXIDIZED; as above, increasingly clayey w/depth; possibly silty clay texture; thin pebbly sand layers at about 58 ft; generally only sm pebs; sh fairly common, apar increasing w/depth; sl ox along few joints around 127.



(136 - 158) CLAY & SILTY CLAY; UNOXIDIZED; laminated; calc; sm silt lens at 146 ft, more lenses & lam below, also sand lam; pebs at 153 1/2, 155; increasing sand grains in last few feet.

(158 - 161 1/2) CLAY TILL; UNOXIDIZED; gradational upper & lower contacts.

(161 1/2 - 168) SILTY CLAY; UNOXIDIZED; calc; little clay till at 164 ft; much clayey silt by 166; sand grains v rare.

(168 - 177) SILT; UNOXIDIZED; intervals of clay; small carb peb at 175 1/2 ft, more sand grains below.

(177 - 183 1/2) LOAM - SANDY LOAM TILL; UNOXIDIZED; calc; carb pebs; clayey silt beds at 178, 178 1/2, & from 179 - 179 1/2; occ thin lenses of sand and silt; 183 - 183 1/2 clayey silt & silt.

(183 1/2 - 196) LOAM TILL; UNOXIDIZED; more compact, massive; carb pebs common, not dominant; silty interval at 186 ft; fair amount of large pebs; cob at 189 1/2.

(196 - 203) CLAY LOAM TILL; UNOXIDIZED; as above; cob at 200 ft; clay till in last foot.

(203 - 210) CLAY & SILTY CLAY; UNOXIDIZED; thin lenses sandy silt in top 1/2 foot; laminated; calc to 205 ft, then non calc w/reddish beds; brnish bands by 206; pebbly layer at 206 1/2, some bands here are mod calc; from 207 laminated noncalc clay and sl to mod calc clayey silt; back to reddish bands by 209, fade out by 210.

(210 - 221) VARVED CLAY & SILT; UNOXIDIZED; generally sl calc clay beds twice as thick as mod calc silt beds; fgr silt lam & few pebs in last 1/2 foot.

(221 - 224) COBBLY, SANDY LOAM TILL; sl calc; no carb pebs noted.

(224 - 226) SAPROLITE; clayey broken rock; mixed w/till in upper 1/2 foot.

(226 - 236) BEDROCK; TUFFACEOUS ARGILLITE; fgr; strongly foliated.

Appendix 1-7C.

J = Special Mineralogy

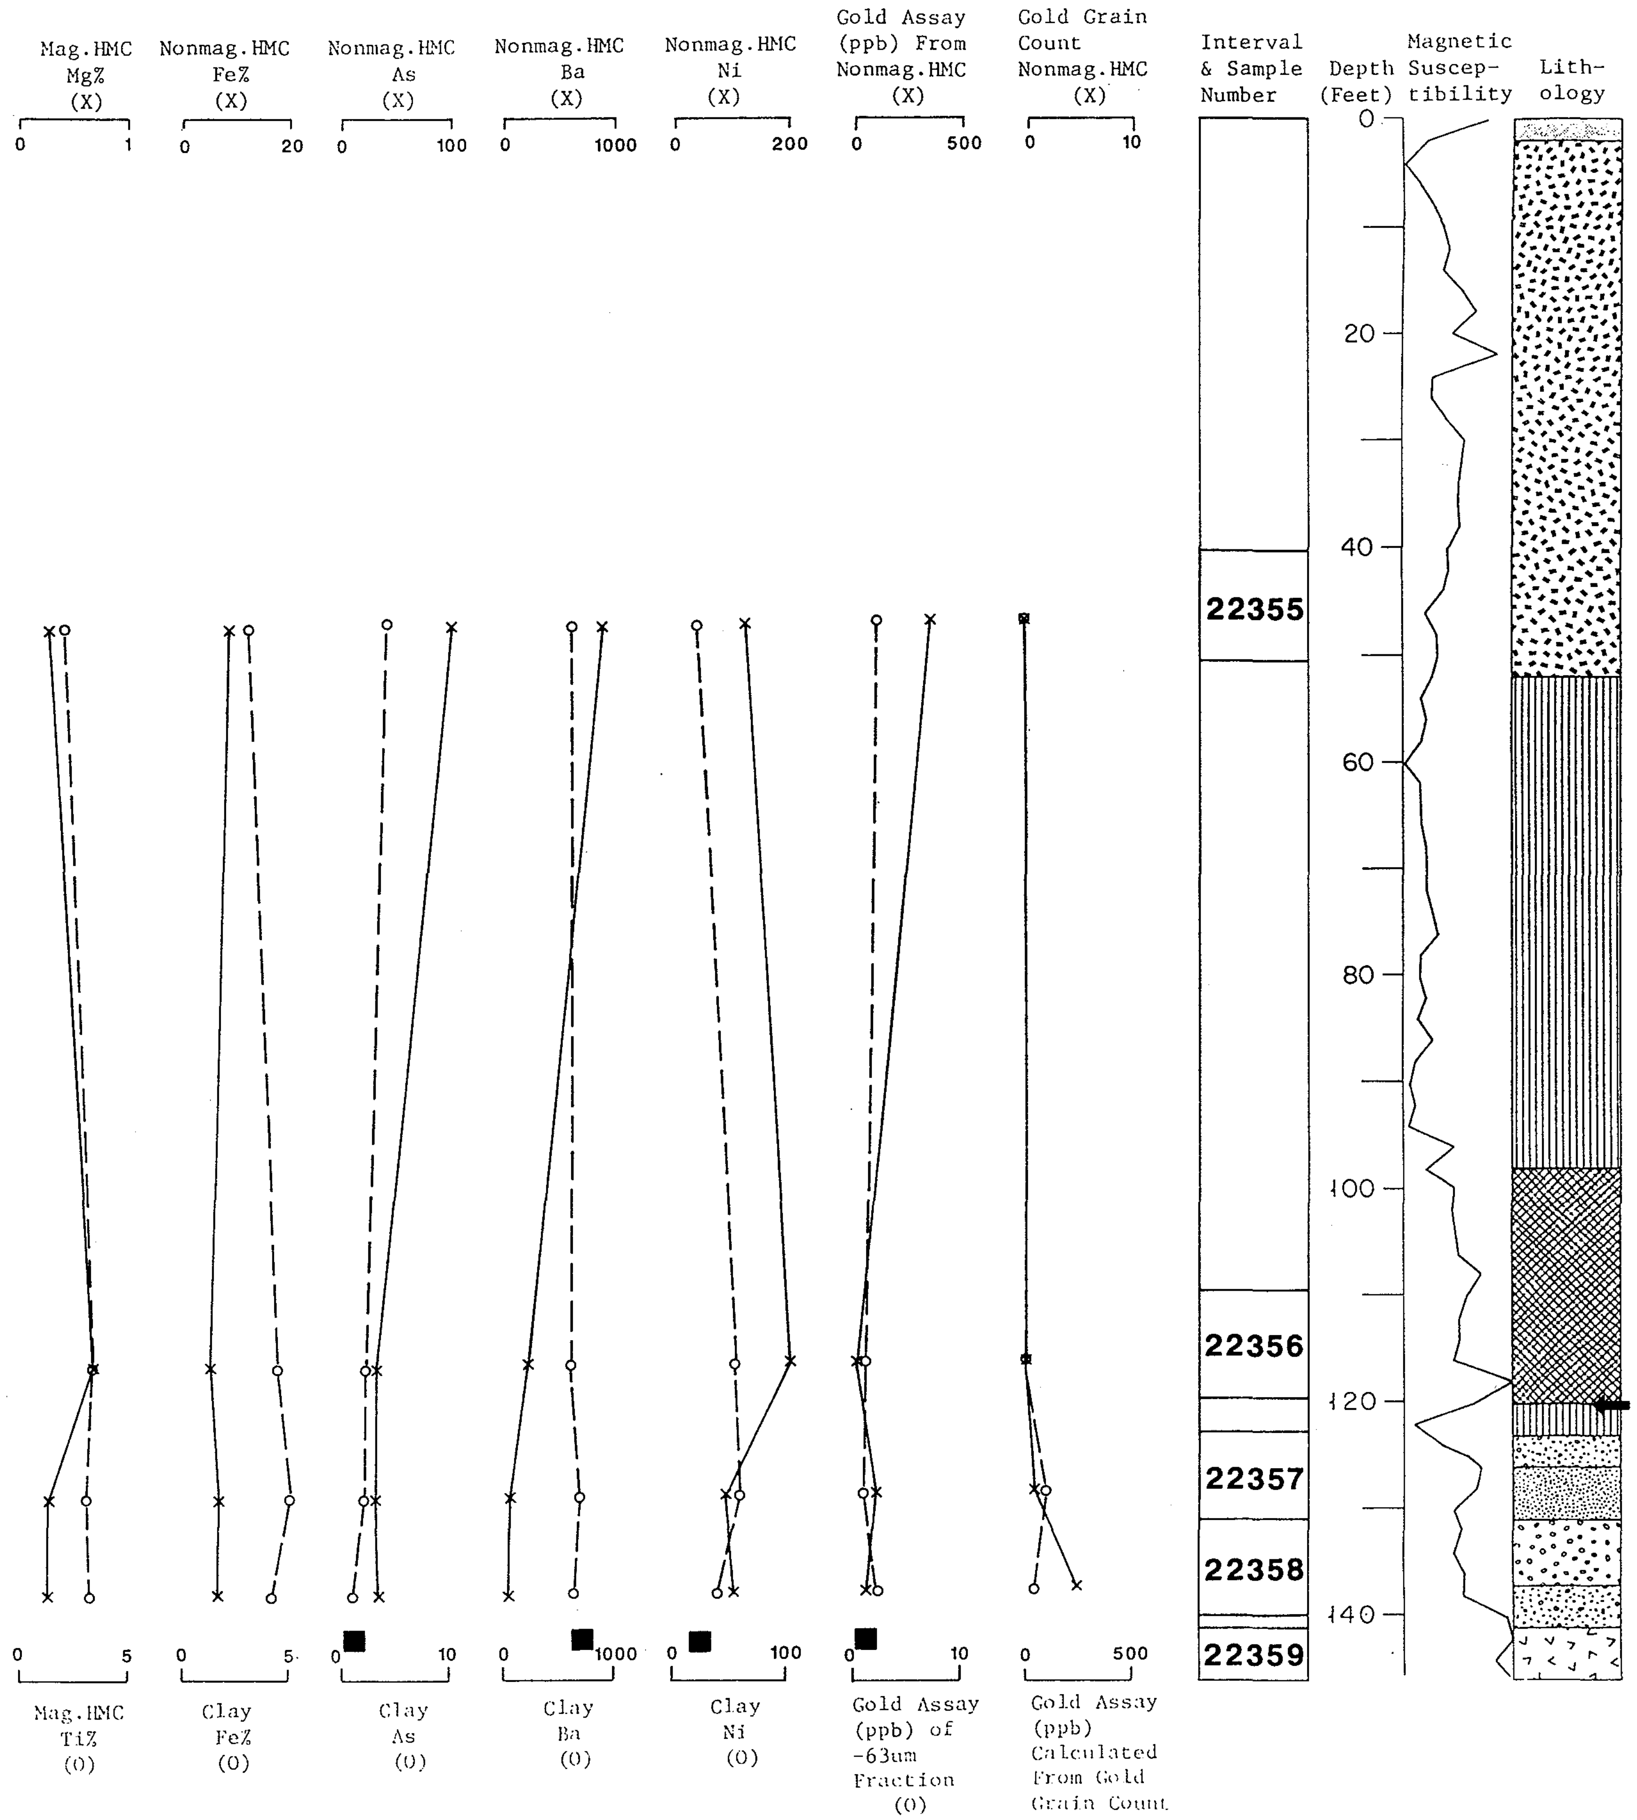
BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Foliated hornblende-bearing quartz diorite/monzodiorite (based on thin section mode; see description). Color varies depending on the degree to which feldspar is oxidized. Rock is equigranular and medium-grained (1-3mm). Generally the rock is fresh with feldspar oxidized adjacent to epidote veinlets. No obvious modal banding, but the orientation of Fe-Mg and irregular feldspar-quartz zones dip 75°. Mineralization is minor with a trace percent of disseminated pyrite and thin irregularly oriented epidote veins. Magnetic Susc. 0.46-1.40 x 10-3 CGS. Source of more magnetic zone (1.0-1.4) can't be macroscopically defined, but thin section was taken from that zone.

Thin Section Description: OB-311, 146 ft. Medium-coarse grained, foliated quartz diorite/monzodiorite (Streckeissen classification). Estimated mode (volume %): Plagioclase 63%; Quartz 9%; Orthoclase 8%; Hornblende 15%; Epidote 1%; Sphene 1%; Chlorite 1-2%; Fe-Ti Oxides 2%; Calcite Tr; Zircon Tr; Apatite Tr. Primary igneous foliation is defined by the preferred orientation of inequant hornblende, sphene, and plagioclase. Plagioclase is stained by red dusty hematite(?) and is moderately saussuritized to sericite and epidote, preferentially in the cores. The grains are sub- to anhedral and equant, but the polysynthetic twinning is typically aligned parallel to the foliation. Orthoclase is fresh, slightly stained by reddish hematite; and both quartz and orthoclase are anhedral-interstitial, locally forming a myrmekitic intergrowth. Hornblende forms subhedral, tabular grains which are commonly twinned,and contain small inclusions of quartz, plagioclase, and apatite, and partially enclose blocky oxide grains. Chlorite, and relatively large subhedral epidote, occur along late, random fractures, most likely as a late deuteric alteration product of plagioclase and hornblende.

Scintillometer Reading (cps): 75-85

OB-311



Geologic Descriptions

K (0 - 2) FINE - MEDIUM SAND; OXIDIZED; few inches of peat on top; calc towards base; abrupt basal contact.

(2 - 52) CLAY LOAM TILL; UNOXIDIZED by 13 ft; upper 1/2 foot could be sorted; carb pebs common to abundant; some sh; small cobs at 22, clay texture from 22; v sm lenses of silty sand at 46; v clayey by 46 1/2.

(52 - 98) SILTY CLAY - CLAY; UNOXIDIZED; calc; thin silty lam to about 55 ft; occ pebs, incl carb & sh; few v thin silt lam by 86, increasing from 91; thin flow till layers from 94 1/2, clayey till layer 95 1/2 - 96.

Note: Solid square denotes the bedrock assay, which was performed on the total bedrock sample rather than on the silt/clay or HMC fraction.

(98 - 120) LOAM TILL; UNOXIDIZED; calc; 98 - 99 1/2 ft loam to clay loam till; carb pebs common, noted sh; v fgr sand lens at 110, gravelly sand 113 - 113 1/2, 114 - 115; cobs at 106, 115; clay loam till from 119.

R (120 - 123) CLAY; UNOXIDIZED; thin silt lam; noncalc to sl calc, silt mod calc; grnish gray.

(123 - 126) SANDY LOAM TILL; UNOXIDIZED; sl calc, few carb grains; grnish gray.

(126 - 131) GRAVELLY LOAMY SAND; UNOXIDIZED; hard, compact, could be till; few carb pebs.

(131 - 137) COBBLY SAND & GRAVEL; UNOXIDIZED; 131 - 133 loamy cobbly sand, could be till; 133 - 134 clean gvlly sand, couple cobs, carb pebs fairly common; 134 - 135 1/2 loamy, cobbly sand; 135 1/2 - 136 1/2 cobs; 136 1/2 - 137 loamy, cobbly sand.

(137 - 141) COBBLY SANDY LOAM TILL; UNOXIDIZED; sl to mod calc; 139 - 140 clean coarse sand; 140 - 141 loamy till; no carb, prob saprolite mix, over clear coarse sand bed, over sl calc pebbly clay—apar reworked saprolite.

(141 - 146) BEDROCK; QUARTZ MONZODIORITE; cgr, mod igneous foliation.

Appendix 1-8C.

Geologic Descriptions

K (0 - 30 1/2) CLAY LOAM TILL; UNOXIDIZED by 15 ft; calc by 2; 0 - 1 few inches of peat over silty, v fgr sand; carb & sh pebs; large pebs fairly common, carb dominant; more clayey, less pebs w/depth.

(30 1/2 - 105 1/2) CLAY TILL; UNOXIDIZED; few v thin silt lam; thin lenses of sandy silt 54 - 54 1/2 ft; 78 - 79 loam till, apar laminated w/clay till; sh pebs fairly common; few thin lenses of sandy silt from 84 1/2 - 85, 91 - 91 1/2; pebs fairly common by 91 1/2; loam till lam at 98.

(105 1/2 - 113 1/2) SILT, CLAY, & CLAYEY TILL; laminated; calc; mostly clayey silt from 111 ft; sand grains mostly sh; last 1/2 foot laminated silt & clay.

(113 1/2 - 123 1/2) LOAM TILL; UNOXIDIZED; grades into lake sed in upper foot; carb pebs common; large cob at 116 ft.

(123 1/2 - 126) FINE SAND; UNOXIDIZED; v fgr by 124 1/2 ft; few sm pebs & sm till lenses; grades into till below.

(126 - 131 1/2) SANDY LOAM TILL; UNOXIDIZED; v little clay; sand lens at 128 ft; laminated sandy till, mgr sand, v fgr sand & silt from 129.

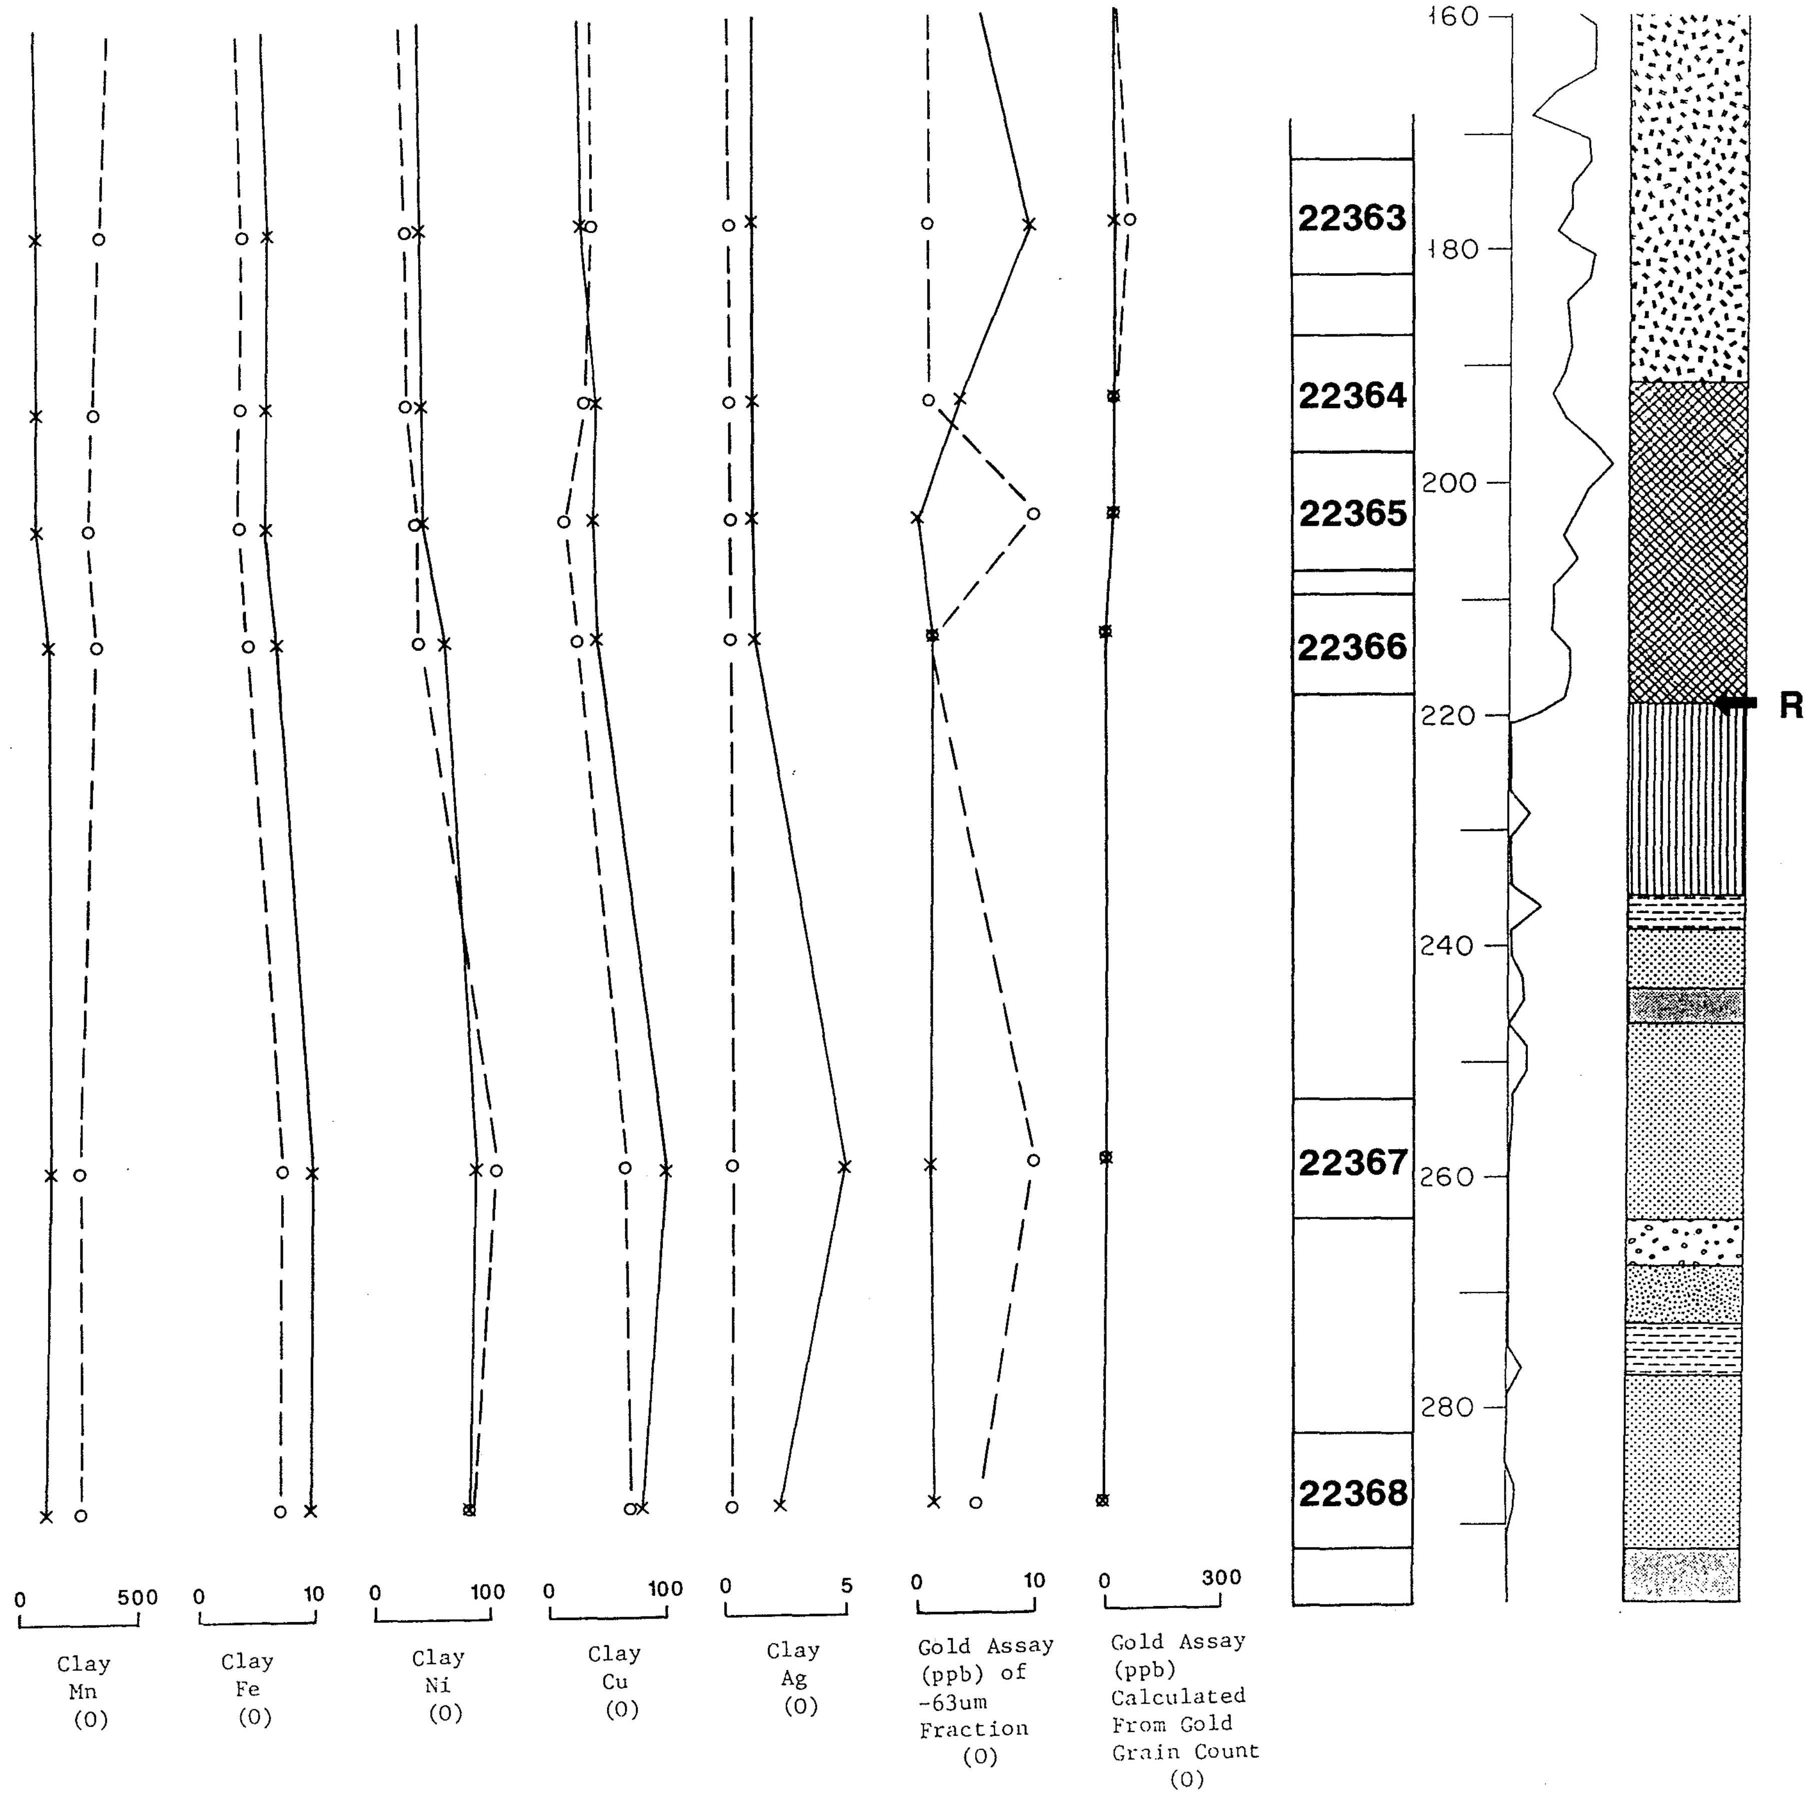
(131 1/2 - 134) GRAVELLY COARSE SAND; UNOXIDIZED; coarsens upward.

(134 - 136) FINE SAND; UNOXIDIZED; v fgr to 134 1/2 ft; pebbly in last 1/2 foot; carb pebs common.

(136 - 146) SANDY LOAM - LOAM TILL; UNOXIDIZED; appears laminated; v little clay as above till.

(146 - 151) LOAM TILL; UNOXIDIZED; sev large pebs; mgr sand bed at 147 ft, lenses at 148.

(151 - 191) LOAM - CLAY LOAM TILL; UNOXIDIZED; calc; carb pebs common to abundant; occ sh grains; thin cgr sand lenses at 168 ft; large pebs fairly common.



(191 - 218 1/2) LOAM TILL; UNOXIDIZED; calc; 198 - 199 1/2 ft sandy loam till, mod calc, upper contact v abrupt, lower gradational; below 199 1/2 mod calc to calc, little less carb pebs, few sh pebs; cob at 204 1/2, 213 1/2; clayey till in last foot.

(218 1/2 - 235) CLAY; UNOXIDIZED; v sl to sl calc; couple calc loam till lenses in upper 1/2 foot; reddish sl calc to noncalc bed at top; clayey silt lam from 219 1/2 ft; finely bedded w/varying colors, brn to grn casts; no dropstones; reddish beds 221 1/2 - 222 1/2; few brnish below, gone by 223 1/2; about twice as much clay beds to silt, about equal 224 1/2 - 225 1/2; some silt beds mod calc; sl to mod calc by 230, also sand grains; sl calc by 233.

(235 - 238) SILT; UNOXIDIZED; sl calc; by 236 1/2 ft v fgr sandy silt beds, few sm pebs; cob near base.

(238 - 243) FINE - MEDIUM SAND; UNOXIDIZED; mgr to cgr from 242 ft.

(243 - 246) FINE SAND; UNOXIDIZED; few silty lam at top.

(246 - 263) FINE - MEDIUM SAND; UNOXIDIZED; biotite flakes common; no pebs but few coarse grains; noncalc; 252 - 253 ft pebbly cgr sand, no carb noted; silty from 253 1/2 - 254 1/2; grnish sandy silt bed at 254 1/2, over cgr sand w/some silt, few sm pebs to base.

(263 - 267) COBBLY SAND & GRAVEL; some silt.

(267 - 272) GRAVELLY SAND; silty in upper foot; cobs at 268 & 268 1/2 ft; more silty from 270 w/silt to sandy silt lenses.

(272 - 276 1/2) SILT; UNOXIDIZED; v sl calc; sand lam, more sandy w/depth; clay beds at base.

(276 1/2 - 291 1/2) FINE - MEDIUM SAND; silty bed toward top; cgr sand bed at 278 ft; varies from silty, fgr sand to cgr sand; abundant mica flakes; all fgr to mgr by 282.

(291 1/2 - 296) SILTY, VERY FINE SAND; UNOXIDIZED; grnish gray; dropstones; sl calc; clay bed at 293 1/2 ft over v cgr sand to 294 1/2, couple cobs below 294; v fgr sandy silt from 294 1/2, cob and sand bed at 295, large peb at 295 1/2; cobbly, sandy till in last few inches.

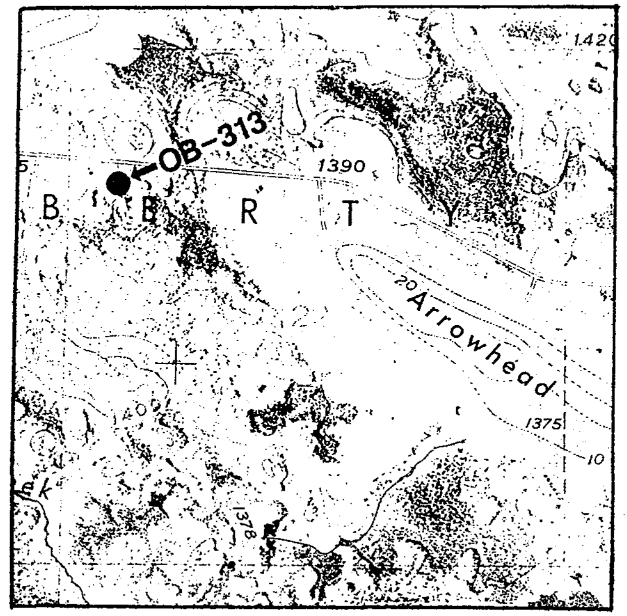
Appendix 1-10A. DRILL HOLE SUMMARY SHEET



IDENTIFICATION
DNR Drill Hole Number: OB-313
Drilling Completion Date: 6/18/88

LOCATION (see map at right)
S-T-R: SW¼-NW¼ - S22 - T149N - R25W
County: Itasca
Quadrangle: Spring Lake 7.5
Regional Survey Area: Effie
UTM Coordinates: 437,300mE; 5284580mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1385 ± 5 ft.
Total Depth: 203 ft.
Elevation, Top of Precambrian Bedrock: 1191.5 ft.
Elevation, Top of Saprolite: 1194.5 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

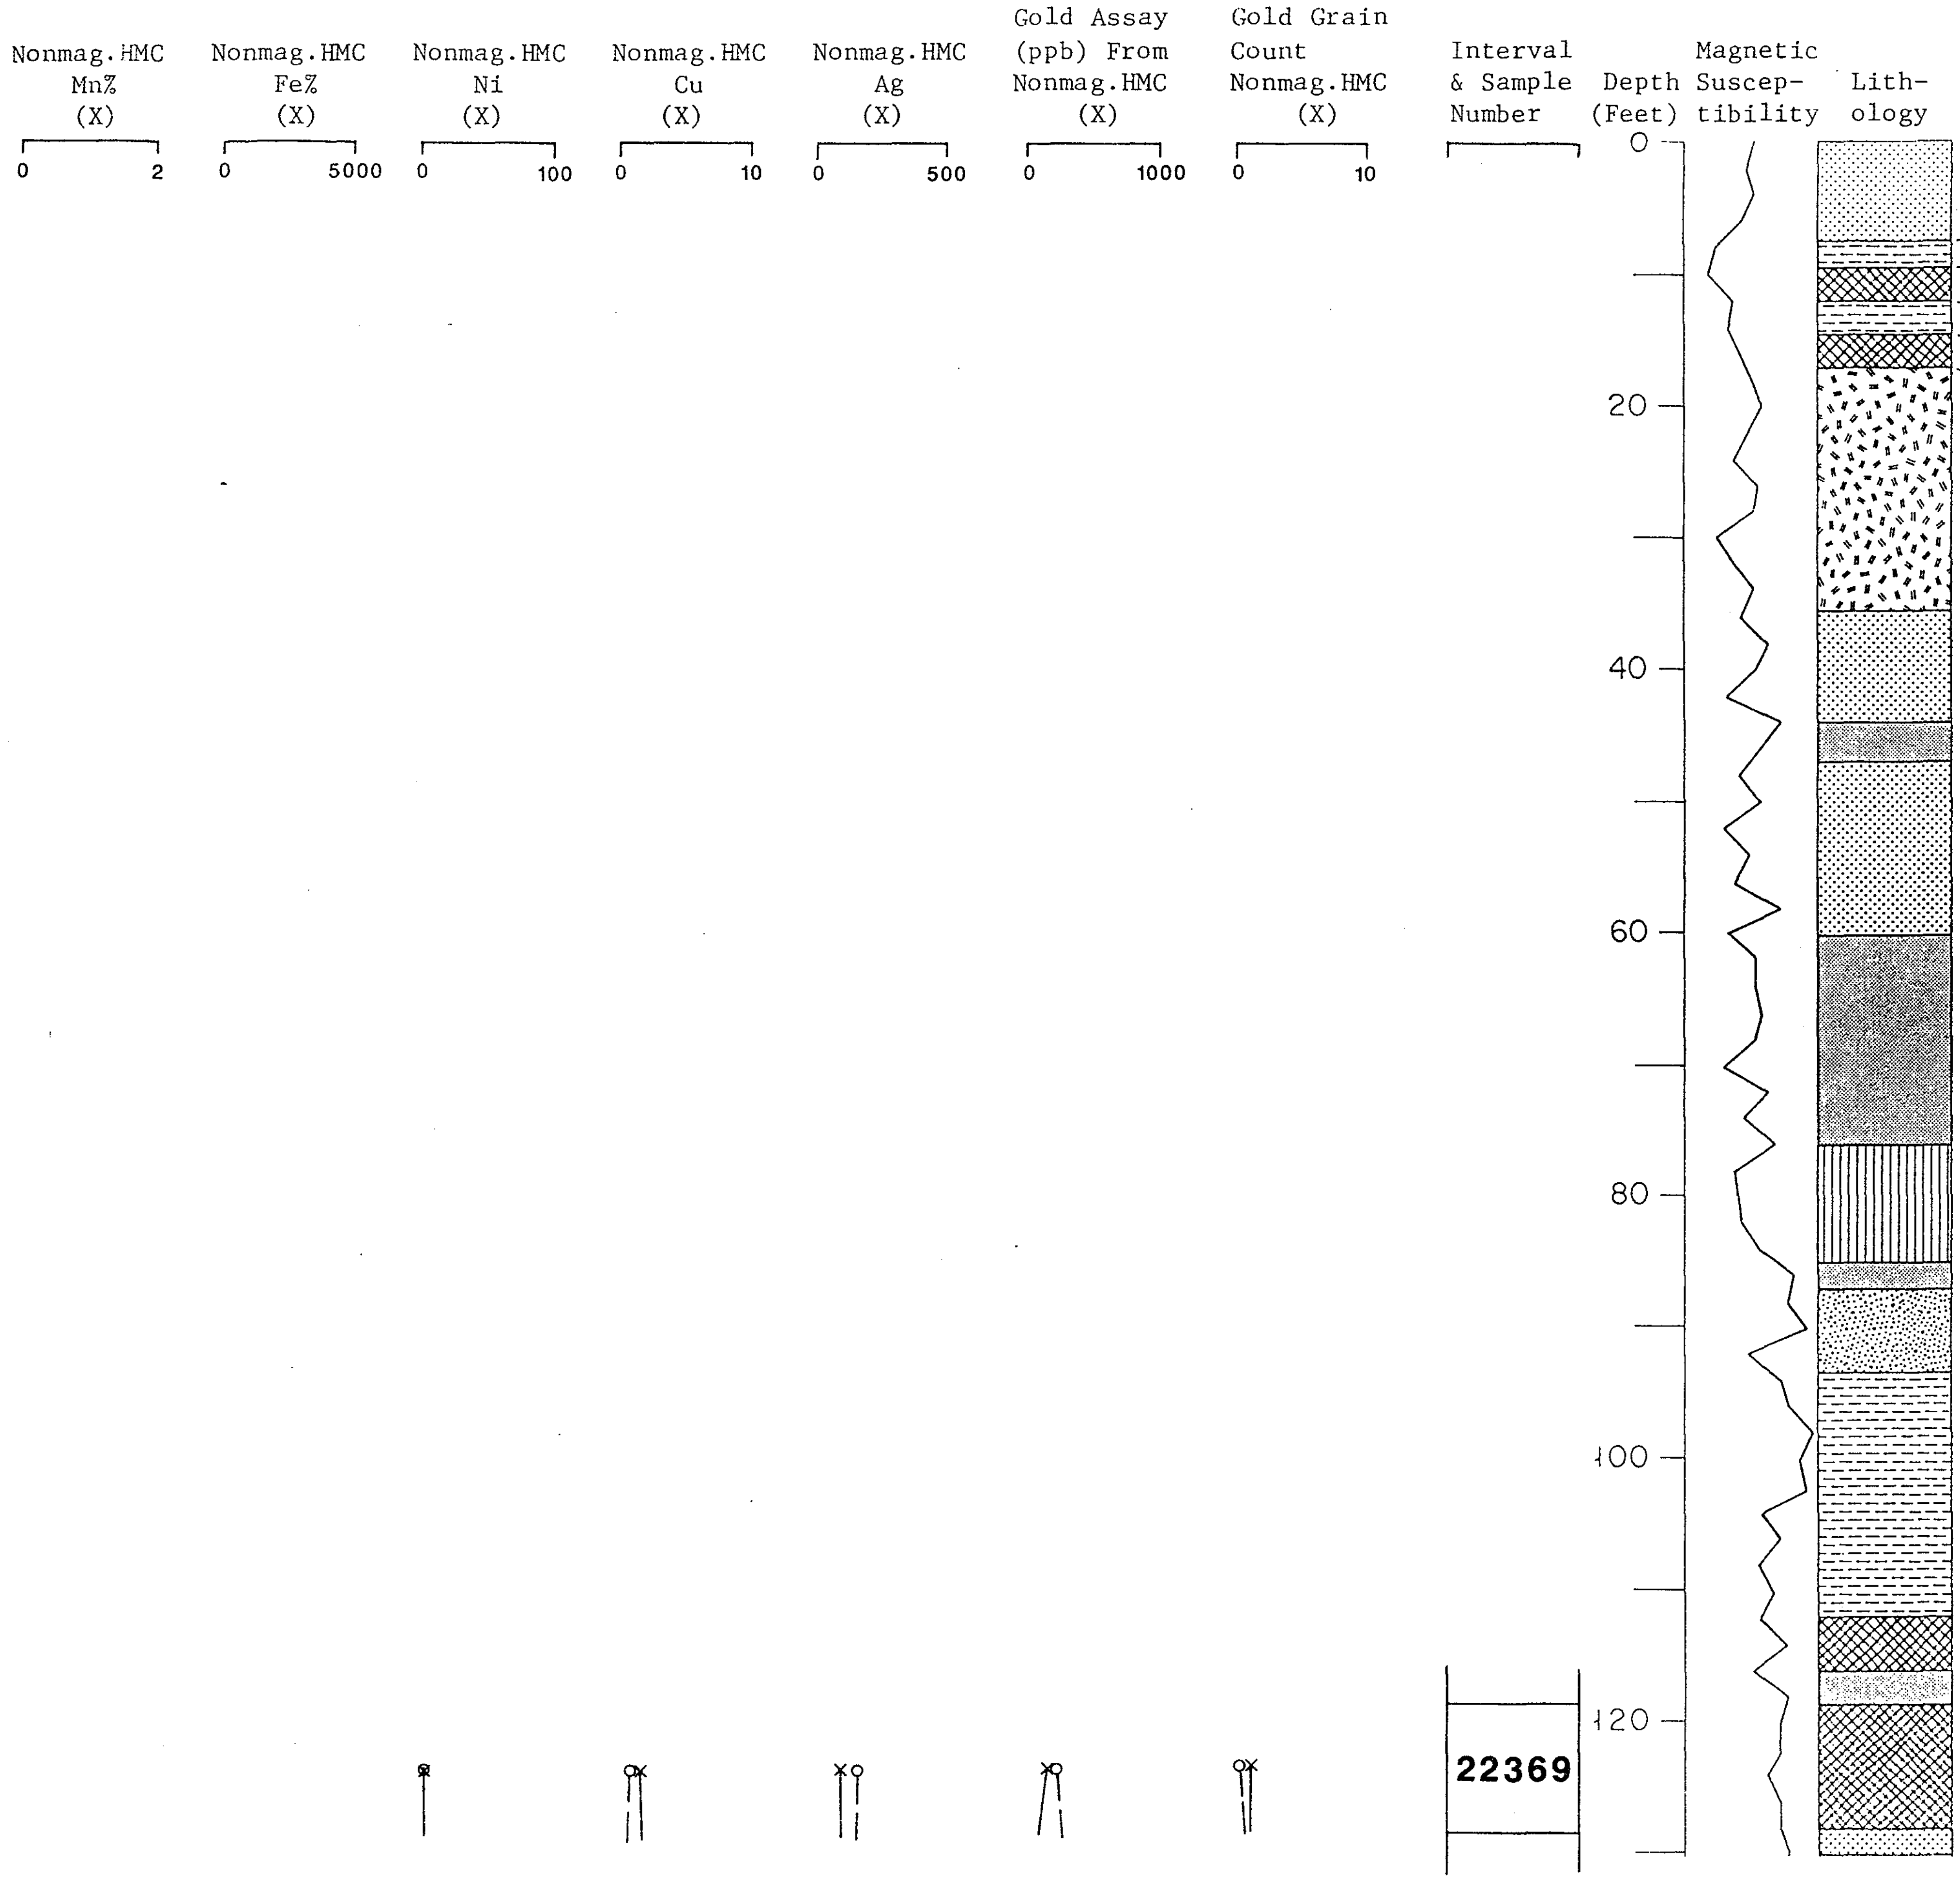
Core Description: Core contains 2 dominant rock-types; red to pink granitoid and a dark greenish gray metavolcanic rock (basaltic andesite): 188-193.5 Weathered (clayey) volcanic rock with irregular, weathered zones of granitoid: 193.5-195 Granitoid; 195-196 Metavolcanic rock. Metavolcanic is very fine-grained trachyitic and contains a weak flow(?) foliation that is parallel to contacts dipping 80-85°. Thin section 313A is typical. Granitoid may be classified as tonalite, but is unusual in lacking Kspar and being quartz rich. Thin section 313B is representative. Grain size is 2-5mm; coarser than might be expected for intrusions that are < 1m thick. Modal banding is absent, however, irregular wispy zones of slightly more melanocratic rock exist. It is uncertain whether the granitoid is intrusive into, or contains xenoliths of the metavolcanic rock; but the latter relationship is favored as no chilled margin exists near the Metavolcanic rocks. Multiple irregular fractures with Fe-oxide and several thin veinlets of epidote and plagioclase(?) occur in the metavolcanic rock. Magnetic Susc: metavolcanic 0.02-0.04 x 10-3 CGS; granitoid 0.00-0.02 x 10-3 CGS.

Thin Section Description: OB-313A, 185 ft. Fine-grained, massive basaltic andesite. Rock consists of minute decussate to weakly trachytic, lath-shaped plagioclase in a groundmass of chlorite, fine-grained feldspar plus quartz, and clots of dusty Fe-oxides (hematite?; 3-5% of rock volume). Rare plagioclase phenocrysts are present, as are small amygdules of chlorite and quartz. Rock is transected by randomly-oriented, narrow alteration zones which are depleted in chlorite and enriched in quartz; these still retain plagioclase. A few narrow brittle fractures filled with quartz are also present.
OB-313B, 188 ft. Moderately tectonized trondhjemite or leucotonalite (Streckeissen Classification). Estimated Mode (volume %): Quartz 40%; Plagioclase (albite) 35%; Antiperthite/anorthoclase 20%; Chlorite (pennine) 3%; Epidote 2%; Zircon Tr. Quartz-rich plutonic rock which originally consisted of medium- to coarse-grained quartz and zoned plagioclase (composition unknown) which have prominent overgrowth rims of antiperthite (anorthoclase or albite). Subsequent brittle deformation has resulted in the present texture of strained and broken quartz and feldspar grains up to 2 mm wide in a groundmass of mortar-textured quartz and feldspar. Crude optical tests indicate a composition of An05 for the plagioclase; this high albite content appears to be a primary composition, as no evidence for albitization of an initially more calcic feldspar exists. Both the albitic core and anorthoclase/antiperthite rims are slightly sericitized. The mafic component is very small, consisting of chlorite along fractures and clots of granular epidote. Evidence for any appreciable content of ferro-magnesian minerals is nil.

Scintillometer Reading (cps): 60-80

Appendix 1-10B.

OB-313



Geologic Descriptions

K

(0 - 7 1/2) FINE - MEDIUM SAND; OXIDIZED; few sm pebs, silty in spots; sandy silt bed at 4 ft, silty, v fgr to mgr sand below; at 7 silty mgr w/some cgr sand.

(7 1/2 - 9 1/2) SANDY SILT; OXIDIZED; 8 - 8 1/2 ft clay beds, mostly silt below; calc towards base; gradational basal contact.

(9 1/2 - 12) LOAM TILL; OXIDIZED; calc; few clay lam, gradational w/lake sed to about 11 ft.

(12 - 14 1/2) SANDY SILT; OXIDIZED; flow till beds?

(14 1/2 - 17) LOAM TILL; OXIDIZED; clay lam at 15 ft; silty, v fgr sand bed at 16, sandy silt beds to 16 1/2.

(17 - 35 1/2) CLAY LOAM TILL; UNOXIDIZED; abrupt upper contact; carb pebs common, sh present; large cob near top; approaching loam till by 26 ft; clay till from 29, few lenses of loamy till; large cob at base.

(35 1/2 - 44) FINE - MEDIUM SAND; UNOXIDIZED; silty bands at top; some mgr sand beds, few sm carb pebs.

(44 - 47) SILTY, VERY FINE SAND; UNOXIDIZED; sandy silt at top.

(47 - 60) MEDIUM - COARSE SAND; UNOXIDIZED; sand & fine gvl bed at top; sh & carb pebs; fgr to mgr from 56 ft.

(60 - 76) FINE SAND; UNOXIDIZED; fgr to mgr from 62 - 71 ft; few sh grains; silt lam at 71, & from 74 - 76.

(76 - 85) CLAY & SILT; UNOXIDIZED; laminated, more clay than silt; mod calc; no sand or pebs; thin, fgr to mgr sand bed at 84 1/2.

(85 - 87) SILTY, VERY FINE SAND; UNOXIDIZED; coarser beds.

(87 - 93 1/2) GRAVELY MEDIUM - COARSE SAND; UNOXIDIZED; pebs sm, mostly carb; 89 - 90 ft sandy silt w/few sm pebs, beds of sandy silt to silt below.

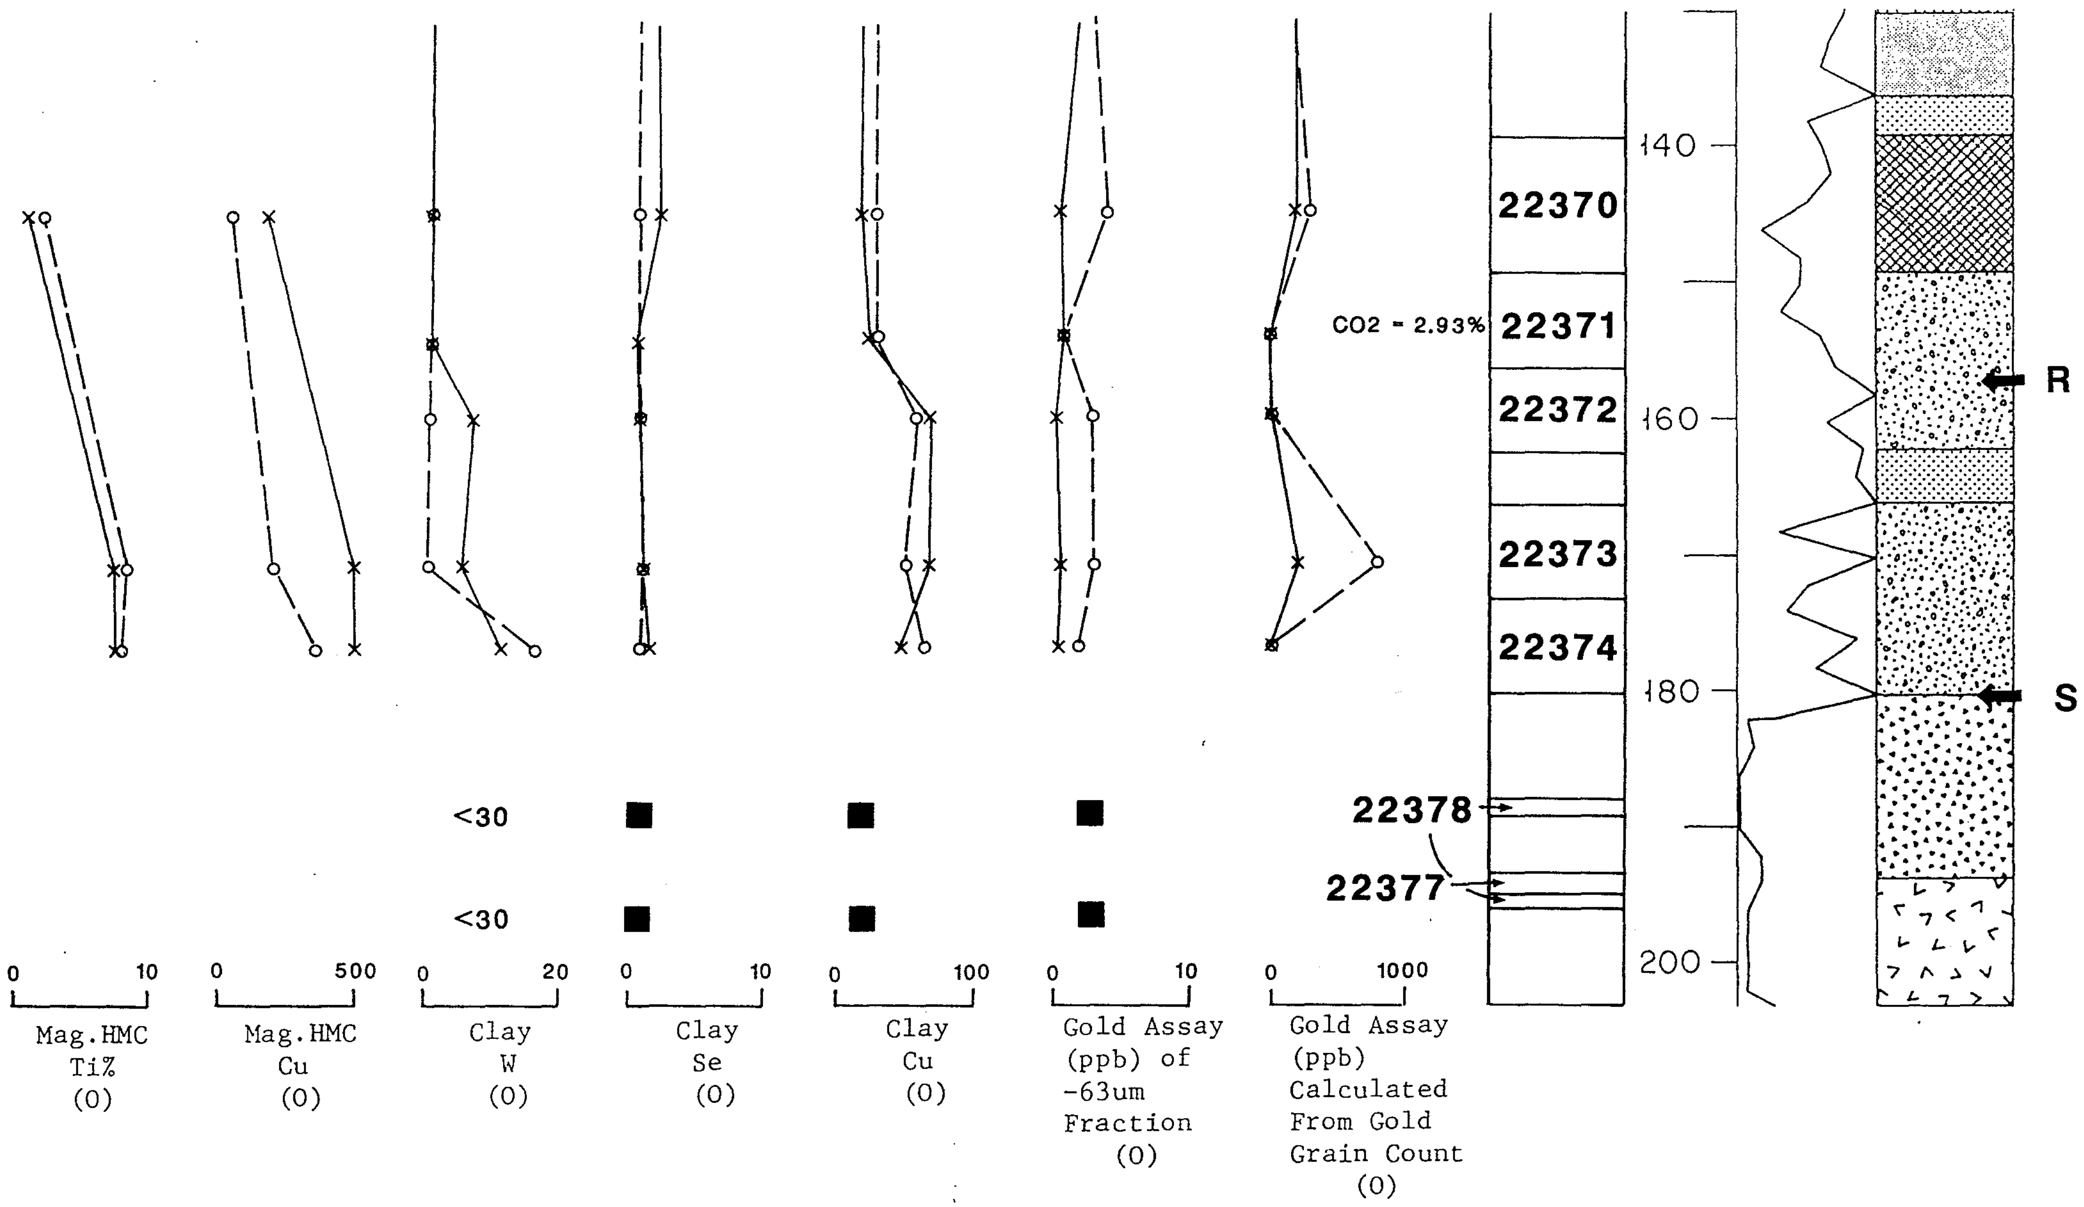
(93 1/2 - 112) VERY FINE SANDY SILT; UNOXIDIZED; pebbly at top, few pebs below; till-like 96 - 97 1/2 ft, few possible till layers; sh pebs; large cob at 104, more pebs below, prob dropstones; pebbly sand bed near base.

(112 - 116) CLAY LOAM - SANDY LOAM TILL; UNOXIDIZED; bedded flow till; sh & carb pebs common; sand & gvl beds.

(116 - 118 1/2) LOAMY SAND; UNOXIDIZED; sm pebs.

(118 1/2 - 128) LOAM TILL; UNOXIDIZED; grnish gray; carb & sh pebs; silty, pebbly sand lense at 120 ft, sm cob at 122; pebbly cgr sand lens near base.

(128 - 130) GRAVELLY SANDY SILT - SAND; UNOXIDIZED; few thin till beds.



(130 - 136) SILTY, VERY FINE SAND; UNOXIDIZED; few pebs; 134 1/2 - 136 ft pebbly, sandy silt, prob not till; large cob at base.

(136 - 139) COARSE SAND; sh peb layer at 136 1/2 ft.

(139 - 149) LOAM - CLAY LOAM TILL; UNOXIDIZED; carb, abundant sh pebs; sev sm cobs at top.

(149 - 156) LOAM - SANDY LOAM TILL; UNOXIDIZED; calc; upper contact fairly abrupt; cobs at 151 1/2, 155; more sandy w/depth, sandy loam till by 155; no sh noted.

(156 - 162) GRAVELLY, SANDY LOAM TILL; UNOXIDIZED; capped by foot of laminated mod calc silt & sl calc clay; grnish gray; sl calc; cob near top, many large pebs.

(162 - 166) MEDIUM - COARSE SAND; UNOXIDIZED; grnish gray; some silt.

(166 - 180) VERY GRAVELLY SILT LOAM - SANDY LOAM TILL; UNOXIDIZED; grnish gray, sl calc; many large cobs; more sandy matrix by 171 ft; v compact.

(180 - 193 1/2) SAPROLITE; 180 - 190 1/2 ft core stones w/residual debris removed by drilling action or fluvial/lacustrine processes, or stack of locally derived boulders; 190 1/2 - 193 1/2 clay & broken rock.

(193 1/2 - 203) BEDROCK; BASALT; intruded by weakly tectonized trondhjemite.

Appendix 1-10C.

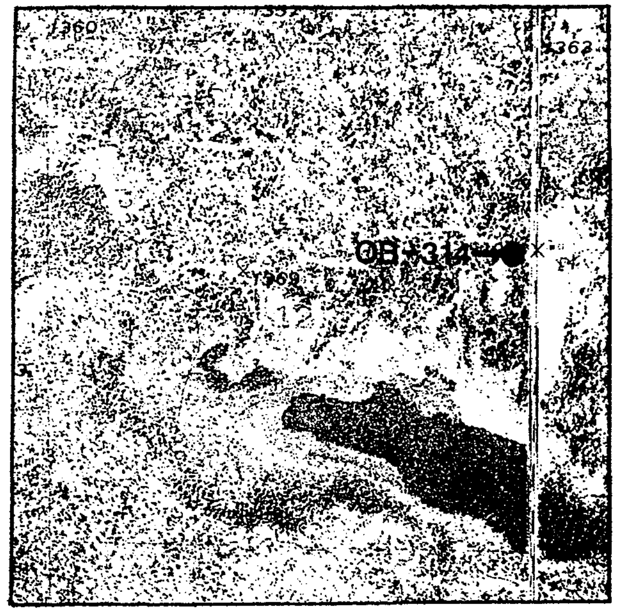
DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-314
Drilling Completion Date: 6/24/88

LOCATION (see map at right)
S-T-R: SE¼-NE¼ - S12 - T150N - R25W
County: Itasca
Quadrangle: Wildwood SE 7.5
Regional Survey Area: Effie
UTM Coordinates: 441,850mE; 5297040mN; 15,N.



HOLE PARAMETERS
Surface Elevation: 1371 ± 3 ft.
Total Depth: 115 ft.
Elevation, Top of Precambrian Bedrock: 1258 ft.
Elevation, Top of Saprolite: 1259 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

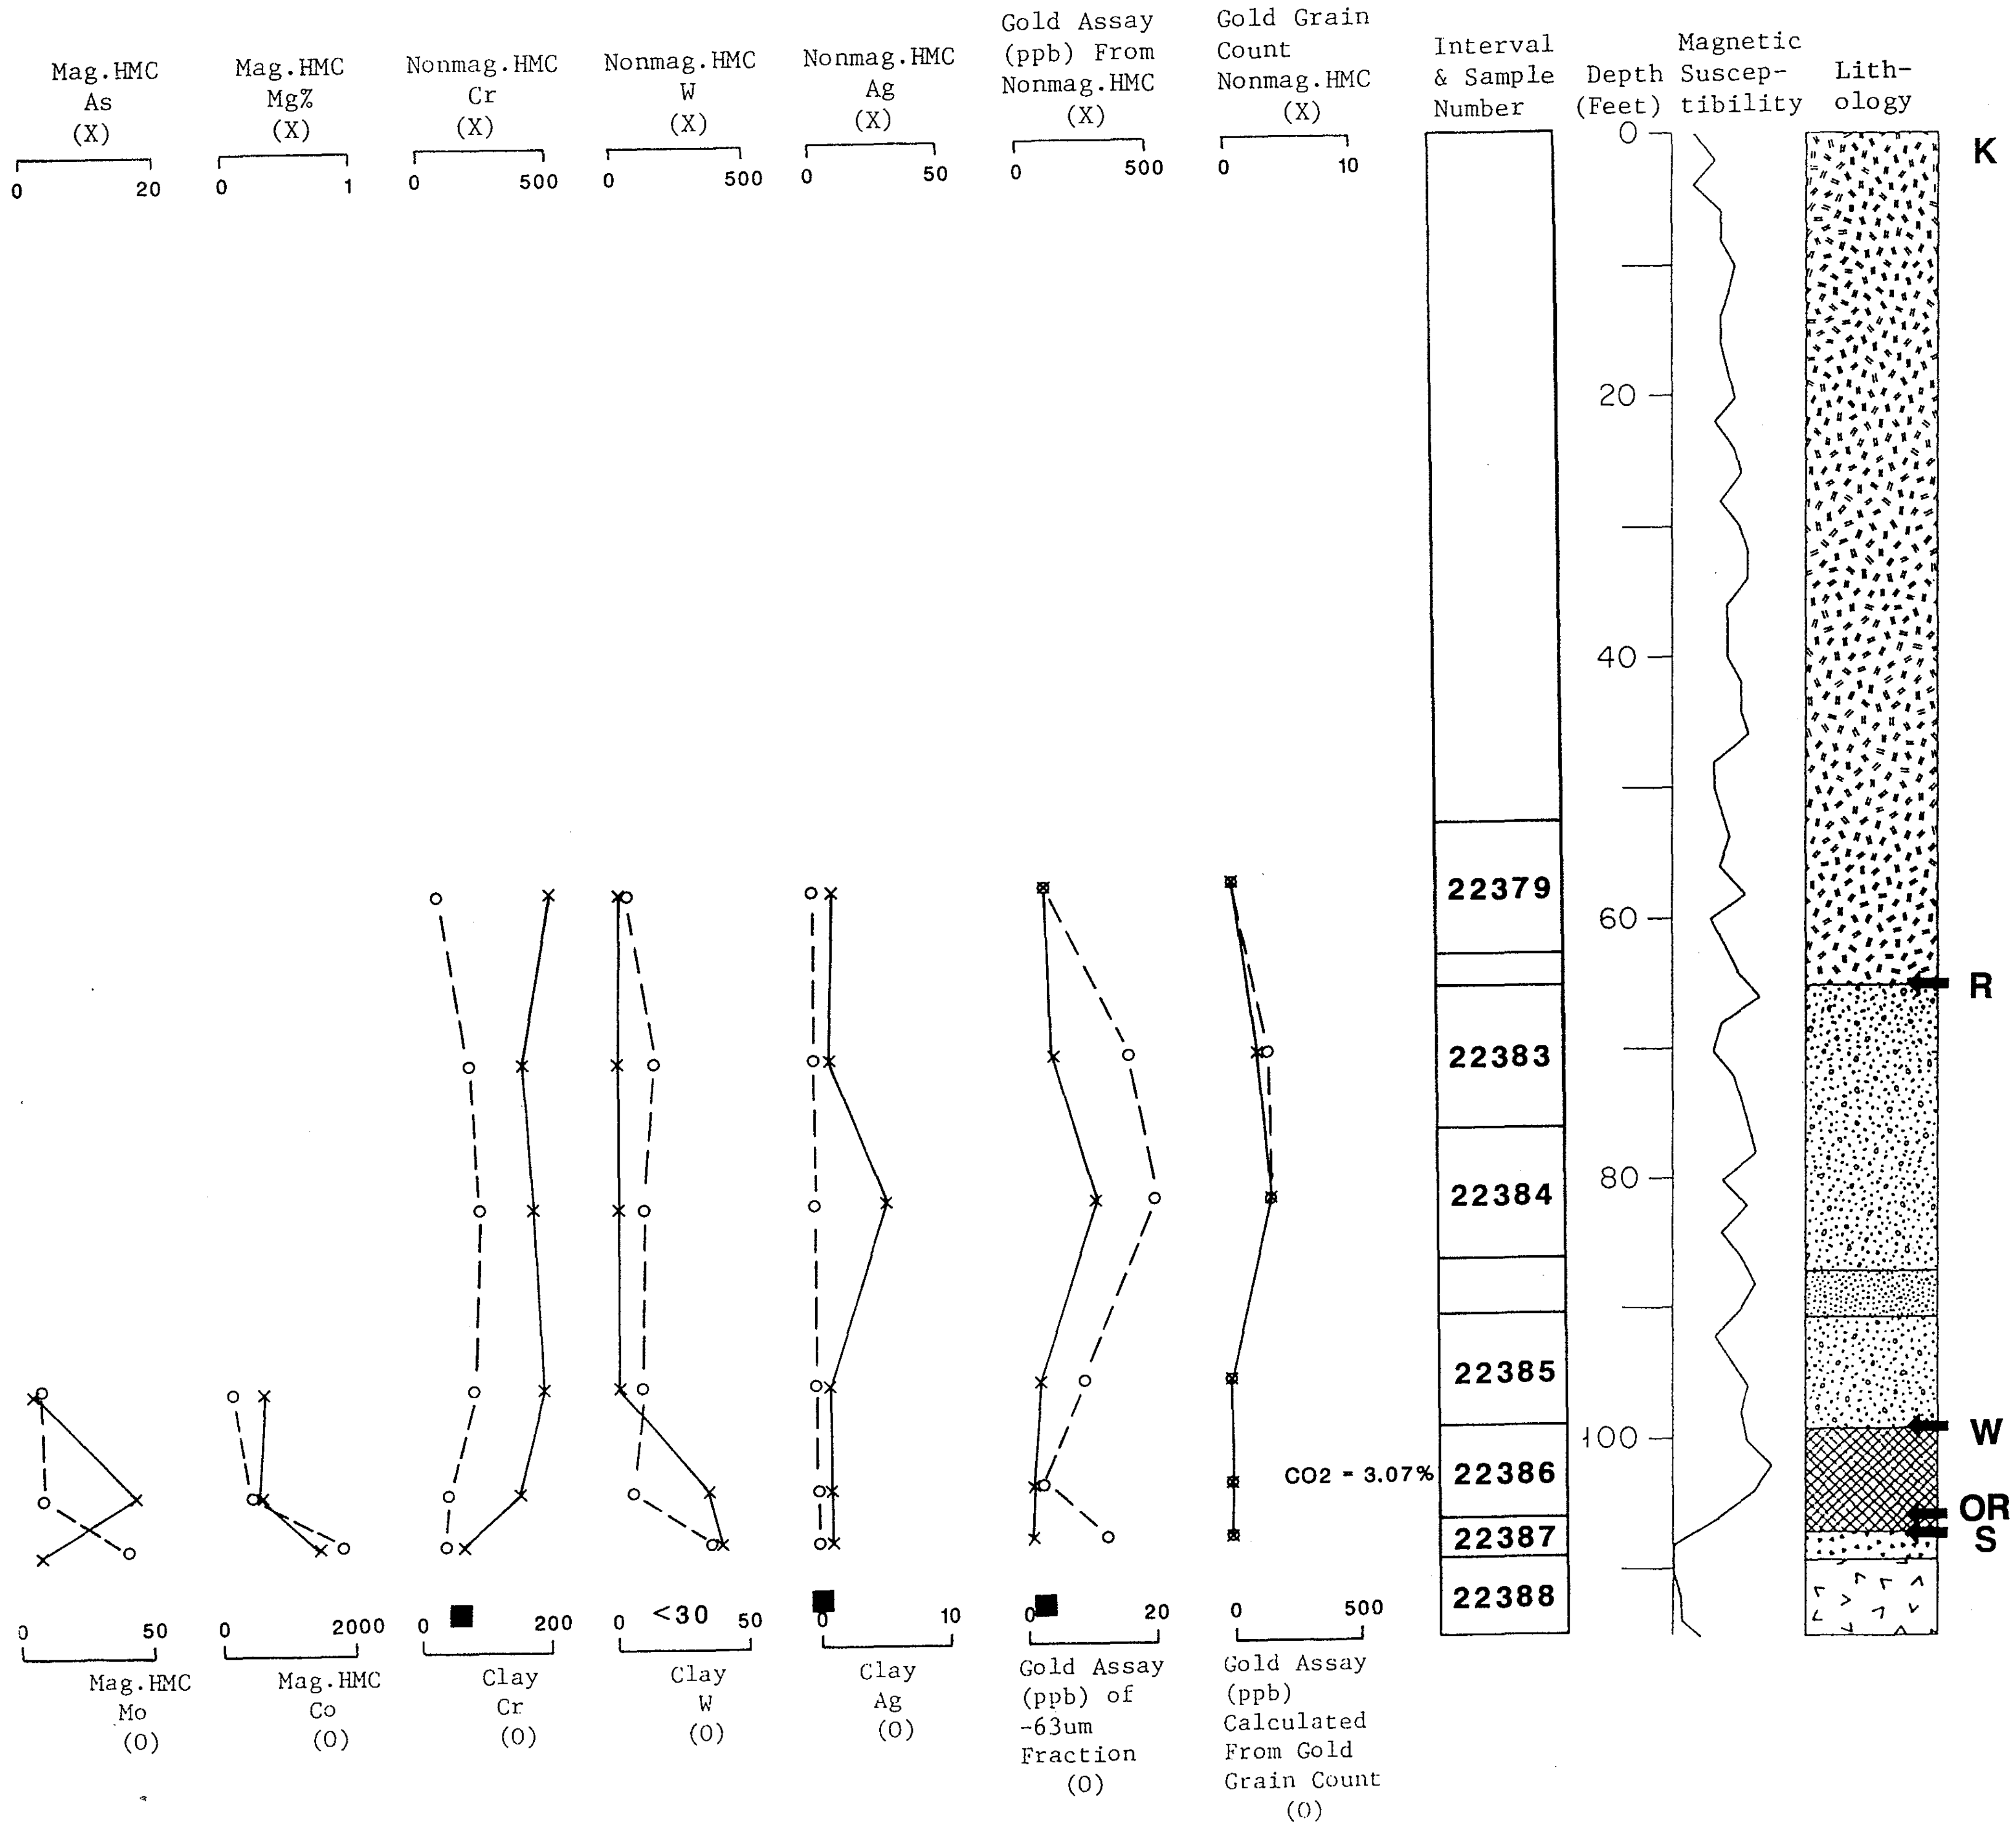
Core Description: Altered tonalite. Rock is equigranular and coarse grained (2-3mm). Color varies from white in freshest parts to red in oxidized zones adjacent to ubiquitous veins. No obvious modal banding, except at 109-111' where a pegmatoid zone occurs. This zone contains 2.0 cm salmon-colored feldspar and minor interstitial quartz and aegirine. Pegmatoid zone has irregular borders that dip about 55°. Veining is complex and pervasive: two vein systems exist, described in relative order from earliest to latest below: 1.) Vertical, closely spaced veins are main feature of the rock. They are 1.0 mm to 2.0 cm wide and consist of aegirine (based on thin sections) and calcite with minor quartz and pyrite. Host rock is altered in 0.5 - 1.0 cm wide bands adjacent to veins. This alteration is manifested in red color; petrography indicates color due to oxidized adularia in alteration zones along with calcite, apatite and aegirine. Thin section is from this alteration zone. 2.) Two very thin veins of green mineral (aegirine?) dip about30°. No obvious adjacent wall-rock alteration exists. Magnetic Susc. 0.01 - 0.03 x 10-3 CGS.

Thin Section Description: OB-314, 111 ft. Highly altered (carbonatized), coarse-grained tonalitic rock. Estimated Mode (volume %): Quartz 16%; Plagioclase (twinning still visible) 40%; Calcite 19%; Aegirine 9%; Anorthoclase 5%; Apatite 1%; Adularia (? unidentifiable 'groundmass') 10%; Zircon Tr. Very altered rock, primary coarse-grained texture of plagioclase and quartz is still evident in half of section (red-colored area on heel). Recognizable plagioclase grains are blocky, moderately altered to white mica, and locally altered in patches to replacement assemblage of the rest of the slide. The bulk of the slide is altered to an assemblageof calcite, aegirine, adularia, and apatite. Apatite comprises up to 1% of the overall volume of the rock, but in local patches is very abundant as euhedral, hexagonal prisms of variable size (0.3 mm maximum diameter). These clusters of apatite occur in patches of red-stained, very fine-grained feldspar (adularia?) or feldspathoid (?). Aegirine forms long, splintery crystals which have weakly pleochroic, pale yellowish-green to deep green colors. The aegirine occurs with carbonate alteration, and forms felty mats in the most highly altered portions of the slide, along with calcite, quartz, and apatite. The high volume of calcite, aegirine, and apatite in the alteration assemblage indicate that the rock may have undergone fenitization, or possibly the rock itself may have been part of a volatile-rich, highly evolved intrusion which supplied the volatiles for deuteric alteration.

Scintillometer Reading (cps): 120-140

Appendix 1-11B.

OB-314



Geologic Descriptions

(0 - 65) CLAY LOAM TILL; UNOXIDIZED by 15 ft; cob at top; sh, carb pebs dominate; little more sandy from 40, loam till in spots; sandy lam at 47, sandy & pebbly lam at 54; 62 1/2 - 65 mixed zone, clayey & sandy till.

(65 - 87) LOAMY SAND - SANDY LOAM TILL; UNOXIDIZED; sl calc; little carb; fairly compact, not real rocky; sandy lens at 72 ft, others below; mostly sandy loam till from 75, also mod calc w/increasing carb content; sev cobs at 84, and below; 86 - 86 1/2 mgr to cgr sand, pebbly at base.

(87 - 90 1/2) GRAVELLY FINE - COARSE SAND; UNOXIDIZED; cob at 88 ft, pebbly below; 89 1/2 - 90 silty, v fgr sand.

(90 1/2 - 99) LOAMY SAND - SANDY LOAM TILL; UNOXIDIZED; sl calc; not many large pebs; 96 - 98 hard, grnish, sandy loam till, sl to mod calc, cob at base; 98 - 99 fgr to v fgr sand.

(99 - 107) LOAM - SILT LOAM TILL; UNOXIDIZED; calc; horizontal mottling, apar joint related; pebbly zone at top; cobs at 102, 106 ft; carb pebs common; 106 - 107 mgr to cgr ang sand over cobbly gvl, little carb.

(107 - 109) SAPROLITE; upper foot prob reworked, gravelly sandy loam; rock 108 - 108 1/2 ft, over rocky clay.

(109 - 115) BEDROCK; TONALITIC ROCK; cgr; highly altered & carbonized.

Appendix 1-11C.

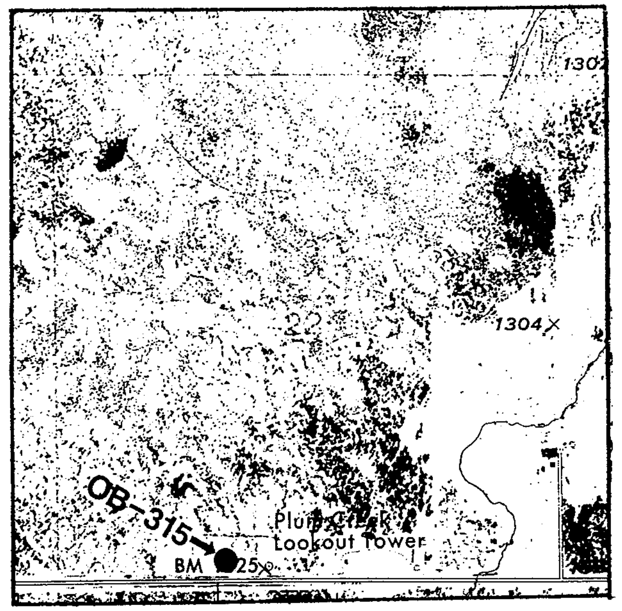
Appendix 1-12A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-315
Drilling Completion Date: 5/24/88



LOCATION (see map at right)
S-T-R: SE¼-SW¼ - S22 - T151N - R25W
County: Koochiching
Quadrangle: Wildwood NE 7.5
Regional Survey Area: Effie
UTM Coordinates: 437,710mE; 5302640mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1327 ± 2 ft.
Total Depth: 171 ft.
Elevation, Top of Precambrian Bedrock: 1165 ft.
Elevation, Top of Saprolite:
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

156.5-162	Old Rainy lobe gl. drift	B,C,G	A,B,C	A=W B=W,Co C=Co,Mo
162-171	Sound bedrock	G,H	I	

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core

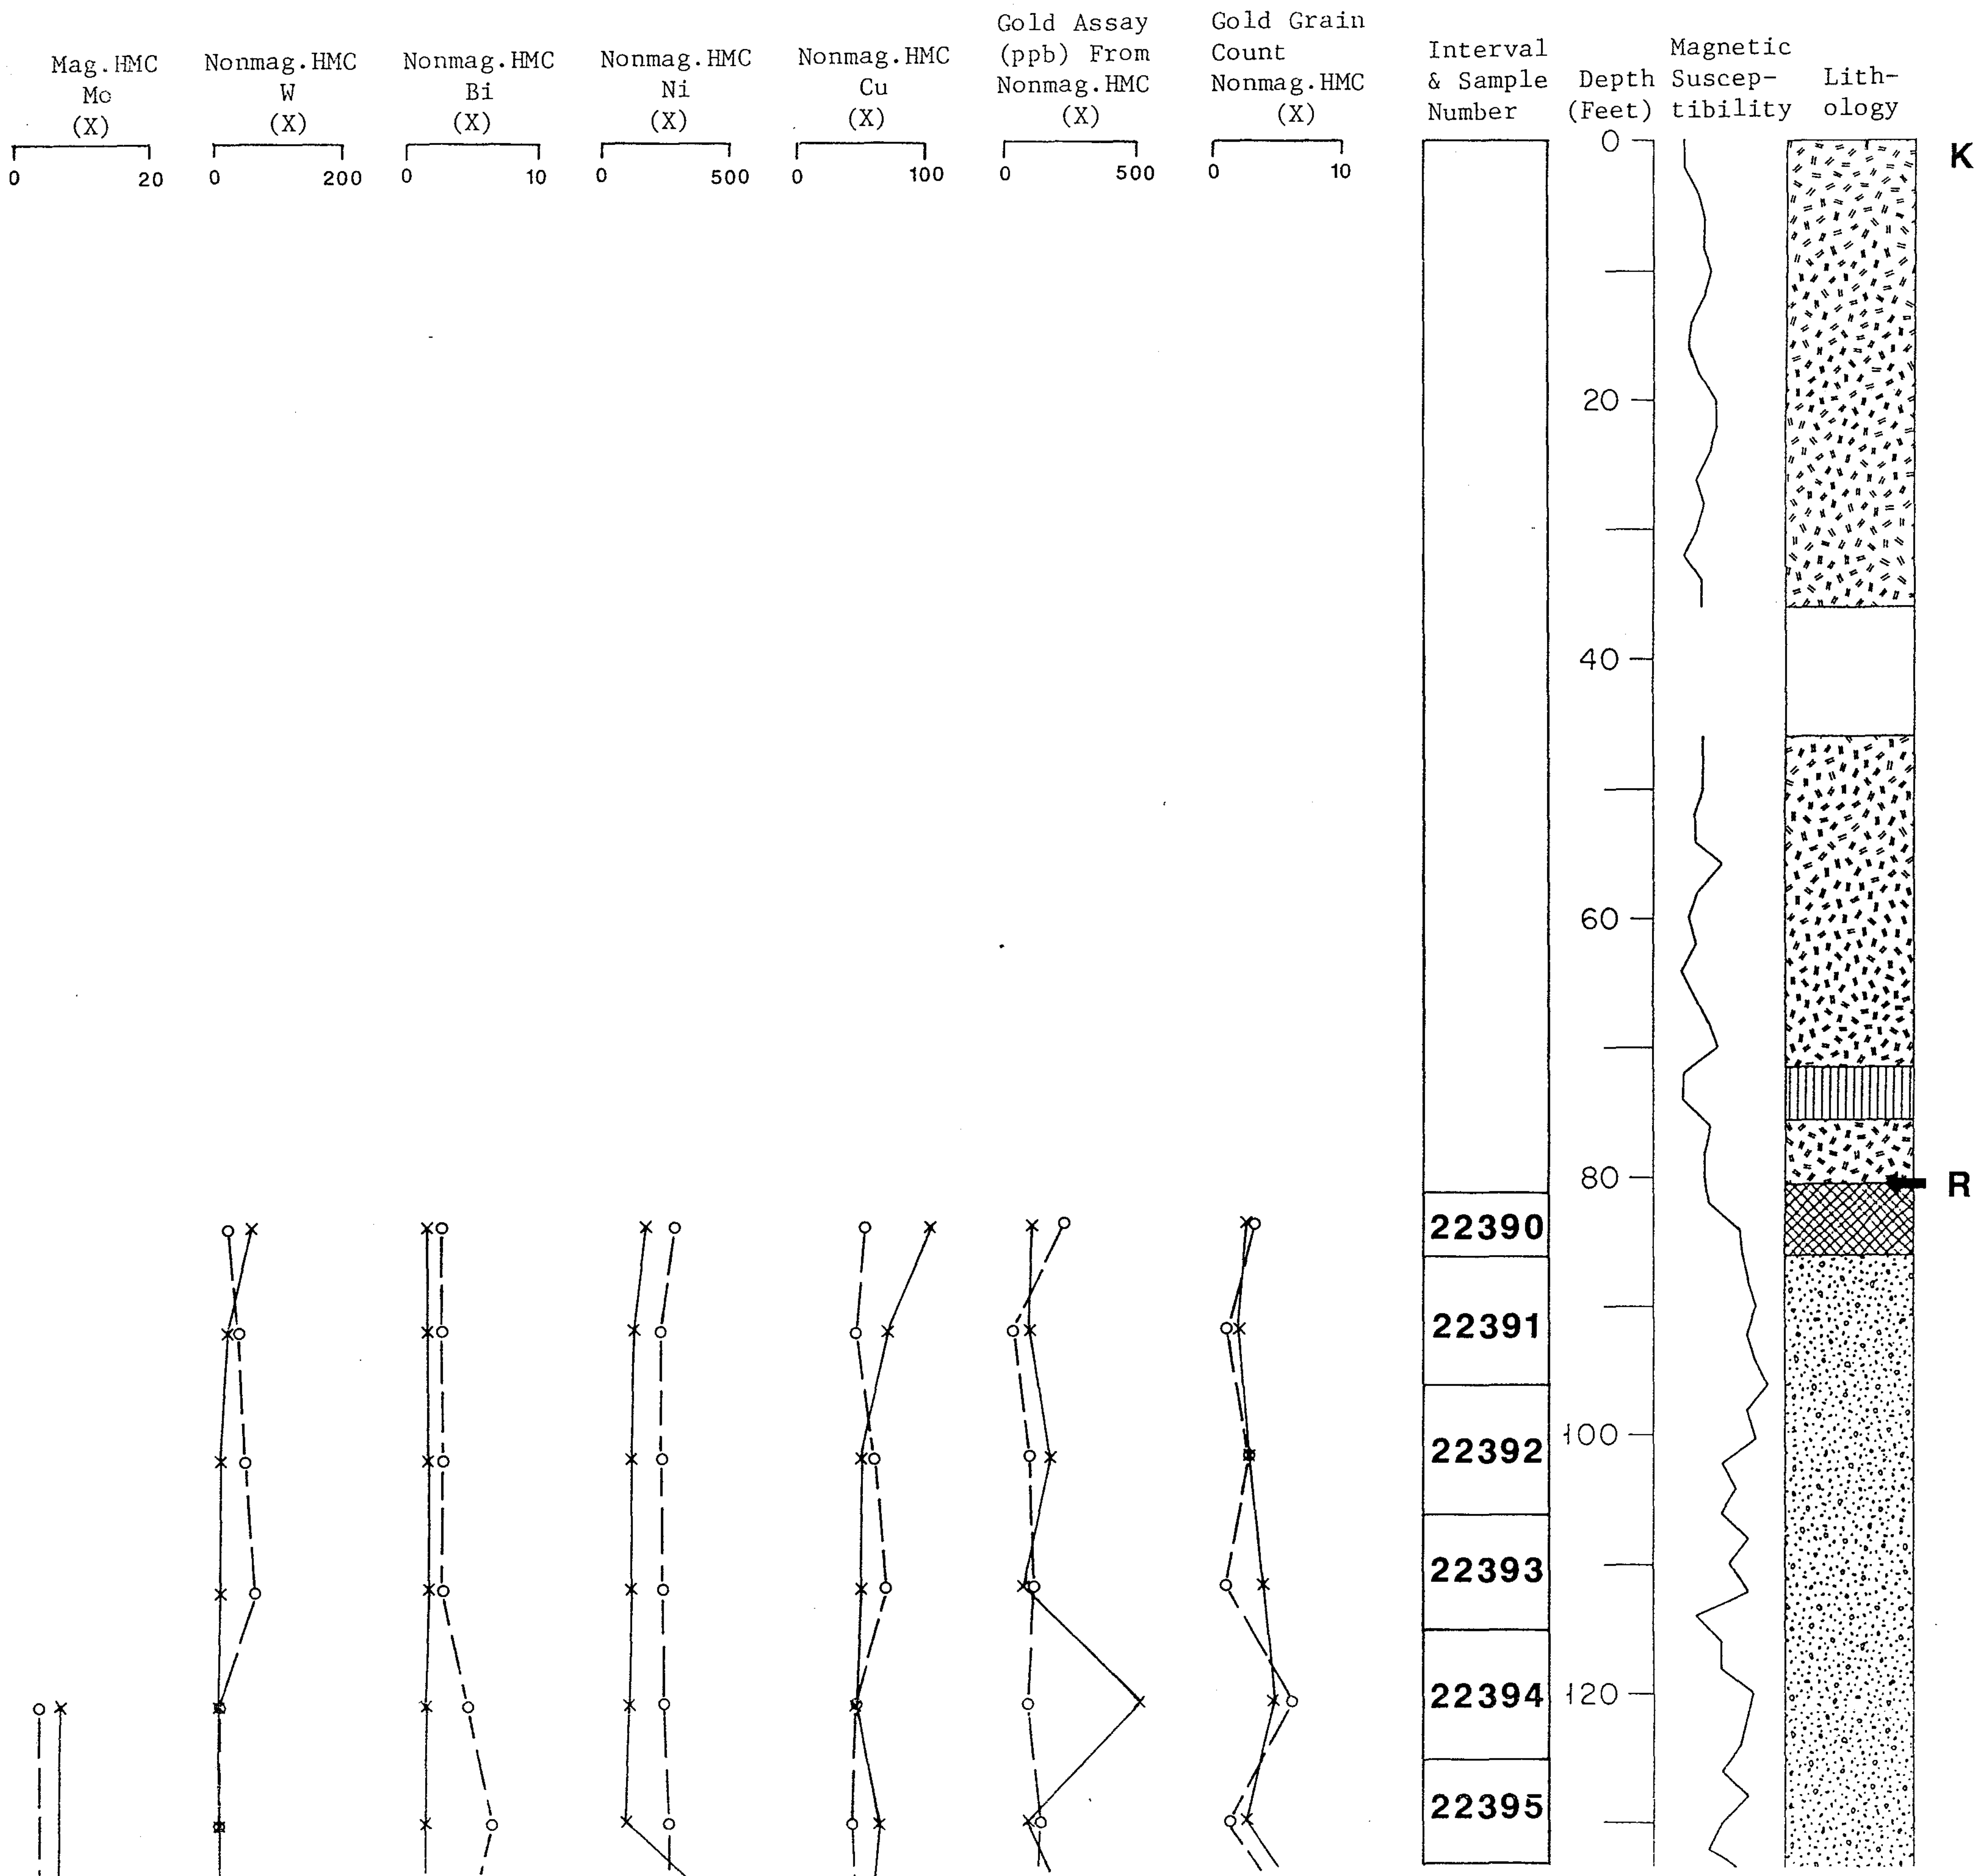
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Core is composed of solid rock and dark red-brown saprolite with pieces of fresher rock. Most solid at 162-166 feet where it appears to be a very altered felsic to intermediate volcanic protolith. Composed mostly of aphanitic feldspar and carbonate (see thin section description), and 1-3 mm, lineated amphibole crystals. A weak modal banding of more and less amphiboles is nearly parallel to core axis (ie., vertical). Rock and red saprolite from 166-171 feet appears bedded but apparently brecciated with bands and small blocks of coarse vs. fine carbonate. Pyrite is disseminated throughout, but most abundant (1-3%) in rubbly, red, lower part of core (166-171 ft.). This part also contains more apparent carbonate alteration and veining than above. Two nearly vertical vein sets exist: 1.) Earlier veins are subparallel to hornblende foliation and consist of adularia, calcite and pyrite. These typically have red oxidized walls. 2.) Second vein set are close spaced, and though vertical, are perpendicular to the first. They are thin and contain sea-green colored talc and leucoxene. The presumably earliest hornblende-rich veins and latest net-like veinlets described in the thin section (numbers 1 and 4 below, respectively) were not noted in core inspection. Magnetic susc. 0.01 x 10-3 CGS in solid, less pyritic upper part (162-166 feet). 0.04-0.07 x 10-3 CGS in lower, more weathered part.

Thin Section Description: OB-315, 165 ft. Meta-felsic volcanic (silica undersaturated). Estimated mode (volume %): Hornblende poikiloblasts 12% (of which 2% is blue); Feldspar 70%; Fine, fibrous amphibole 16%; Pyrite/hematite 1-2%; Calcite Tr; 'Talc' Tr; Adularia Tr. Subhedral, decussate, inclusion-laden amphibole poikiloblasts up to 1mm length are in a groundmass of granoblastic feldspar, fine-grainedfibrous amphibole, calcite, and disseminated oxidized pyrite. The amphibole poikiloblasts consist of green hornblende with thin, ragged rims of pale grayish-blue to blue reibeckite. Amphibole in proximity to cross-cutting veins is entirely blue, apparently altered by fluids introduced through the vein. The blue amphiboles are also locally abundant in the ground mass as tiny, equant grains; also the pervasive fibrous, radial amphiboles in the groundmass are of the blue variety. Very close inspection of the granoblastic groundmass yields no evidence of quartz. Several narrow veinlets which cut the rock are described below in apparent order of emplacement from earliest to latest: 1.) Veins composed of a linear concentration of ragged green hornblende with vague boundaries. Hornblende is altered to blue where this vein contacts the talc-bearing vein described below. 2.) Moderately well-defined veins that are roughly zoned from adularia (near walls) to calcite (in center) to pyrite (oxidized). 3.) A sea-green colored (macroscopically) intergrown mixture of talc (?sericite), leucoxene(?), and very fine-grained fibrous amphiboles which is relatively sulfide-poor. These veins are very well defined and have altered the adjacent hornblende from green to blue. One of these veins merges into the adularia- and calcite-bearing vein. These talc-bearing veins may be related to Na-metasomatism, an event which may also have albitized the entire rock.

Scintillometer Reading (cps): 120-140



OB-315

Geologic Descriptions

(0 - 36) CLAY LOAM TILL; UNOXIDIZED by 16 ft; calc by 2; sh & carb pebs; few sandy lenses at 17 1/2, little more grit from 19; carb cob at 23, but not many large pebs.

(36 - 46) NO CORE

(46 - 71 1/2) CLAY LOAM TILL; UNOXIDIZED; as above; sandy lam at 47 1/2 ft, sand lenses at 50 1/2; 50 1/2 - 51 1/2 fine sand w/carb-rich fine gvl at base; fine sand lenses at 53 & 54; 54 - 55 1/2 loam till w/sand lens at base; more sandy w/depth from 60, approaching loam texture by 63; clay lam at base.

(71 1/2 - 75 1/2) CLAY - SILTY CLAY; UNOXIDIZED; calc; silty clay lam by 75 ft; little clayey silt towards base.

(75 1/2 - 80 1/2) CLAY LOAM TILL; UNOXIDIZED; calc; gradational upper contact from 75 1/2 - 77 1/2 ft; loamy zone at 77, sm cob at 79; little more sandy, grn, & less dark than above till.

(80 1/2 - 86) LOAM TILL; UNOXIDIZED; capped by more than 1/2 ft of mod calc silt; mod calc to calc; not much carb; cobbly zone at 82 ft; matrix mostly silt & sand, sandy loam in places; thinly bedded in places w/silty and sandy beds, possibly mixed in upper part.

(86 - 94) SANDY LOAM TILL; UNOXIDIZED; sl to mod calc; gradational upper contact; more sandy, less calc w/depth; only occ cobs.

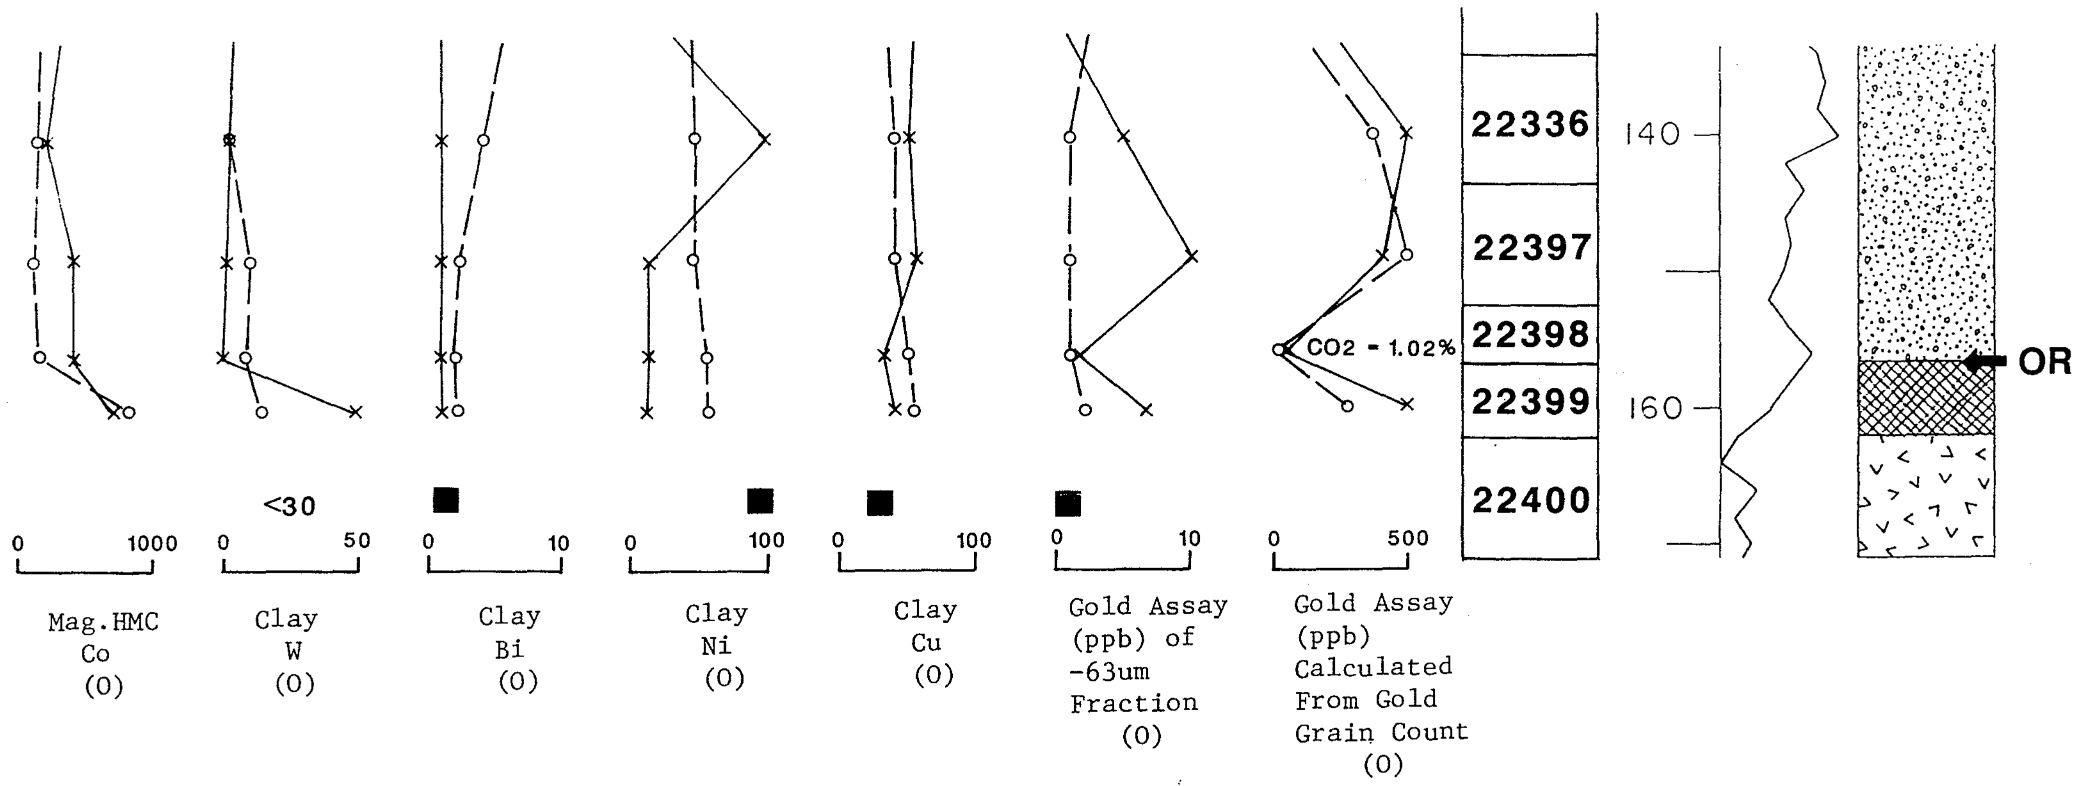
(94 - 99 1/2) LOAMY SAND TILL; UNOXIDIZED; 96 - 96 1/2 ft clean pebbly sand, v sandy, prob somewhat sorted 'flow' till below.

(99 1/2 - 125) SANDY LOAM - LOAMY SAND TILL; UNOXIDIZED; sl calc; cobs fairly common; pebbly cgr sand 106 - 106 1/2, mgr to cgr sand bed at 110 1/2; 114 - 115 fgr sand, mgr in places, silty at top, till lens & silt lam at base; grades to pebbly sand from 118 - 119 1/2; clean sandy zone at 121 1/2; occ sm carb pebs.

(125 - 133 1/2) LOAMY SAND TILL; UNOXIDIZED; interbedded w/pebbly sand; v sandy towards base.

(133 1/2 - 152 1/2) SANDY LOAM TILL; UNOXIDIZED; loamy sand till in upper two ft; sl calc; occ cobs; harder and grner w/depth; darker, clayey calc till lam at 141 (older till); mod calc by 141; more silty w/depth; sm carb cob at 146 1/2, interbedded sand and sandy till to 148; little carb but mostly Precambrian; loam till by 150; 151 - 152 1/2 mgr sand, silty w/sand pebbles in lower part.

(152 1/2 - 156 1/2) SANDY LOAM TILL; UNOXIDIZED; mod calc; carb cob at 154, but not much carb grains in matrix; olive color in places, prob mixed w/till below.



(156 1/2 - 162) LOAM TILL; OXIDIZED to 160 1/2 ft; noncalc; sl calc by 158, top prob leached; more calc w/depth but v few carb grains; matrix mostly silt and sand; cobs fairly common, boulder at base.

(162 - 171) BEDROCK; FELSIC METAVOLCANIC; fgr; lineated.

Appendix 1-12C.

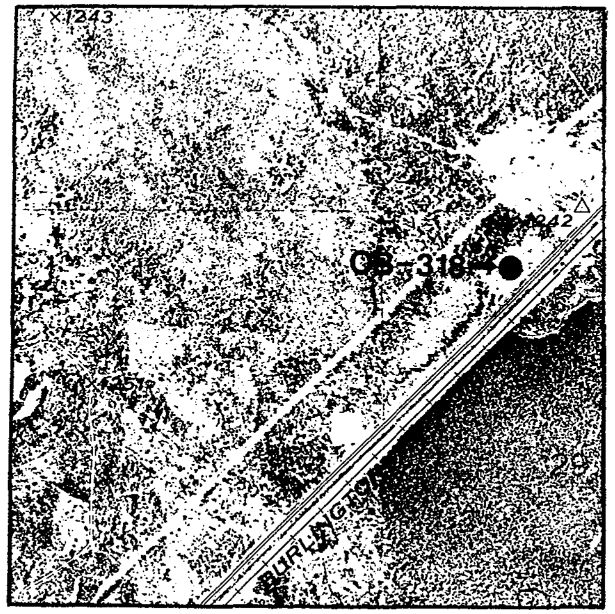
Appendix 1-13A. DRILL HOLE SUMMARY SHEET



IDENTIFICATION
DNR Drill Hole Number: OB-318
Drilling Completion Date: 6/15/88

LOCATION (see map at right)
S-T-R: NE¼-NW¼ - S29 - T154N - R25W
County: Koochiching
Quadrangle: Big Falls NW 7.5
Regional Survey Area: Effie
UTM Coordinates: 434,590mE; 5331420mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1240 ± 3 ft.
Total Depth: 89 ft.
Elevation, Top of Precambrian Bedrock: 1159 ft.
Elevation, Top of Saprolite:
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

Interval (ft.)	Interpretation	Library Samples Available	Subsamples Tested	Geochem Assays Worthy of Further Review
0-39.5	Kooch. lobe gl. drift			A=Au B=Au C=Pb
39.5-81	Rainy lobe gl. drift			B=Au,W
81-89	Sound bedrock	G,H		

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

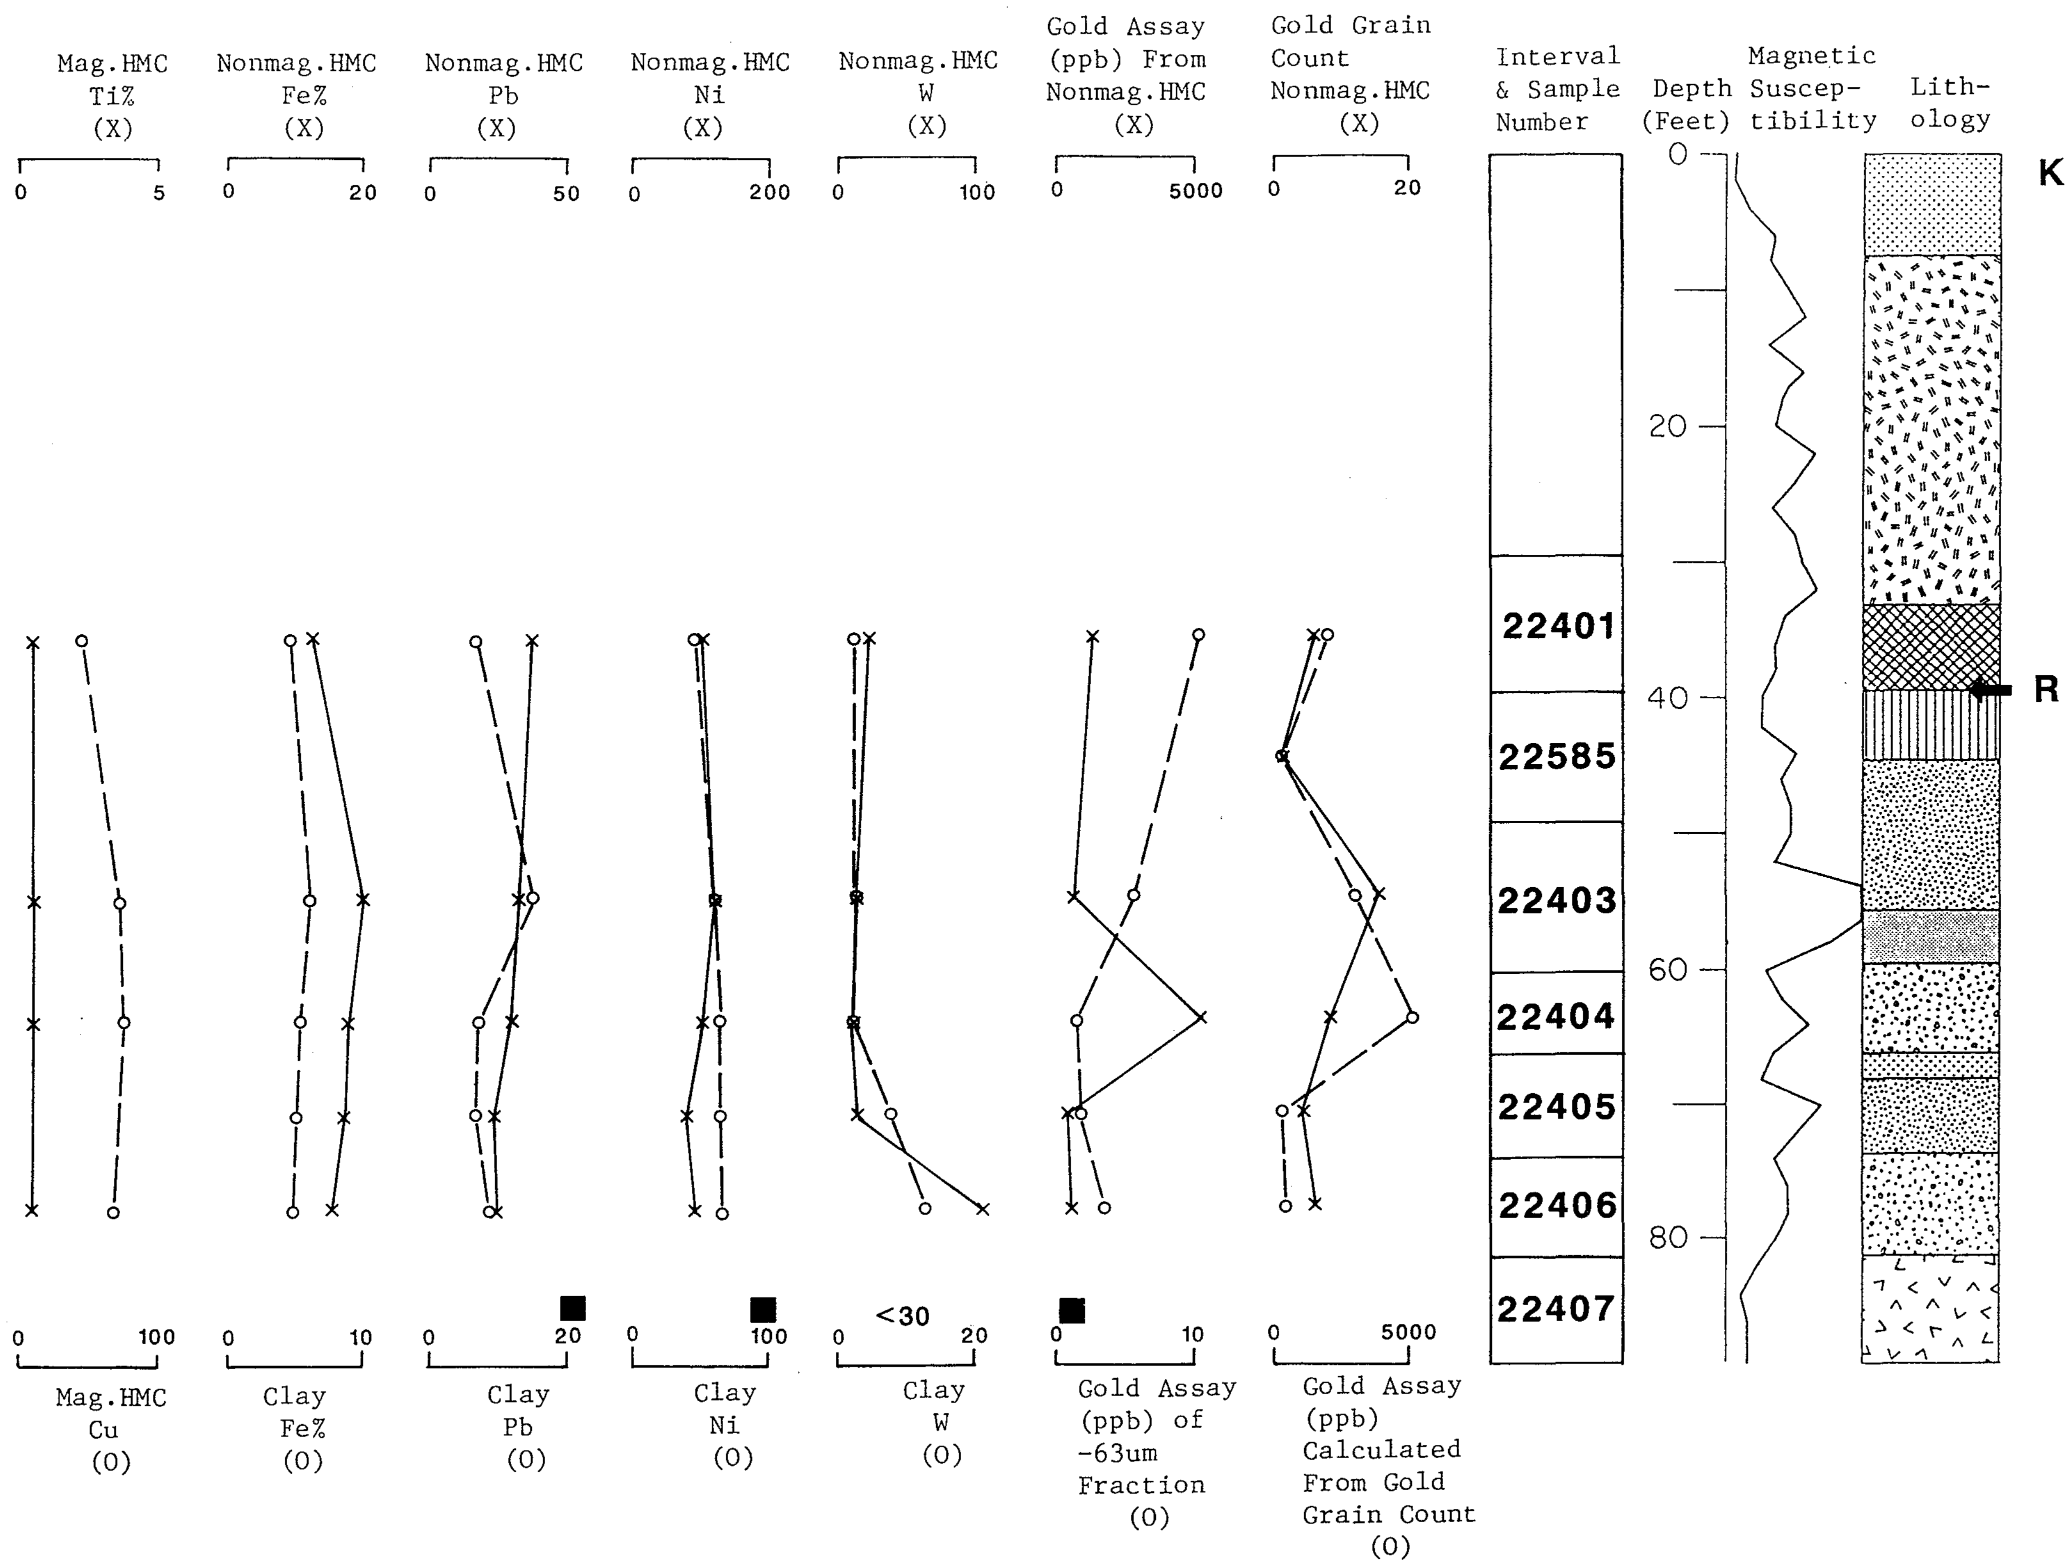
BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Fresh, solid core of gray plagioclase-quartz-biotite schist. Rock is not noticeably banded, but lower part is slightly finer grained and less biotitic than the upper. Protolith may be granitic or sedimentary; however, slightly coarser (1mm) equant feldspar grains and round quartz give a meta-sedimentary appearance, like crystal tuff or volcanogenic wacke. Lineation of biotite dips about 45°. Veins of quartz occur at varied angles and although they cut the main foliation, they are folded. A second set of quartz and quartz-feldspar-pyrite veins are straight and subparallel to foliation. Neither vein set is very abundant. Magnetic Susc. 0.00-0.02 x 10-3 CGS.

Thin Section Description: OB-318, 85 ft. Quartzofeldspathic biotite schist/ gneiss. Estimated mode (volume %): Biotite (including chlorite alteration) 18%; Sphene Tr; Quartz porphyroclasts 6%; Pyrite Tr; Groundmass quartz 30%; Garnet Tr; Groundmass chlorite 6%; Groundmass plagioclase 39%; Apatite Tr; Tourmaline Tr. Moderately well foliated rock with abundant small biotite/ chlorite porphyroblasts and quartz porphyroclasts in a fine-grained matrix of quartz and plagioclase. The biotite is partially altered to chlorite, and contains abundant spindle-shaped inclusions of quartz and feldspar which parallel the biotite cleavage. Although the long dimensions of the biotite grains are parallel to foliation, the internal cleavage ofbiotite is perpendicular to foliation, which combined with the irregular grain shapes implies that the biotite is pre- to syndeformation. Quartz grains are monocrystalline, undulose, and form large (up to 1mm) rounded grains. The matrix is comprised of inequant (foliated) grano-blastic grains of quartz, plagioclase, and fine-grained chlorite; orthoclase content is nil. Minor blocky, fresh pyrite is disseminated throughout, and a single sub-mm vein of quartz and minor plagioclase transects the rock at approximately 15° to the foliation.

Scintillometer Reading (cps): 80-90

OB-318 **Appendix 1-13B.**



Geologic Descriptions

(0 - 7 1/2) MEDIUM SAND; OXIDIZED; 0 - 1 ft peat; till lens at 6, sand pebbly & unox below; sh & carb pebs common; sm cob & sev large pebs at base.

(7 1/2 - 33) CLAY LOAM - LOAM TILL; UNOXIDIZED; calc; not many large pebs; 19 - 20 ft clay loam till w/clay & silt beds; 20 - 20 1/2 silty, pebbly sand w/till lenses (could be sluff); carb & sh pebs; large cobs at 27 1/2, 28 1/2, 32 1/2.

(33 - 39 1/2) LOAM TILL; UNOXIDIZED; calc; hard & rocky, possibly mixed w/Rainy; cobs at 35, 36, 37 1/2, 39 1/2.

(39 1/2 - 44 1/2) SILTY CLAY - CLAYEY SILT; UNOXIDIZED; laminated; scattered, v fine sand grains; v thin red beds, gone by 45 1/2 ft; sand lens at 43 1/2, laminated clay & silt below; large peb near base.

(44 1/2 - 55 1/2) GRAVELLY SAND; 44 1/2 - 45 1/2 silty, pebbly sand w/lens of pebbly silt & silt, sl calc; 45 1/2 - 49 pebbly, cgr sand; 49 - 55 1/2 cgr sand and gvl, few sm cobs, few carb pebs.

(55 1/2 - 59 1/2) FINE SAND; UNOXIDIZED; v fgr at base.

(59 1/2 - 66) GRAVELLY, LOAMY SAND TILL; UNOXIDIZED; sl calc; fairly rocky, mostly cobs w/sandy matrix from 64 1/2 ft; few sm carb pebs.

(66 - 68) VERY COARSE SAND

(68 - 73 1/2) GRAVELLY SAND; UNOXIDIZED; pebbly mgr to cgr sand; little silt; large cob near top & at 69 1/2, 72 ft; silt lens at 70.

(73 1/2 - 81) SANDY LOAM TILL; UNOXIDIZED; sl calc; more compact, silty, & grner w/depth; two cobs near top, others at 75, 77 1/2, 74 1/2, 81 ft.

(81 - 89) BEDROCK; QUARTZOFELDSPATHIC BIOTITE SCHIST; fgr; well foliated.

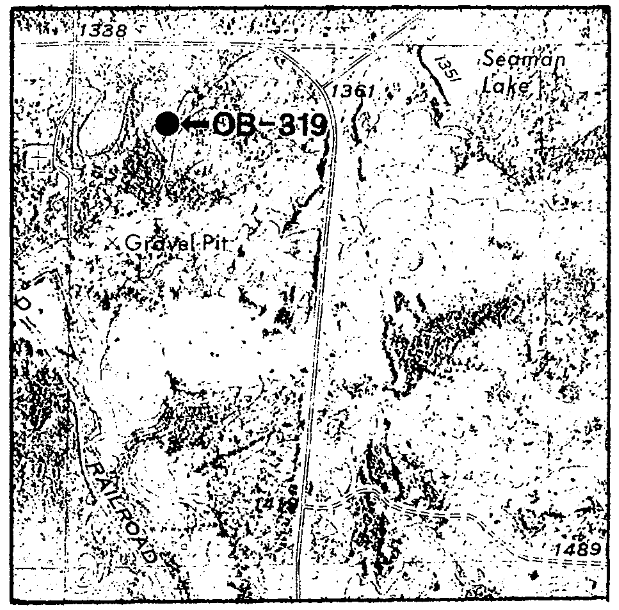
Appendix 1-14A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-319
Drilling Completion Date: 6/18/88



LOCATION (see map at right)
S-T-R: NW¼-NW¼ - S14 - T149N - R26W
County: Itasca
Quadrangle: Wirt 7.5
Regional Survey Area: Effie
UTM Coordinates: 429,310mE; 5286370mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1350 ± 4 ft.
Total Depth: 132 ft.
Elevation, Top of Precambrian Bedrock: 1225 ft.
Elevation, Top of Saprolite: 1235 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

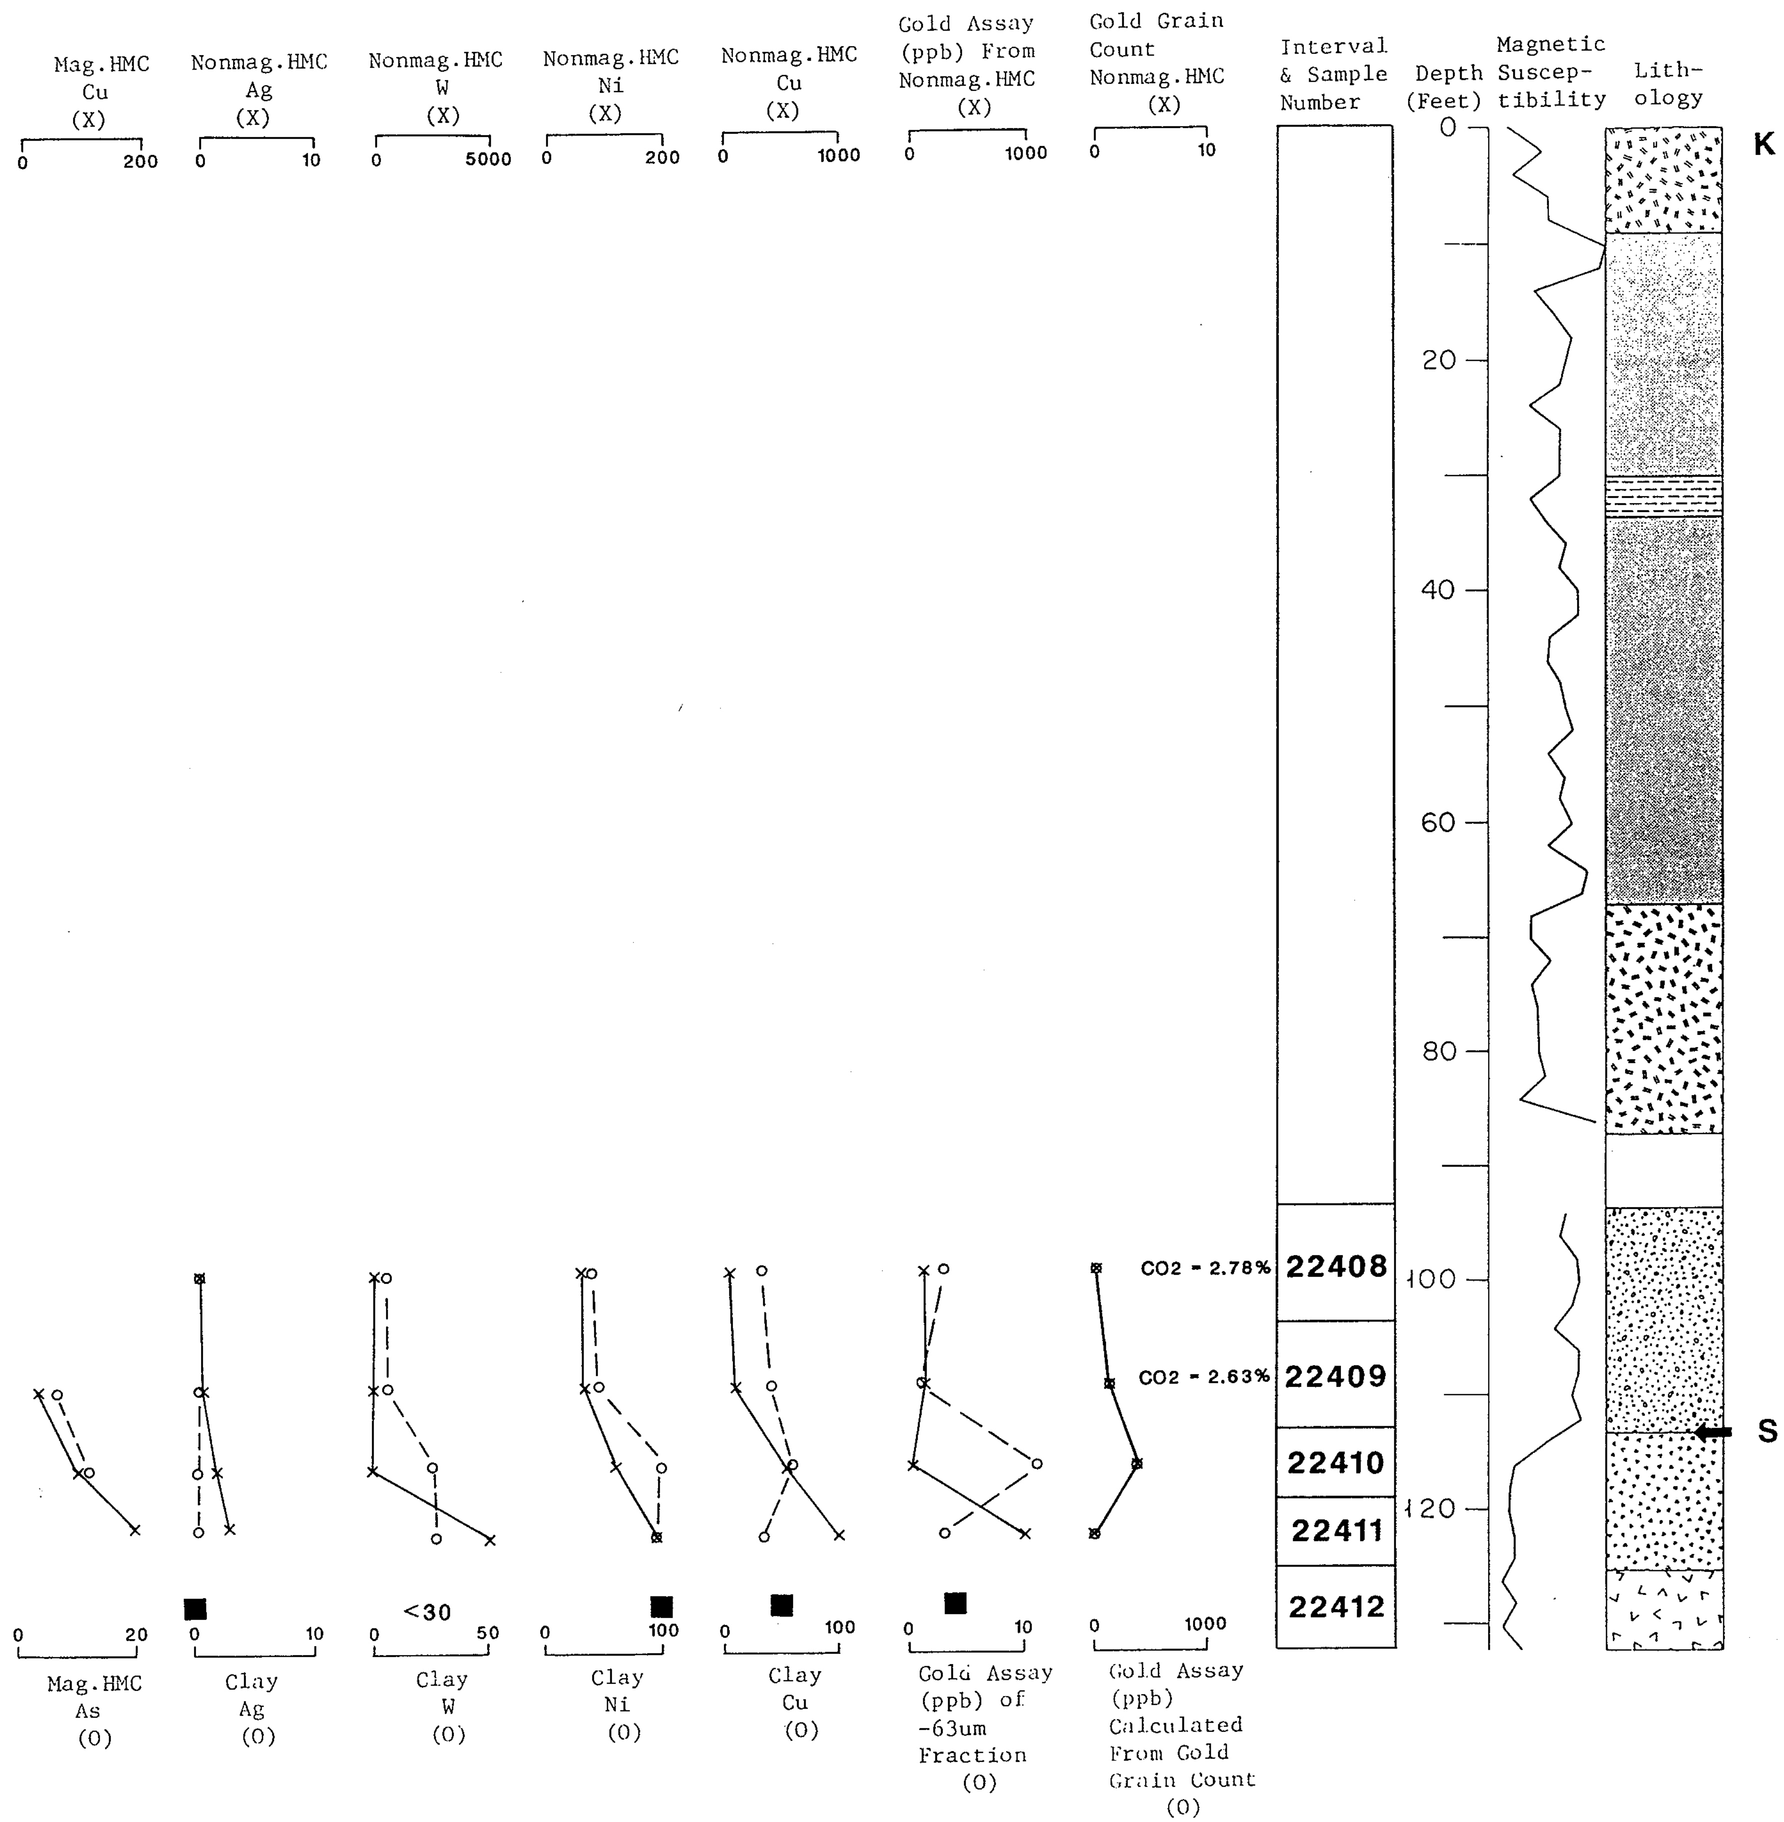
Core Description: Irregular-textured tonalitic intrusion consisting of coarser and finer grained fractions. Thin section contains both fractions. No consistent fabric or veining exists. Magnetic Susc. unknown.

Thin Section Description: OB-319, 128 ft. Coarse-grained tonalitic rock in contact with a fine-grained decussate mafic rock. A variable-textured rock consisting of coarse (3 mm) blocky, subhedral, saussuritized plagioclase in a fine-grained groundmass of epidote, chlorite, quartz, Fe-Ti oxides, and apatite. This is in diffuse contact with a fine-grained, decussate epidote- and chlorite-rich rock that is similar to the fine-grained groundmass. The massive, fine-grained portion of the rock consists of approximately 33% epidote, 12% Fe-Ti oxides (with a narrow rim of sphene), 10% quartz, 45% chlorite, and minor pyrite and apatite. The apatite, oxides, and deuteric chlorite-epidote mineral assemblage suggests that the rock may have originated from an evolved, volatile-rich melt in conjunction with a magma mixing process. Alternatively, and more simply, the mafic portion may represent a thoroughly altered mafic inclusion, but no relict texture is present. The similar mineralogies of the massive portion and the groundmass suggest a genetic link between the two textural variations, however.

Scintillometer Reading (cps): 80-90

OB-319

Appendix 1-14B.



Geologic Descriptions

(0 - 9) CLAY - SILTY CLAY TILL; OXIDIZED; calc by 5 1/2 ft; more silty w/depth; 8 - 9 silty, v fgr sand bed over sandy silt lake sed.

(9 - 30) FINE SAND; UNOXIDIZED by 17 1/2 ft; sh-rich layers; silty from 14 - 15, silty w/silt lam from 17 1/2; fairly clean below 21 1/2, still few silt lenses; clay lam at 28, over silty, v fgr sand to 29, over bedded silt & v fgr sand.

(30 - 33 1/2) SILT; UNOXIDIZED; calc; clay lam from 31 1/2 ft, thick clay bed at base.

(33 1/2 - 67) VERY FINE - FINE SAND; UNOXIDIZED; 33 1/2 - 35 ft v fgr sand; 35 - 36 silty, v fgr sand w/few silt & clay lam; 36 - 38 1/2 fgr sand, sm cob & pebs at base; 38 1/2 - 39 1/2 calc clayey till; 39 1/2 - 49 v fgr sand w/few pebs, till lens at 44; 49 - 50 bedded clayey till, w/sh, & v fgr sand; 50 - 67 fgr sand, v fgr to fgr from 55.

(67 - 87) CLAY TILL; UNOXIDIZED; calc; upper 1/2 foot clay loam till; fgr sand lam at 74 ft, sandy silt lam at 77, 78; few pebs; harder w/depth; sharp contact at 85; clay loam till w/sh 85 - 86; 86 - 87 loam till w/clay loam till bed in upper part.

(87 - 93 1/2) NO CORE

(93 1/2 - 113) SANDY LOAM TILL; UNOXIDIZED; calc; carb pebs common; upper foot loamy till w/clayey till lens at 94 ft; cob at 94 1/2, 95, 107, 108 1/2, carb cob at base; no sh noted.

(113 - 115) REWORKED SAPROLITE; few erratics, but most rock fragments are of bedrock below.

(115 - 125) SAPROLITE; top 5 inches hard rock (moved slab?) over rocky loam, much punky rock; more rock, much hard, at 117 ft, clay mainly joint fillings; mostly clay & punky rock from 120.

(125 - 132) BEDROCK; TONALITE; cgr, massive, deuterically altered.

Appendix 1-14C.

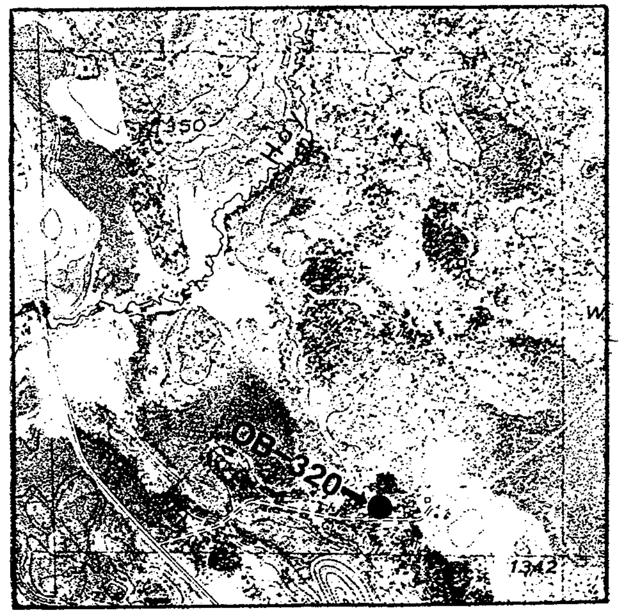
Appendix 1-15A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-320
Drilling Completion Date: 6/1/88



LOCATION (see map at right)
S-T-R: SW¼-SE¼ - S28 - T150N - R26W
County: Itasca
Quadrangle: Pomroy 7.5
Regional Survey Area: Effie
UTM Coordinates: 426,790mE; 5291640mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1352 ± 2 ft.
Total Depth: 224 ft.
Elevation, Top of Precambrian Bedrock: <1128 ft.
Elevation, Top of Saprolite: 1152 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

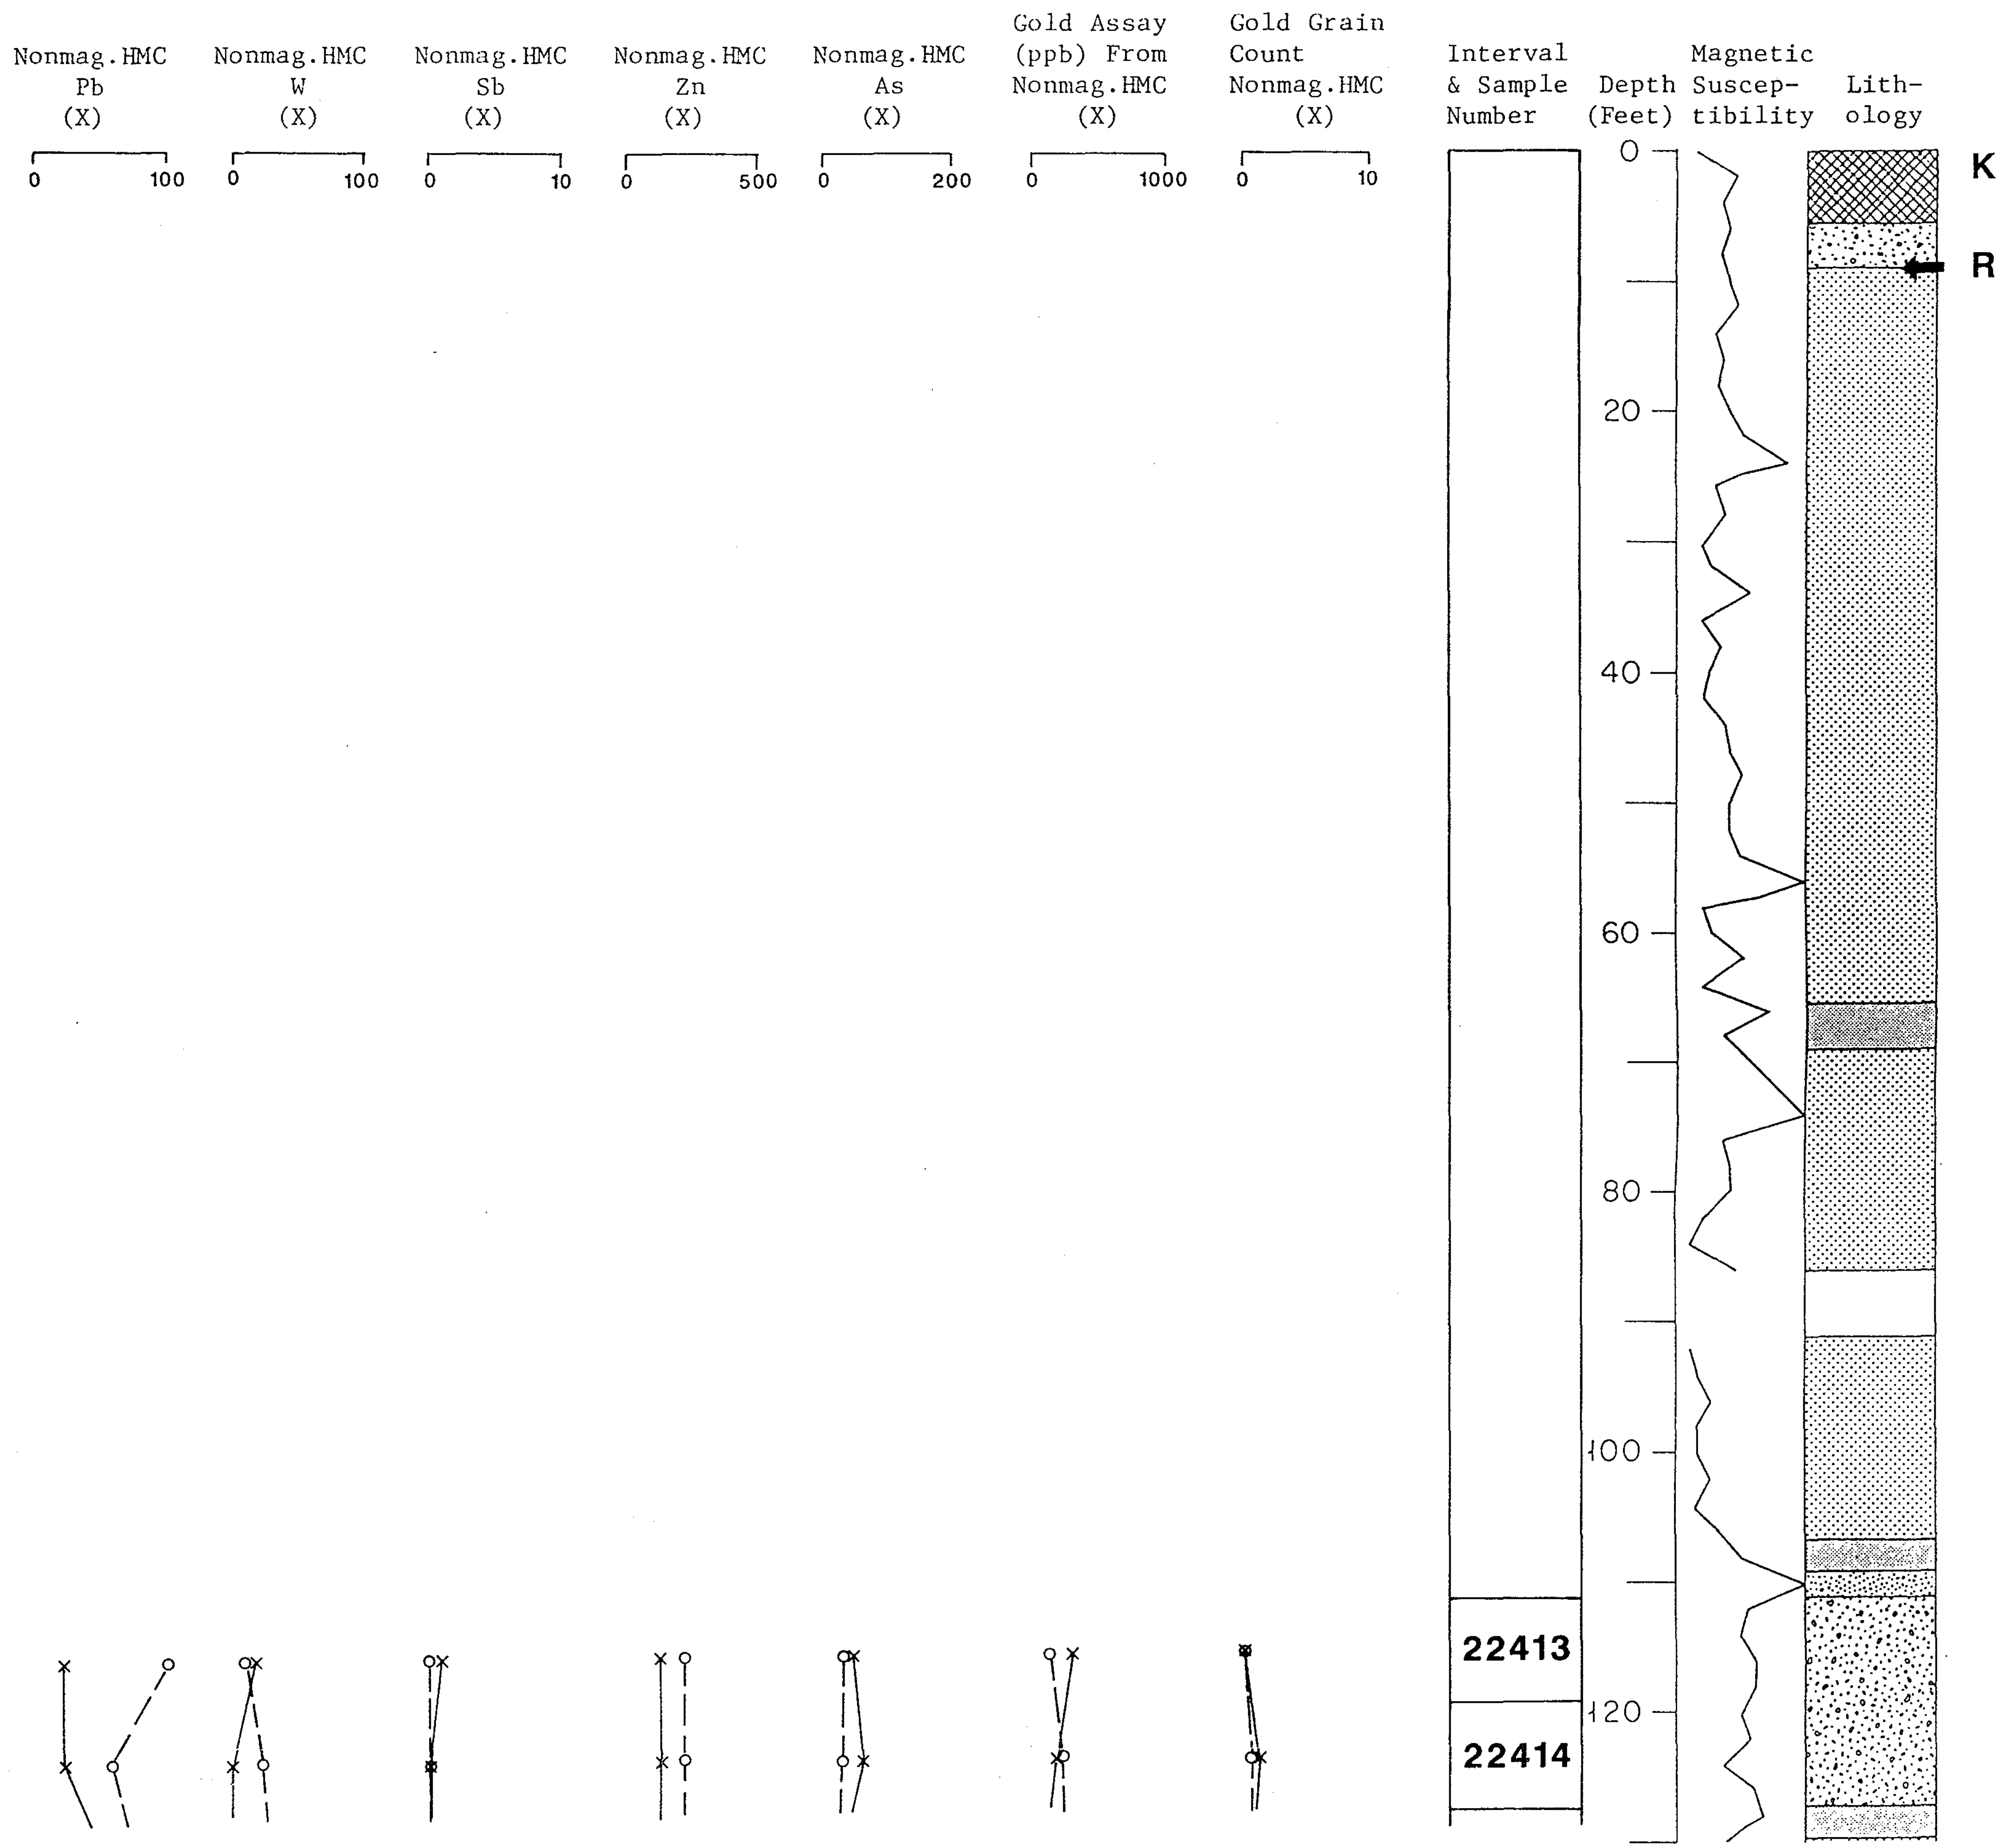
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK
No bedrock reached in this hole.

BLANK PAGE

OB-320



Geologic Descriptions

(0 - 5 1/2) LOAM TILL; OXIDIZED; couple inches silty sand on top, interbeds of fgr sand to 3 ft; sandy clay loam till to 2; leached to 3 1/2, carb pebs dominate below.

(5 1/2 - 9) SANDY LOAM TILL; OXIDIZED; 5 1/2 - 6 1/2 ft silty sand; cob at 7, sand bed at 8.

(9 - 35) MEDIUM - COARSE SAND; OXIDIZED; little silt, cob at 13 ft, mgr to v cgr sand below; silt lam at 22; fgr to mgr sand beds below 26.

(32 - 52) COARSE SAND; cob at 40 ft; few sm pebs below; 42 - 43 mgr to cgr sand, v cgr sand w/occ pebs below; some large pebs 46 - 48 1/2; gnl size or smaller below 50; carb fairly common, but Precambrian dominate.

(52 - 65 1/2) MEDIUM SAND; UNOXIDIZED; fgr sand bed at 56 ft, fgr to mgr and mgr sand beds below; mgr to cgr in last few feet, w/few pebs towards base.

(65 1/2 - 69) FINE SAND; UNOXIDIZED; 65 1/2 - 66 ft silty v fgr sand.

(69 - 86) FINE - COARSE SAND; UNOXIDIZED; 69 - 80 ft fgr to mgr, some cgr by 76; 80 - 82 mgr to cgr, 82 - 83 cgr, 83 - 83 1/2 v cgr, 83 1/2 - 85 1/2 mgr to cgr, 85 1/2 - 86 v cgr bed then mgr.

(86 - 91) NO CORE

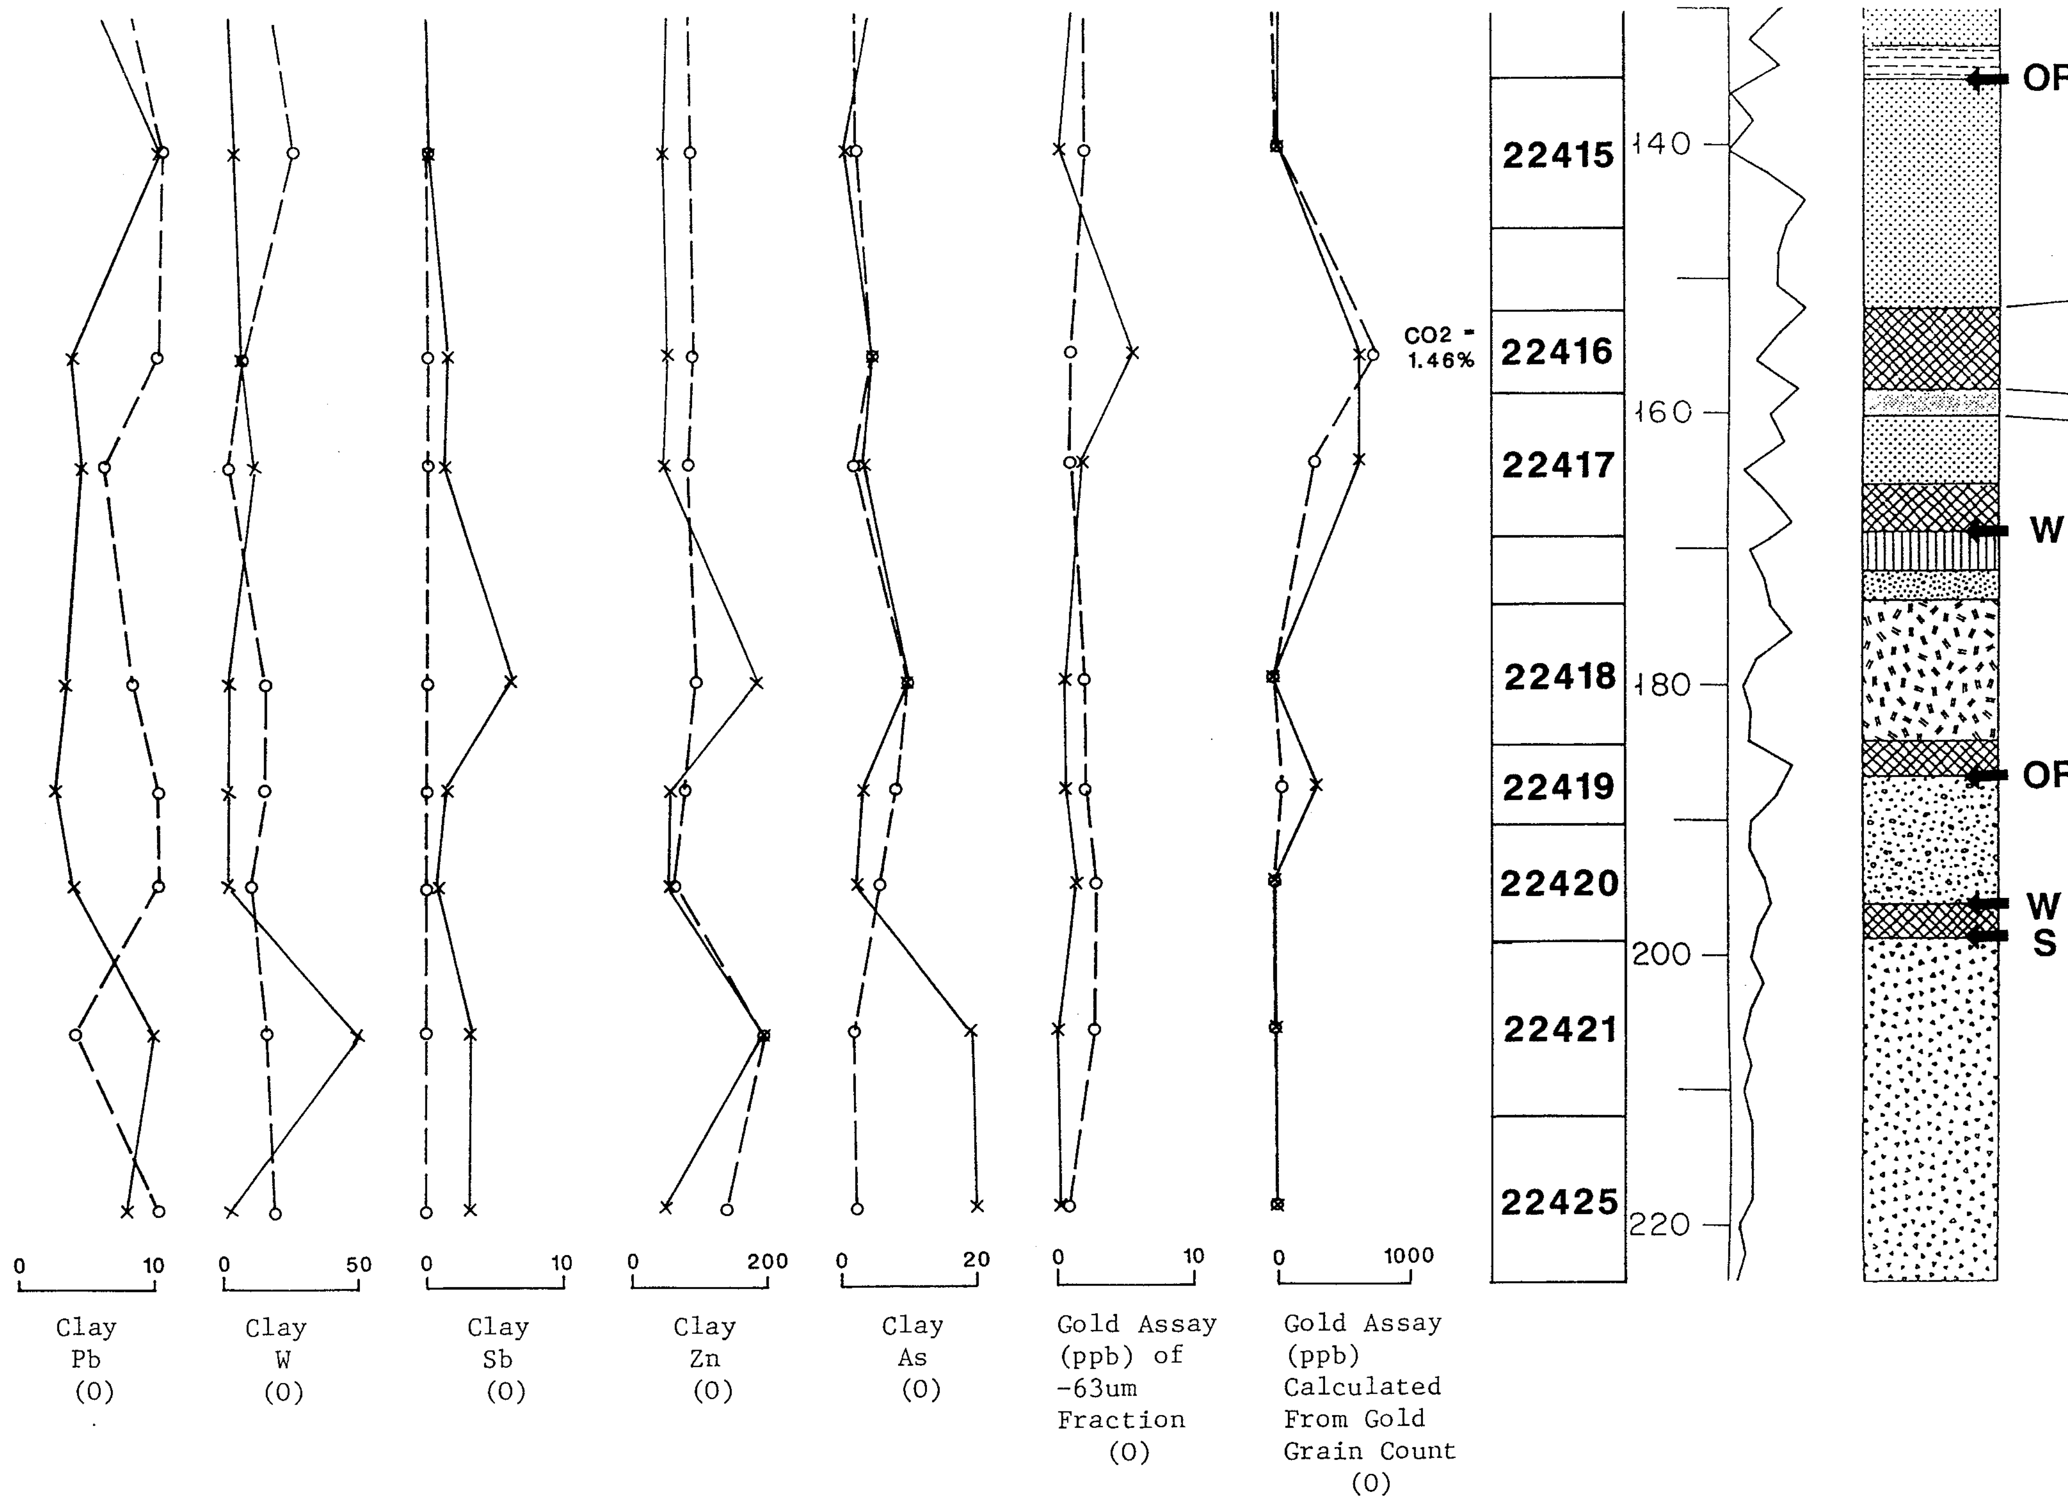
(91 - 106 1/2) MEDIUM - COARSE SAND; 91 - 96 ft mgr w/increasing coarse grains to 94 1/2, then cgr w/few sm pebs; 96 - 99 cgr, v cgr in last foot; 99 - 106 1/2 mgr to cgr, mainly cgr from 103, mgr in last 1/2 foot.

(106 1/2 - 109) FINE SAND; UNOXIDIZED; v fgr bed at 107 1/2, v fgr to fgr below.

(109 - 111) GRAVELLY SAND; UNOXIDIZED; 109 - 110 fgr to mgr sand, pebbly w/depth, silt lam towards top; 110 - 111 cobbly gvl, poorly sorted, some silt, carb pebs.

(111 - 127) SANDY LOAM TILL; UNOXIDIZED; mod calc to calc; less than 10% carb pebs; cobs fairly common; grnish saprolite bleb at 116 ft; by 118 more sandy & only mod calc at most; pebbly fgr sand 126 - 126 1/2, till grades to sand below.

(127 - 129 1/2) SILTY FINE SAND; UNOXIDIZED; sm cob near top, gradational upper contact.



(129 1/2 - 132 1/2) MEDIUM SAND; silt bed at 132 ft.

(132 1/2 - 135) SILT; UNOXIDIZED; sl calc; fair amount of sand grains, few sm pebs; couple large pebs at 134 1/2 ft, few v thin grnish lam below, could be 'flow till.'

(135 - 152) COARSE & MEDIUM SAND; REDUCED; olive colored; 135 - 141 ft cgr, w/large peb at 138; 141 - 146 mgr, lens of grnish sandy till(?) at 144, grnish silt lens at 146; 146 - 152 cgr, cgr to v cgr from 149, not as grn as above, sm cob at base.

(152 - 155 1/2) LOAM TILL; UNOXIDIZED; may be redu; calc; fgr sand & sandy silt lam; more clayey from 153 1/2 ft & interbedded w/v fgr sand; last 1/2 foot silty, v fgr sand.

(155 1/2 - 158) LOAM TILL; OXIDIZED; unox by 158 ft; calc; silt lens & sm cob at 156, clay bed at 157 & at base.

(158 - 160) SILTY, VERY FINE SAND; UNOXIDIZED; grnish gray.

(160 - 165) MEDIUM - COARSE SAND; some silt; cgr by 162 ft w/some v coarse grains; silty towards base.

(165 - 168 1/2) LOAM TILL; UNOXIDIZED; silty clay bed at top; calc; sm cob at 167 ft; clay loam till from 167 1/2, mixed w/underlying lake clay.

(168 1/2 - 171 1/2) CLAY; UNOXIDIZED; mottled; hard; fgr sand lens near base.

(171 1/2 - 173 1/2) GRAVELLY SAND; UNOXIDIZED; gvlly loam (till?), mgr sand, & silty pebbly sand; large cob near top & at 172 1/2 ft.

(173 1/2 - 184) LOAM - CLAY LOAM TILL; UNOXIDIZED; mottled to 179 ft; calc; hard; carb & sh pebs common; sand lam at 177, cob at 175; clay loam till by 179; clast rich.

(184 - 186 1/2) LOAM TILL; UNOXIDIZED; calc; 184- 184 1/2 ft v silty cgr sand, sm cob at base; similar to above till.

(186 1/2 - 196) SANDY LOAM TILL; UNOXIDIZED; mod calc to calc; carb pebs sm; few ox bands, iron stains; occ cobs; 188 1/2 - 190 ft pebbly cgr sand, little silt; 91 1/2 - 192 & 195 1/2 - 196 silty cgr sand w/few pebs; sand lam; cgr sand beds at 194, 195.

(196 - 198 1/2) LOAM TILL; UNOXIDIZED; sm carb pebs common; saprolite mix from 198 ft, sm cob near base.

(198 1/2 - 224) FOLIATED GRANITE SAPROLITE; possibly sl reworked to about 200 ft; punky rock, more clayey below 201; punky rock w/clay bands from 203 1/2; v punky rock w/pockets of sandy clay from 209, clay increasing w/depth

Appendix 1-15C.

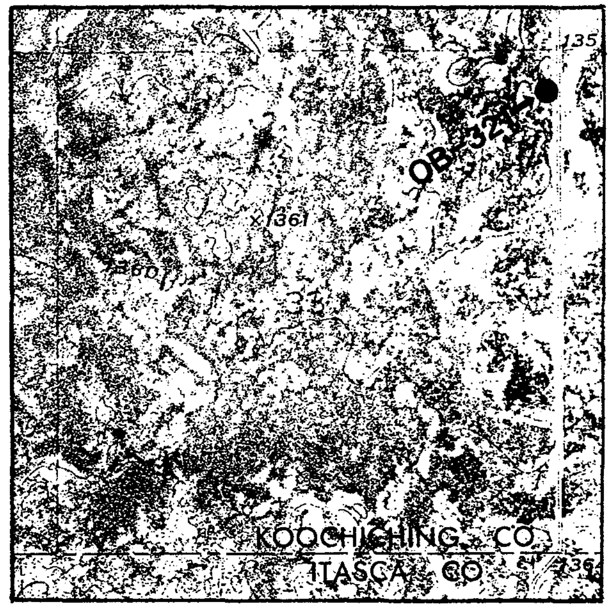
Appendix 1-16A. DRILL HOLE SUMMARY SHEET



IDENTIFICATION
DNR Drill Hole Number: OB-321
Drilling Completion Date: 5/25/88

LOCATION (see map at right)
S-T-R: NE¼-NE¼ - S33 - T151N - S26W
County: Koochiching
Quadrangle: Pomroy 7.5
Regional Survey Area: Effie
UTM Coordinates: 427,330mE; 5301080mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1352 ± 2 ft.
Total Depth: 255 ft.
Elevation, Top of Precambrian Bedrock: <1097 ft.
Elevation, Top of Saprolite: Unknown
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

SEE FOLLOWING PAGES

INFORMATION SUMMARY

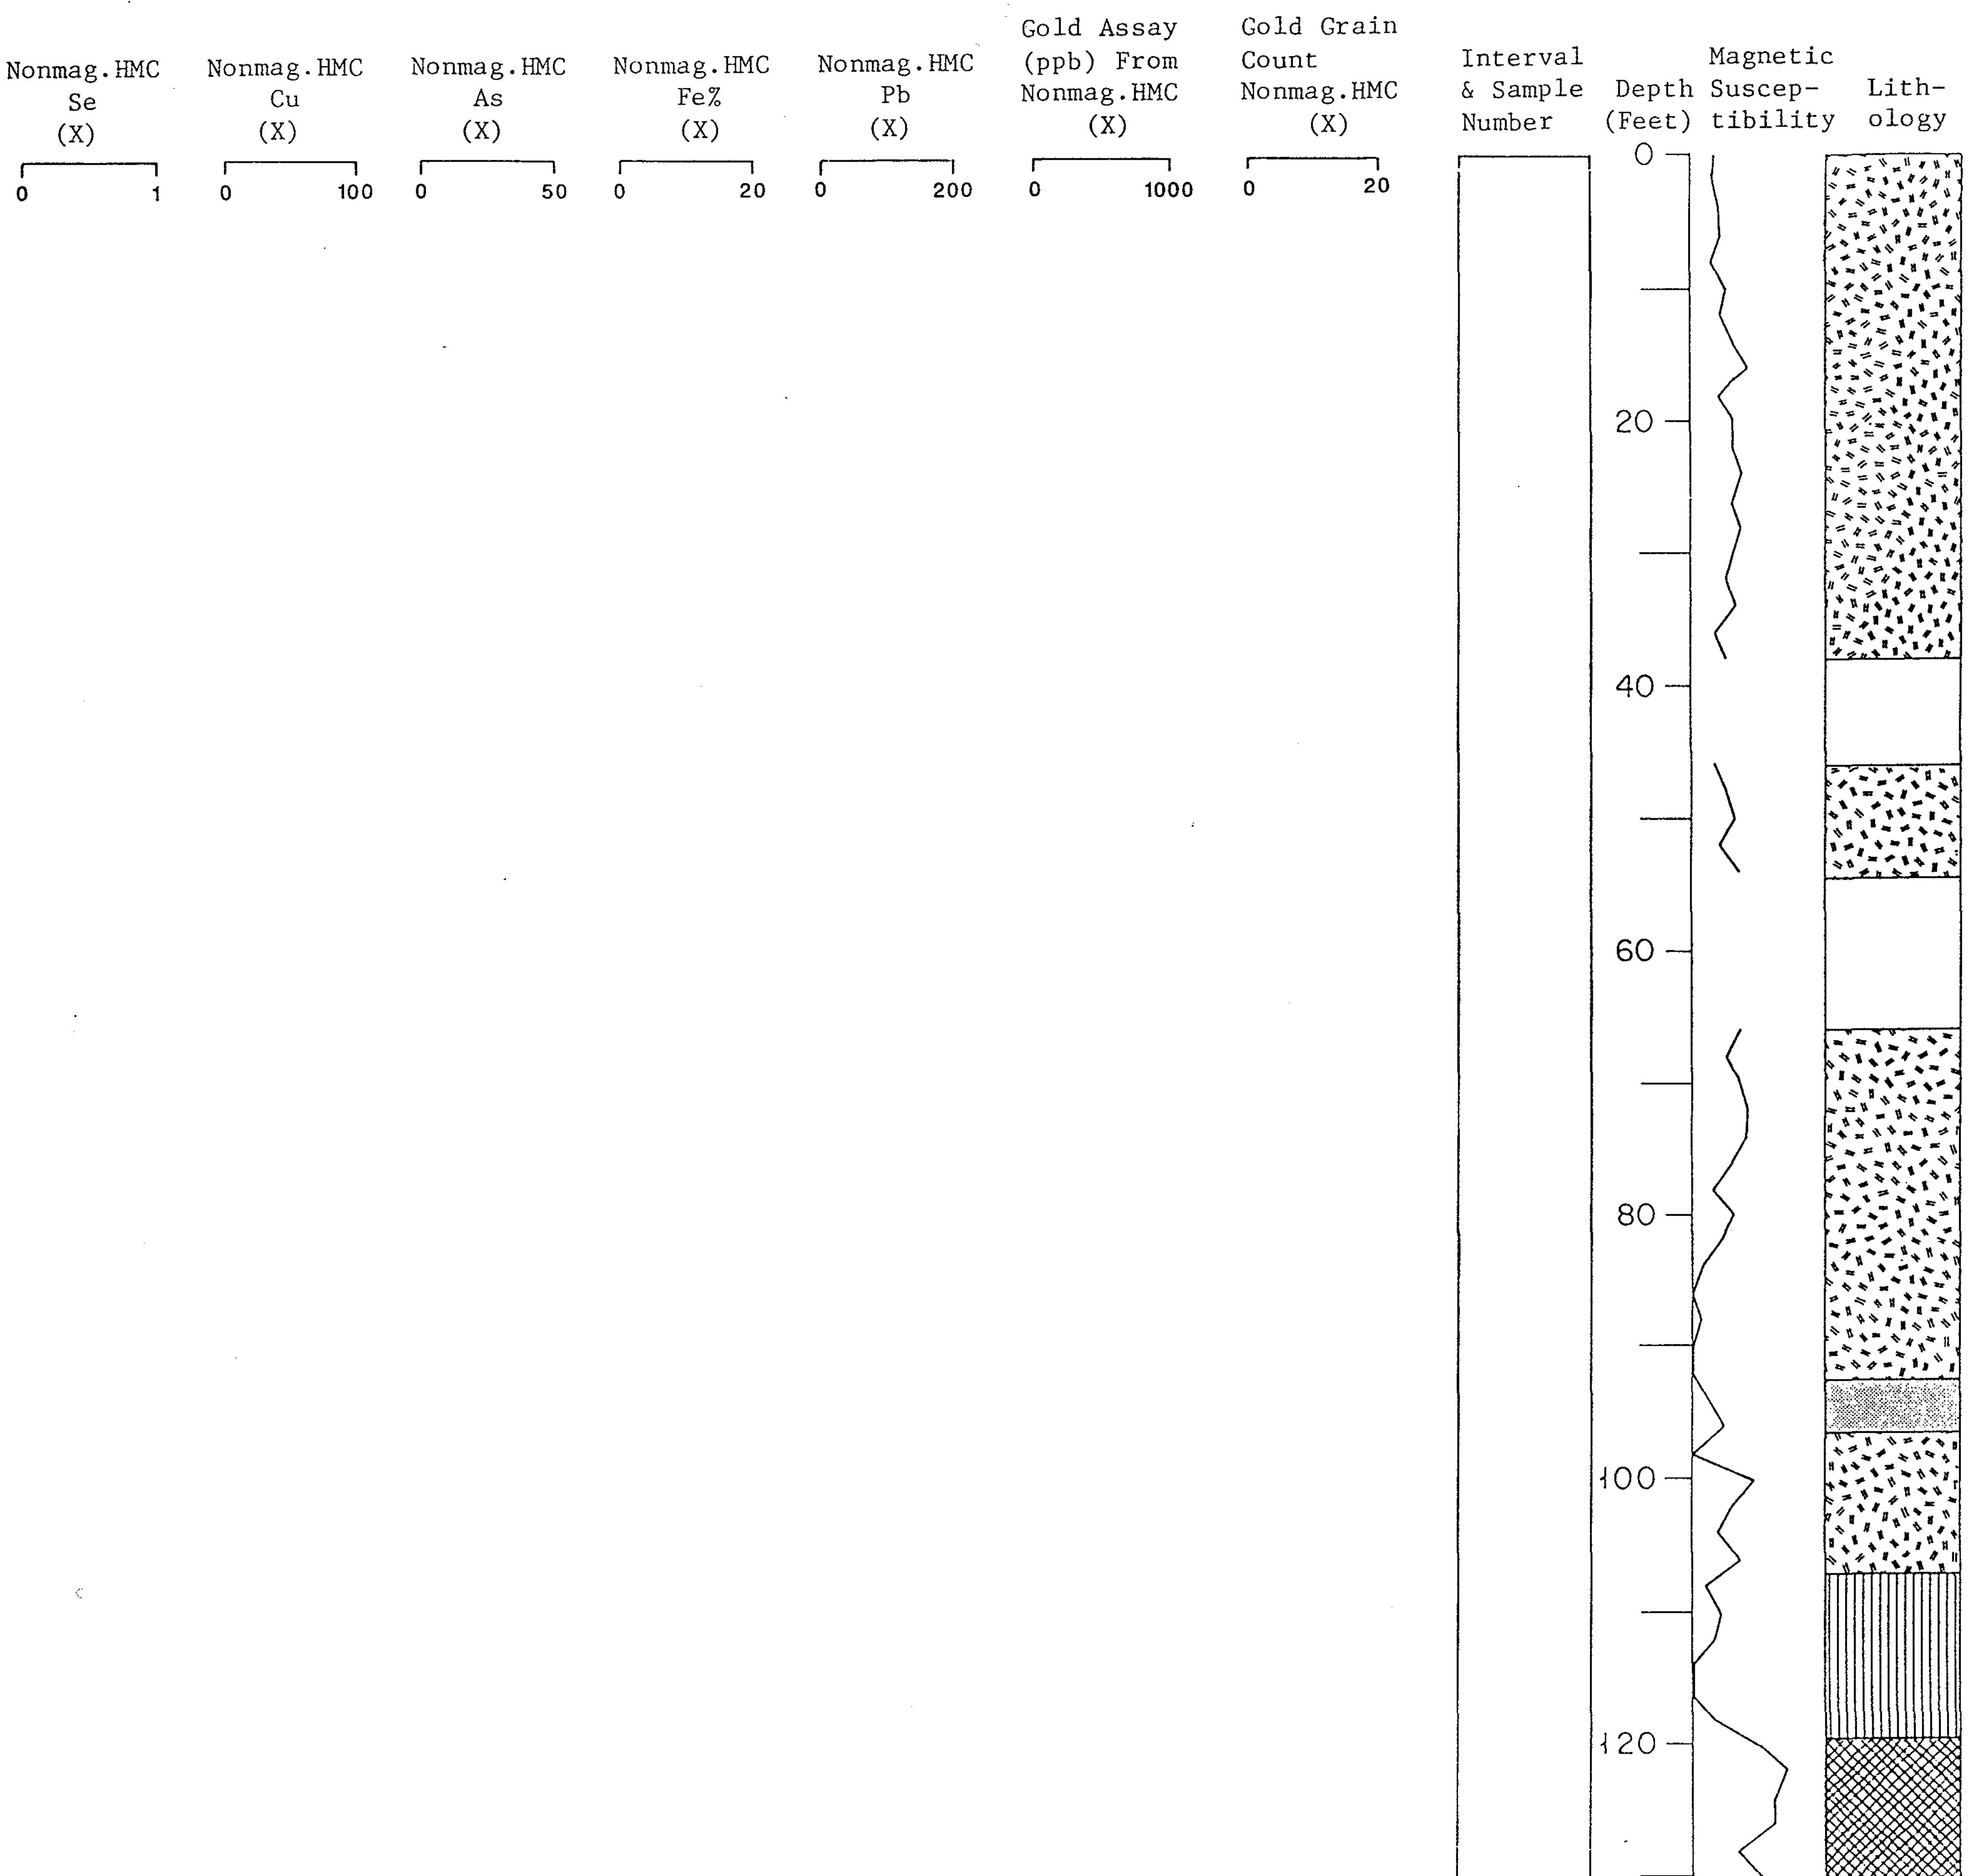
Interval (ft.)	Interpretation	Library Samples Available	Subsamples Tested	Geochem Assays Worthy of Further Review
0-131.5	Kooch. lobe gl. drift	G		
131.5-154.5	Winnipeg lobe gl. drift	G		
154.5-172	Interglacial	G		
172-176.5	Old Rainy lobe gl. drift	B,C,G	A,B,C	A=Au,Pb B=Au
176.5-179	Winnipeg lobe gl. drift	B,C,G	A,B,C	A=Au,Pb B=Au
179-243	Old Rainy lobe gl. drift	B,C,G	A,B,C	B=Au,Pb

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK
No bedrock reached in this hole.

BLANK PAGE

OB-321



Geologic Descriptions

K (0 - 38) CLAY TILL; UNOXIDIZED by 15 ft; 0 - 1/2 peat over silty, v fgr sand; pebbly fgr sand lens at 1; leached to 1 1/2; carb pebs dominate, sh present.

(38 - 46) NO CORE

(46 - 54 1/2) CLAY TILL; UNOXIDIZED; as above; 53 1/2 - 54 silty clay w/v fgr sand lenses at base.

(54 1/2 - 66) NO CORE

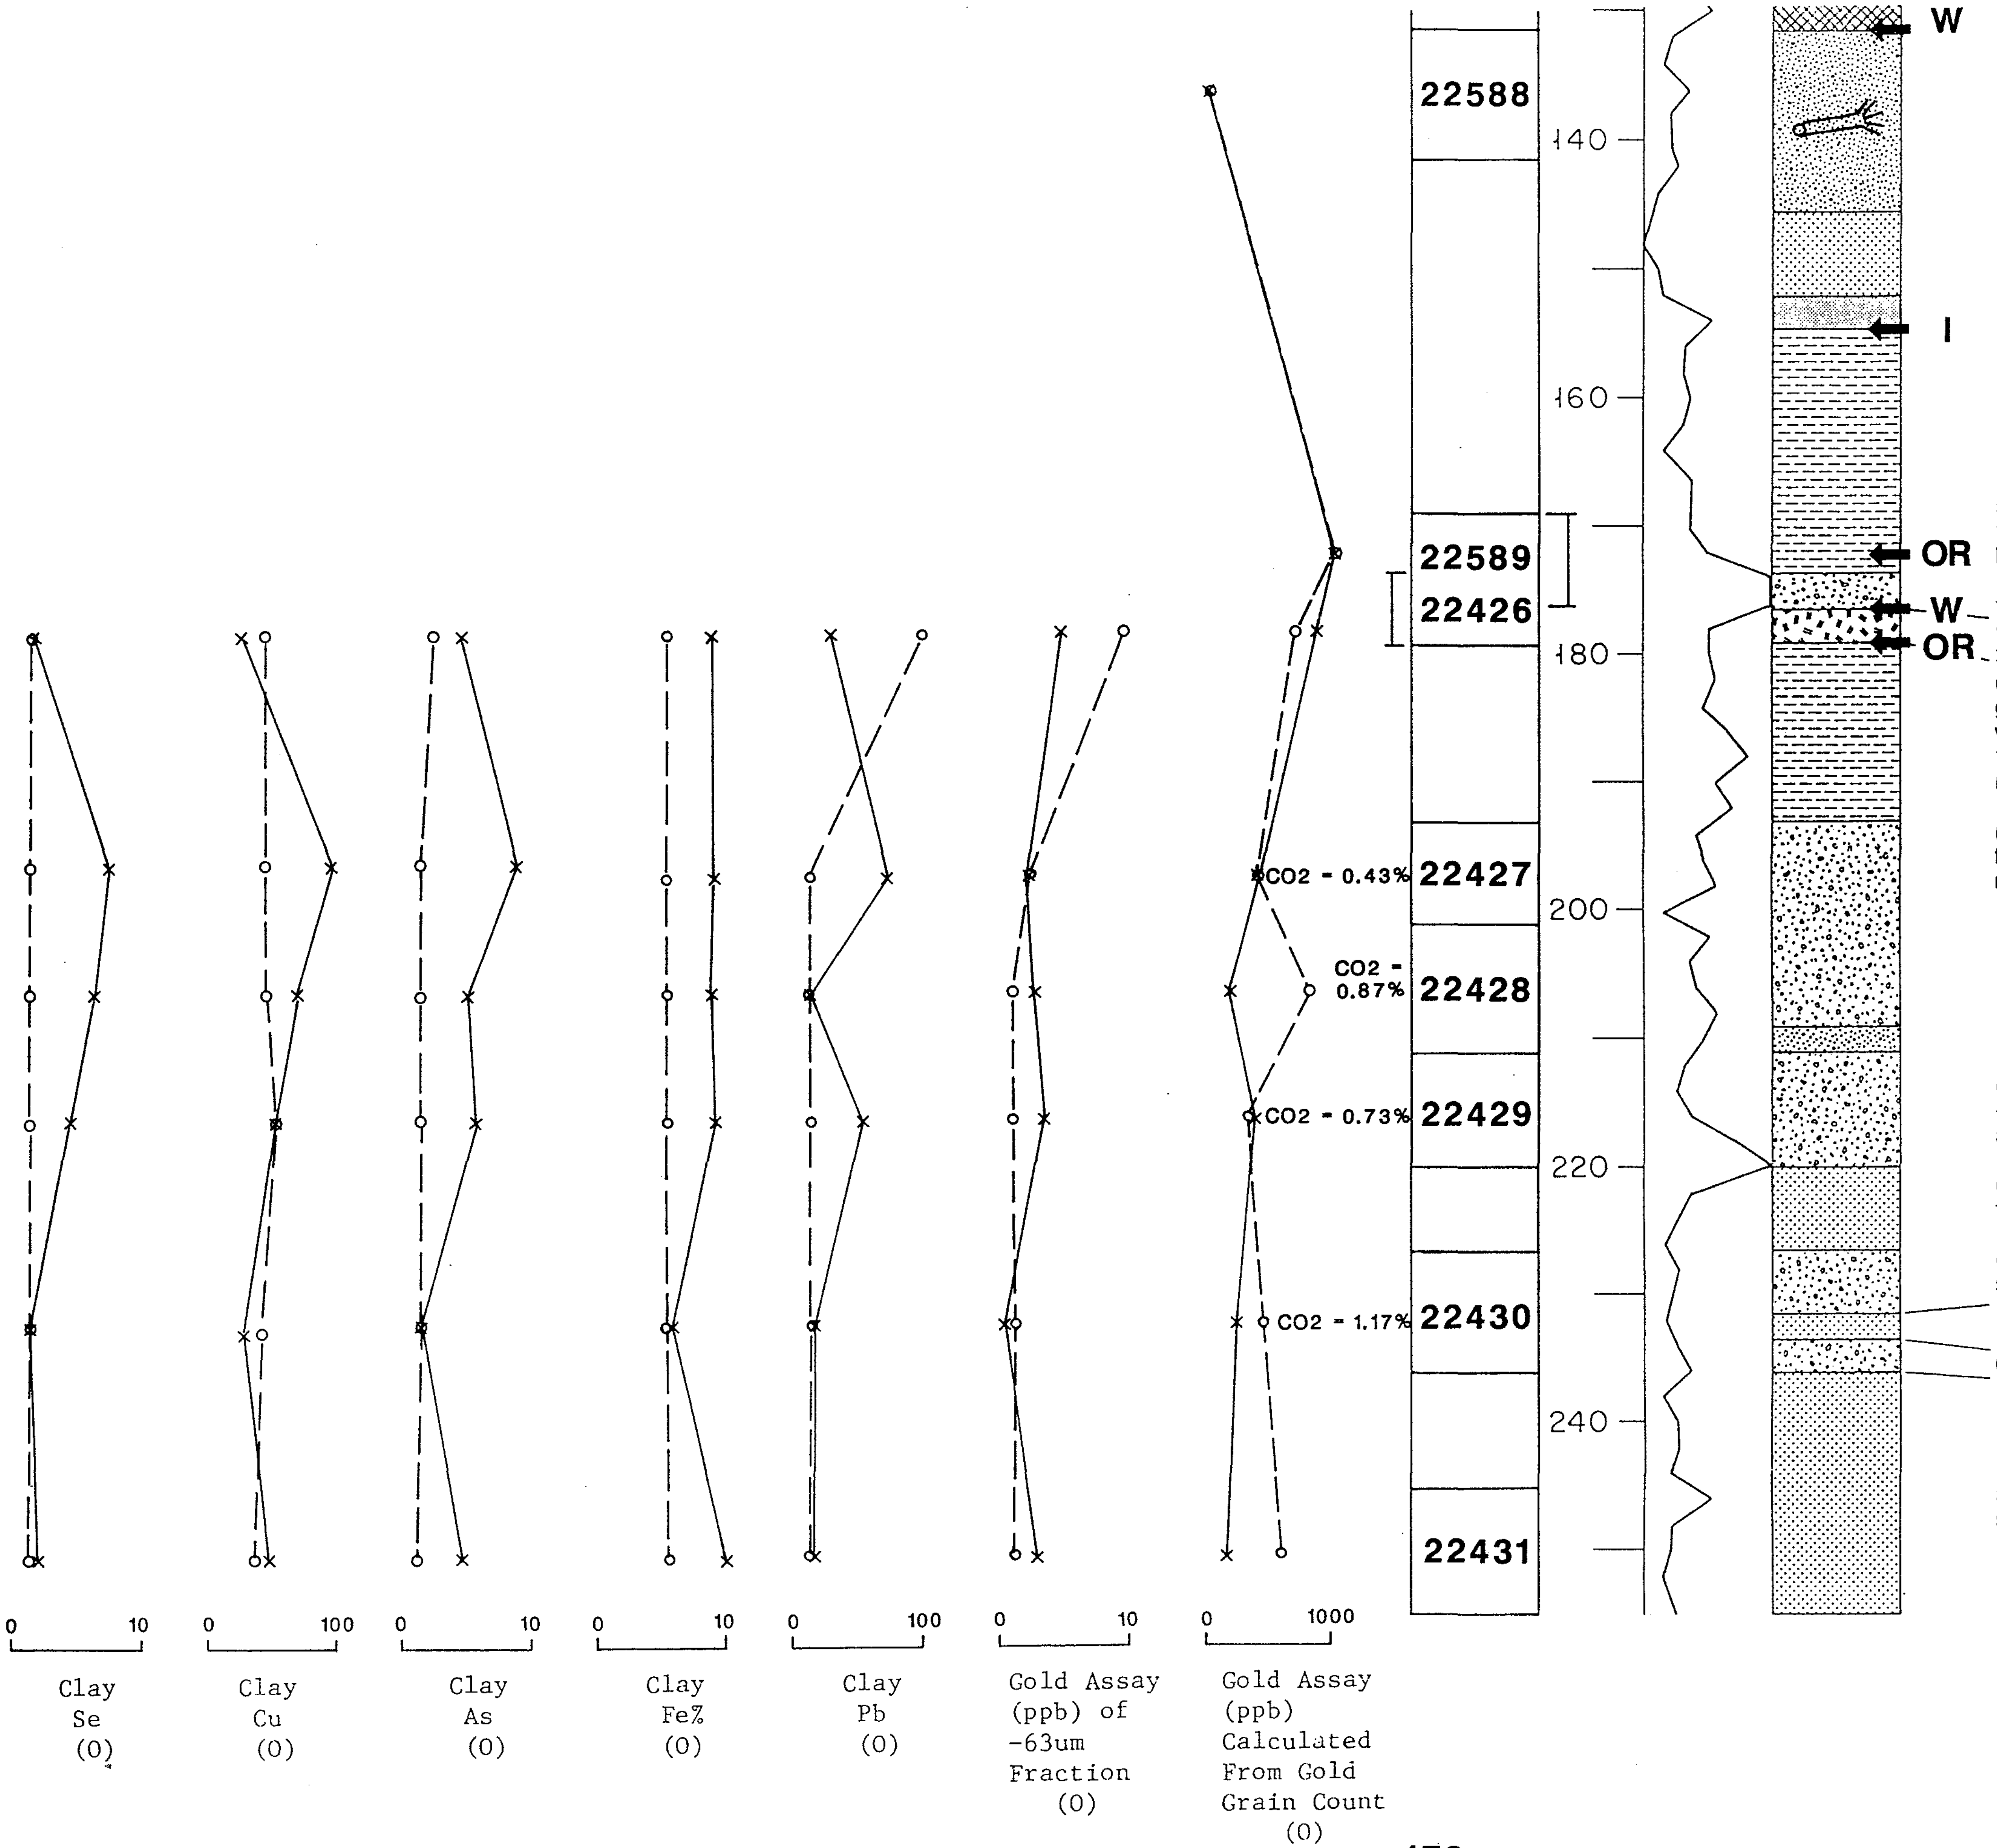
(66 - 92 1/2) CLAY - CLAY LOAM TILL; UNOXIDIZED; lith as above incl sh; 80 1/2 - 81 1/2 ft clay loam till, more pebbly; few v sm pockets of fgr sand below 90.

(92 1/2 - 96 1/2) SILTY, VERY FINE - FINE SAND; UNOXIDIZED; 94 - 94 1/2 ft clayey till w/sand bed towards top; silty, fgr sand in last 1/2 foot apar w/clayey till beds.

(96 1/2 - 107) CLAY TILL; UNOXIDIZED; small cob, sandy lam towards top; sh pebs; only few large pebs; last foot mixed w/lake clay & silt.

(107 - 119 1/2) SILTY CLAY; UNOXIDIZED; calc; few sand grains; more silty w/depth to 114 1/2 ft, w/clay lam; clay texture from 114 1/2, harder than above w/few dropstones; laminated from 116 w/silty clay, clayey silt, & loamy 'till.'

(119 1/2 - 131 1/2) LOAM - SANDY LOAM TILL; UNOXIDIZED; calc, carb & sh pebs present; cobs fairly common; grnish gray by 122 ft; sm balls of ox sandy silt at 126 1/2; clayey till inclusions w/ox rinds from 128; mostly silt loam till from 130 1/2.



(131 1/2 - 145 1/2) GRAVELLY SAND; UNOXIDIZED; sand & gvl to 132 ft, then pebbly cgr sand, some silt; carb pebs fairly common; pebbly, v cgr sand from 136; sev chunks of ragged wood at 139, mostly wood from 141 - 141 1/2, dated greater than 40,600 radiocarbon years; pebbly cgr sand from 141 1/2.

(145 1/2 - 152) MEDIUM SAND; UNOXIDIZED; well sorted.

(152 - 154 1/2) FINE SAND; UNOXIDIZED.

(154 1/2 - 173 1/2) SILT - VERY FINE SANDY SILT; UNOXIDIZED; mod calc; laminated; brownish organic lam from 155 1/2 - 157 ft; sev inches of fgr sand at 155 1/2; sand-size shell fragment at 156; grnish gray 155 1/2 - 157; 157 - 158 1/2 silty, v fgr sand; 158 1/2 - 161 silt, organic lam at top & bottom; 161 - 162 1/2 v fgr sandy silt w/organic lam; 162 1/2 - 165 silt, calc, finely disseminated organics; 165 - 167 v fgr sandy silt, minor organic lam, grnish gray (to 172), grades to silt below; 167 - 168 1/2 silt w/little organics; 168 1/2 - 169 silt & sandy silt w/large pod of organic silt w/peaty rind; 169 - 172 sandy silt w/lenses of fgr sand, mixed w/mgr sand & few pebs from 171; 172 - 173 1/2 silty pebbly sand, cob at base.

(173 1/2 - 176 1/2) GRAVELLY, SANDY LOAM TILL; UNOXIDIZED; sl calc; more clayey from 176 ft.

(176 1/2 - 179) SILTY CLAY TILL; UNOXIDIZED; calc; common sm carb pebs; sandy zone at 178 ft, apar reworked lake sed below; grnish gray.

(179 - 193) VERY FINE SANDY SILT; UNOXIDIZED; sl calc, prob mainly quartz; grnish gray; well sorted; silt bed & silty fgr to mgr sand lens in upper foot; 185 - 186 ft sandy silt w/small pebs, sl to mod calc; 188 1/2 - 190 sandy silt w/few coarse grains, large peb at 189 1/2, fgr sand at base; 190 - 191 1/2 coarse, loamy till, mod calc, most sand is v fgr, more compact & more pebs than above; grades to till below.

(193 - 209) SANDY LOAM TILL; UNOXIDIZED; grnish gray; sl calc; sand lens at 193 1/2 ft, from 195 - 196, & at 205, mostly pebbly sand from 203 1/2 - 204 1/2; cobs fairly common; mod calc by 201.

(209 - 211) COARSE SAND; UNOXIDIZED; large pebs in lower half.

(211 - 220) SANDY LOAM TILL; UNOXIDIZED; sl to mod calc, mod calc by 213 ft; 215 1/2 - 217 mostly sandy silt & sand, could be sluff; iron stains at 219; till finer grained w/depth; abrupt basal contact.

(220 - 226 1/2) MEDIUM-COARSE SAND; UNOXIDIZED; sandy till lenses at 221 1/2, 223 ft; little silt, few pebs.

(226 1/2 - 231 1/2) SANDY LOAM TILL; UNOXIDIZED; sl to mod calc; few large pebs; sand lens at 230 ft, then grades to sand below.

(231 1/2 - 233 1/2) MEDIUM - COARSE SAND; UNOXIDIZED; little silt, few pebs; sandy till lens at 232 ft; grades to till below

(233 1/2 - 236) SANDY LOAM TILL; OXIDIZED; mod calc; as till above.

(236 - 243) FINE - MEDIUM SAND; OXIDIZED; two cobs at about 236 1/2 ft, mgr sand below; pebble at 238; some coarse grains; fgr to mgr by 241.

(243 - 255) COARSE SAND; UNOXIDIZED; carb grains not very common; pebs at 246; mgr to cgr 246 - 247; fgr sand bed at about 253 over four-inch, cgr silt bed, cgr to v cgr sand w/few pebs below.

Appendix 1-16C.

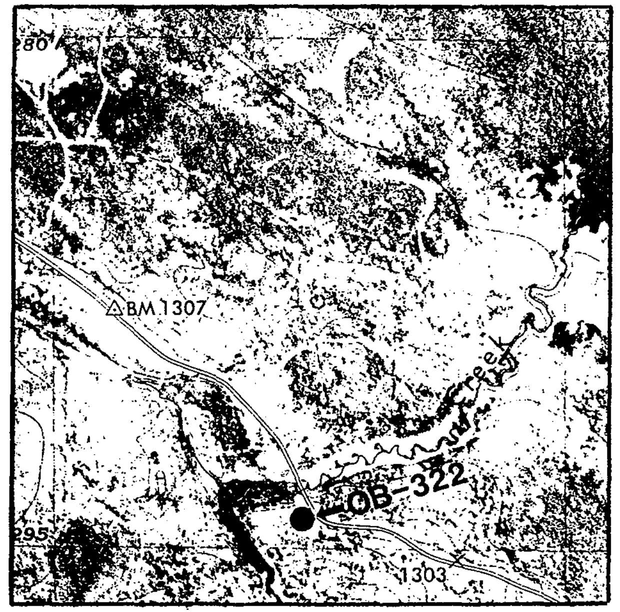
Appendix 1-17A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-322
Drilling Completion Date: 6/10/88



LOCATION (see map at right)
S-T-R: SW¼-SE¼ - S16 - T152N - R26W
County: Koochiching
Quadrangle: Wildwood 7.5
Regional Survey Area: Effie
UTM Coordinates: 426,680mE; 5314180mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1290 ± 3 ft.
Total Depth: 202 ft.
Elevation, Top of Precambrian Bedrock: 1094 ft.
Elevation, Top of Saprolite:
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

INFORMATION SUMMARY

Interval (ft.)	Interpretation	Library Samples Available	Subsamples Tested	Geochem Assays Worthy of Further Review
0-69.5	Kooch. lobe gl. drift	G		
69.5-172	Rainy lobe gl. drift	B,C,G	A,B,C	A=W
172-196	Old Rainy lobe gl. drift	B,C,G	A,B,C	A=Mo,Fe C=As
196-202	Sound bedrock	G,H	I	

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

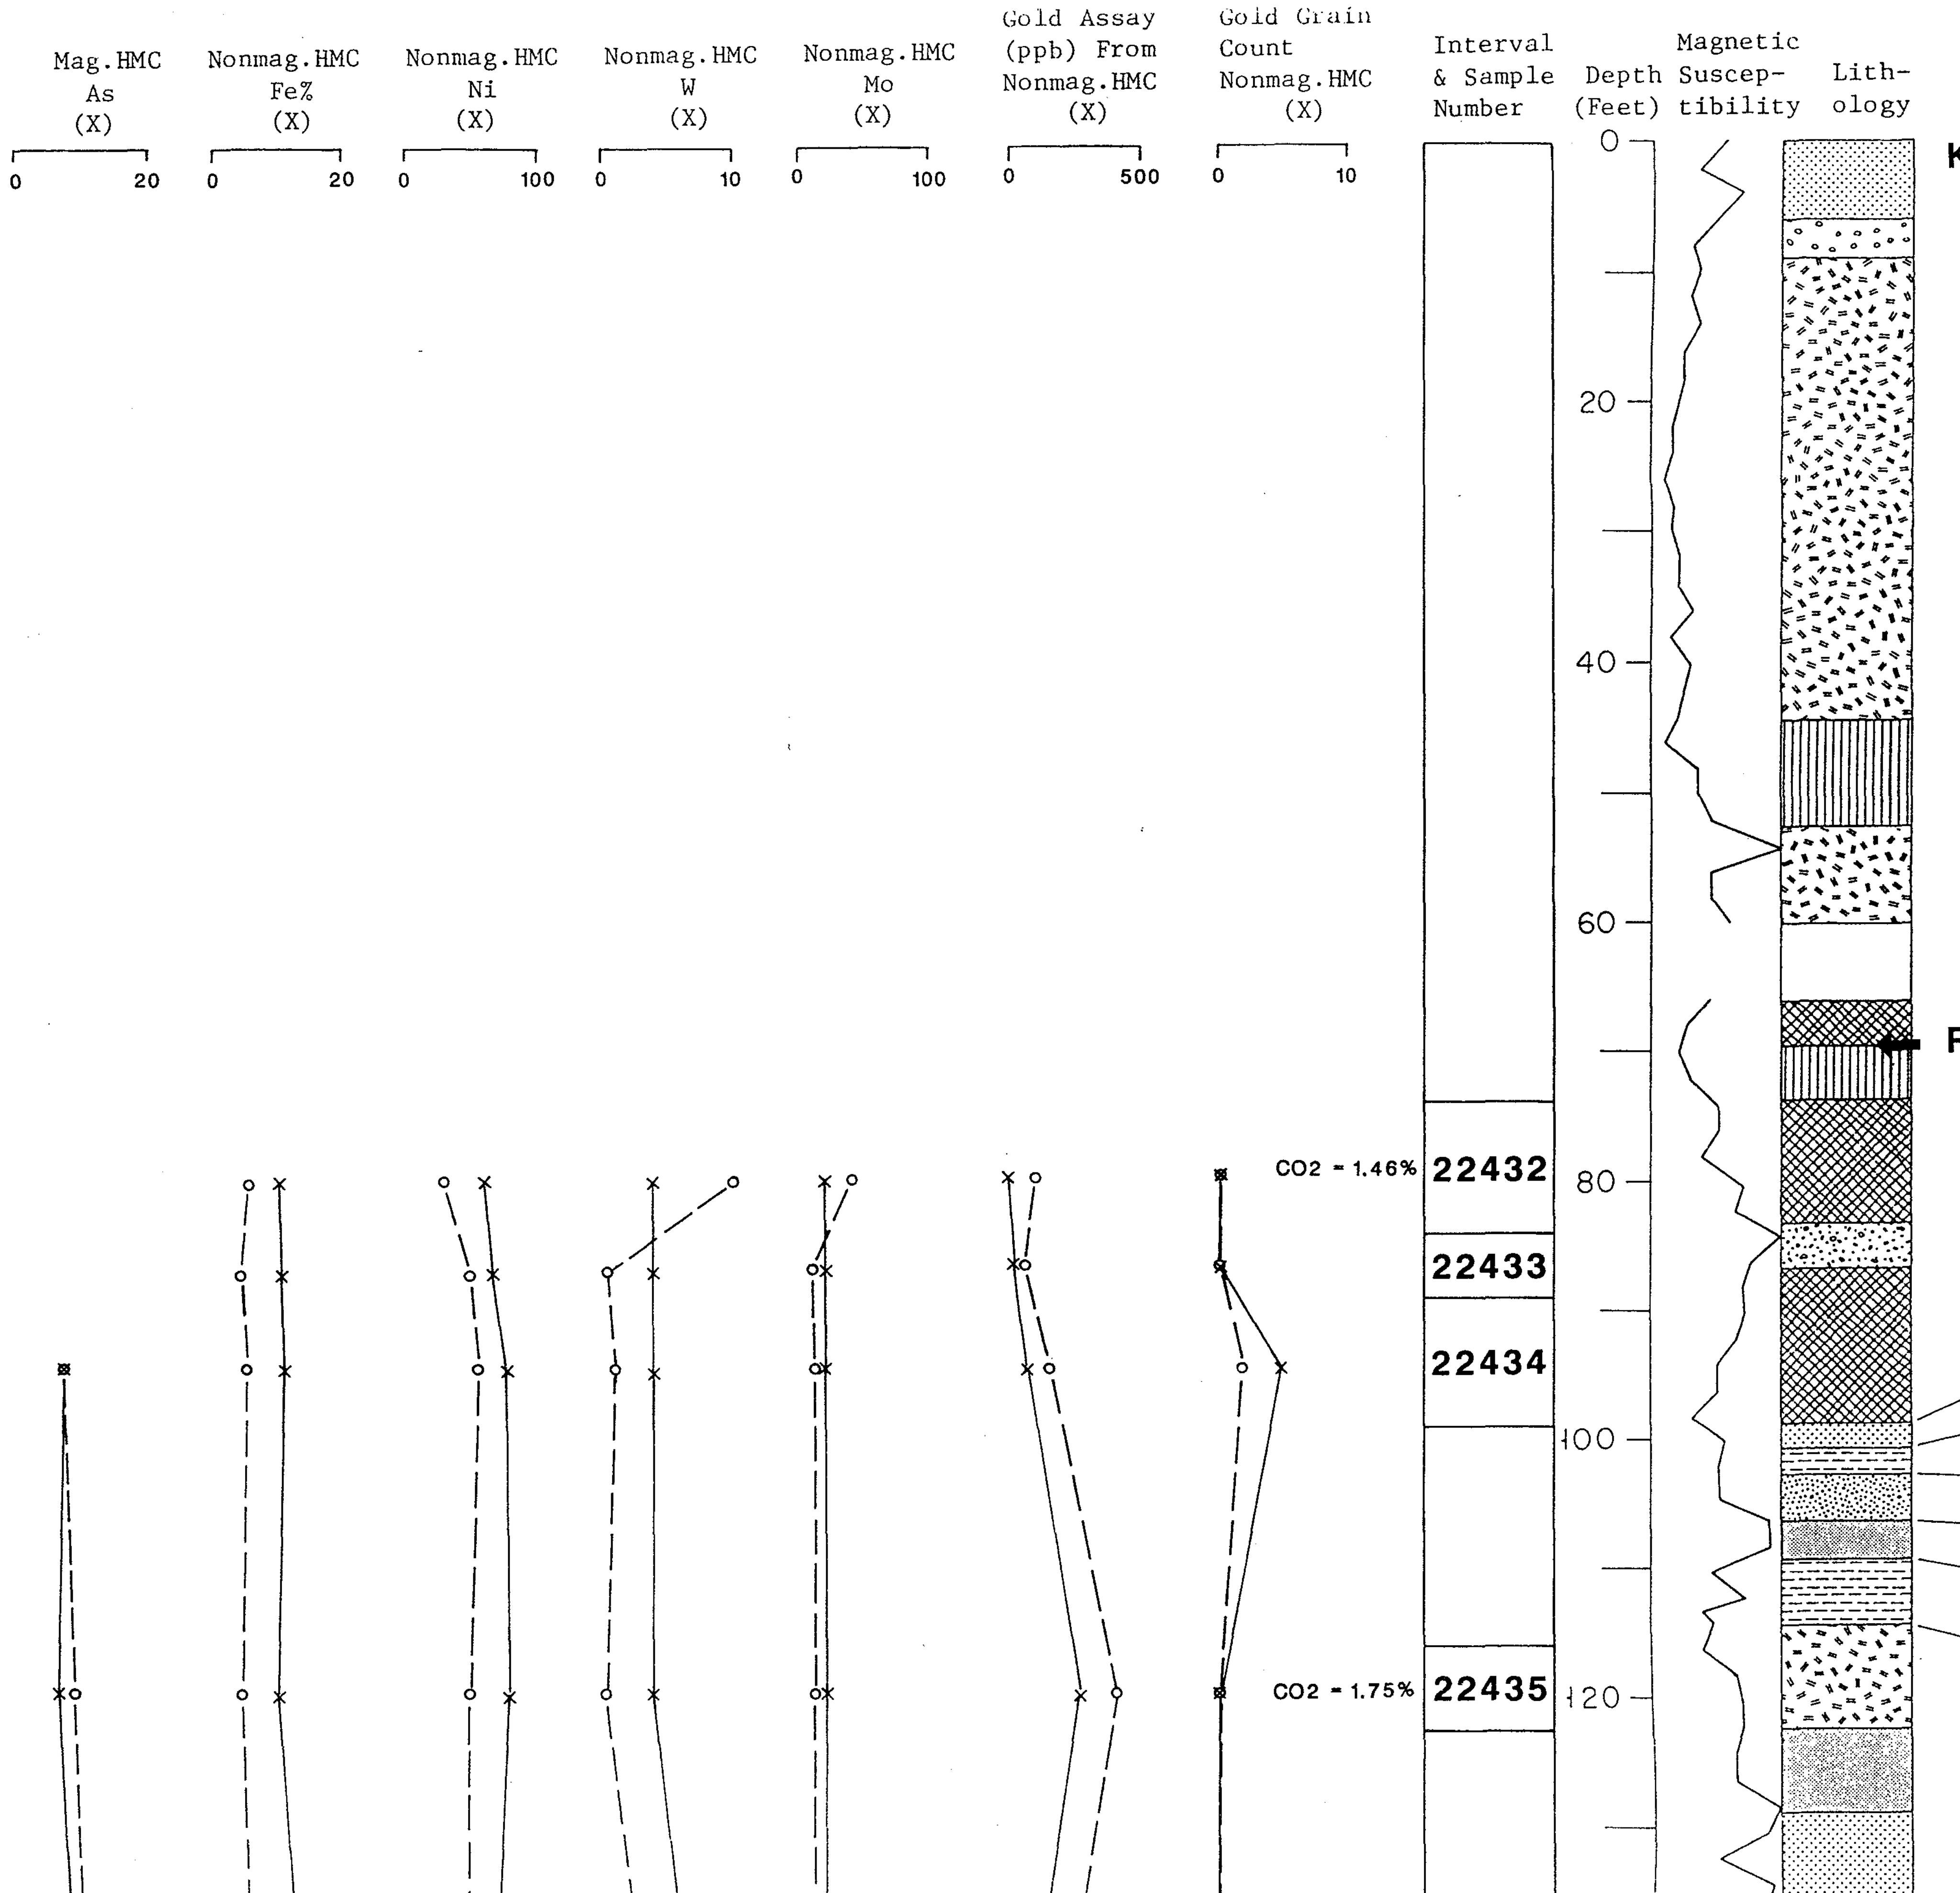
Core Description: White to pinkish, foliated hornblende monzodiorite. Thin section is representative of bulk of the core. Hornblende is strongly lineated and dips about 85°, as does crude modal banding. Contains few pink veinlets. Magnetic Susc. 0.25 - 0.70 x 10-3 CGS, average about 0.50 (detectable with weak hand magnet).

Thin Section Description: OB-322, 200 ft. Coarse-grained, foliated quartz monzodiorite/diorite (Streckeisen classification). Estimated mode (volume %): Plagioclase 64%; Orthoclase 9%; Quartz 19%; Hornblende 4%; Epidote 1%; Chlorite 2%; Fe-Ti oxides Tr-1; Sphene (leucoxene) Tr; Apatite Tr-1; Zircon Tr. Vaguely foliated, moderately cataclasized igneous rock. Contains large (2-6 mm) sericitized plagioclase, sub- to anhedral hornblende, anhedral-interstitial quartz, and fresh anhedral-interstitial orthoclase. Foliation is defined by inequant hornblende and plagioclase. Relatively coarse-grained epidote and lesser chlorite are associated with hornblende as a deuteric alteration product; epidote near fractures is a deep golden yellow color. Rock is cut by web-like fractures of varying orientations, along which sericite is removed from plagioclase and hornblende is altered to chlorite and epidote. One of the fractures contains calcite along part of its length. Coarse-grained primary quartz is typically rutilated.

Scintillometer Reading (cps): 100-120

OB-322

Appendix 1-17B.



Geologic Descriptions

(0 - 6) SILTY MEDIUM - COARSE SAND; OXIDIZED; few pebs; v silty from 2 1/2 ft; 4 1/2 - 6 pebbly sandy loam.

(6 - 9) COARSE GRAVEL; sm cob at base; apar washed by drill action.

(9 - 44 1/2) CLAY TILL; UNOXIDIZED by 11 ft; calc; sandy lens at 17; few large pebs; occ sh pebs; clay to clay loam from 34 1/2 - 35 1/2, & 37 - 43; sandy pockets 41 - 43; grades to lake clay.

(44 1/2 - 52 1/2) CLAY; UNOXIDIZED; massive; little silt, v rare sand; till lens at 48 ft, some pebs below incl sh; silt lam from 51 1/2.

(52 1/2 - 60) CLAY LOAM TILL; UNOXIDIZED; calc; 52 1/2 - 54 ft mostly "flow" clay till, coarse silt bed at base; hard, much less clayey below 54, much more pebs.

(60 - 66) NO CORE

(66 - 69 1/2) LOAM TILL; UNOXIDIZED; calc; 68 - 69 1/2 boulder.

(69 1/2 - 73 1/2) CLAY & SILTY CLAY; UNOXIDIZED; mod calc to calc; laminated; some brnish lam at 71 ft; silt & v fine sandy lam from 72; laminated clay & sandy silt by 72 1/2.
(73 1/2 - 83) LOAM TILL; UNOXIDIZED; grnish gray; sl calc; bedded w/clay towards top; fgr sand 74 1/2 - 75 ft; fairly compact by 75 1/2, mod calc; fair amount of large pebs, sm carb pebs; fgr sand lenses at 81 1/2, 82 1/2.

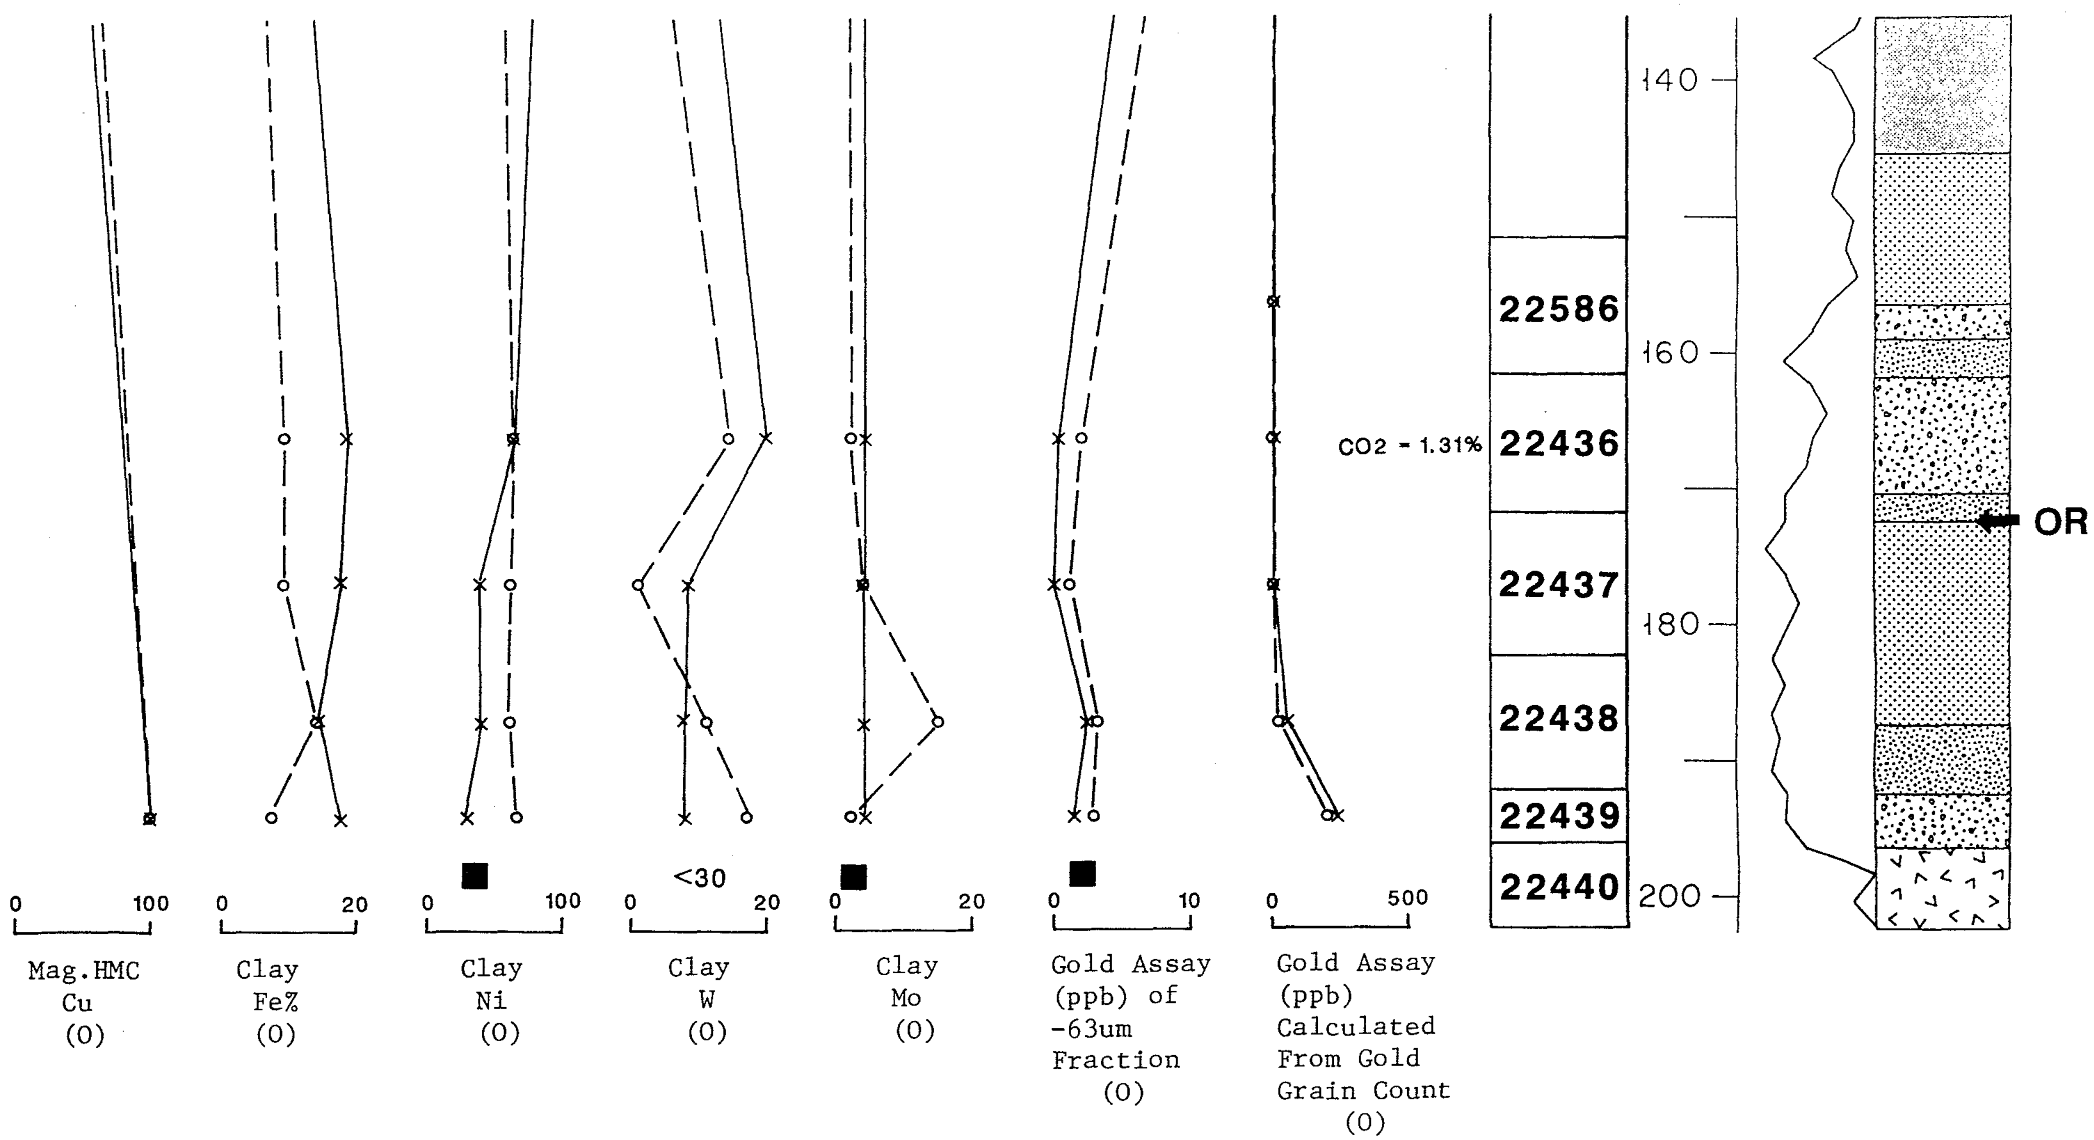
(83 - 86 1/2) SANDY LOAM TILL; UNOXIDIZED; 83 - 84 1/2 boulder.

(86 1/2 - 98 1/2) LOAM TILL; UNOXIDIZED; mod calc; carb relatively uncommon; silty in upper foot; generally high silt content; fgr sand lenses at 96, 98 ft; mostly sandy silt from 98.

(98 1/2 - 100 1/2) MEDIUM - COARSE SAND; UNOXIDIZED; 99 1/2 - 100 silt w/clay lam; cgr to v cgr pebbly sand below.
(100 1/2 - 102 1/2) SILTY 'TILL,' SILT, CLAY; UNOXIDIZED; laminated; mod calc; top 1/2 foot v fgr to fgr sand.
(102 1/2 - 106) GRAVELLY SAND; 102 1/2 - 104 interbedded fine & pebbly, mgr sand w/silt lam; cgr sand to sand & fine gvl below.
(106 - 109) VERY FINE, SANDY SILT - SILTY SAND; UNOXIDIZED; grnish "till" in upper 1/2 foot.
(109 - 114) SILT & CLAY; UNOXIDIZED; mod calc; laminated; mostly silt to 111 ft; 111 - 112 1/2 v fgr silty sand w/silt lam; v fgr sandy silt bed at 112 1/2; clay increasing w/depth.
(114 - 122) SILTY CLAY LOAM TILL; UNOXIDIZED; calc; laminated to 115 1/2 ft; less than 15% carb pebs; grades to silt below.

(122 - 128 1/2) FINE SAND; 122 - 123 1/2 ft laminated silt, sandy silt & clay, w/large peb; 123 1/2 - 125 1/2 fgr to mgr sand w/silt beds; 125 1/2 - 126 pebbly cgr sand; fgr grading to silty v fgr by 127.

(128 1/2 - 135) FINE - MEDIUM SAND



(135 - 145) FINE SAND

(145 - 156) FINE - MEDIUM SAND

(156 - 158 1/2) GRAVELLY, LOAMY SAND TILL; UNOXIDIZED; grnish gray; cobbly.

(158 1/2 - 161 1/2) GRAVELLY SAND; UNOXIDIZED; silty.

(161 1/2- 170) GRAVELLY, LOAMY SAND TILL; UNOXIDIZED; grnish gray; cobbly; v sl calc; no carb grains noted; 163 - 164 silty, pebbly sand; sandy loam till 164 1/2 - 166; silty, pebbly sand 166 - 167 1/2.

(170 - 172) SILTY SAND & FINE GRAVEL; UNOXIDIZED; few large pebs; noted carb grains; loamy calc till in last 1/2 foot.

(172 - 187) FINE - MEDIUM SAND; REDUCED; olive to grnish gray color; silt lenses at 179 ft; sandy till (?) lens at 179 1/2; silt bed at 180 1/2; mgr to cgr from 179, cgr from 180 1/2; 182 - 183 mod calc silt w/cgr sand bed; some silt below 183, also ox.

(187 - 192) GRAVELLY COARSE SAND; OXIDIZED; some silt, couple silt lam; most gvl actually gnl.

(192 - 196) COBBLY, GRAVELLY LOAM; UNOXIDIZED; grnish gray; mod calc; no carb grains noted; little saprolite in matrix, cobbles mostly same lith as bedrock below.
(196 - 202) BEDROCK; QUARTZ MONZODIORITE; cgr; strong igneous foliation.

Appendix 1-17C.

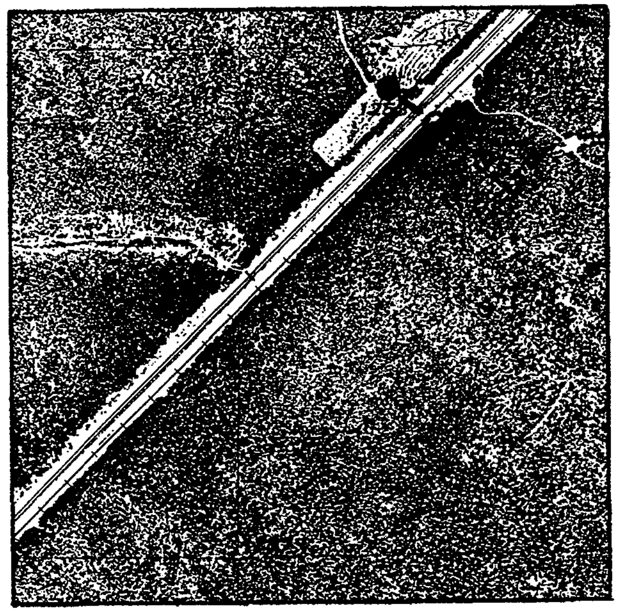
Appendix 1-18A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-323
Drilling Completion Date: 6/14/88

LOCATION (see map at right)
S-T-R: NE¼-NW¼ - S29 - T153N - R26W
County: Koochiching
Quadrangle: Ridge 7.5
Regional Survey Area: Effie
UTM Coordinates: 424,760mE; 5321890mN, 15,N.



HOLE PARAMETERS
Surface Elevation: 1253 ± 2 ft.
Total Depth: 143 ft.
Elevation, Top of Precambrian Bedrock: 1118 ft.
Elevation, Top of Saprolite: 1119 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

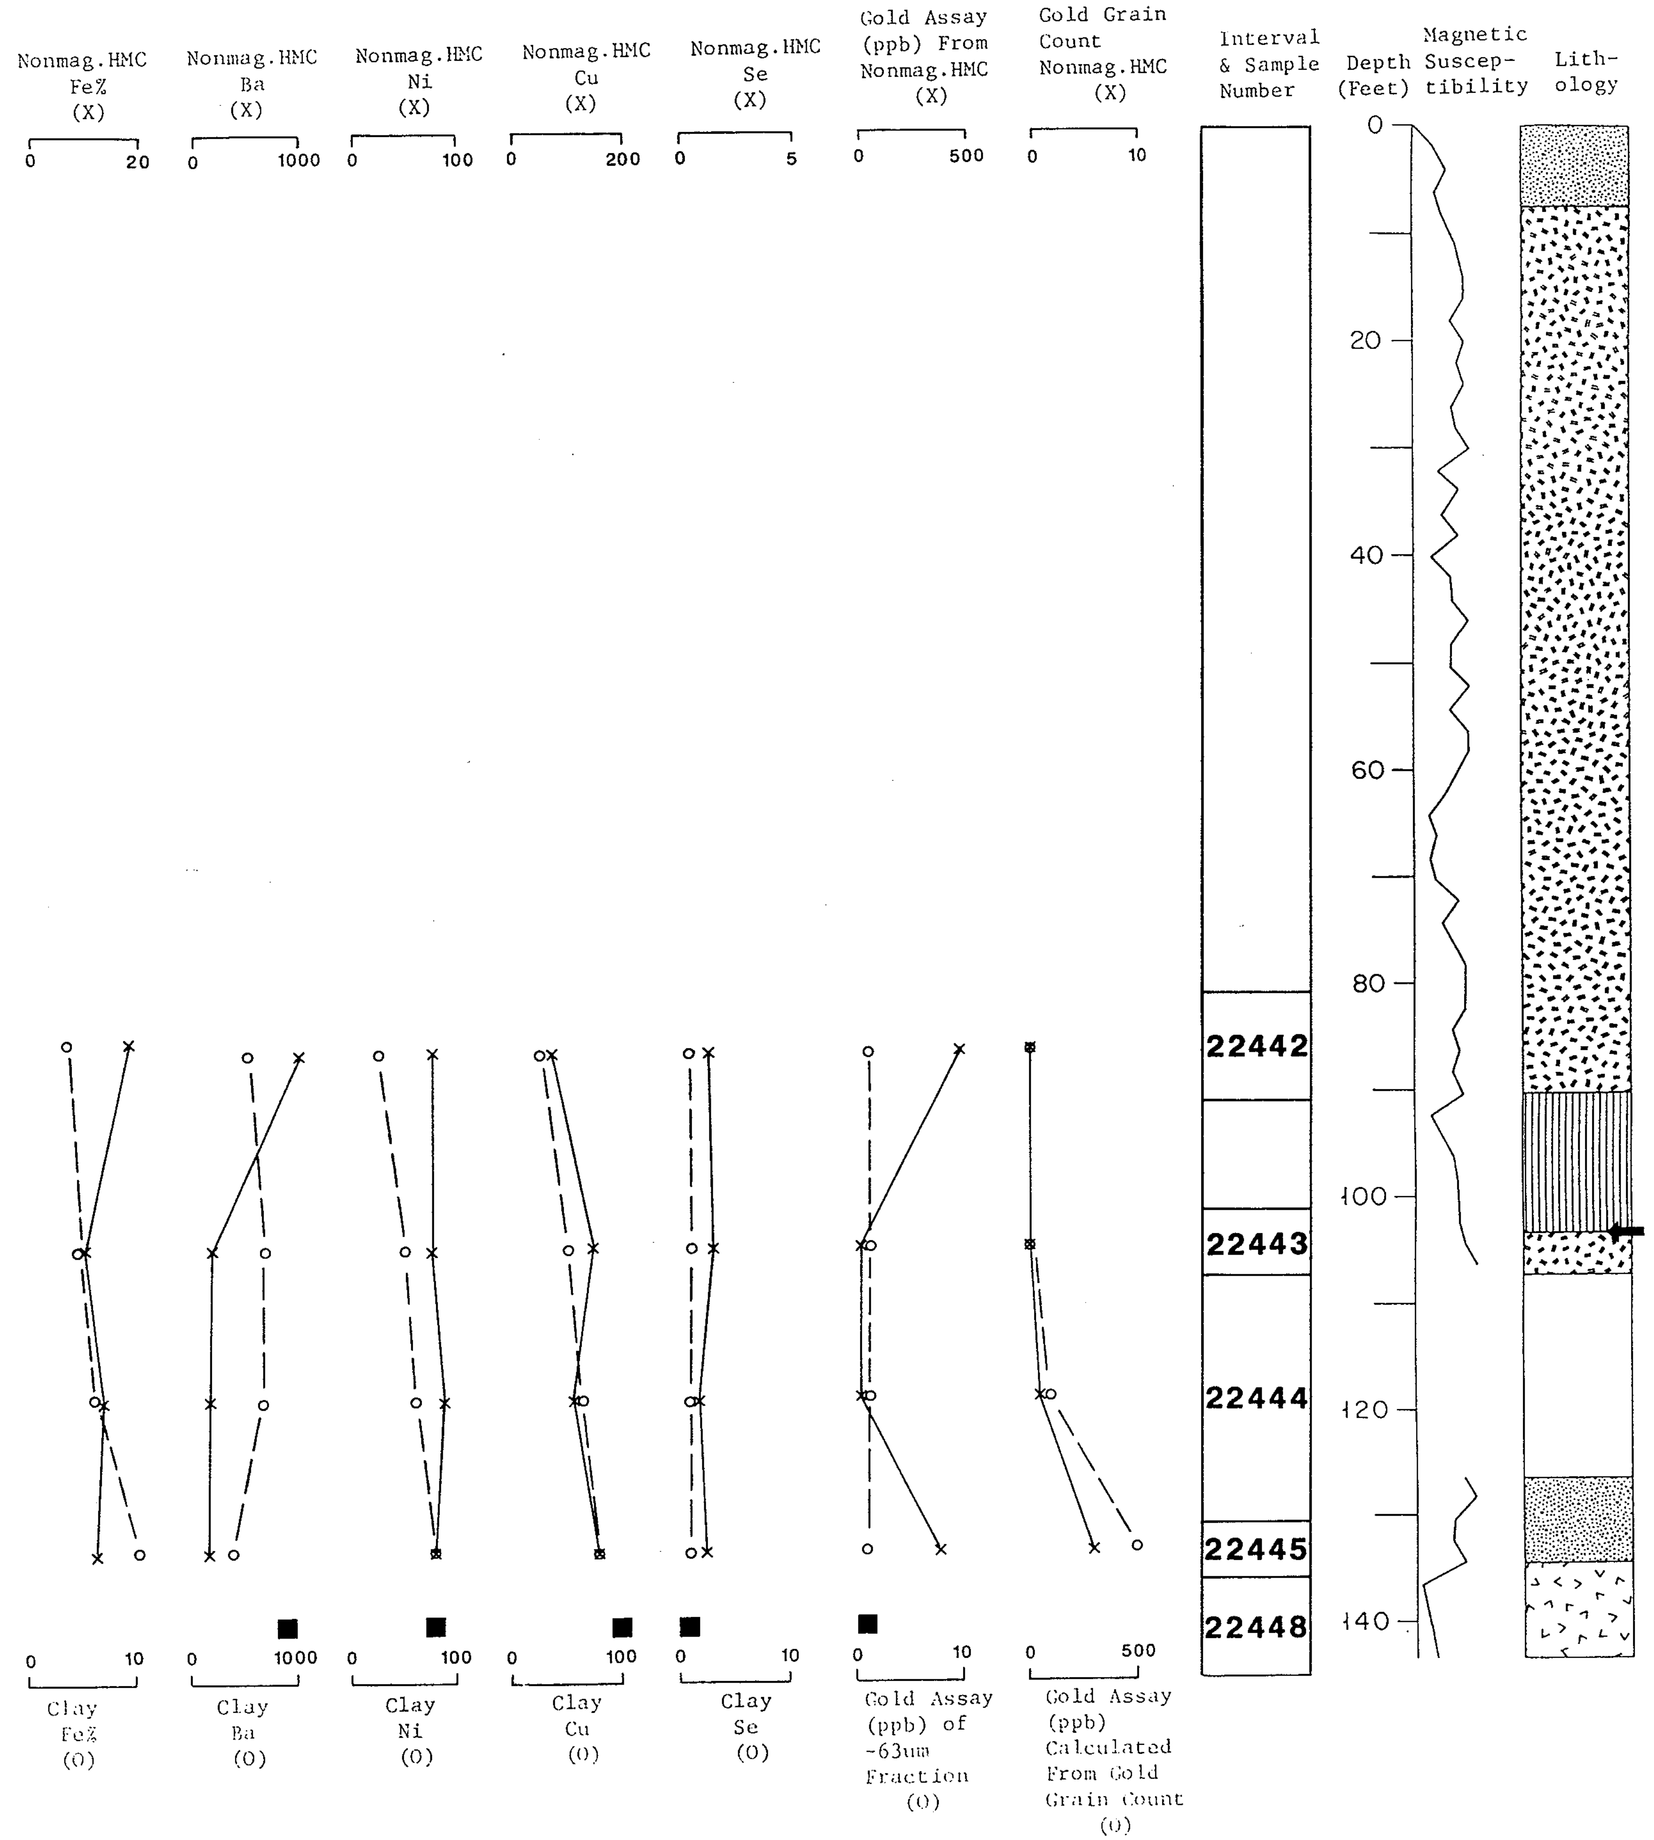
Core Description: Strongly flattened, amygdaloidal and pillowed basalt or basaltic andesite (now chloritic schist). Rock is light to medium green except pillow rinds which are dark green and a few mm to 1 cm thick. Apparent shape of pillows and strong elongation of quartzose amygdules indicates extreme flattening. The lineation dips about 70°. Amygdules tend to be more abundant and larger in the up-core sides of pillows, implying that the flow is upright. Quartz is present between pillow rinds (in interpillow). Thin calcite veins dip slightly less steeply than the foliation. Local, foliation-parallel "shear fractures" contain chlorite, pyrite and minor chalcopyrite. Pyrite also is disseminated throughout (<1%). Magnetic Susceptibility not measured but rock is non-magnetic with hand magnet.

Thin Section Description: OB-323, 138 ft. Fine-grained metabasalt/andesite (chlorite schist). Estimated mode (volume %): Chlorite 50%; Epidote/clinozoisite 14%; Actinolite 8%; Quartz 12%; Calcite 16%. Epidote may be sphene in part, as very fine-grained, granular, semi-opaque masses. Strongly foliated, fine-grained green schist contains abundant chlorite, actinolite, and elongate, disseminated calcite blebs. Rock is very homogeneous overall, with the exception of one darker green fine-grained, foliation-parallel chloritic zone (1.5 mm wide). The rock is cut by thin carbonate veins which are parallel to or + 15° to foliation (conjugate sets); also perpendicular to foliation. Quartz occurs as fine-grained granoblastic ellipses, some of the larger quartz masses may be amygdules.

Scintillometer Reading (cps): 80-90

OB-323

Appendix 1-18B.



Geologic Descriptions

K (0 - 7) GRAVELLY MEDIUM - COARSE SAND; OXIDIZED; silty to 3 ft; fgr sand from 4 1/2 - 5 1/2; common carb & sh; unox by 6 1/2.

(7 1/2 - 60) CLAY LOAM TILL; UNOXIDIZED; calc; less large pebs, more grit w/depth; clay loam to loam from 11 - 18 ft & 46 - 60; sh fairly common.

(60 - 90) CLAY TILL; UNOXIDIZED; much less sand & pebs than above; sm sandy lens at 63 ft; clay loam 71 1/2 - 75, clay to clay loam from 76, more compact, still few pebs.

(90 - 103) CLAY; UNOXIDIZED; grades upward into till; mod calc; few sand grains, sm pebs; silty clay towards base.

R (103 - 107) CLAY LOAM TILL; UNOXIDIZED; grnish gray; sl to mod calc; grades up into lake sed; loamy, cobbly gvl from 106 ft, large cob at base; carb pebs present.
(107 - 126) NO CORE

(126 - 134) GRAVELLY COARSE SAND; UNOXIDIZED; cobbly to 127 1/2 ft, large pebs from 129 1/2; some carb grains; mostly fgr sand 133 - 133 1/2; mod calc, grnish-gray sandy silt 133 1/2 - 134, could be reworked saprolite.

(134 - 143) BEDROCK; METABASALT; fgr; strongly foliated; saprolite, possibly reworked, in upper foot.

Appendix 1-18C.

Appendix 1-19A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-325
Drilling Completion Date: 6/21/88

LOCATION (see map at right)
S-T-R: NE¼-NE¼ - S16 - T149N - R27W
County: Itasca
Quadrangle: Dora Lake 7.5
Regional Survey Area: Effie
UTM Coordinates: 417,430mE; 5286420mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1327 ± 3 ft.
Total Depth: 258 ft.
Elevation, Top of Precambrian Bedrock: <1069 ft.
Elevation, Top of Saprolite: Unknown
Drilling Method: Rotasonic
Sample Diameter: 3.5 meter
Sample Collection Method: Core: Sleeved & Boxed

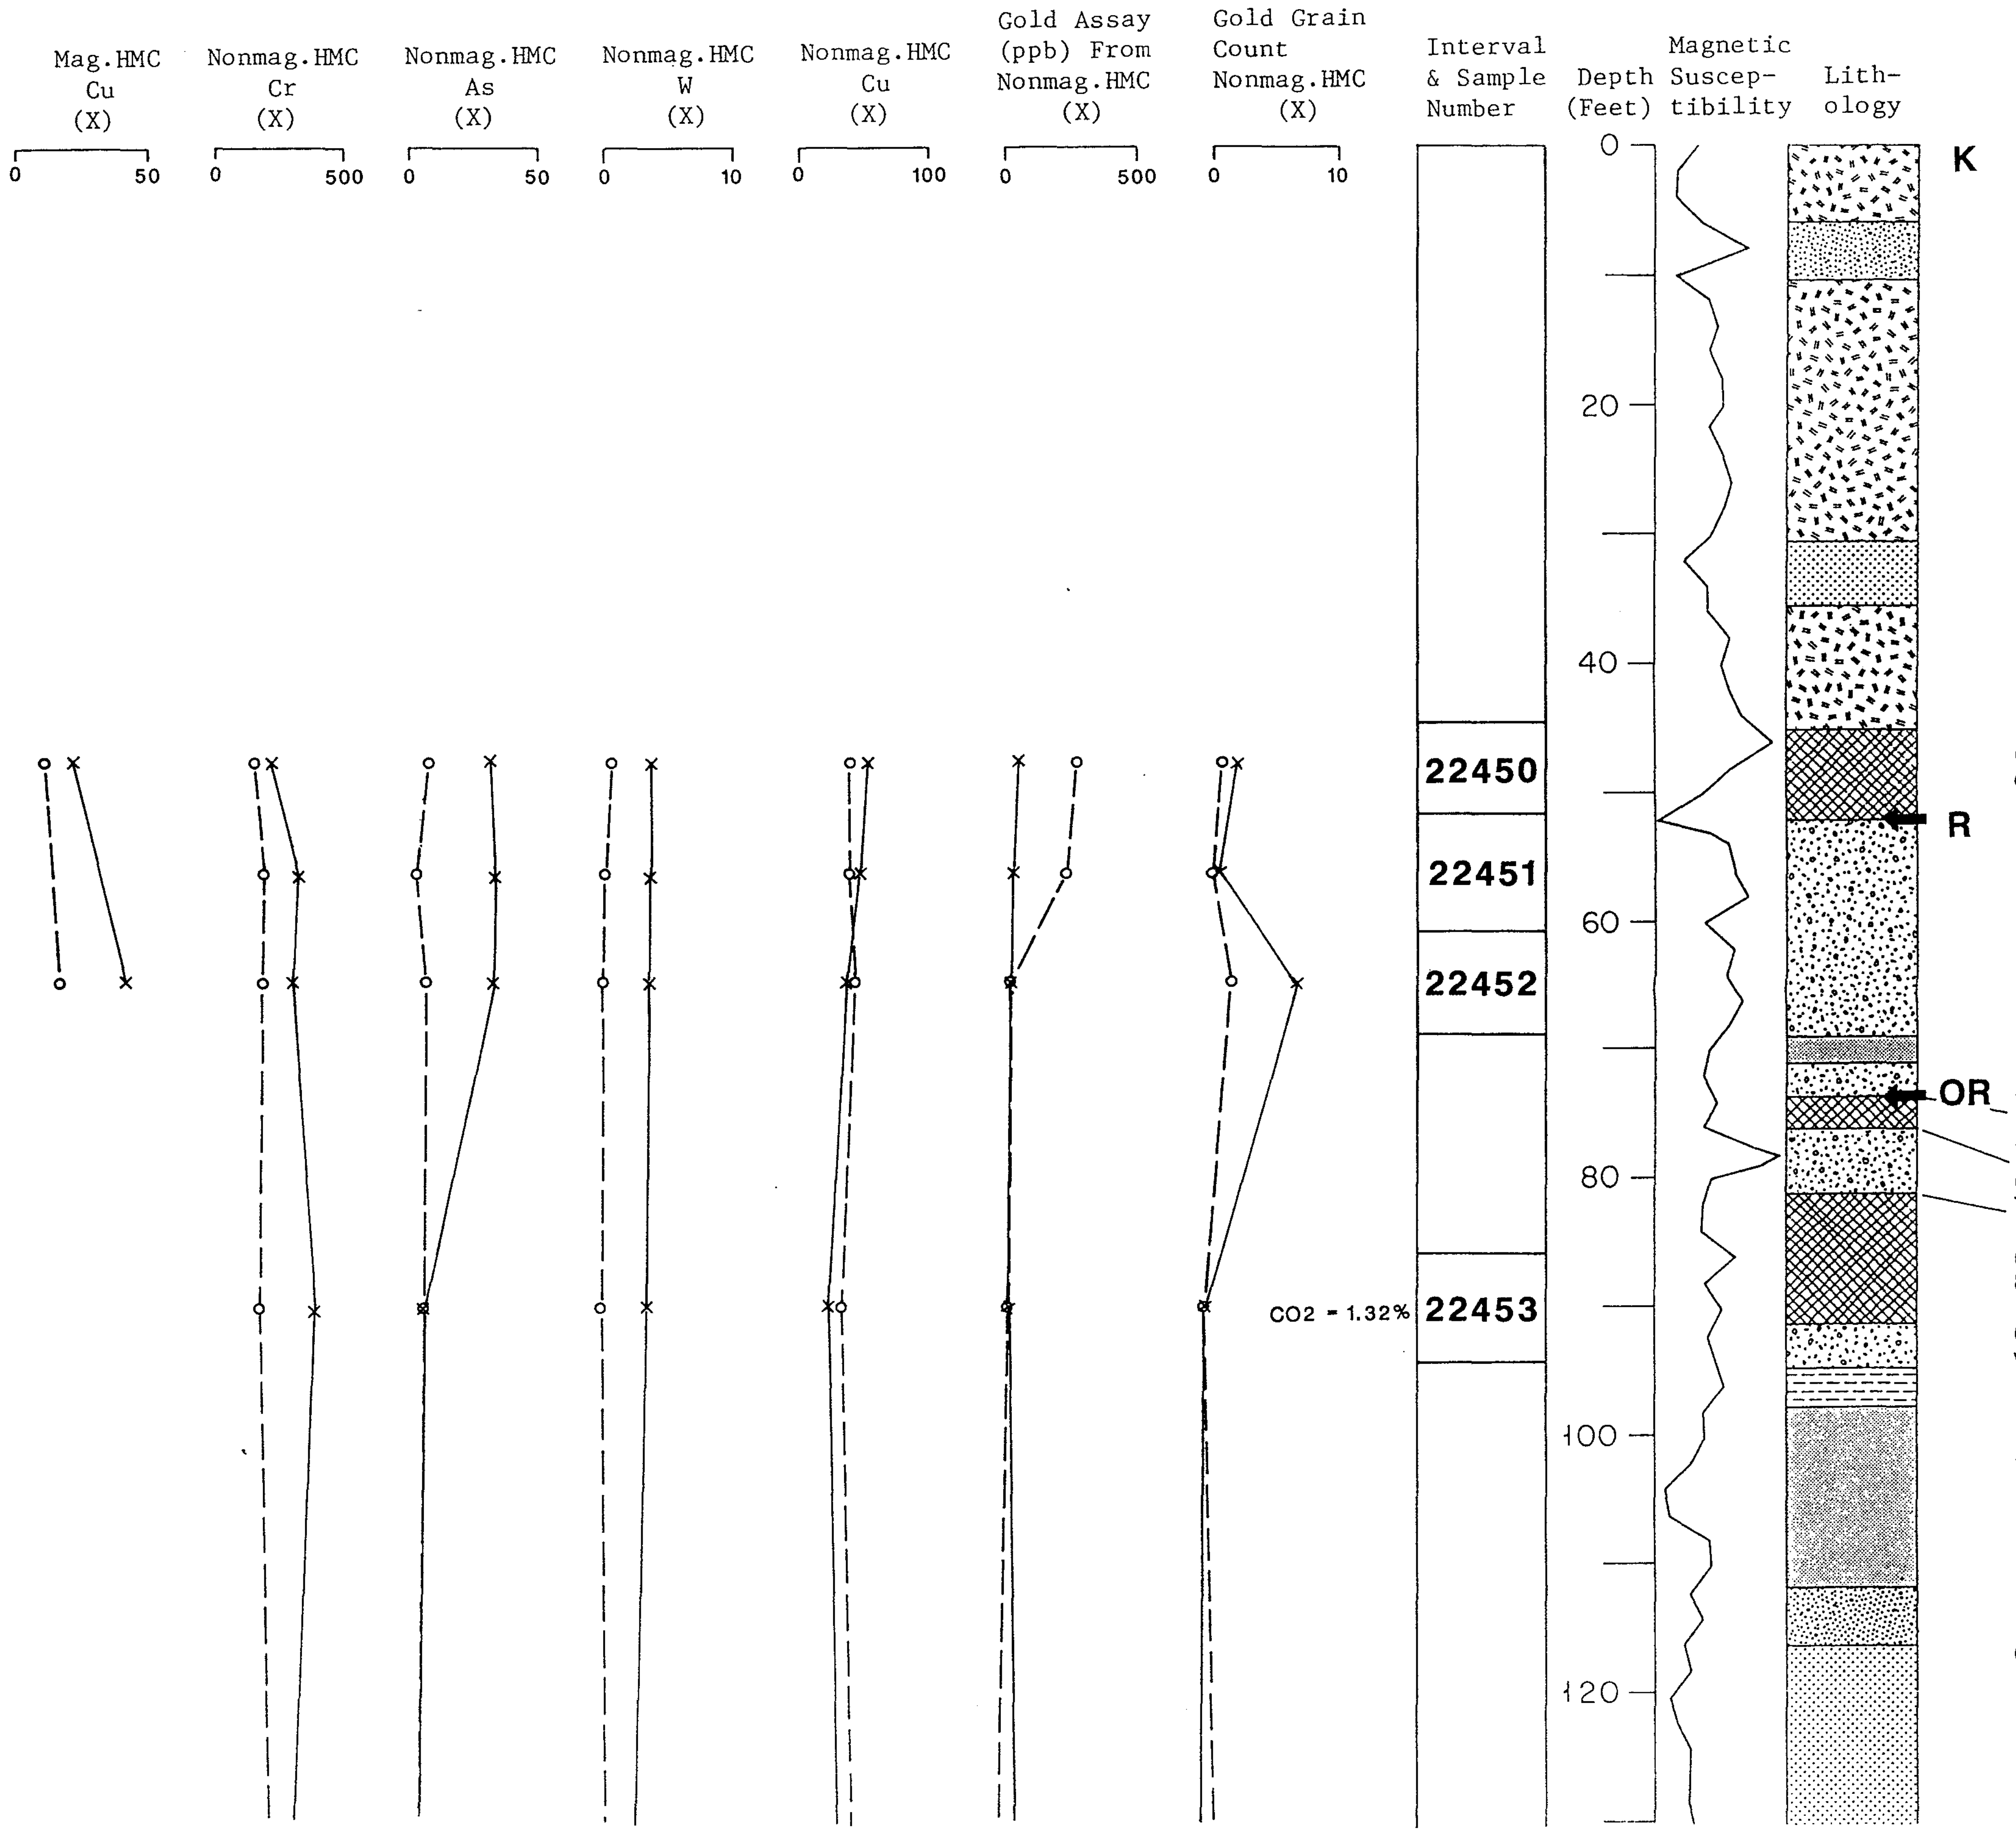
OB-325



Geologic Descriptions

(0 - 6) CLAY TILL; OXIDIZED; 0 - 1 ft little fill over organic clay loam; leached to about 4; sh pebs.

(6 - 10 1/2) GRAVELLY COARSE SAND; OXIDIZED; silty; abrupt upper contact, gradational lower contact.

(10 1/2 - 30 1/2) CLAY - CLAY LOAM TILL; UNOXIDIZED; calc; thin pebbly lenses 16 1/2 - 17 ft; cobs at 17, 25, & at base; sand lens near base.

(30 1/2 - 35 1/2) FINE - MEDIUM SAND; 30 1/2 - 31 1/2 ft fgr & pebbly; mgr to 33 1/2; pebbly cgr sand in last 1/2 ft.

(35 1/2 - 45) CLAY LOAM TILL; UNOXIDIZED; more grit, more compact than above till; clay loam to loam by 40 ft.

(45 - 52) LOAM TILL; UNOXIDIZED; calc; compact; sandy bed at fairly abrupt upper contact; two large cobs at base.

(52 - 69) SANDY LOAM TILL; UNOXIDIZED; calc to mod calc; compact; sand lenses at 55 1/2 ft, 57 ft; cobs fairly common to 62; few big carb pebs noted below 63 1/2.

(69 - 71) SILTY FINE SAND; some coarser grains; sm cob at 71 ft.

(71 - 73 1/2) LOAMY SAND TILL; UNOXIDIZED; mostly fgr sand; some carb pebs; last 1/2 foot mostly loamy sand.

(73 1/2 - 76) LOAM TILL; UNOXIDIZED; calc; compact; grnish gray; organic blebs near top; appears mottled in upper part; sandy silt bed at 75 ft.

(76 - 81) SANDY LOAM - SANDY CLAY LOAM TILL; UNOXIDIZED; calc; cobs at 76 1/2, 77 1/2 ft; carb fairly common.

(81 - 91) LOAM TILL; UNOXIDIZED; 81 - 81 1/2 ft sandy silt; compact; clayey beds at 83, 84; lake clay 87 - 88; clay or v clayey beds at 90.

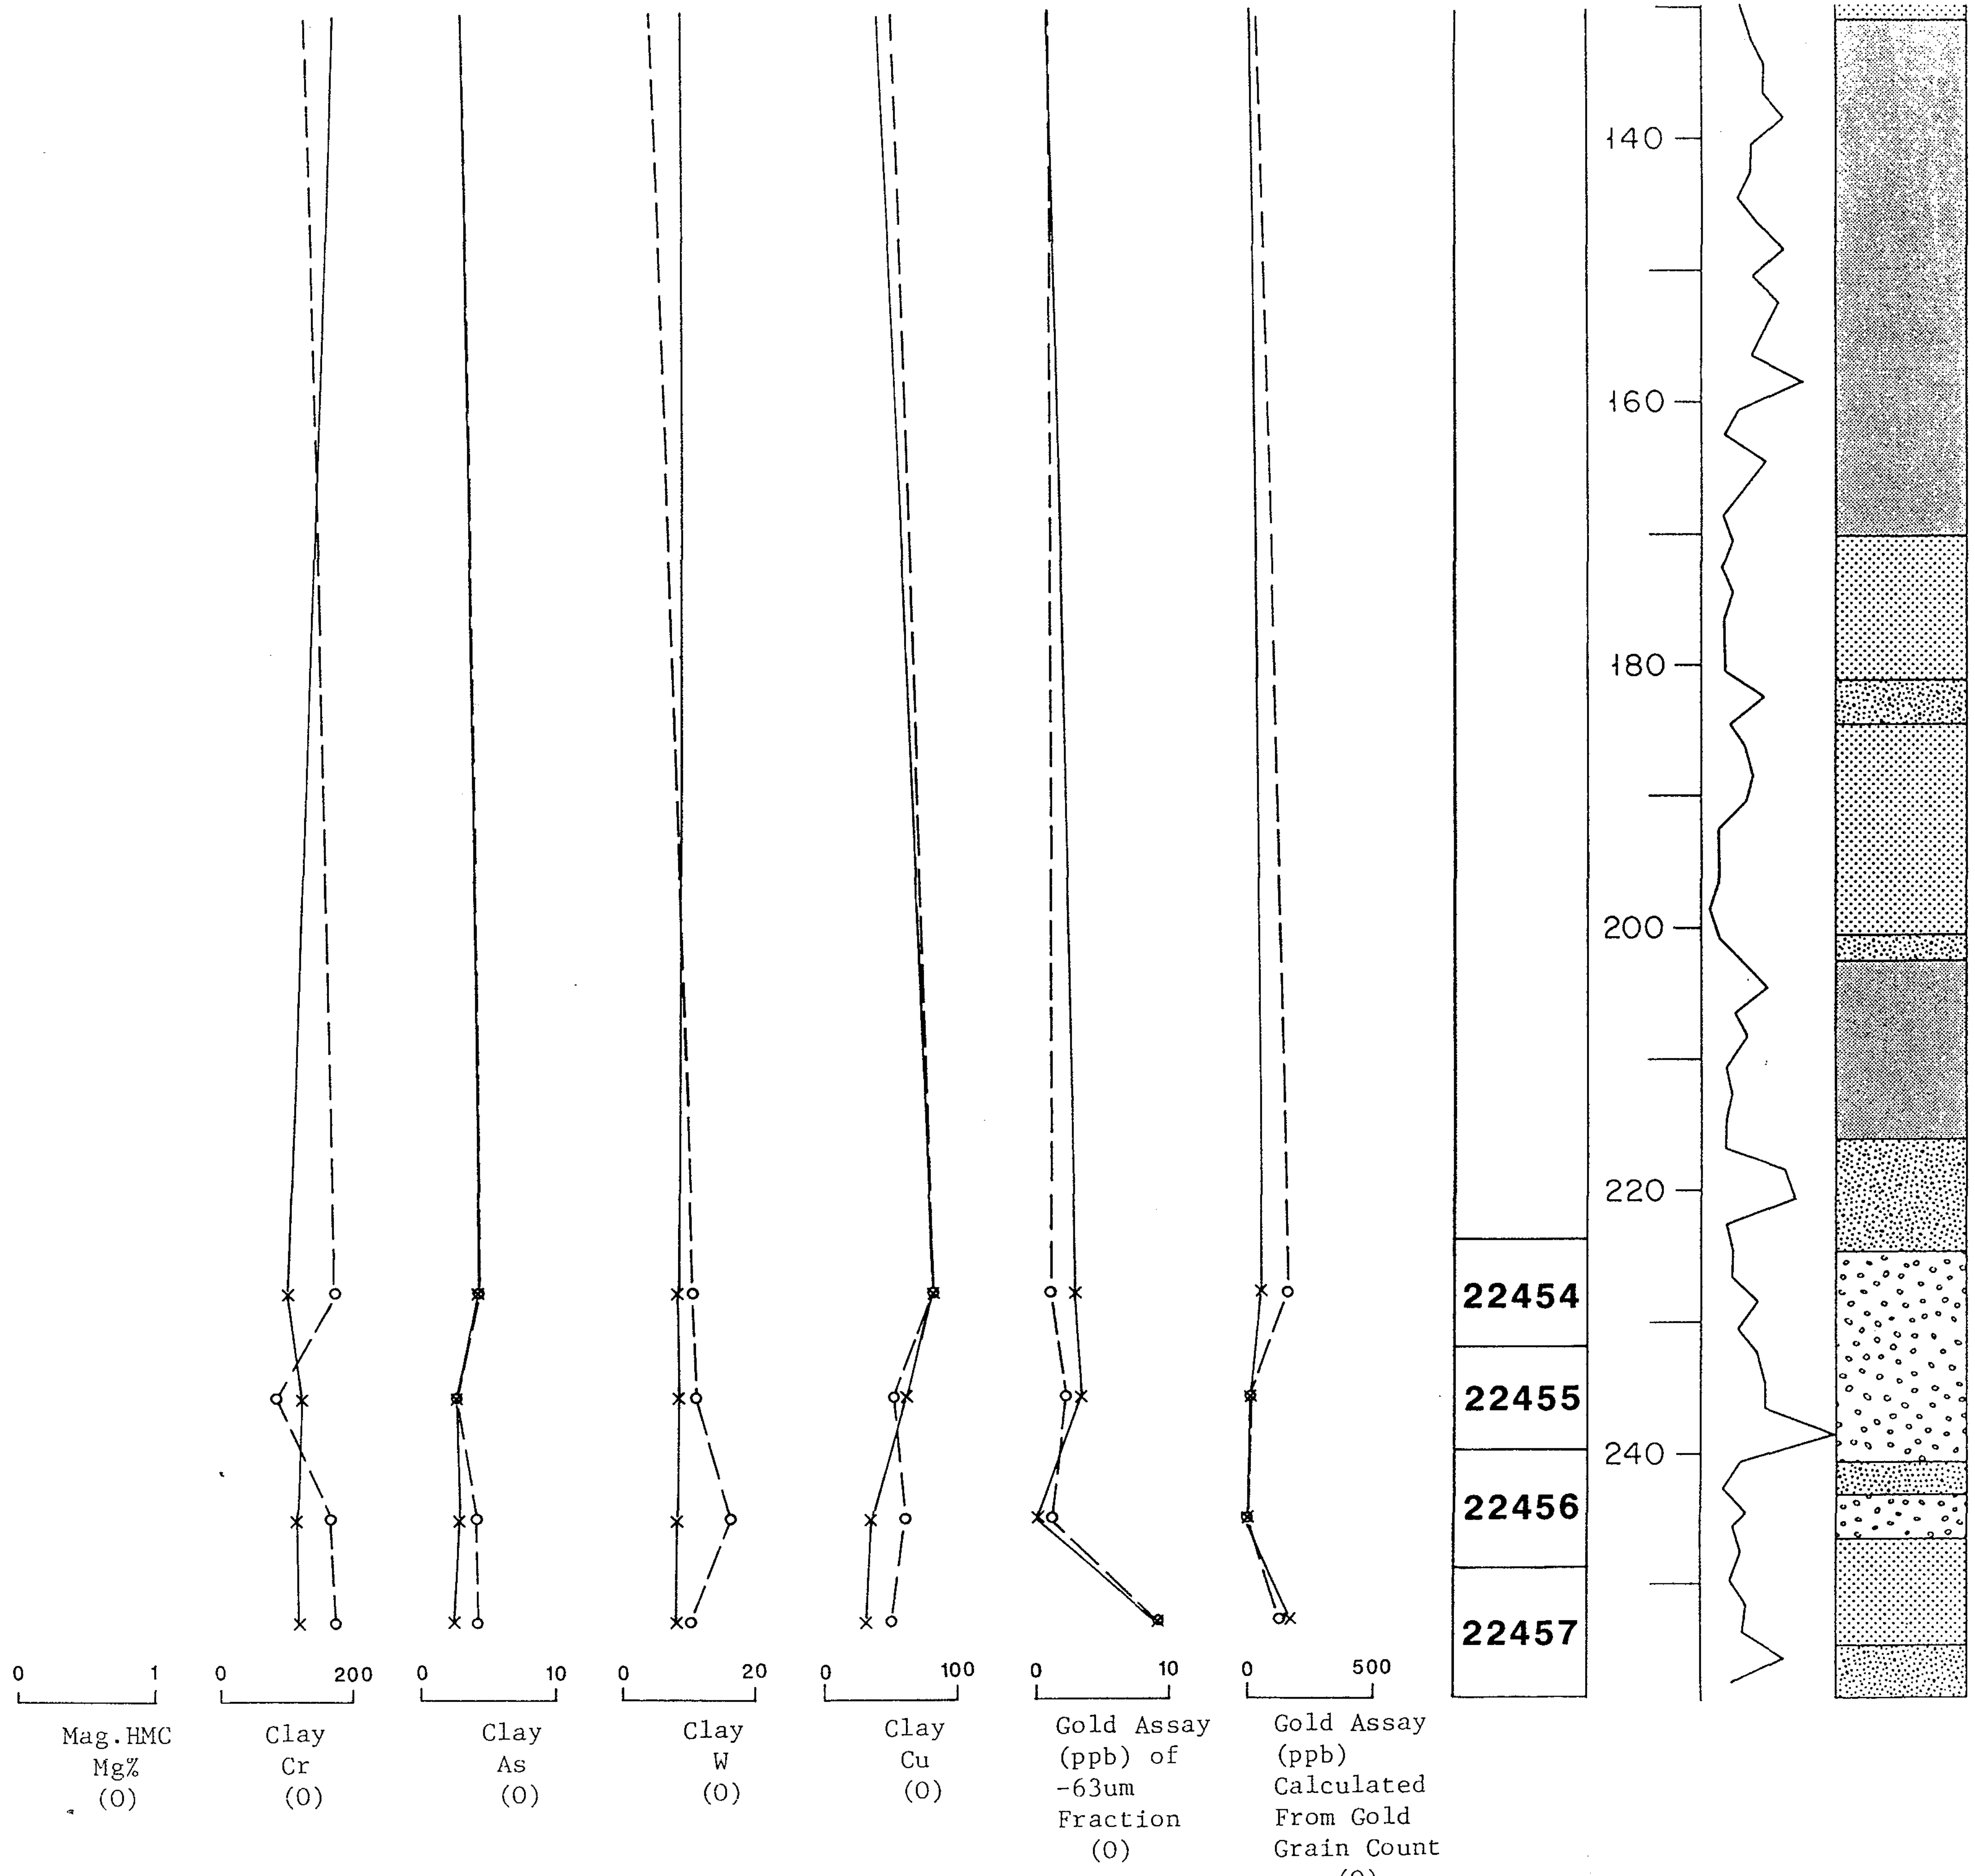
(91 - 94 1/2) SANDY LOAM TILL; UNOXIDIZED; compact; boulder 91 - 92 ft; interbedded w/sandy silt in lower foot or more.

(94 1/2 - 97 1/2) SANDY SILT; UNOXIDIZED; silt bed at base.

(97 1/2 - 111 1/2) FINE SAND; UNOXIDIZED; silt beds from 100 - 101 ft; v fgr 106 - 110, fgr at 110; 110 - 111 1/2 grnish-gray silt.

(111 1/2 - 116) GRAVELLY COARSE - VERY COARSE SAND; UNOXIDIZED; fgr to cgr sand to 113 ft; large peb at 114 1/2, most pebs sm.

(116 - 130 1/2) COARSE - VERY COARSE SAND; few gnl.



(130 1/2 - 169 1/2) FINE SAND; UNOXIDIZED; v fgr 136 - 139 ft; v fgr bed at 143; 148 - 158 1/2 v fgr w/cgr lam at base; fgr to mgr 162 - 164 1/2; grnish-gray v fgr to fgr sand 164 1/2 - 166.

(169 1/2 - 180 1/2) VERY COARSE SAND; some gnl; carb not real common; cgr to v cgr by 177 ft.

(180 1/2 - 184) VERY COARSE SAND, GRANULES, FINE GRAVEL; cob & large peb at 182 ft; large peb layers at 183, 184.
(184 - 191) VERY COARSE SAND; little more silt than above; few pebs.

(191 - 200) MEDIUM - COARSE SAND; v cgr bed at 192 ft; cgr w/gnl 195 1/2 - 196 1/2

(200 - 202) GRAVELLY COARSE SAND.

(202 - 215 1/2) VERY FINE - FINE SAND; v fgr 205 1/2 - 206 ft; mostly fgr in last foot.

(215 1/2 - 224) GRAVELLY MEDIUM - COARSE SAND; 216 1/2 - 218 ft cgr sand w/peb layers; 218 - 218 1/2 gvl, fair amount of carb pebs; 220 - 222 cgr sand & fine gvl, lot of dark pebs, uncommon carb; mgr sand 222 - 223; pebbly cgr sand to base.

(224 - 240) GRAVEL; cobbly in upper foot, rather poorly sorted; carb uncommon, lot of dark pebs; poorly sorted cobbly gvl w/fgr sand matrix from 233 ft; more silty from 237, approaching loamy sand matrix.

(240 - 242 1/2) GRAVELLY COARSE SAND; better sorted than above; cob at 241 ft.
(242 1/2 - 246) COBBLY COARSE SAND; ball of saprolite; sandy till (?) ball at base.

(246 - 254) COARSE SAND; UNOXIDIZED; few pebs.

(254 - 258) GRAVELLY COARSE SAND; large pebs & till balls 254 - 255 ft; cobbly 255 - 256.

Appendix 1-19C.

Appendix 1-20A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-326
Drilling Completion Date: 6/2/88

LOCATION (see map at right)
S-T-R: NW¼-NW¼ - S14 - T150N - R27W
County: Itasca
Quadrangle: Coddington Lake 7.5
Regional Survey Area: Effie
UTM Coordinates: 419,440mE; 5296350mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1357 ± 3 ft.
Total Depth: 275 ft.
Elevation, Top of Precambrian Bedrock: 1110? ft.
Elevation, Top of Saprolite: 1122 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

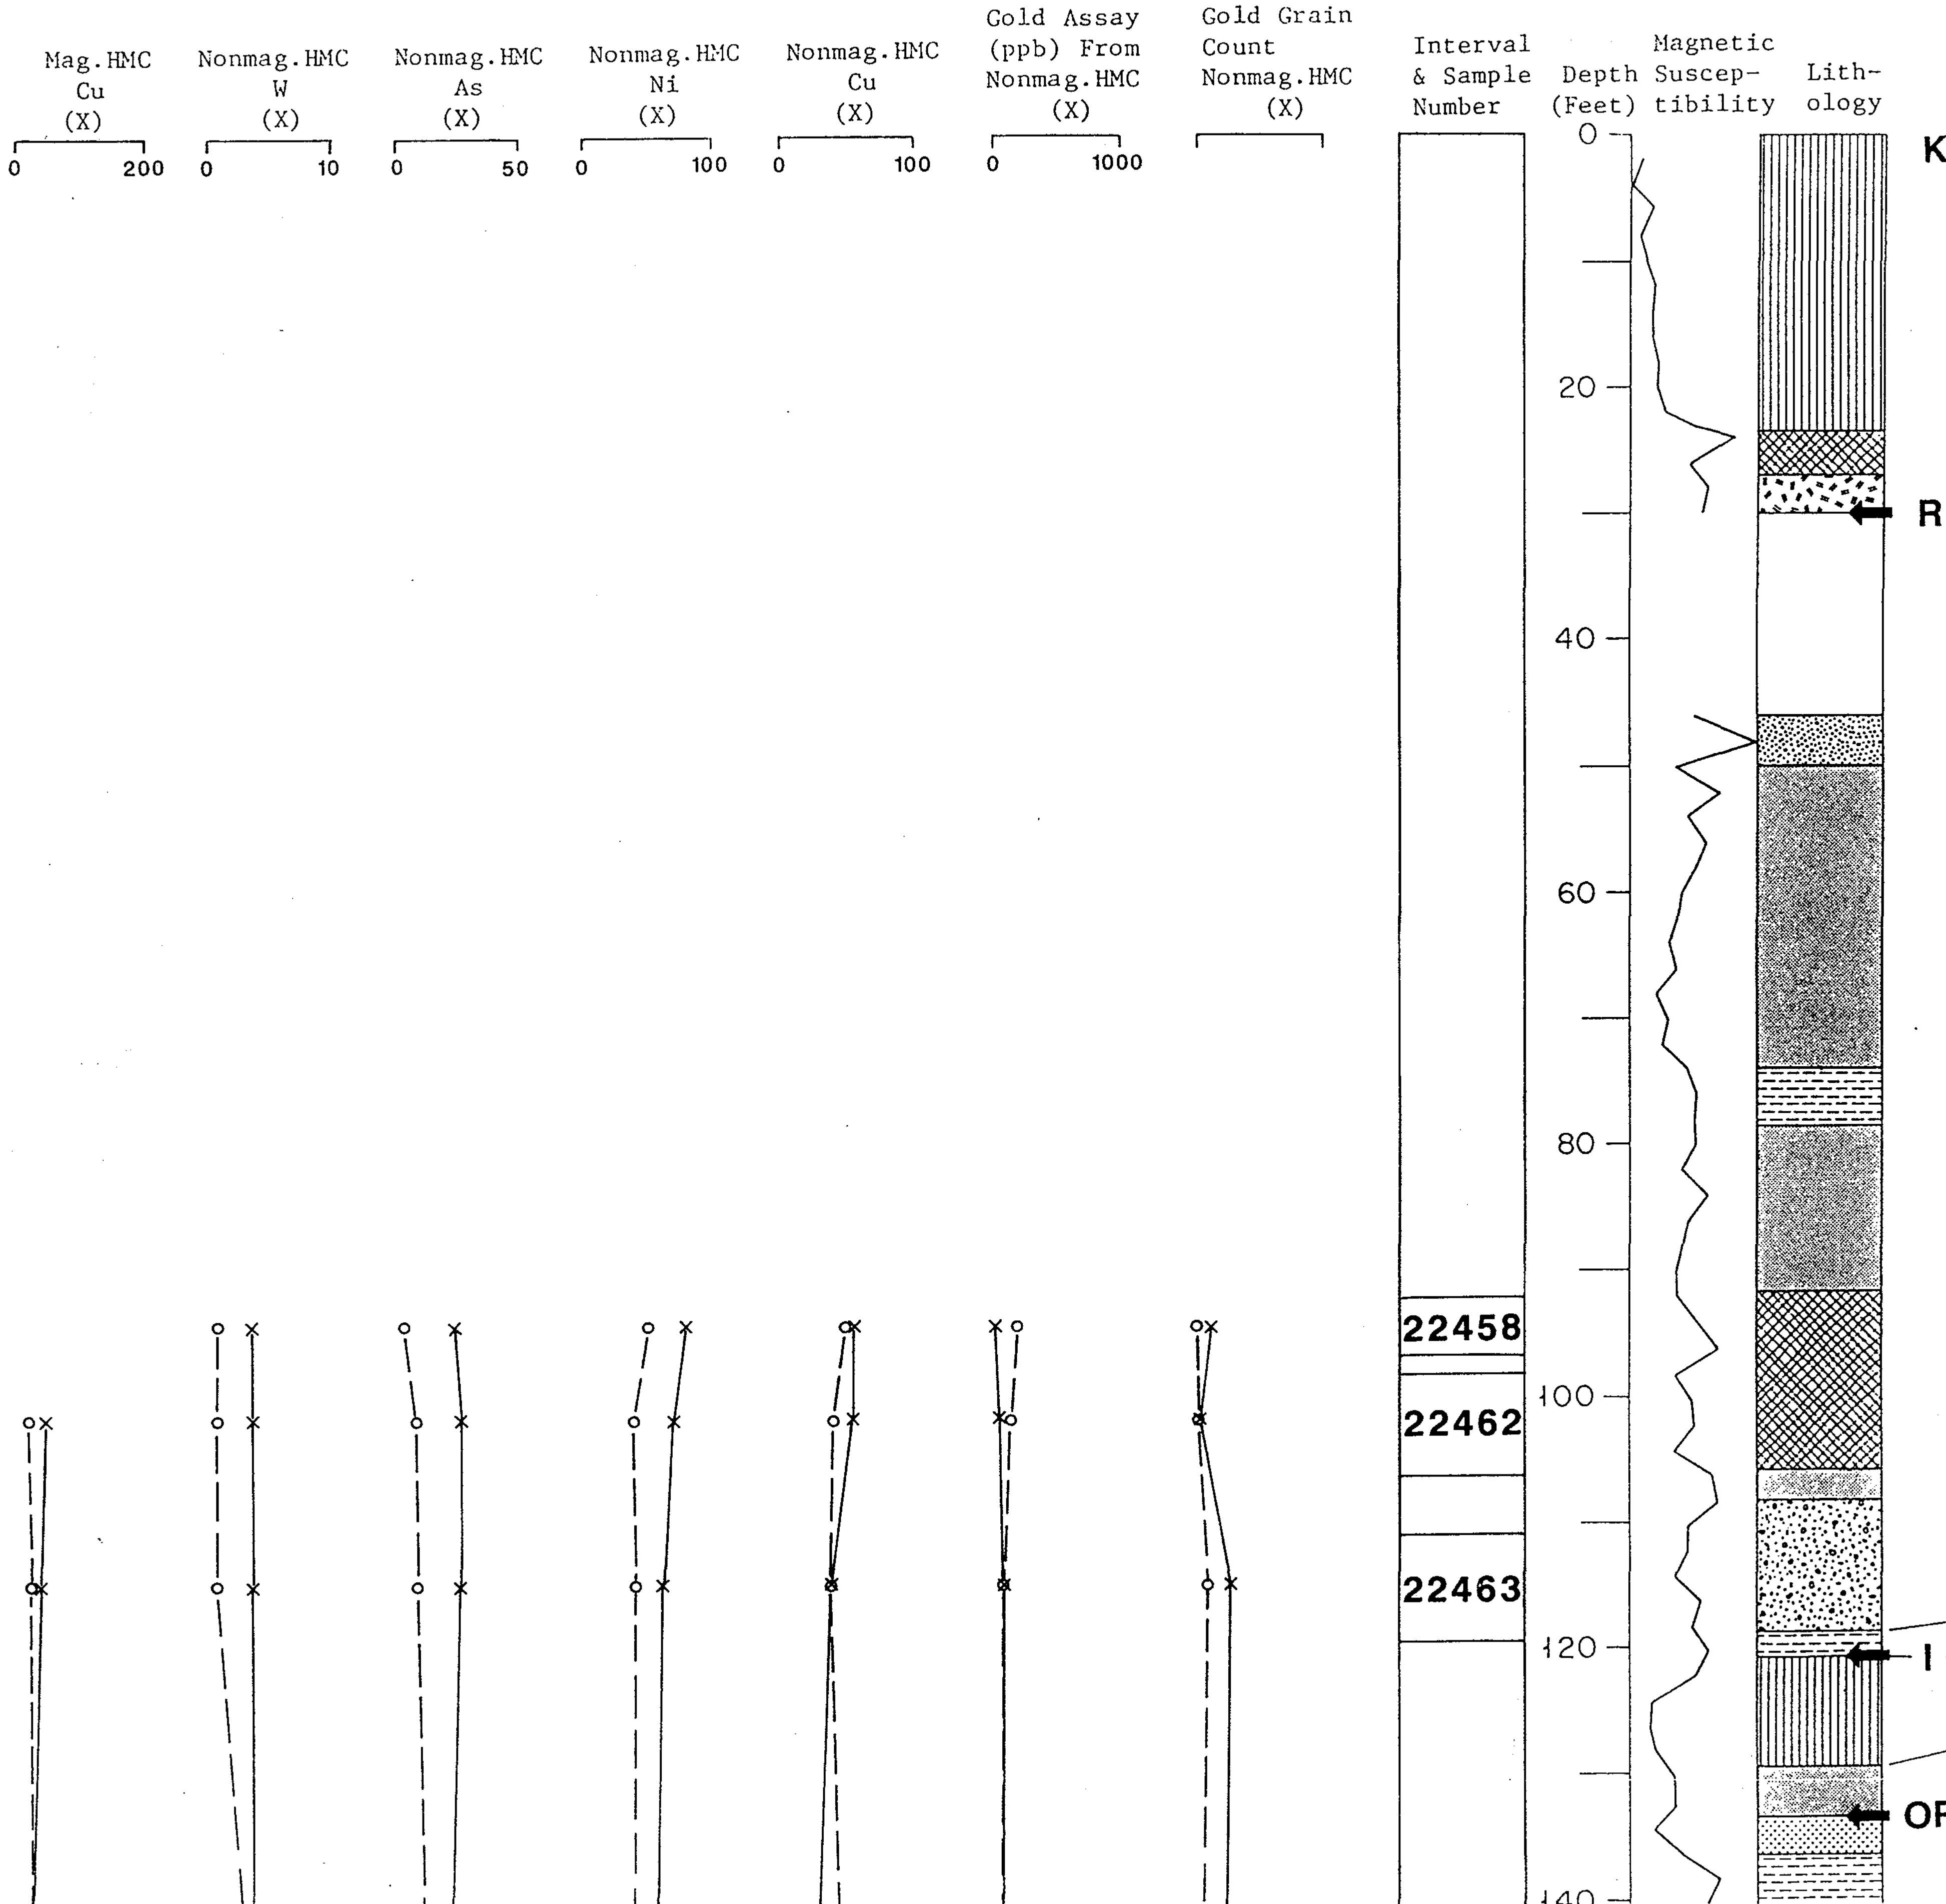
Core Description: White to very light greenish and brownish gray, aphanitic schist. Strongly cleaved at about 75° (S1). A second cleavage crenulates S1 and dips about 50°. The acute angle between S1 and S2 is about 55°. This likely is a weathered "fault rock". Protolith may have been argillite or tuff, however the extent of deformation precludes positive interpretation.

Thin Section Description: OB-326, 254 ft. Strongly foliated, crenulated quartz-sericite-chlorite schist. Estimated mode (volume %): Quartz 49%; Chlorite (Mg) 39%; Sericite 10%; Rutile 1-2; Apatite Tr. Crenulation cleavage (S2), at 40° to foliation (S1), is defined by bending of S1-parallel sericite and chlorite, and neocrystallization of muscovite parallel to S2 crenulation. Abundant fine-grained subhedral, equant to slightly prismatic crystals of rutile follow the S1 fabric; also, clusters of anhedral broken apatite are common, and tend to be strung out along the S1 foliation direction. The protolith of this rock is probably a highly sheared and/or hydrothermally altered volcanic. X-ray diffraction indicated that chlorite is a magnesium variety, and that sericite and rutile are present.

Scintillometer Reading (cps): 35-50

OB-326

Appendix 1-20B.



Geologic Descriptions

(0 - 23 1/2) CLAY - SILTY CLAY; OXIDIZED; leached to 1 foot; massive; v few sand grains; carb gnl at 13 1/2, 19 ft.

(23 1/2 - 27) LOAM TILL; OXIDIZED; calc; unox 23 1/2 - 25 ft; pebbly sand lens at 25, sand lens near 25 & at 27.

(27 - 30) CLAY LOAM TILL; UNOXIDIZED; calc; coarse silt in last few inches, prob lake sed.

(30 - 46) NO CORE

(46 - 50) GRAVELLY SAND; fgr to mgr sand 46 - 47 1/2 ft; cob at 49.

(50 - 74) VERY FINE SAND; UNOXIDIZED; interbedded w/silty,v fgr sand; v fgr to fgr from 62 1/2 ft; v fgr from 72.

(74 - 78 1/2) SANDY SILT; UNOXIDIZED; grnish-gray loam till in upper foot; 75 - 76 silt grading to fine sand; mostly v fgr sand towards base.

(78 1/2 - 91 1/2) VERY FINE SAND; silt lam in places; v fgr to fgr by 86 ft; 88 1/2 - 91 1/2 fgr to mgr sand.

(91 1/2 - 105 1/2) LOAM - SANDY LOAM TILL; UNOXIDIZED; grnish gray to 96 ft; mod calc to calc; mostly silt & fine sand but few pebs; grades to sand by 96, fgr to mgr sand to 97, v fgr sandy silt to 97 1/2; mod calc till as above from 97 1/2; v fgr sand bed at 98; large peb at 100; cob at 103; pebbly fine sand bed at 103 w/sev large pebs incl carb; if is till is reworked sandy silt lake sed; grades into silty, pebbly sand at base.

(105 1/2 - 108) SILTY FINE SAND; many coarser grains up to gnl.

(108 - 118 1/2) SANDY LOAM TILL; UNOXIDIZED; mod calc to calc; cobbly gvl w/silty fine sand matrix to 108 1/2 ft, v sandy till w/only sm pebs to 110; cob at 110, hard sandy till below; cobs at 111, 111 1/2; loamy spot at 113, increasing carb pebs w/depth; sand lenses 115 - 115 1/2.

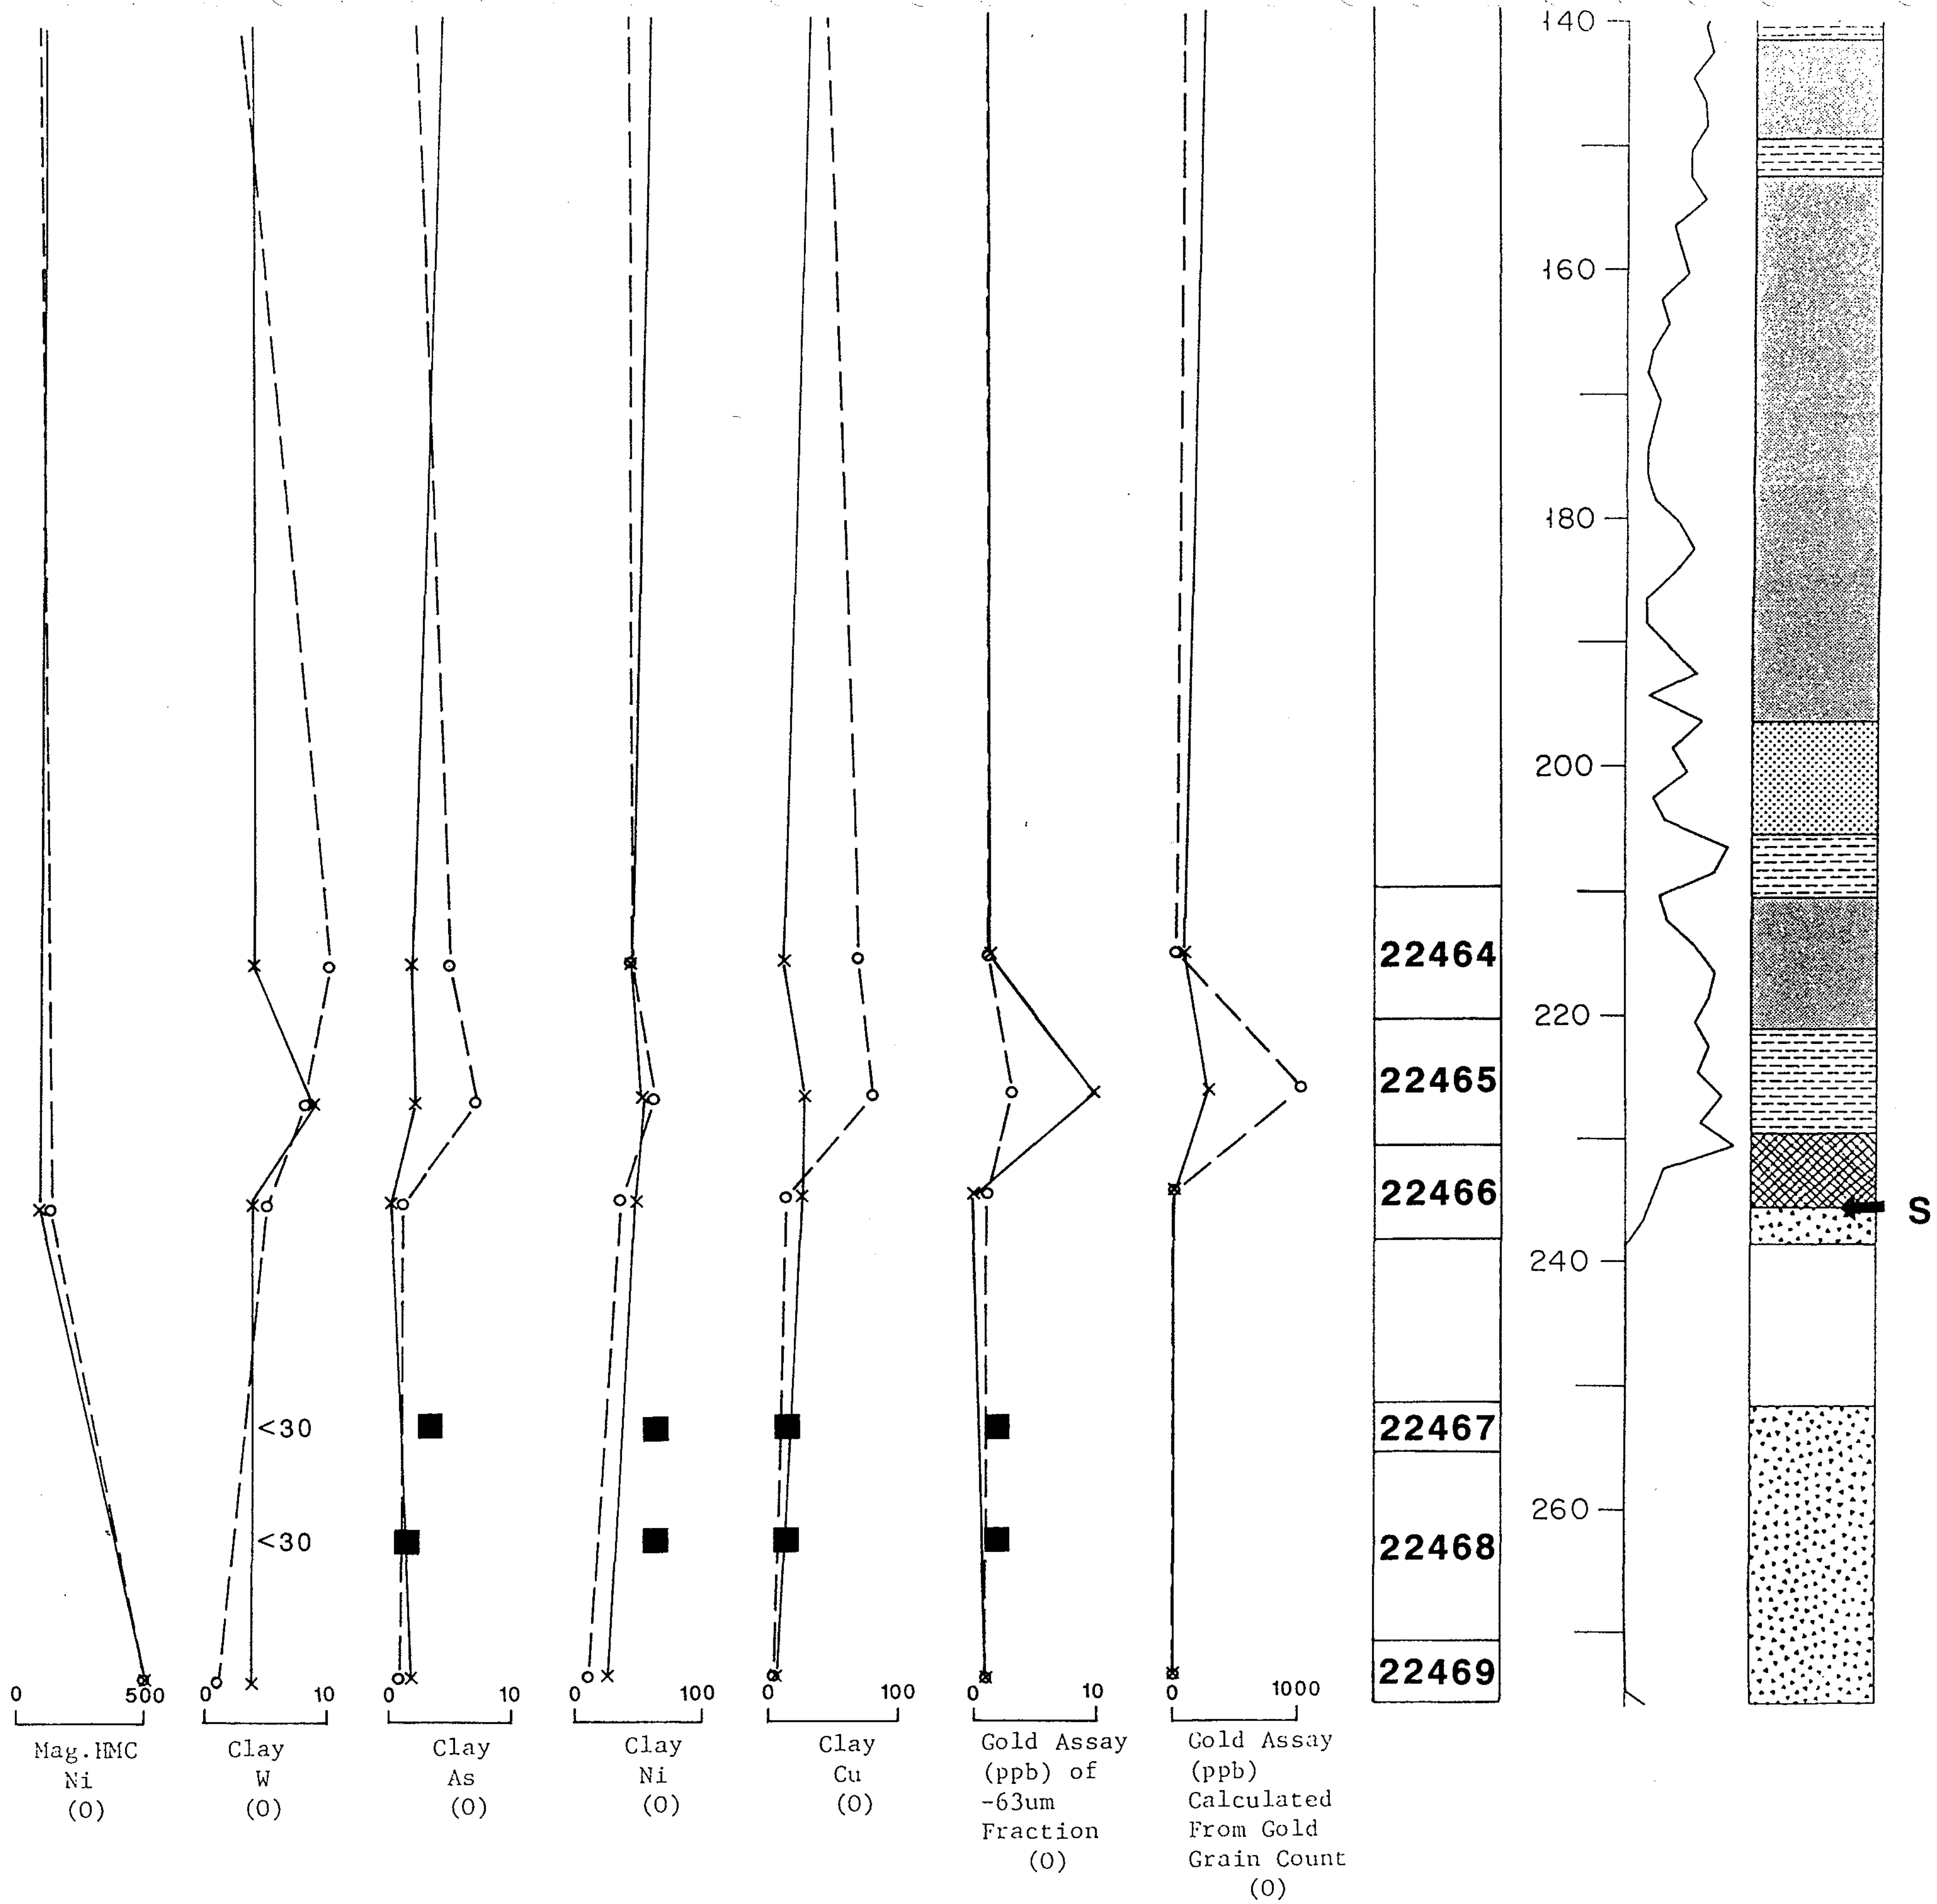
(118 1/2 - 120 1/2) SILT & SANDY SILT; UNOXIDIZED; sl to mod calc; organic rich w/few sm twig fragments; 118 1/2 - 119 mgr sand w/cob at base.

(120 1/2 - 129) CLAY; UNOXIDIZED; mottled; calc; large cob at top within sandy loam lens; hard; sandy lam at 124 1/2 ft, much sand grains in clay below to 125; clay loam texture in last foot, much fine sand.

(129 - 133) SILTY FINE SAND; UNOXIDIZED; dark brown sandy silt bed at 130 ft prob contains disseminated organics; silt bed at 131; some coarser sand grains by 132; ox in places.

(133 - 136) MEDIUM - COARSE SAND; UNOXIDIZED; cob at 135 ft, also few pebs & grnish-gray noncalc loamy till (?) ball; cob and sev large pebs at base.

(136 - 141) VERY FINE, SANDY SILT; UNOXIDIZED; non calc.



(141 - 149) SILTY, VERY FINE SAND; UNOXIDIZED.

(149 - 152) VERY FINE, SANDY SILT; UNOXIDIZED.

(152 - 196) FINE SAND; some medium grains to 155 ft; fgr to mgr 159 - 162; v fgr bed, 163 - 164, at 171 1/2, & from 173 - 176 1/2; v fgr to fgr 176 1/2 - 181; v fgr to 185; v fgr to fgr to base; silty, v fgr beds at 194, 196.

(196 - 205) MEDIUM SAND; some coarse grains; coarse beds by 201 ft, also fine sand in places; 204 - 205 fgr sand w/silty v fgr bed.

(205 - 210) VERY FINE, SANDY SILT; UNOXIDIZED; mod calc; silty v fgr sand bed at 206 1/2 ft; fgr sand lenses at 208, some silty v fgr sand lam below.

(210 - 220 1/2) VERY FINE SAND; silty by 218 1/2 ft; couple gnl at base.

(220 1/2 - 229) VERY FINE, SANDY SILT; UNOXIDIZED; grnish gray; mod calc; few coarser grains; silt by 226 ft.

(229 - 235) GRAVELLY LOAM - SILT LOAM TILL; UNOXIDIZED; sl calc; prob saprolite incorporated above 230 1/2 ft, below is mostly reworked sandy, rocky clay saprolite w/smears of sl calc loam w/erratic clasts; large carb peb at 230; sandy zone at 230 1/2.

(235 - 238) REWORKED SAPROLITE; sev large erratic pebs 235 - 237 ft.

(238 - 251) NO CORE

(251 - 275) SAPROLITE; QUARTZ-SERICITE SCHIST; fgr; strongly foliated, crenulated; apar in place rock & saprolite by 251 ft.

Appendix 1-20C.

Appendix 1-21A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-327
Drilling Completion Date: 6/6/88

LOCATION (see map at right)
S-T-R: SE¼-NW¼, S36 - T152N - R27W
County: Koochiching
Quadrangle: Mizpah NE 7.5
Regional Survey Area: Effie
UTM Coordinates: 421,500mE; 5310460mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1340 ± 2 ft.
Total Depth: 271 ft.
Elevation, Top of Precambrian Bedrock: <1069 ft.
Elevation, Top of Saprolite: 1121 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

INFORMATION SUMMARY

Interval (ft.)	Interpretation	Library Samples Available	Subsamples Tested	Geochem Assays Worthy of Further Review
0-61.5	Kooch. lobe gl. drift	G		
61.5-153.5	Rainy lobe gl. drift	B,C,G	A,B,C	B=Au,Ag,W C=Mo
153.5-220	Old Rainy lobe gl. drift	B,C,G	A,B,C	B=W C=Mo
220-242.5	Saprolite	B,C,G	A,B,C,J	C=Ag,Cu,Co
242.5-259	Sound bedrock	G,H	I	

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

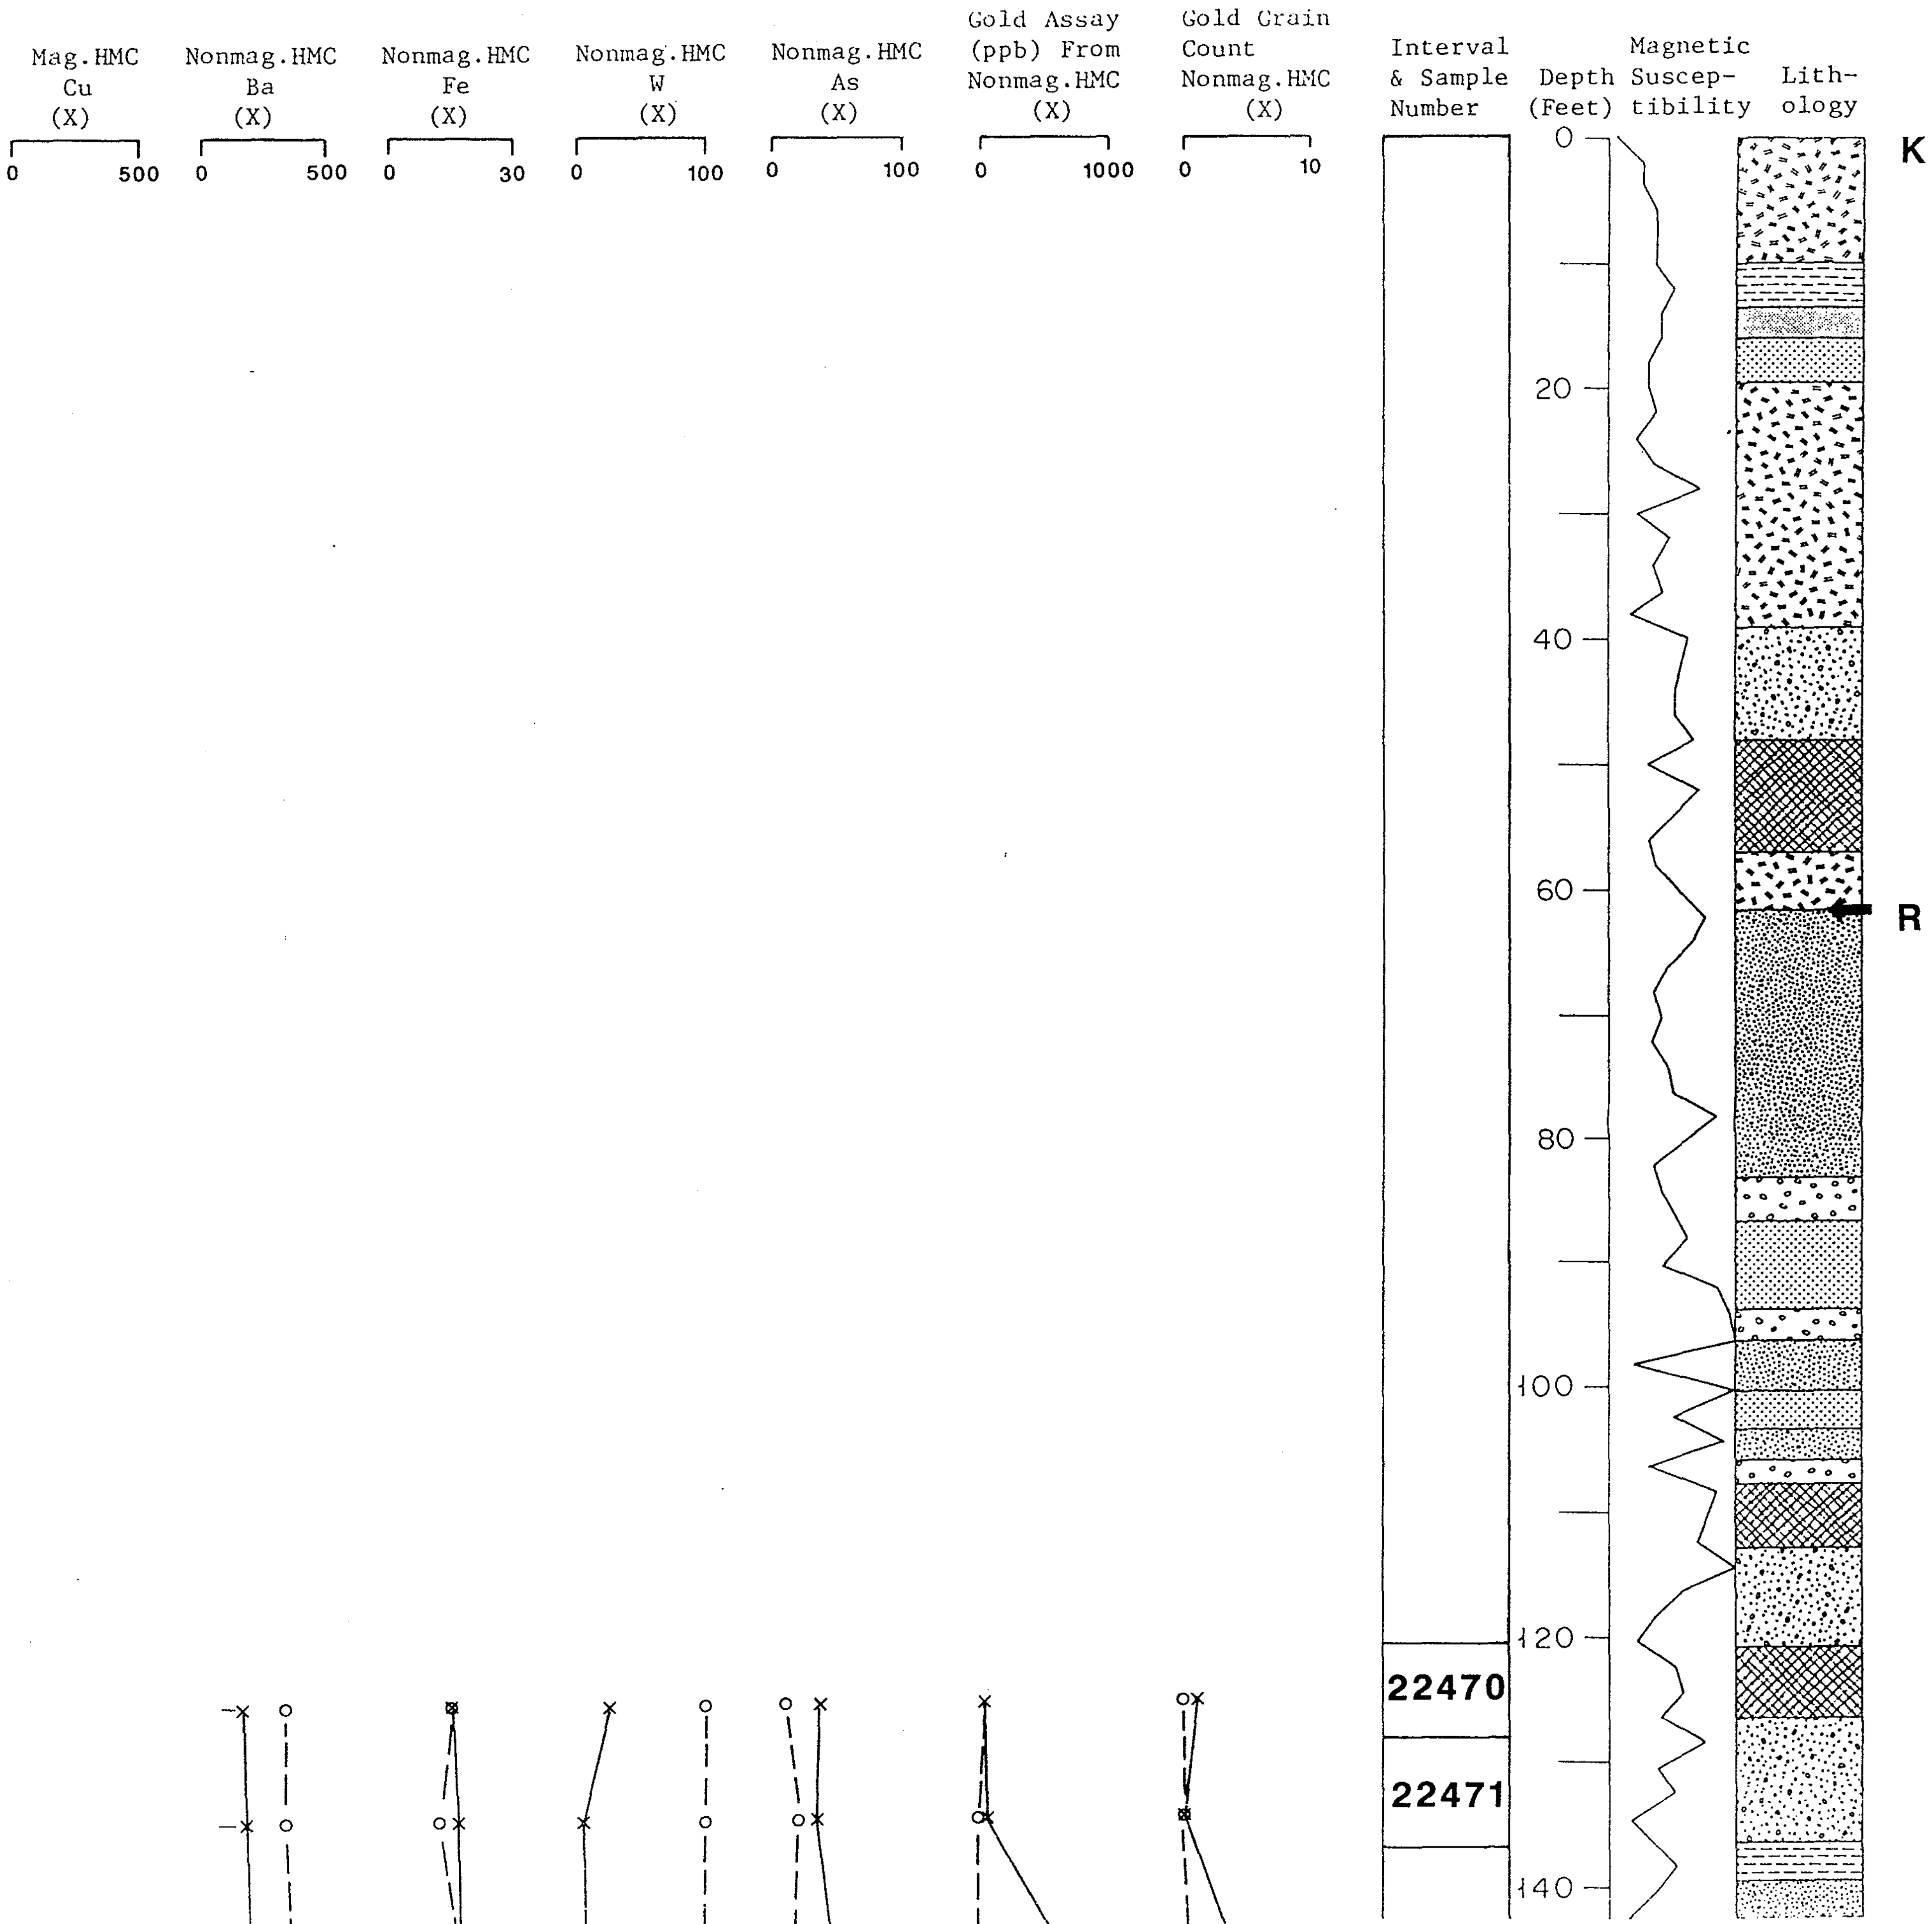
BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Weathered tonalitic rock; contains zones of pristine-igneous textured clay saprolite and sound rock apparently of same composition. The extent and distribution of weathering appears related to jointing rather than different compositions. Thin section was taken from least weathered rock (254'). A weak lineation defined by irregular clots of quartz dips about 85°. Overall fabric appears largely metamorphic. A few thin zones ofreddish oxidized feldspar trend parallel to this lineation. Rock contains 1% fine disseminated pyrite (not confirmed by petrography). Magnetic Susc. 0.02 - 0.06 x 10-3 CGS.

Thin Section Description: OB-327, 264.5 ft. Coarse-grained tonalite or trondhjemite (Streckiesen classification). Estimated mode (volume %): Plagioclase (albite/oligoclase?) 51%; Quartz 35%; Biotite 6%; Epidote 1%; Hornblende (?) alteration assemblage 6%; Sphene Tr; Calcite Tr; Apatite Tr; Chlorite 1%. Partially recrystallized and retrograded tonalite. Larger plagioclase crystals are 2-6 mm across, zoned, blocky, altered to epidote, sericite, and chlorite in cores. Myrmekitic quartz intergrowths are common near grain edges and in smaller plagioclase grains, and many of the plagioclase grains are cut by zones of recrystallization to granoblastic quartz/feldspar. Smaller blocky plagioclase crystals occur with granoblastic quartz in the matrix, these are probably the result of granulation/recrystallization. Most of the quartz occurs as large, strained, coarsely recrystallized grains. Biotite is green and partially altered to chlorite; and hornblende pseudomorphs are composed of brown, birefringent clay material, a colorless, fibrous mineral (antigorite?), calcite, and minor chlorite. The rock is cut by several tight anastamosing fractures which have little effect on the rock except to induce slight retrograde metamorphism. Relatively large enhedral epidote crystals are found along these fractures. The slide was stained for K-feldspar, with negative results.

Scintillometer Reading (cps): 70-80

OB-327 **Appendix 1-21B.**



Geologic Descriptions

(0 - 10) CLAY TILL; OXIDIZED; leached to 2 ft; little peat on top; sandy lens at 2 1/2; carb common, noted sh; clay loam by 8 w/more pebs; sm carb cob at base.

(10 - 13 1/2) VERY FINE, SANDY SILT; OXIDIZED; till lens at 11 1/2 ft.

(13 1/2 - 16) SILTY, VERY FINE SAND; OXIDIZED; fgr by 15 ft.

(16 - 19 1/2) FINE - MEDIUM SAND; OXIDIZED; some coarse grains.

(19 1/2 - 39) CLAY TILL; UNOXIDIZED; calc; v fgr sand lense 20 1/2 - 23 1/2 ft & at 26; 28 - 29 1/2 v fgr sand; till more compact w/more silt, less pebbles from 29 1/2; few more pebs incl sh from 33; silty v fgr sand lens at 35, lam below to 35 1/2.

(39 - 48) SANDY LOAM TILL; UNOXIDIZED; calc; pebbly zone at top, large cob at 40 ft; carb pebs common, noted sh; sand lens at 44; less sandy w/depth.

(48 - 57) LOAM TILL; UNOXIDIZED; large peb at 51 1/2 ft, not many below; silty pebbly fgr sand bed at 56, sand lam to base.

(57 - 61 1/2) CLAY LOAM TILL; UNOXIDIZED; clast rich incl sh; sm carb cob near top; 60 - 61 ft silty pebbly sand w/two cobs.

(61 1/2 - 83) GRAVELLY COARSE SAND; UNOXIDIZED; silty to 70 ft; large carb peb near top, many large pebs from 65, sm cob at 66; carb pebs not very common; cgr gvl bed at 78.

(83 - 86 1/2) COBBLES; silty cgr sand & gvl matrix; dark pebs common, carb fairly common.

(86 1/2 - 93 1/2) SAND; mgr to 88 1/2 ft w/peb layer at base; fgr to 91 1/2 w/peb layer at base; cgr to 93 1/2.

(93 1/2 - 96) COBBLY COARSE SAND & GRAVEL; large cob at 94 1/2 ft & at base.

(96 - 100) COARSE SAND & GRAVEL; sl to mod calc, grnish-gray sandy silt bed at top; sm cob at 97 1/2 ft.

(100 - 103) COARSE SAND; large cob at base.

(103 - 105 1/2) COARSE SAND & GRAVEL.

(105 1/2 - 107 1/2) COBBLES; v silty coarse gvl from 106 1/2 ft.

(107 1/2 - 112 1/2) LOAM TILL; UNOXIDIZED; calc; carb pebs appear mr, increase w/depth; many large pebs to 109 ft; sm cobs at 111 1/2 & 112 1/2.

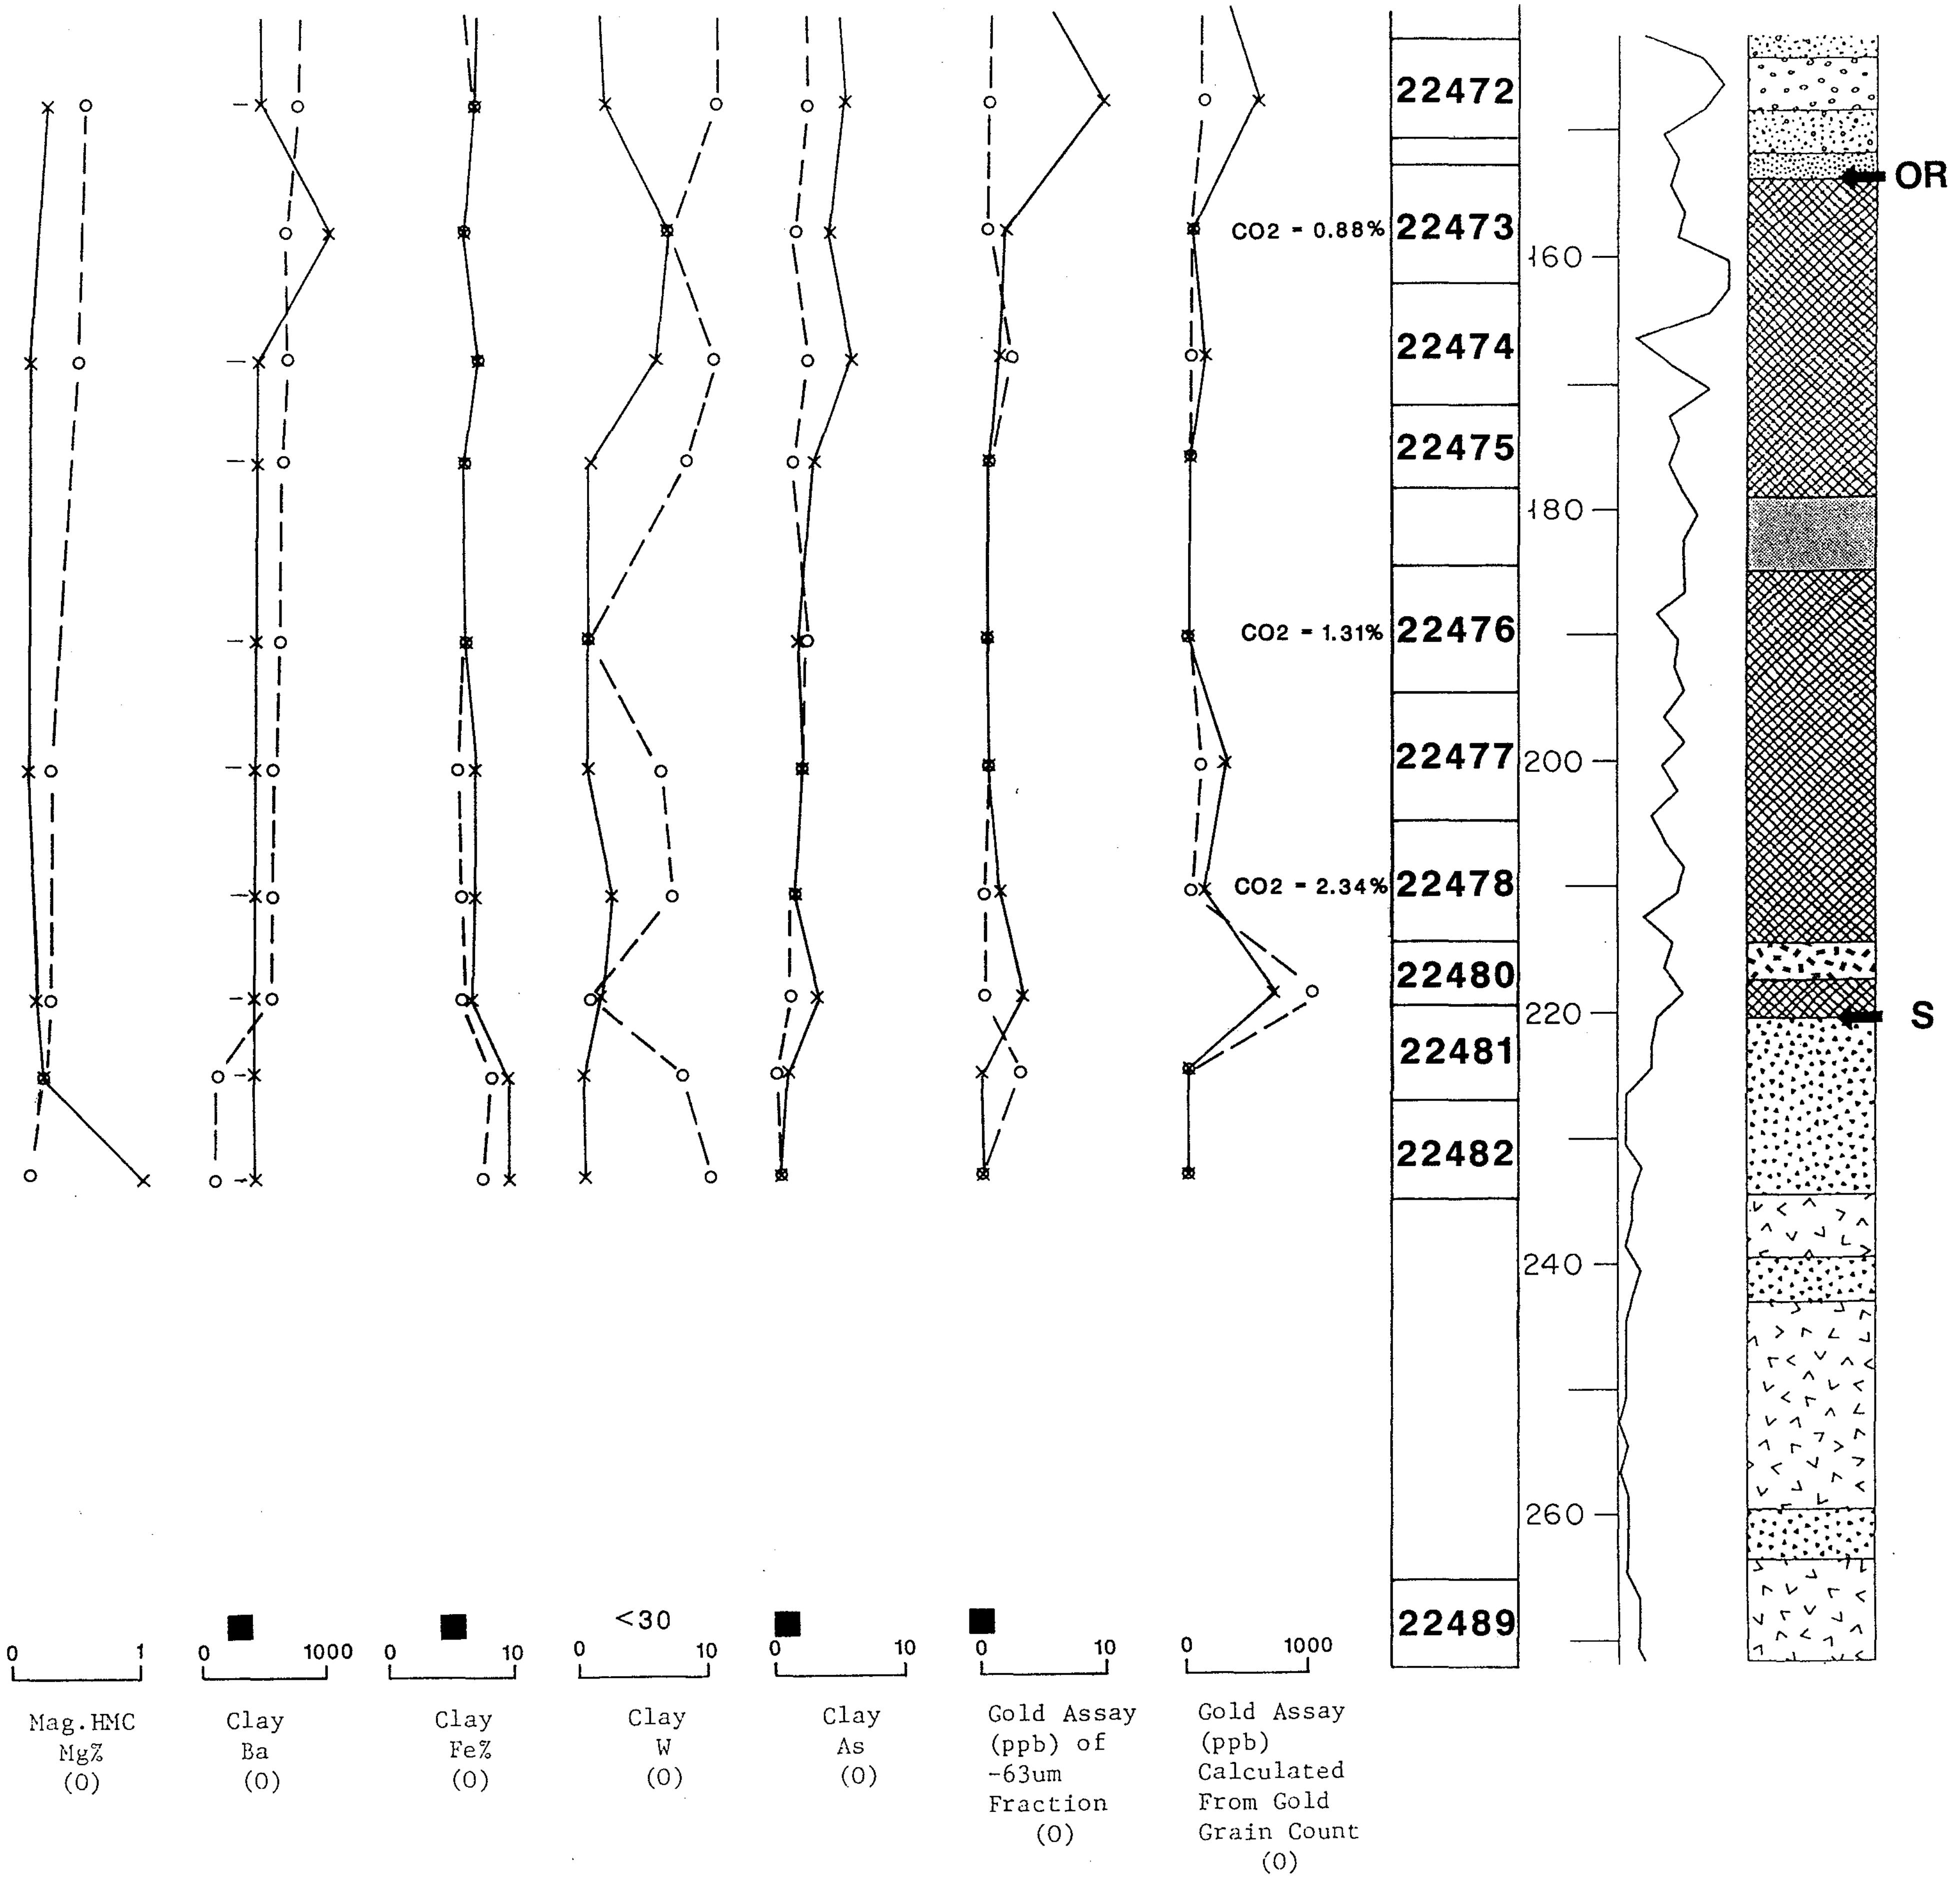
(112 1/2 - 120 1/2) SANDY LOAM TILL; UNOXIDIZED; sl calc; cobs at 113 1/2, 115, 117 ft; boulder 118 1/2 - 120 1/2.

(120 1/2 - 126) LOAM TILL; UNOXIDIZED; sl to mod calc; few carb grains; cobs at 121, 123, 126 ft.

(126 - 136) SANDY LOAM TILL; UNOXIDIZED; cobs at 128, 128 1/2, 133 1/2 ft; sandy zone at 127; 134 1/2 - 136 pebbly, cgr sand, carb pebs fairly common.

(136 - 139) SILT; UNOXIDIZED; calc; v fgr sandy silt from 137 ft; grades to sand.

(139 - 142) GRAVELLY MEDIUM SAND; silty; carb fairly common; large pebs toward bottom, cob at base.



(142 - 144) SANDY LOAM TILL; UNOXIDIZED; mod calc; sm carb cob near top.

(144 - 148) COBBLES; loamy, gravelly sand matrix; thin, pebbly sand beds; v fgr sand bed at 147 ft, over pebbly mgr to cgr sand to base.

(148 - 151 1/2) COBBLY, GRAVELLY LOAM TILL; carb pebs sm.

(151 1/2 - 153 1/2) GRAVELLY MEDIUM SAND; cob in middle.

(153 1/2 - 178 1/2) LOAM TILL; UNOXIDIZED; calc; compact; pebbly cgr sand lens at 159 ft; mod calc by 160; fairly cobbly to 168, calc & less rocky below; cob & large pebs at base.

(178 1/2 - 184 1/2) SILTY, VERY FINE SAND; UNOXIDIZED; v fgr sandy silt from 183 ft; till bed at 184.

(184 1/2 - 214) LOAM TILL; UNOXIDIZED; calc; compact; apar as above; carb pebs fairly common, not dominant; occ cobs, two near base; sand lens at 213 ft.

(214 - 217) CLAY LOAM TILL; UNOXIDIZED; grnish gray; compact; calc; more clay & pebs than above; cob at 215 ft over loamy sand & gvl to 215 1/2.

(217 - 220) LOAM TILL; calc; two cobs at 218 1/2 ft; mostly saprolite from 219.

(220 - 234) SAPROLITE; cgr sandy clay; punky rock from 225 ft.

(234 - 239) BEDROCK; TONALITE OR TRONDHJEMITE; cgr; weakly retrograde metamorphosed.

(239 - 242 1/2) SAPROLITE; cgr sandy clay to punky rock.

(242 1/2 - 259) BEDROCK; as above.

(259 - 263) SAPROLITE; v punky rock.

(263 - 271) BEDROCK; as above.

Appendix 1-21C.

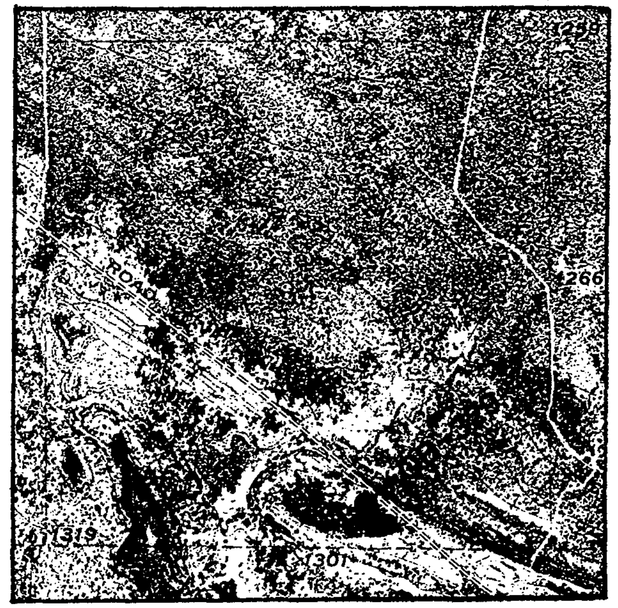
Appendix 1-22A. DRILL HOLE SUMMARY SHEET



IDENTIFICATION
DNR Drill Hole Number: OB-329
Drilling Completion Date: 6/9/88

LOCATION (see map at right)
S-T-R: SW¼-SE¼ - S34 - T153N - R27W
County: Koochiching
Quadrangle: Ridge 7.5
Regional Survey Area: Effie
UTM Coordinates: 418,870mE; 5319060mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1310 ± 3 ft.
Total Depth: 226 ft.
Elevation, Top of Precambrian Bedrock: 1096 ft.
Elevation, Top of Saprolite: 1154 ft.
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

SEE FOLLOWING PAGES

J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

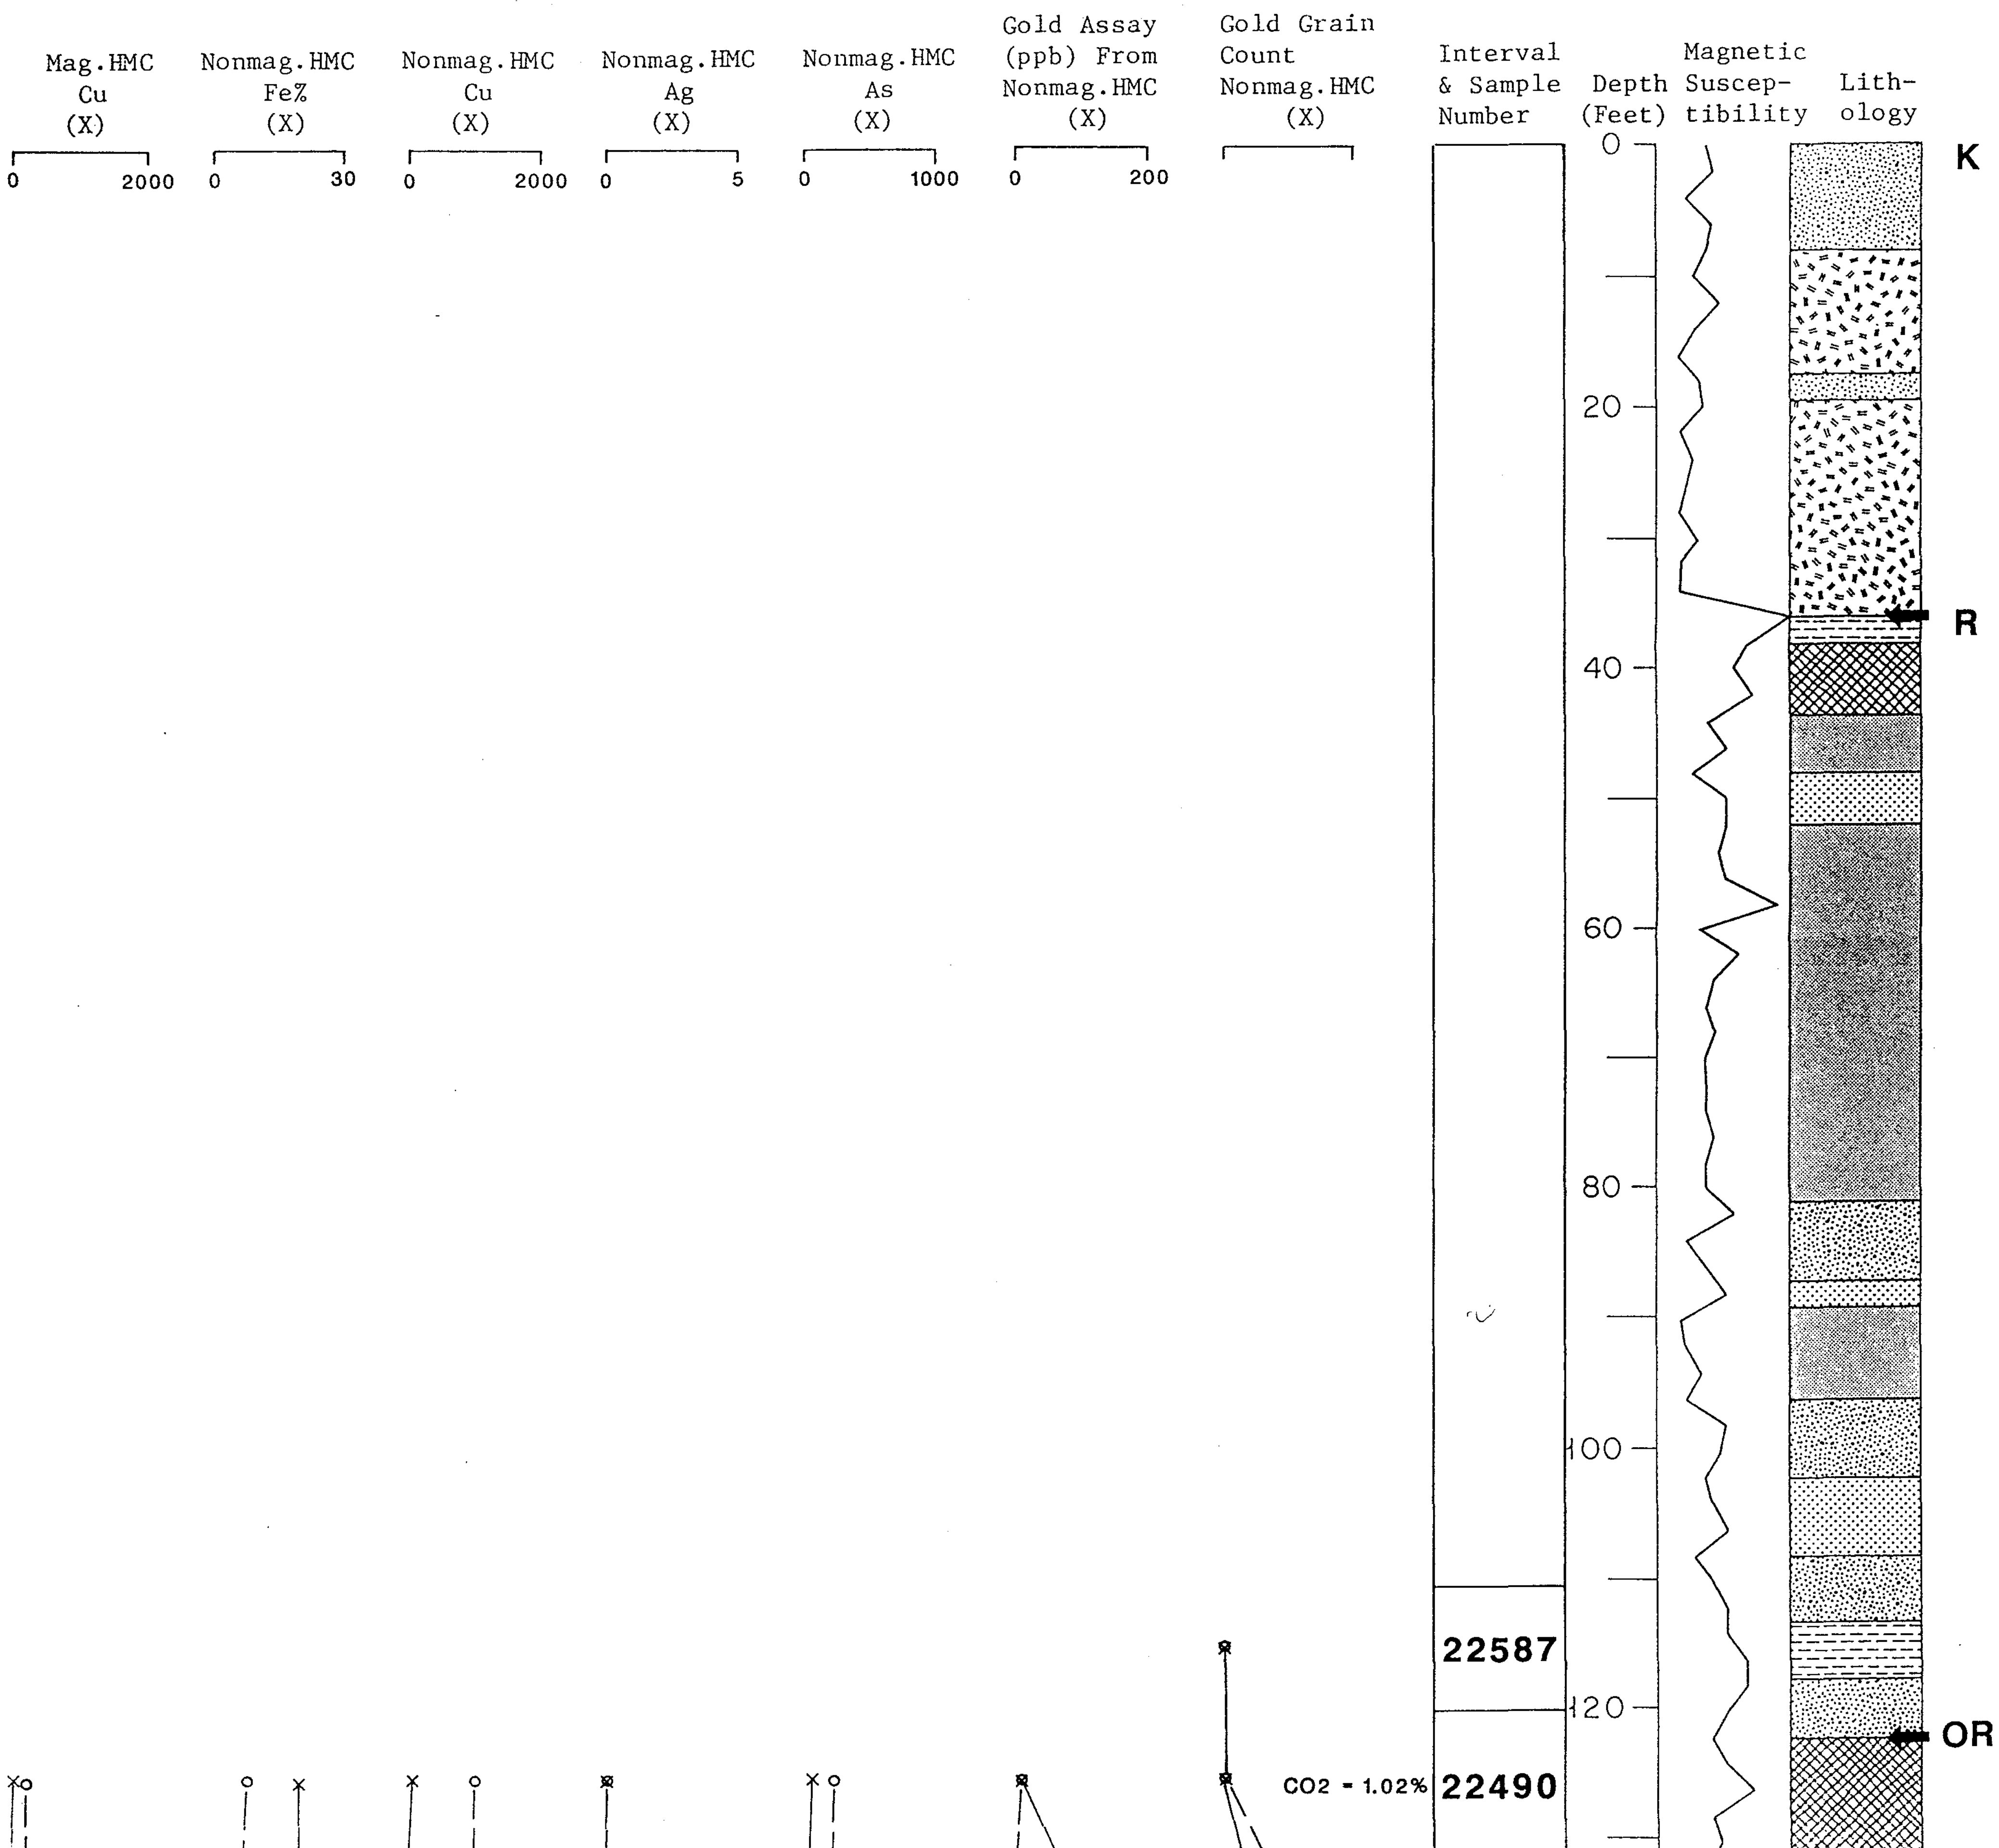
Core Description: Massive mafic intrusion. Thin section taken from zone in core which is identical to bulk of the rock except for containing a larger percentage and grain size of ilmenomagnetite crystals. Trace percent of disseminated pyrite exists, though not confirmed by petrography. Magnetic Susc: 0.03-0.06 x 10-3 CGS; one reading in ilmenomagnetite-rich zone = 0.15 x 10-3 CGS.

Thin Section Description: OB-329, 219 ft. Deuterically altered quartz gabbro/ diorite. Estimated mode (volume %): Plagioclase (and pseudomorphs) 35%; Actinolite (mostly hornblende pseudomorphs) 57%; Quartz 3%; Chlorite 3%; Ilmeno-magnetite (pseudomorphs) 2%; Apatite Tr; Hematite Tr. Massive, decussate-textured rock consisting of blocky, very clino-zoisite-altered plagioclase, fibrous actinolite after hornblende and/or pyroxene, subpoikilitic quartz, and masses of leucoxene which pseudomorph ilmenite or ilmenomagnetite. The feldspars (up to 3 mm) appear nearly opaque due to replacement by fine granular masses of a Ca-Al (+Fe) silicate such as clinozoisite. Fibrous to massive actinolite appears to have replaced (along with chlorite) earlier hornblende and/or pyroxene. A few of these pseudomorphs contain patches of green to brown pleochroic horn-blende, and many still contain relict twinning. Pale green chlorite is present throughout as an alteration product, and also in veins with quartz. Quartz occurs as poikilitic masses up to 5mm across which enclose plagio-clase and partially enclose pseudomorphic actinolite. Pseudomorphic masses (up to 3 mm across) of leucoxene, minor sphene and ilmenite are present; these are after primary subhedral, ilmenomagnetite which contain a small amount of (111) lamellar ilmenite. Scattered blebs of sphene-rimmed ilmenite are present, and blebs of ilmenite are associated with patches of clayey alteration. The rock is cut (perpendicular to length of slide) by open brittle fractures healed with quartz and chlorite (not zoned); and by tighter, brittle shear-type fractures which are more or less normal to the other fractures.

Scintillometer Reading (cps): 75-85

OB-329

Appendix 1-22B.



Geologic Descriptions

(0 - 8) GRAVELLY COARSE SAND; OXIDIZED; carb pebs at 2 ft; silty to 4; two unox clay till beds from 6 - 7.

(8 - 17 1/2) CLAY TILL; UNOXIDIZED; calc; carb & sh grains; sand lens at 8 ft; occ cobs; clay loam by 13.

(17 1/2 - 19 1/2) SILTY SAND & GRAVEL.

(19 1/2 - 36) CLAY LOAM TILL; UNOXIDIZED; as above; 27 1/2 - 28 silty sand & gvl; clay till by 30 ft.

(36 - 38) VERY FINE SANDY SILT; UNOXIDIZED; grnish gray; mod calc; cob near top; grades to till below; large carb peb near base.

(38 - 43 1/2) LOAM TILL; UNOXIDIZED; mod calc to calc; couple cobs; matrix low in clay.

(43 1/2 - 48) SILTY, VERY FINE SAND; 44 1/2 - 46 ft v fgr sandy silt w/silt bed; 46 - 48 fgr sand.

(48 - 52) MEDIUM SAND; some coarse grains.

(52 - 81) VERY FINE - MEDIUM SAND; 52 - 55 ft fgr w/few v fgr beds; 55 - 60 1/2 silty, v fgr; 60 1/2 - 62 sandy silt, some coarser grains, 62 - 63 1/2 silty, v fgr w/silty lam; 63 1/2 - 68 v fgr to fgr, coarser w/depth; 68 - 70 fgr to mgr; mgr to 72 1/2; fgr to 74; v fgr to 75 1/2; fgr to 76; v fgr to 81.

(81 - 87) GRAVELLY COARSE SAND; mgr to cgr sand in upper 1/2 ft; sm cob at 84 ft, then v cgr sand w/gnl; some carb, Precambrian dominates.

(87 - 89) MEDIUM - COARSE SAND.

(89 - 96) FINE - MEDIUM SAND; v fgr to fgr 92 - 92 1/2 ft; 93 - 95 1/2 silty, v fgr sand; fgr to 96.

(96 - 102) COARSE SAND & FINE GRAVEL; much dark pebs.

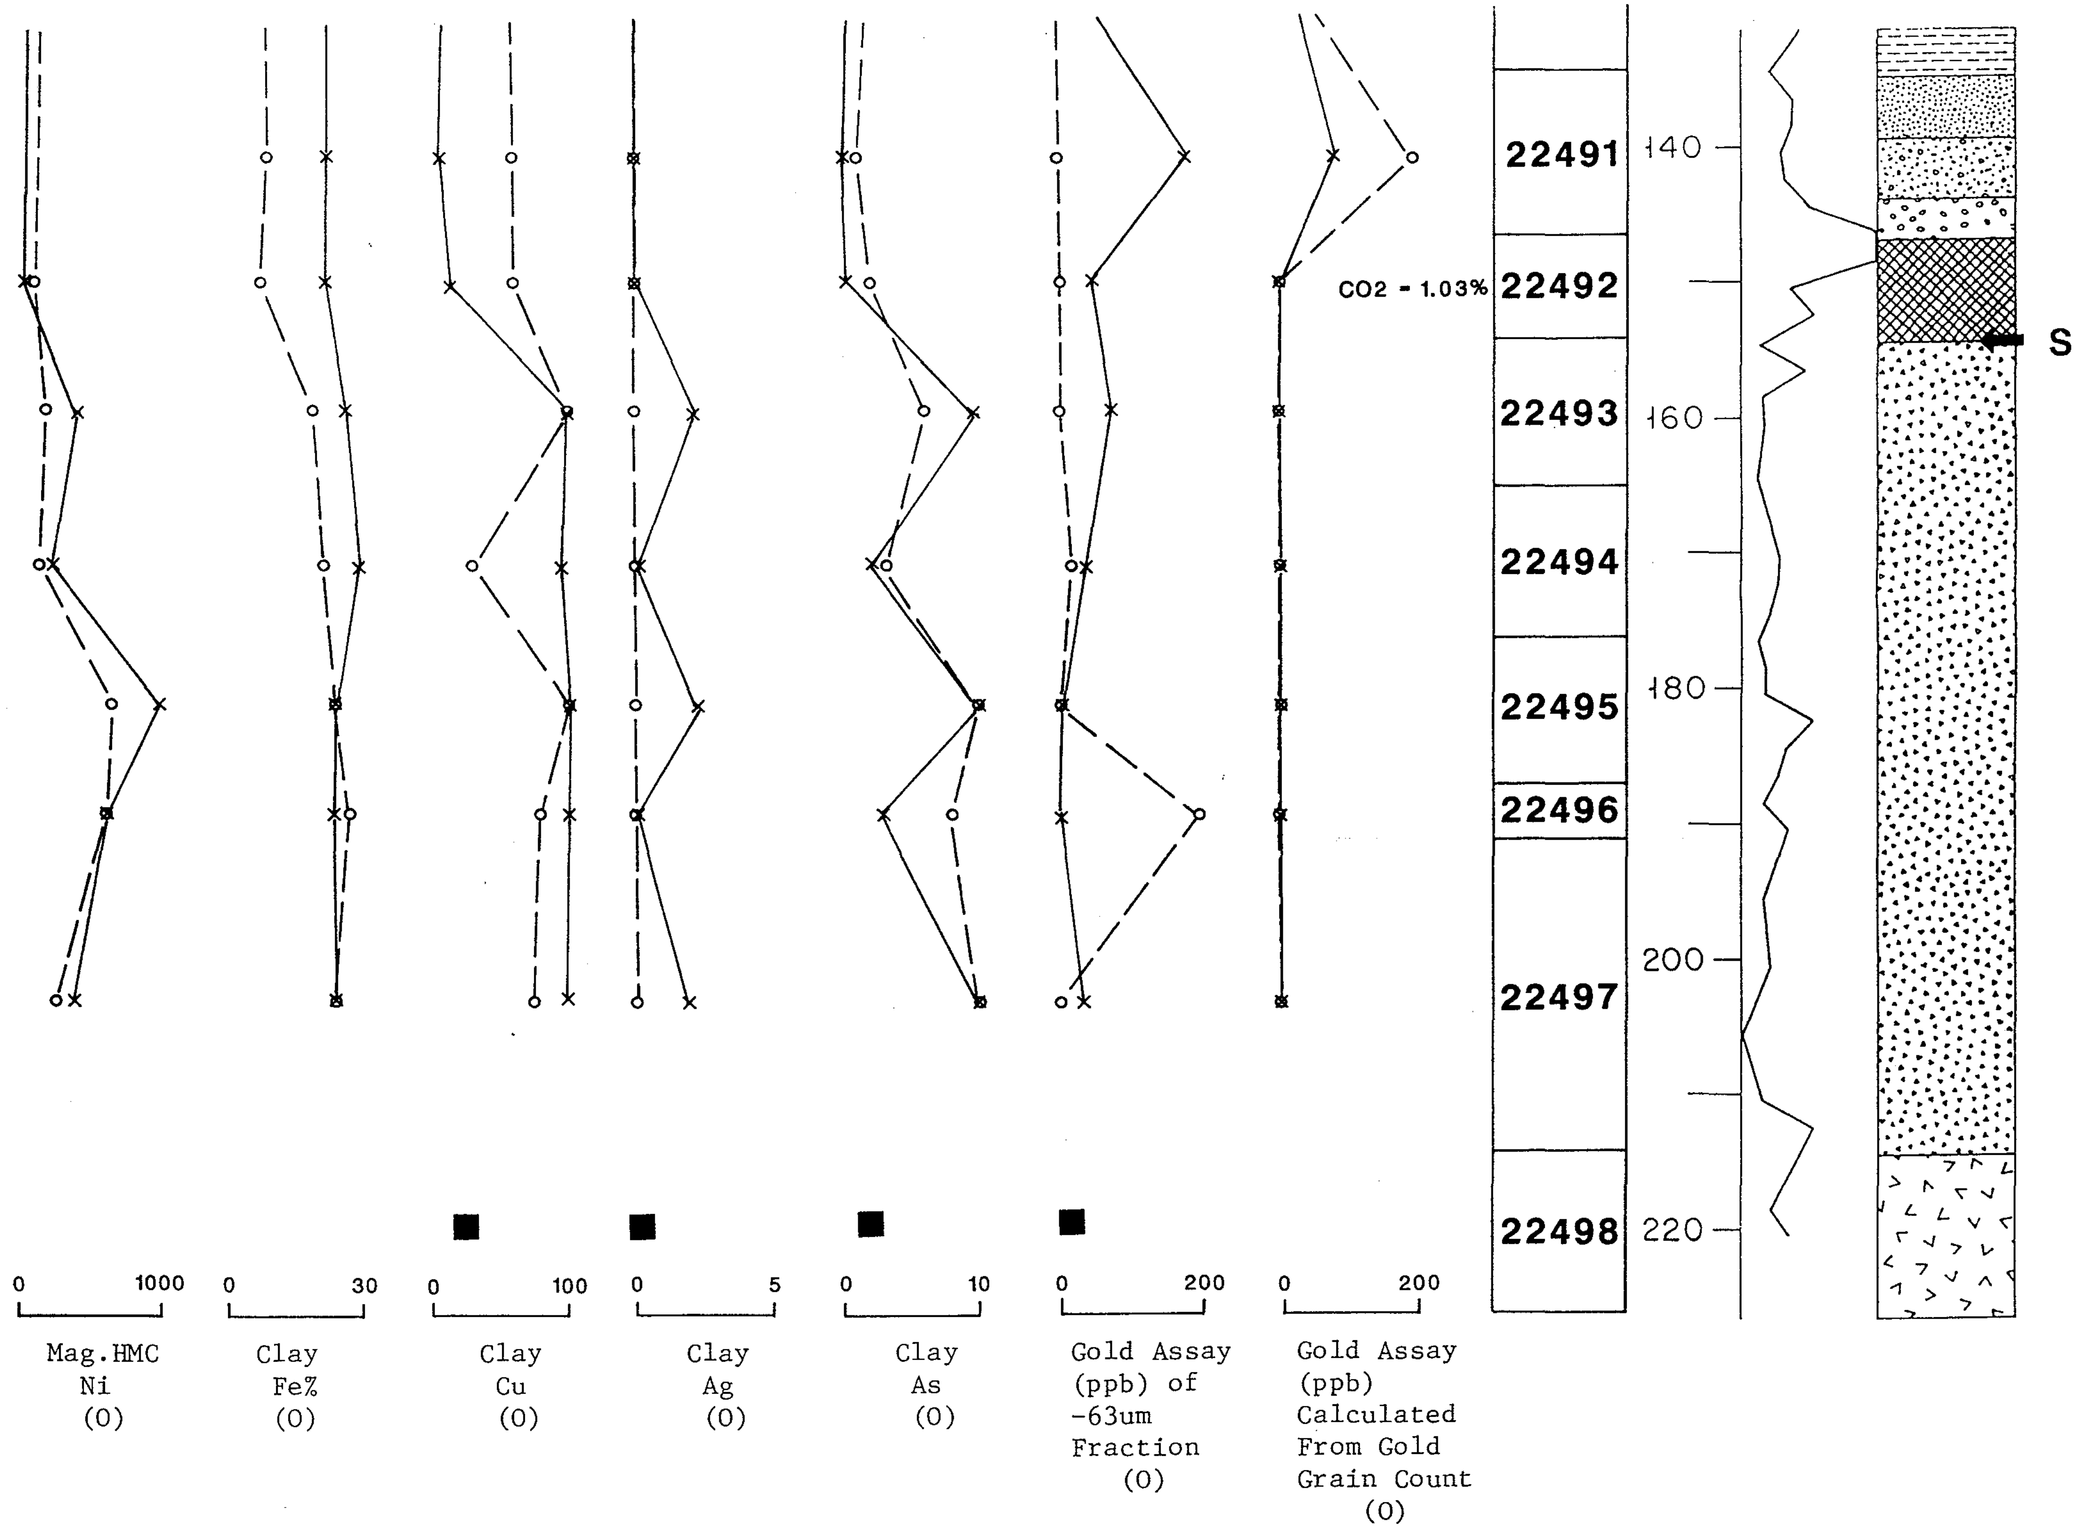
(102 - 108) COARSE SAND; few sm pebs; mgr to cgr from 105 ft.

(108 - 113) COARSE - VERY COARSE SAND & GRANULES; peb layers at 100 1/2, 111 ft; fgr sand last 1/2 foot.

(113 - 117 1/2) GRAVELLY, VERY FINE, SANDY SILT; UNOXIDIZED; grnish gray; sl to mod calc; 116 - 117 1/2 v fgr to mgr sand.

(117 1/2 - 122) COARSE SAND & GRANULES; 120 1/2 - 122 ft silty gvl w/silt & sandy silt beds; large carb peb at base.

(122 - 131) LOAM TILL; UNOXIDIZED; calc; cobbly; 125 1/2 - 126 ft silty cgr sand & gvl; grnish gray from 126; silt bed at 128, less pebbly below.



(131 - 134 1/2) SILT; UNOXIDIZED; calc; clayey silt lam; sand bed near base.

(134 1/2 - 139) LOAMY COARSE SAND & GRAVEL; OXIDIZED; large cob at top, few inches loamy till (?) below; cobs at 135, 135 1/2, 136 1/2, 137 1/2; many large pebs.

(139 - 143 1/2) VERY COBBLY LOAM TILL; UNOXIDIZED; grnish gray; mostly cobbles w/loam matrix; mod calc to calc.

(143 1/2 - 146 1/2) COBBLY, LOAMY SAND & GRAVEL.

(146 1/2 - 154) LOAM TILL; UNOXIDIZED; grnish gray; mod calc; large cob near top; 147 1/2 - 149 1/2 boulder; calc by 149 1/2 ft, more calc and fgr w/depth; cobs at 151, 153; clay loam till by 153 & quite calc, but carb pebs not abundant.

(154 - 214) SAPROLITE; reworked pebbly clay in top 1/2 foot; 154 1/2 - 155 1/2 grnish clay w/some grit; 155 1/2 - 156 1/2 red & clayey; 156 1/2 - 165 variegated gritty clay; 165 - 168 variegated punky rock w/hard rock layers; 168 - 175 mostly punky rock; 175 - 179 hard rock layers; 179 - 186 1/2 mostly punky rock & rocky clay; 186 1/2 - 191 reddish clay, not much grit; 191 - 214 hard, weathered rocky w/punky rock layers, much core loss so prob much punky,rock.

(214 - 226) BEDROCK; GABBRO OR DIORITE; mgr; deuterically altered.

Appendix 1-22C.

DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-331
Drilling Completion Date: 6/4/88

LOCATION (see map at right)
S-T-R: SE¼-SE¼ - S16 - T151N - R27W
County: Koochiching
Quadrangle: Mizpah NE 7.5
Regional Survey Area: Effie
UTM Coordinates: 417,550mE; 5304680mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1355 ± 2 ft.
Total Depth: 215.5 ft.
Elevation, Top of Precambrian Bedrock: 1149 ft.
Elevation, Top of Saprolite:
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

INFORMATION SUMMARY

Interval (ft.)	Interpretation	Library Samples Available	Subsamples Tested	Geochem Assays Worthy of Further Review
0-85.5	Kooch. lobe gl. drift	B,C,G	A,B,C	B=Au C=As,Mo
85.5-205	Winnipeg lobe gl. drift	B,C,G	A,B,C	A=Pb B=Ba
205-206	Old Rainy lobe gl. drift	B,G	A,B	
206-215.5	Sound bedrock	G,H	I	

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

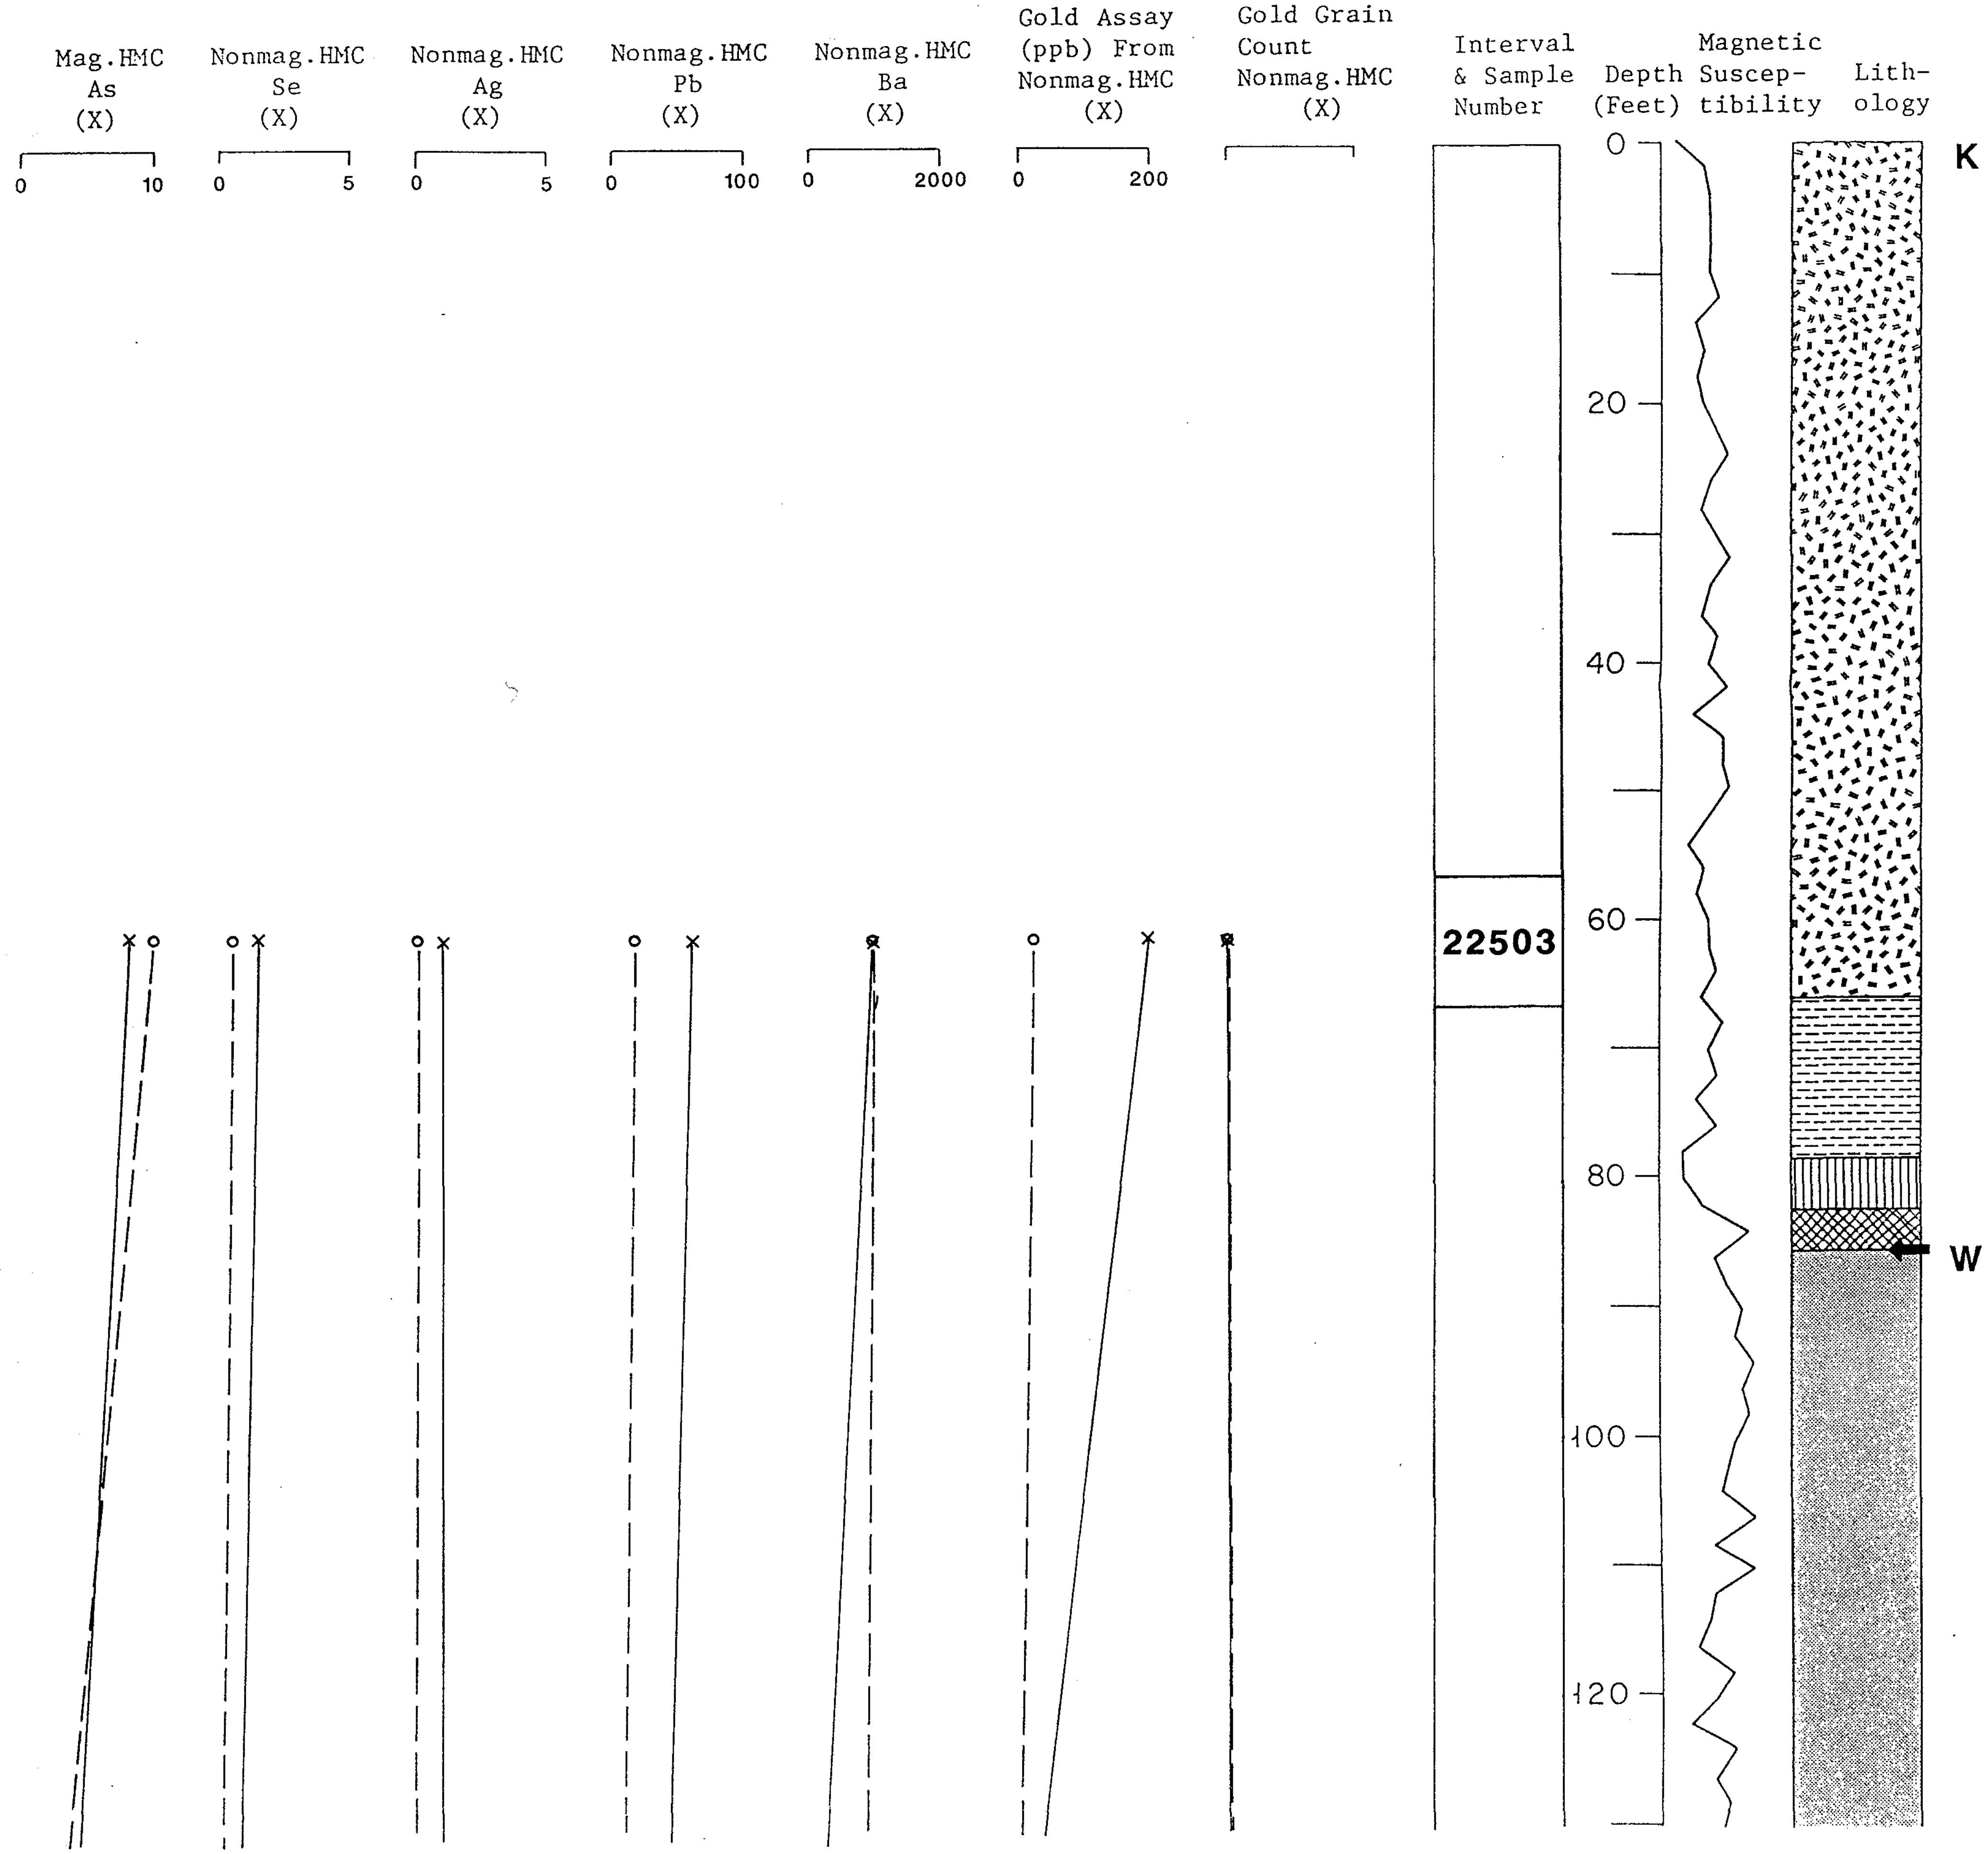
Core Description: Medium-grained trondhjemite of consistent fabric but varied color and apparent composition. 209-209.5′ has unoxidized feldspar: magnetite and pyrite are visible. Magnetic susceptibility = 0.38 -0.96 x 10-3 CGS. 209.5-211.5′ is an apparently oxidized zone in which feldspar is pink and susceptibility is low (0.01-0.04 x 10-3 CGS). 211.5-215.5′ is unoxidized like 209-209.5, susc. = 0.09-0.38 x 10-3 CGS. Magnetite apparently oxidized from central zone by secondary processes. No obvious original modal banding, but moderate lineation of elongate minerals and mineral clots dips about 45°. The borders of the oxidized zone (209.5-211.5′) are gradational and vague. Lower part of core contains small, nearly vertical fractures with 1-3 mm wide border zones in which feldspar grains are oxidized.

Thin Section Description: OB-331, 214.5 ft. Trondhjemite (Streckeisen classification). Estimated mode (volume %): Quartz 45%; Plagioclase 54%; K-feldspar Tr; Muscovite 1; Chlorite Tr; Magnetite Tr; Epidote Tr. Nearly pristine coarse-grained igneous texture. Anhedral concentrations (mm to cm) of coarse granoblastic quartz show a slight strain-shadow extinction. The quartz in the rock heel is rose in color, in thin section quartz contains a very fine hematitic (?) dust which is concentrated in tiny strain fractures that parallel the shadowy extinction (approximately 45° to the main foliation). Plagioclase feldspar (albite to oligoclase) occurs as cm-scale aggregates of blocky, slightly zoned, subhedral grains 0.5 to 2 mm in size. The feldspar is fresh, and contains patches of very fine-grained hematitic(?) dust and fine-grained sericite, controlled by compositional zonation. Coarse, intergrown books of muscovite and dark green chlorite with minor intersheaved biotite, epidote, and blocky sub- to euhedral magnetite are concentrated along vague foliation-parallel zones. The foliation is defined by elongate concentrations of quartz and feldspar and by oriented mica sheaves. One grain of orthoclase was noted, with quartz.

Scintillometer Reading (cps): 85-100

Appendix 1-23B.

OB-331



Geologic Descriptions

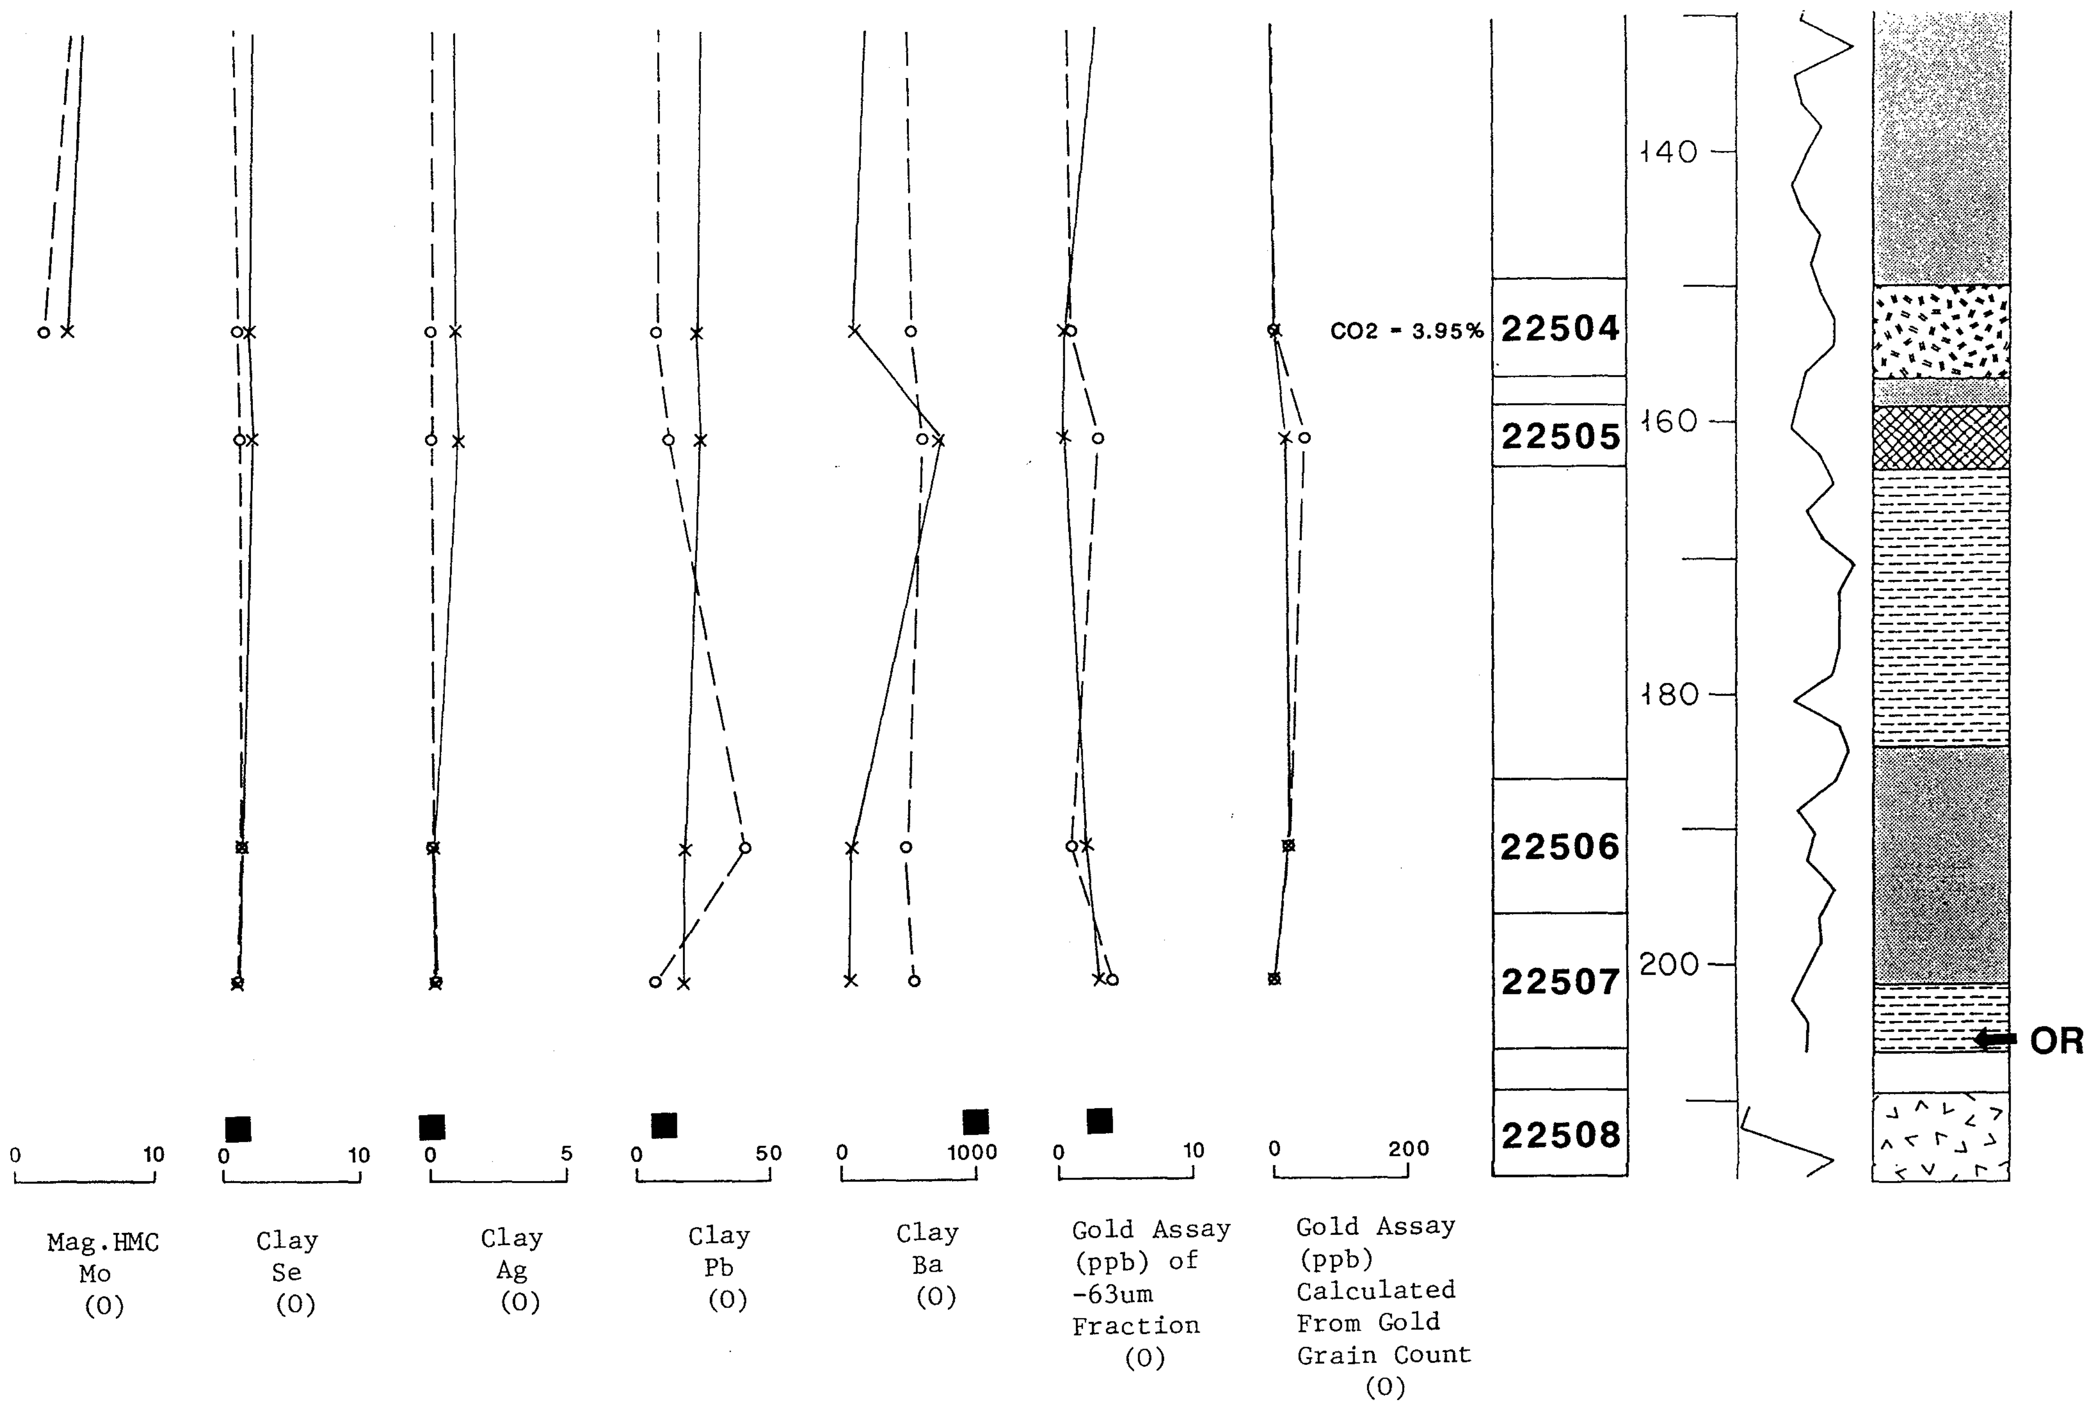
(0 - 66) CLAY - CLAY LOAM TILL; UNOXIDIZED by 16 ft; leached to about 1 foot; carb pebs dominant; no sh noted; clay till from 53, less pebs; few streaks of silty & sandy silt below 61.

(66 - 78 1/2) SILT; UNOXIDIZED; calc; abrupt upper contact; sandy bed at 67 1/2 ft; clay lens at 73; laminated silt & clay from 73 1/2 - 75 1/2.

(78 1/2 - 82 1/2) CLAY & SILTY CLAY; UNOXIDIZED; calc; laminated; few silt & sandy silt lam from 80 1/2 ft; few sand grains.

(82 1/2 - 85 1/2) LOAM TILL; UNOXIDIZED; calc; carb rich; sandy loam in upper foot.

(85 1/2 - 149 1/2) VERY FINE SAND; UNOXIDIZED; till lens near top; fgr to 88 ft; clayey silt bed at about 88; fgr bed at 90 1/2, then silty, v fgr sand, v well sorted to base; noted v fine organic particles in lam at 113 1/2, scattered above & below, another concentration at 126.



(149 1/2 - 156 1/2) LOAM - CLAY LOAM TILL; UNOXIDIZED; calc; carb common, not dominant; little sh; v fgr sand lenses at 150, 150 1/2 - 151 ft; sandy silt lens at 151 1/2; silty, v fgr sand lenses at 154 1/2.

(156 1/2 - 158 1/2) SILTY, VERY FINE SAND; some coarser grains.

(158 1/2 - 163) LOAM TILL; UNOXIDIZED; as above; carb-rich, pebbly sand lenses from 159 1/2 - 160 ft, then interbedded silty sand & loam till.

(163 - 183 1/2) VERY FINE, SANDY SILT; UNOXIDIZED; 163 - 164 1/2 ft v fgr silty sand; 164 1/2 - 166 1/2 mod calc to calc silt, clay lam, mostly silty clay in last 1/2 foot w/carb peb; little organics; silty v fgr sand bed at 179 1/2; silty clay lens at 180 1/2; coarse silt from 182 grading to silt at base.

(183 1/2 - 201) SILTY, VERY FINE SAND; UNOXIDIZED; v fgr sandy silt bed at 185 ft; fgr sand 191 - 192, mostly v fgr sand below; fgr bed at 196; silt lens at 196 1/2; silty, v fgr sand by 198; silt lens at 198.

(201 - 206) COARSE SILT; UNOXIDIZED; mod calc; silty, v fgr sand bed at 201 1/2 ft, 202 1/2 - 203 1/2, v fgr sandy silt to 205; v cgr sand & gnl to base, some carb but mostly Precambrian grains.

(206 - 209) NO CORE; apar is bedrock.

(209 - 215 1/2) BEDROCK; TRONDHJEMITE; cgr; weak igneous foliation.

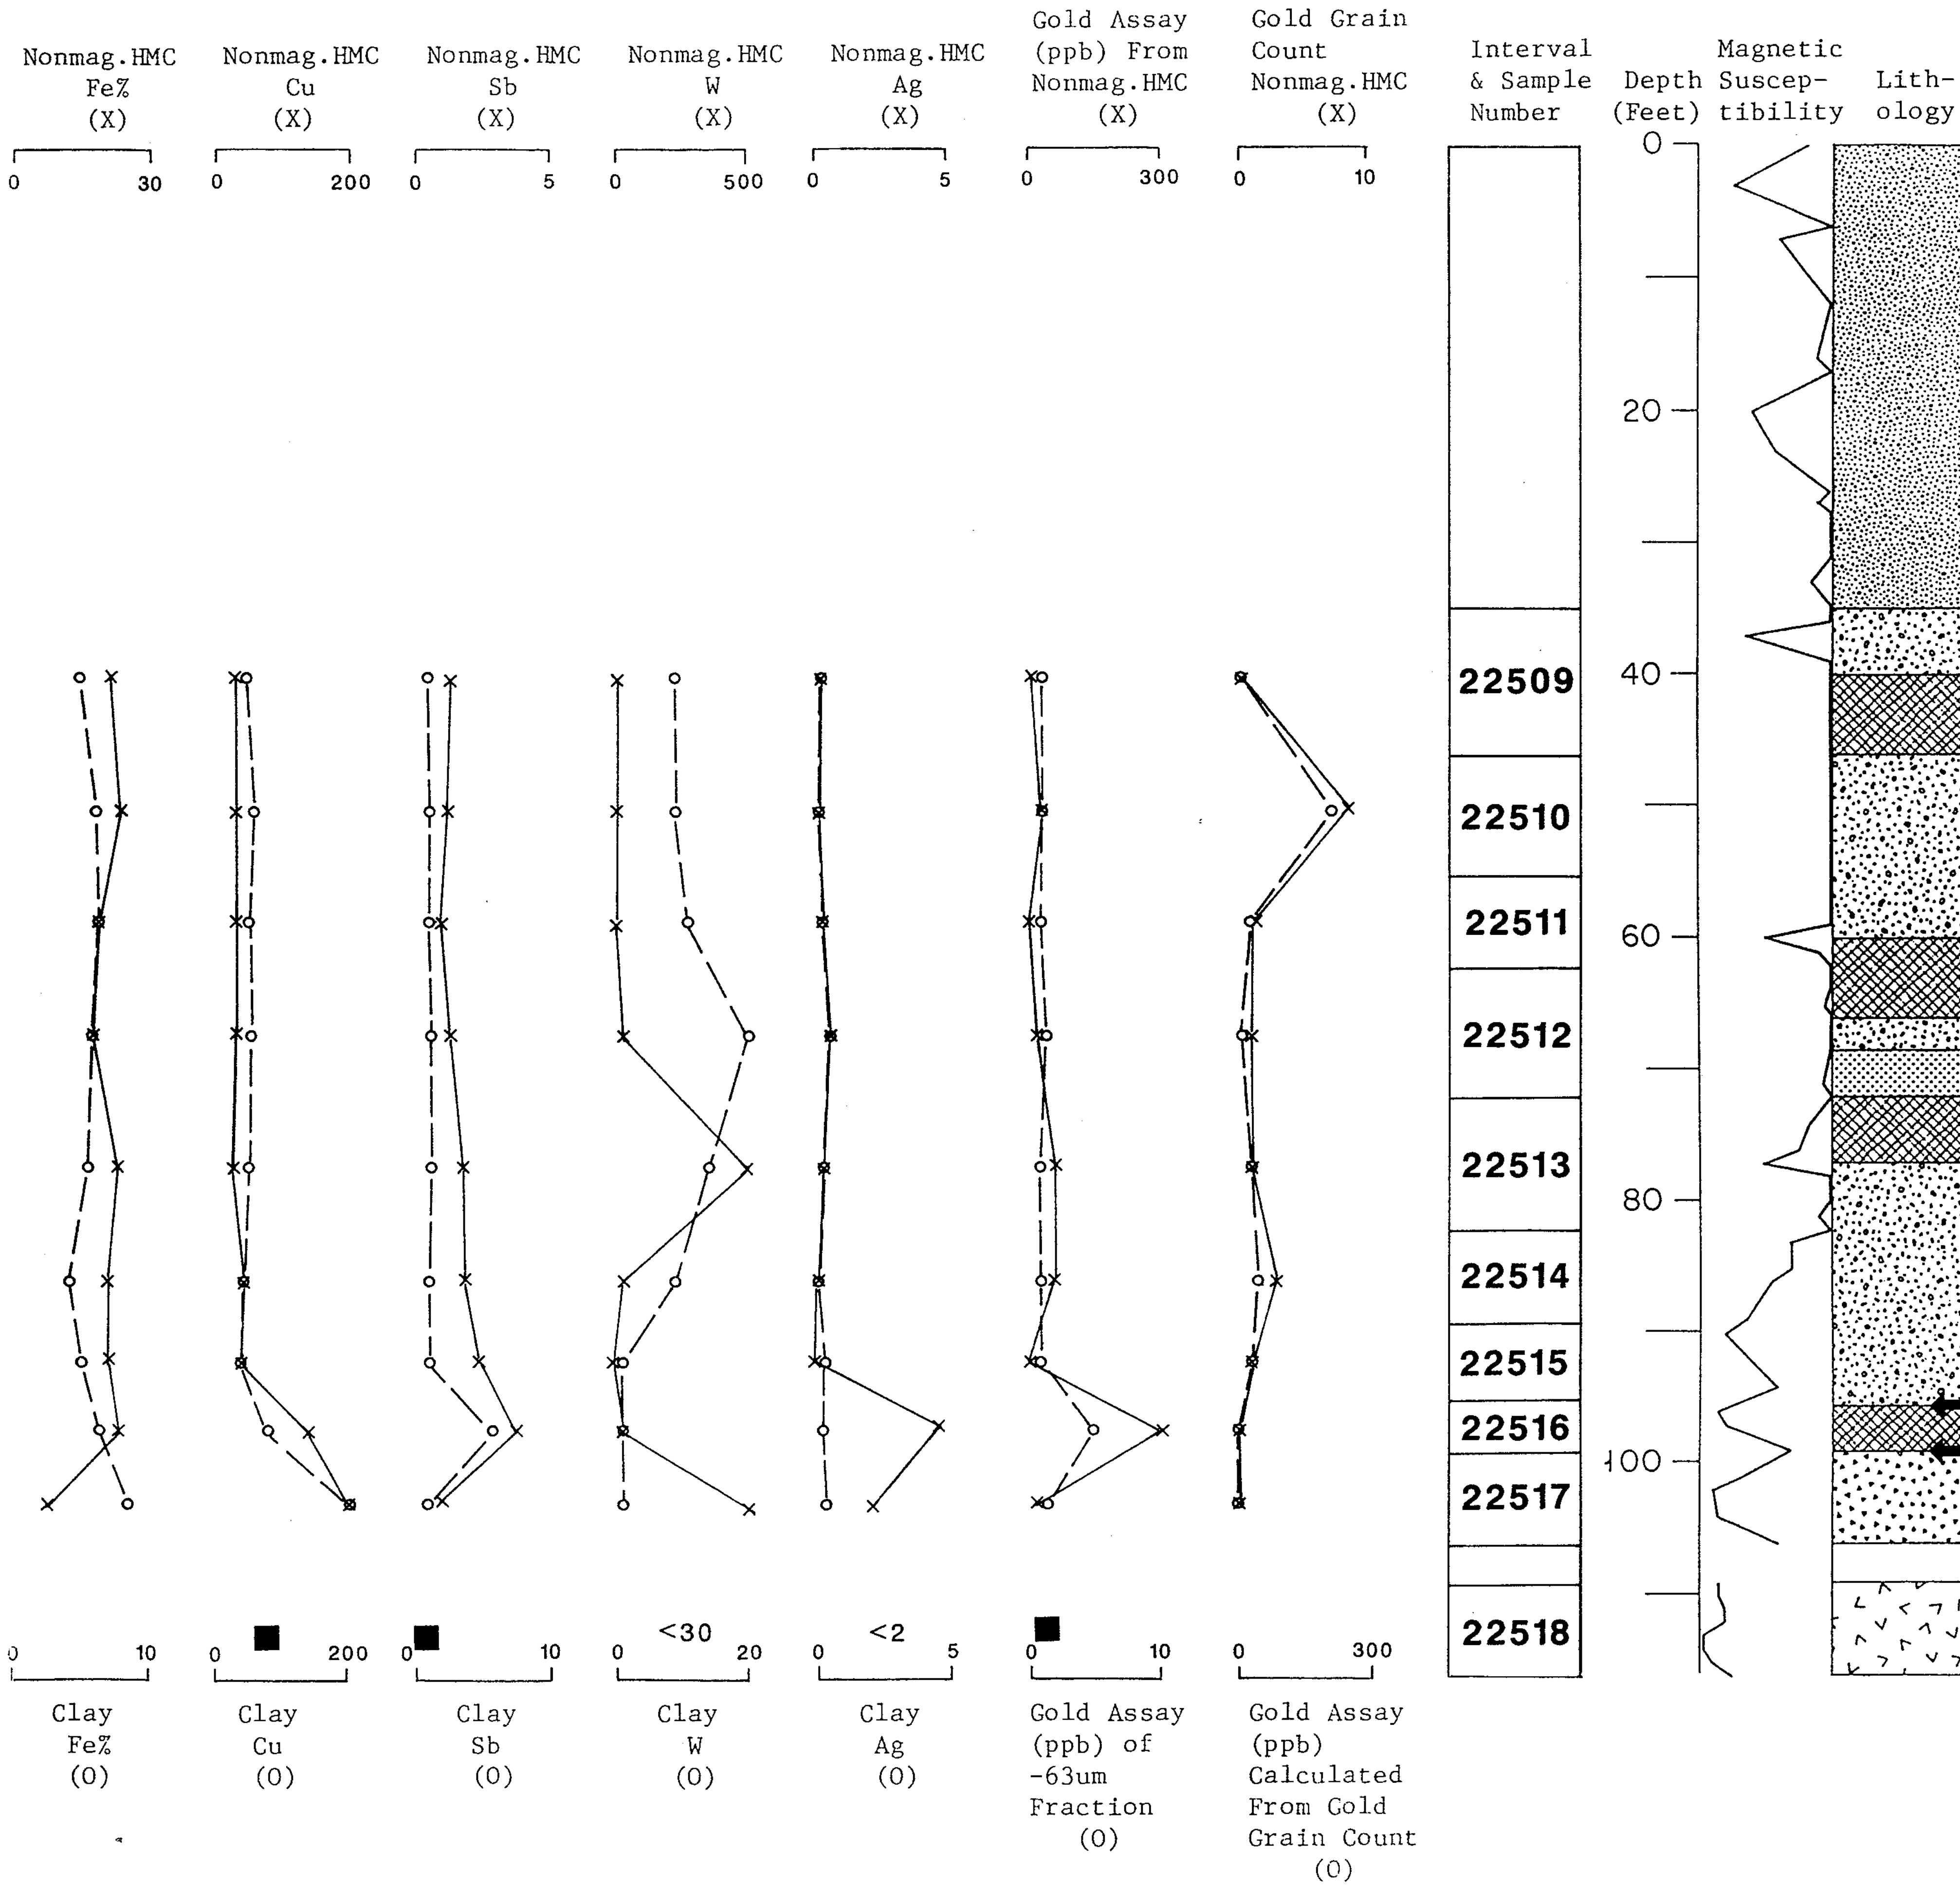
BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Medium-grained, unfoliated metadiabase. Thin section (109.5') represents the bulk of this core.

Thin Section Description: OB-401, 109.5 ft. Metadiabase (flow or sill?). Estimated mode (volume %): Actinolite 45%; Epidote-clinozoisite 45%; Sphene 1-2; Quartz Tr; Muscovite Tr; Chlorite Tr; Plagioclase 7. Heavily altered gabbroic/basaltic rock consisting dominantly of actinolite and fine-grained epidote/clinozoisite. Plagioclase is very heavily altered to epidote, but locally shows relict decussate texture and original grain morphologies, which consisted of slender to blocky, strongly zoned, possibly skeletal grains 2-3 mm maximum length. Colorless to pale green actinolite occurs in blocky grains which pseudomorph primary pyroxene and/or hornblende. The shapes of these pseudomorphs suggest that the primary mafic silicates were blocky, subhedral, 0.5-2 mm across; some relict twinning still exists. Sphene occurs throughout as 1-2 mm angular clots which mimic a primary anhedral-interstitial mineral, probably ilmenite. Quartz appears to be an anhedral-interstitial magmatic mineral; muscovite and chlorite occur as small patches of secondary origin.

Scintillometer Reading (cps): 50-60

OB-401



Geologic Descriptions

R (0 35) SILTY, GRAVELLY MEDIUM - COARSE SAND; OXIDIZED; non calc; 0 - 9 ft mgr, more pebbly below; v silty, couple sm cobs 15 - 20; cgr from 26; more pebs below 28, but are sm; some larger pebs by 30; no carb grains noted; last foot unox & sl calc w/few carb grains.

(35 - 40) COBBLY, SANDY LOAM TILL; UNOXIDIZED; sl calc; 38 - 40 ft more fgr, less cobbles, mottled.

(40 - 46) LOAM - SANDY LOAM TILL; UNOXIDIZED; sl calc; compact; silt rich; no cobs.

(46 - 60) SANDY LOAM TILL; UNOXIDIZED; sl calc; compact; occ cobs, carb pebs; few inches pebbly sand at top, pebbly sand bed 47 1/2 - 48 1/2 ft; 55 - 56 1/2 silty, fgr to mgr sand, few pebs.

(60 - 66) LOAM TILL; UNOXIDIZED; mod calc; no large pebs or cobs.

(66 - 68 1/2) SANDY LOAM TILL; UNOXIDIZED; large cob at base.

(68 1/2 - 72) SILTY MEDIUM - COARSE SAND; UNOXIDIZED; sandy till lenses from 70 - 71 ft; less silt in last foot.

(72 - 77) LOAM - SANDY LOAM TILL; UNOXIDIZED; mod calc; no large pebs noted; large cob at base.

(77 - 95 1/2) SANDY LOAM TILL; UNOXIDIZED; mod calc; few sm cobs; ox from 82 1/2 - 85 ft, could be top of older till; calc from 94; silt lam at base.

W (95 1/2 - 99) SILT LOAM TILL; UNOXIDIZED; calc; abundant carb; much less pebs than above, all sm; noted sm wood fragment; v thin olive grn lam could be incorporated

S saprolite; abrupt basal contact.

(99 - 106) SAPROLITE; core stones w/gritty clay matrix.

(106 - 109) NO CORE.

(109 - 116) BEDROCK; METADIABASE; mgr; massive.

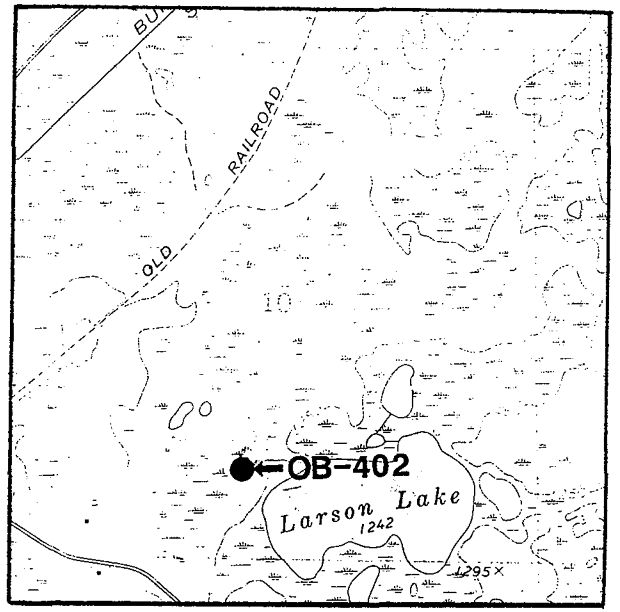
Appendix 1-25A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-402
Drilling Completion Date: 6/29/88



LOCATION (see map at right)
S-T-R: SE¼-SW¼ - S10 - T46N - R28W
County: Crow Wing
Quadrangle: Bay Lake 7.5
Regional Survey Area: Ironton
UTM Coordinates: 433,580mE; 5147270mN; 15,N.

HOLE PARAMETERS
Surface Elevation: 1260 ± 3 ft.
Total Depth: 276 ft.
Elevation, Top of Precambrian Bedrock: 1051 ft.
Elevation, Top of Saprolite: 1051 ft.?
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

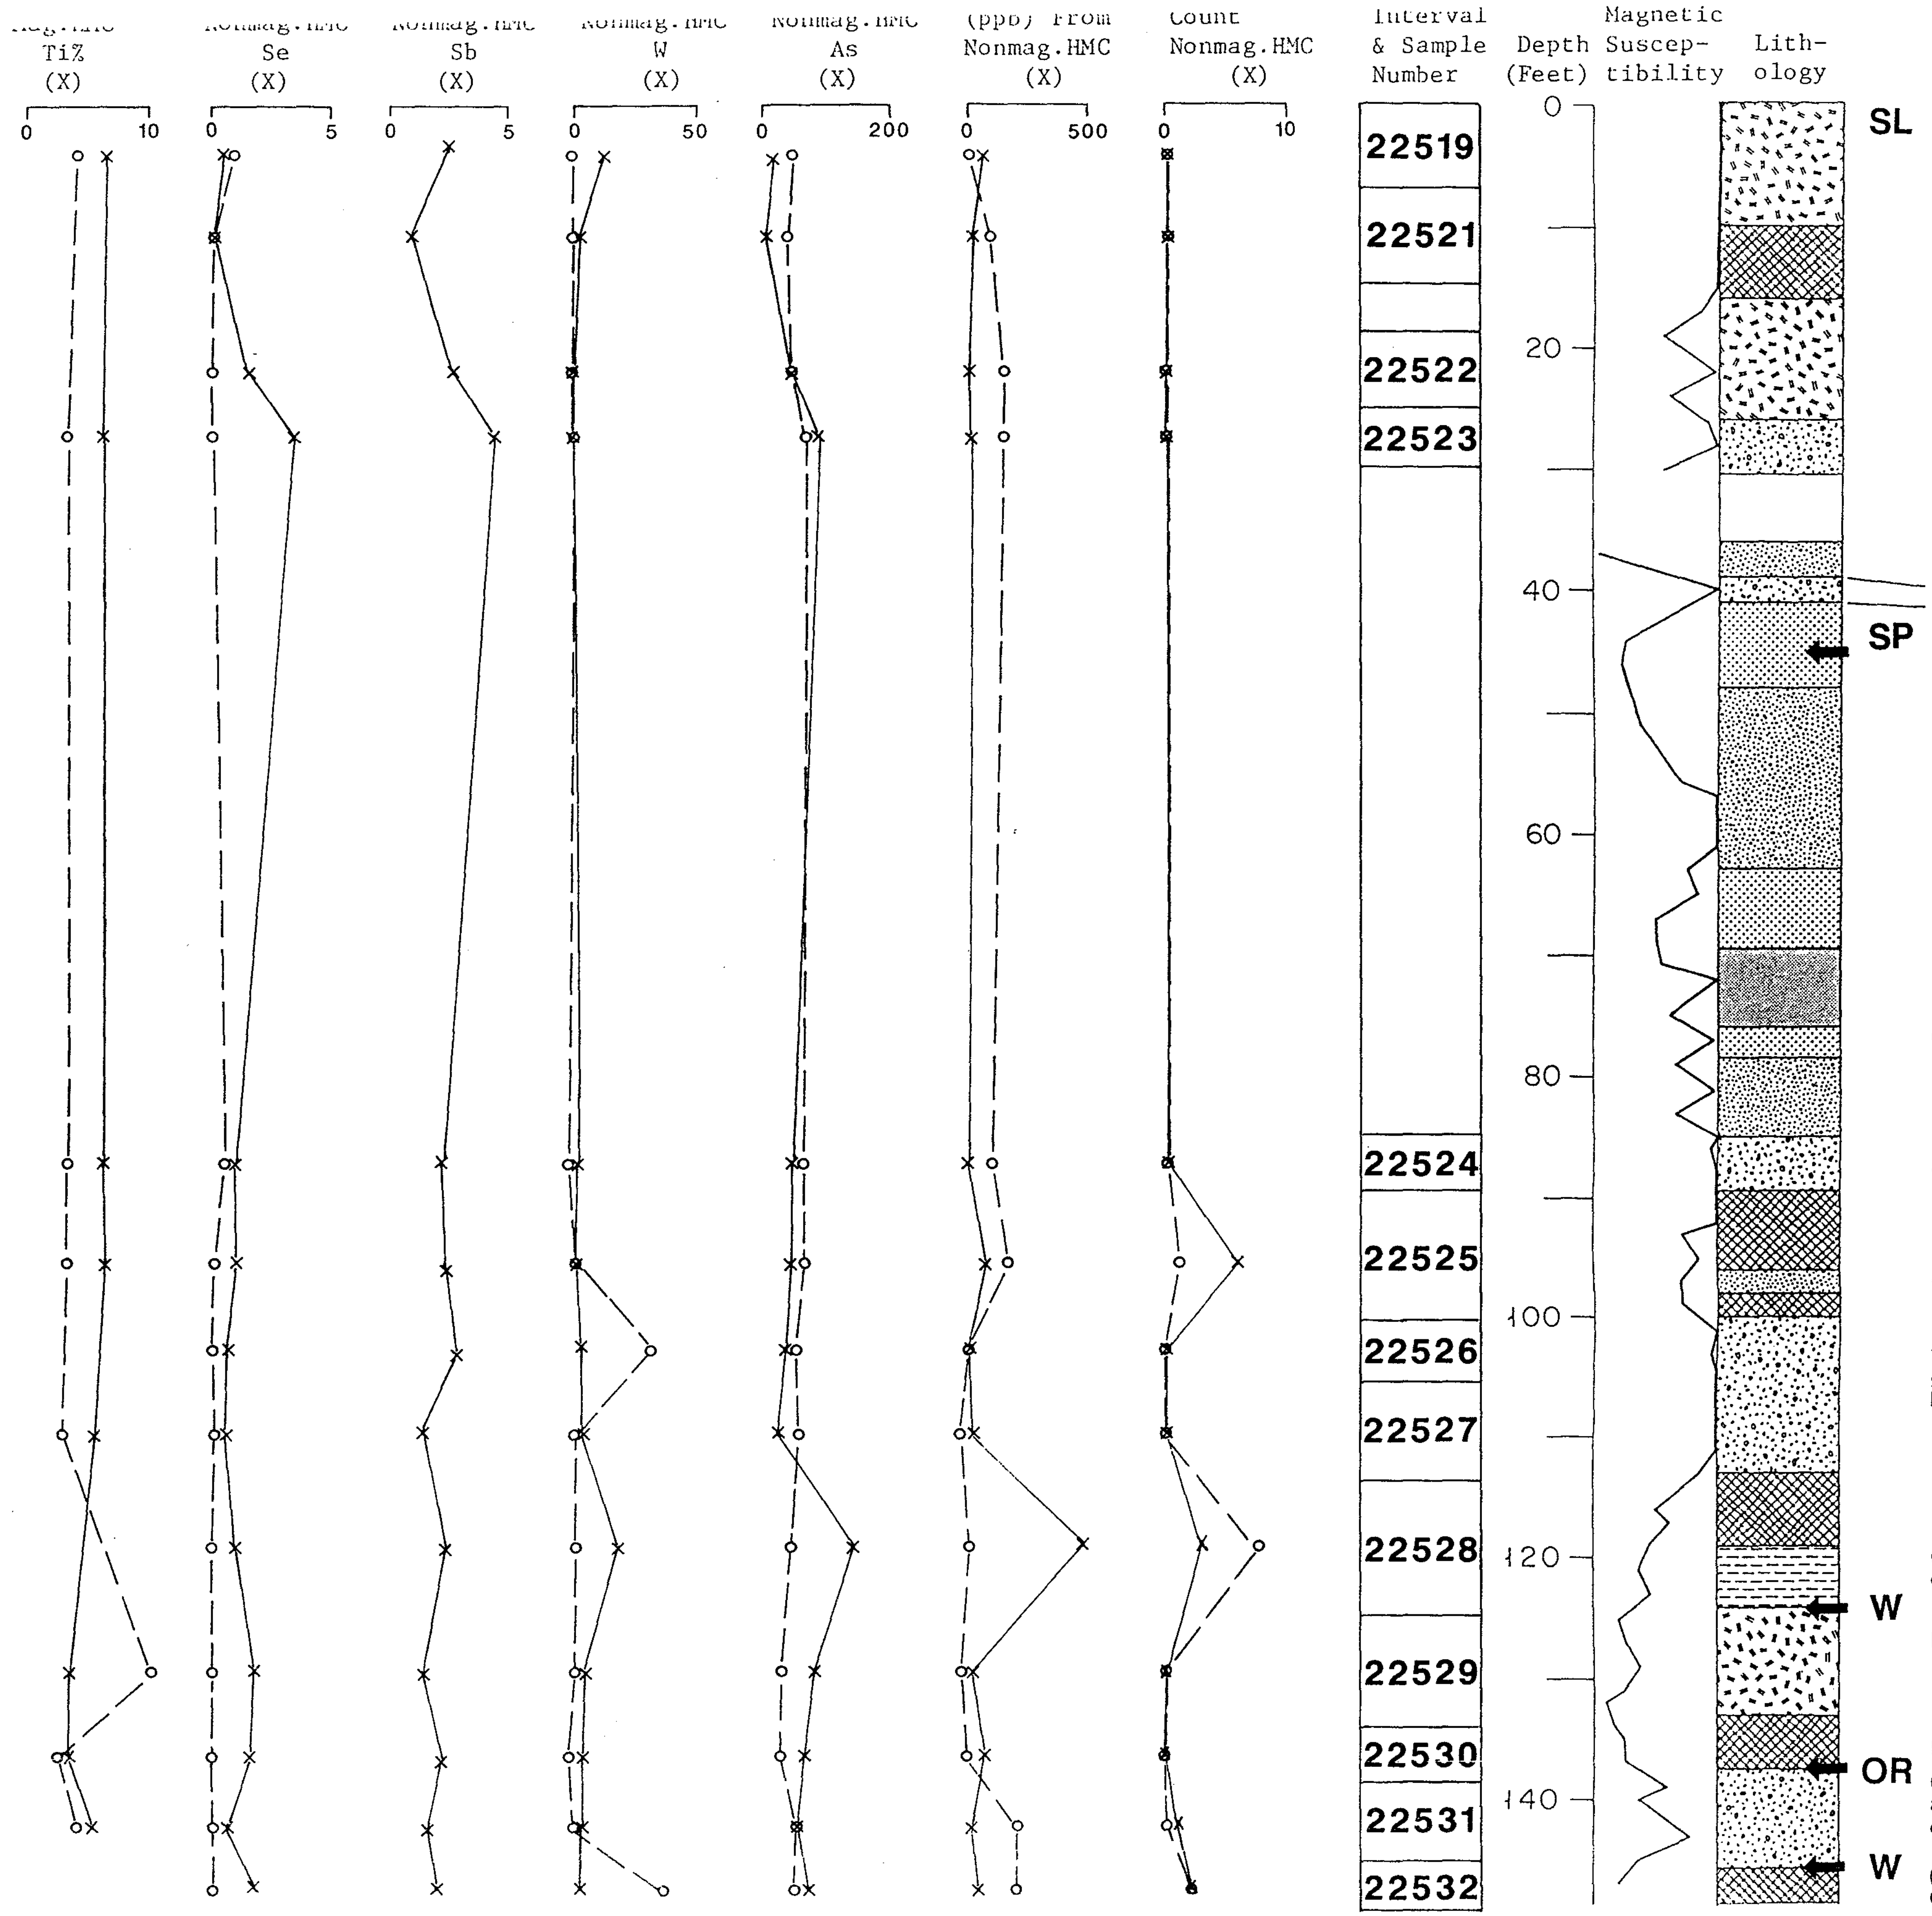
BEDROCK (The following is contributed by Terrence J. Boerboom and Mark Jirsa, MGS).

Core Description: Banded iron-formation. Laminae are 1-5 mm thick, moderately even; a few stand out and may be cherty. Locally grades into clayey graphitic argillite which also is more pyritic. Many of these argillaceous zones appear to have contained massive and semi-massive sulfides, now mostly removed by oxidation. Beds and laminae dip 50-60°. A few thin quartz and carbonate veins exist and are perpendicular to bedding. Malachite (?) or other blue-green Cu-oxide occurs in nearly vertical veins and is most abundant as a remnant vein coating in graphitic zones.

Thin Section Description: OB-402A, 200 ft. Thinly laminated oxide-facies iron-formation. Estimated mode (volume %): Magnetite 23%; Hematite 23%; Quartz (chert) 30%; Stilpnomelane 20%; Pyrite 4%; Chalcopyrite Tr. Thin laminae which consist dominantly of intergrown hematite and magnetite (1 mm or less in thickness) alternate with chert- or stilpnomelane-rich laminae of similar thickness. The chert and stilpnomelane (pale yellow to dark green in color) occur in tiny round granules; stilpnomelane is concentrated into laminae between the oxide-rich laminae. The oxide-rich laminae occur in 0.5 cm- thick mesobands, which alternate with beds of similar thickness that contain more pyrite (and minor chalcopyrite) than oxides. The sulfides also occur in very thin veinlets which are normal to bedding.
OB-402B, 226 ft. Thinly laminated silicate-oxide facies iron-formation. Thin, sub-mm laminae defined by variations in Fe-oxide and stilpnomelane content. Basic mineralogy consists of opaque Fe-oxides, yellowish-brown stilpnomelane, and minor quartz. Cross-cutting brittle veins consist of quartz, lesser calcite, chlorite, and deep red stilpnomelane or hematite(?). The chlorite is bright green and occurs in veins that parallel the laminated bedding and which cross- cut the quartz-calcite veins. The needle-like reddish-brown hematite/stilpnomelane occurs in the more narrow quartz veins and locally emanates from massive patches of felty reddish-brown material of the same composition.

Scintillometer Reading (cps): 65-80

Appendix 1-25B.



OB-402

Geologic Descriptions

(0 - 10) CLAY LOAM TILL: OXIDIZED; noncalc to v sl calc; reddish brn; clast rich, Superior lobe lith; no carb or sh noted; sand & gvl seem at 5 ft; mixed dark gray & reddish brn colors 6 - 8; 8 - 10 calc, reddish brn, mixed clayey till & clayey silt to silty clay lake sed.

(10 - 16) LOAM TILL; OXIDIZED; calc; no carb clasts noted; cobs common; various shades of red to gray.

(16 - 26) CLAY LOAM TILL; UNOXIDIZED by 19 1/2 ft; mod calc; 17 - 18 mixed w/clayey silt lake sed; 18 - 19 1/2 loamy sand; pod of sandy silt at 20 1/2; no cobs from about 17 - 21, fairly rocky below; few carb grains noted; large cob at 25.

(26 - 30 1/2) SANDY LOAM TILL; UNOXIDIZED; fairly abrupt upper contact; about as cobbly as above.

(30 1/2 - 36) NO CORE; prob sand.

(36 - 39) SILTY, GRAVELLY FINE - MEDIUM SAND; UNOXIDIZED; 36 - 37 ft sandy loam till; 38 - 39 mgr to cgr sand.

(39 - 41) LOAMY SAND TILL; UNOXIDIZED; mod calc; cobbly; carb grains; "flow" till.

(41 - 45) COARSE SAND; few sm pebs; lens of unox clayey till at 45 ft.

(45 - 48) MEDIUM - COARSE SAND; OXIDIZED; reddish brn; top of fining upward sequence.

(48 - 63) GRAVELLY COARSE - VERY COARSE SAND; OXIDIZED; pebbly cgr sand to 50 ft, pebbly v cgr sand to 52, sand & gvl to 54; few carb grains; 54 - 61 pebbly, v cgr sand, somewhat silty; few large pebs at 58; 61 - 62 fine gvl; 62 - 63 pebbly cgr sand, sm cobs.

(63 - 69 1/2) FINE - MEDIUM SAND; OXIDIZED; mod calc; few sm carb pebs; apar fining upward; pebbly cgr sand by 66 ft; 67 1/2 - 69 cgr sand; 69 - 69 1/2 fine gvl & v cgr sand.

(69 1/2 - 76) FINE SAND; OXIDIZED; 72 - 72 1/2 ft silty, v fgr to fgr sand; fgr to mgr from 73, w/unox silty fgr sand interbeds from 74 1/2.

(76 - 78 1/2) MEDIUM SAND; UNOXIDIZED.

(78 1/2 - 85) GRAVELLY COARSE SAND; UNOXIDIZED; some silt; sev large pebs; carb rare; some felsite, sandstone.

(85 - 89 1/2) SANDY LOAM TILL; UNOXIDIZED; mod calc; some sm carb pebs; cobs common; sand & gvl lens at 95 1/2 ft.

(89 1/2 - 96) LOAM TILL; UNOXIDIZED; calc; gradational upper contact; apar more carb grains; cobs common; ox sand lens at 95 ft.

(96 - 98) SILTY, GRAVELLY SAND; UNOXIDIZED; poorly sorted.

(98 - 100) LOAM TILL; UNOXIDIZED; as above.

(100 - 119) SANDY LOAM TILL; UNOXIDIZED; mod calc; interbeds of pebbly sand to 105 ft; lens of dark gray, v calc, compact clayey till at 104; sandy loam till by 105; mixed w/dark gray, compact clayey till from 113; carb-rich cgr sand bed at 118 1/2, loam till w/carb pebs below; large iron-formation cob at base.

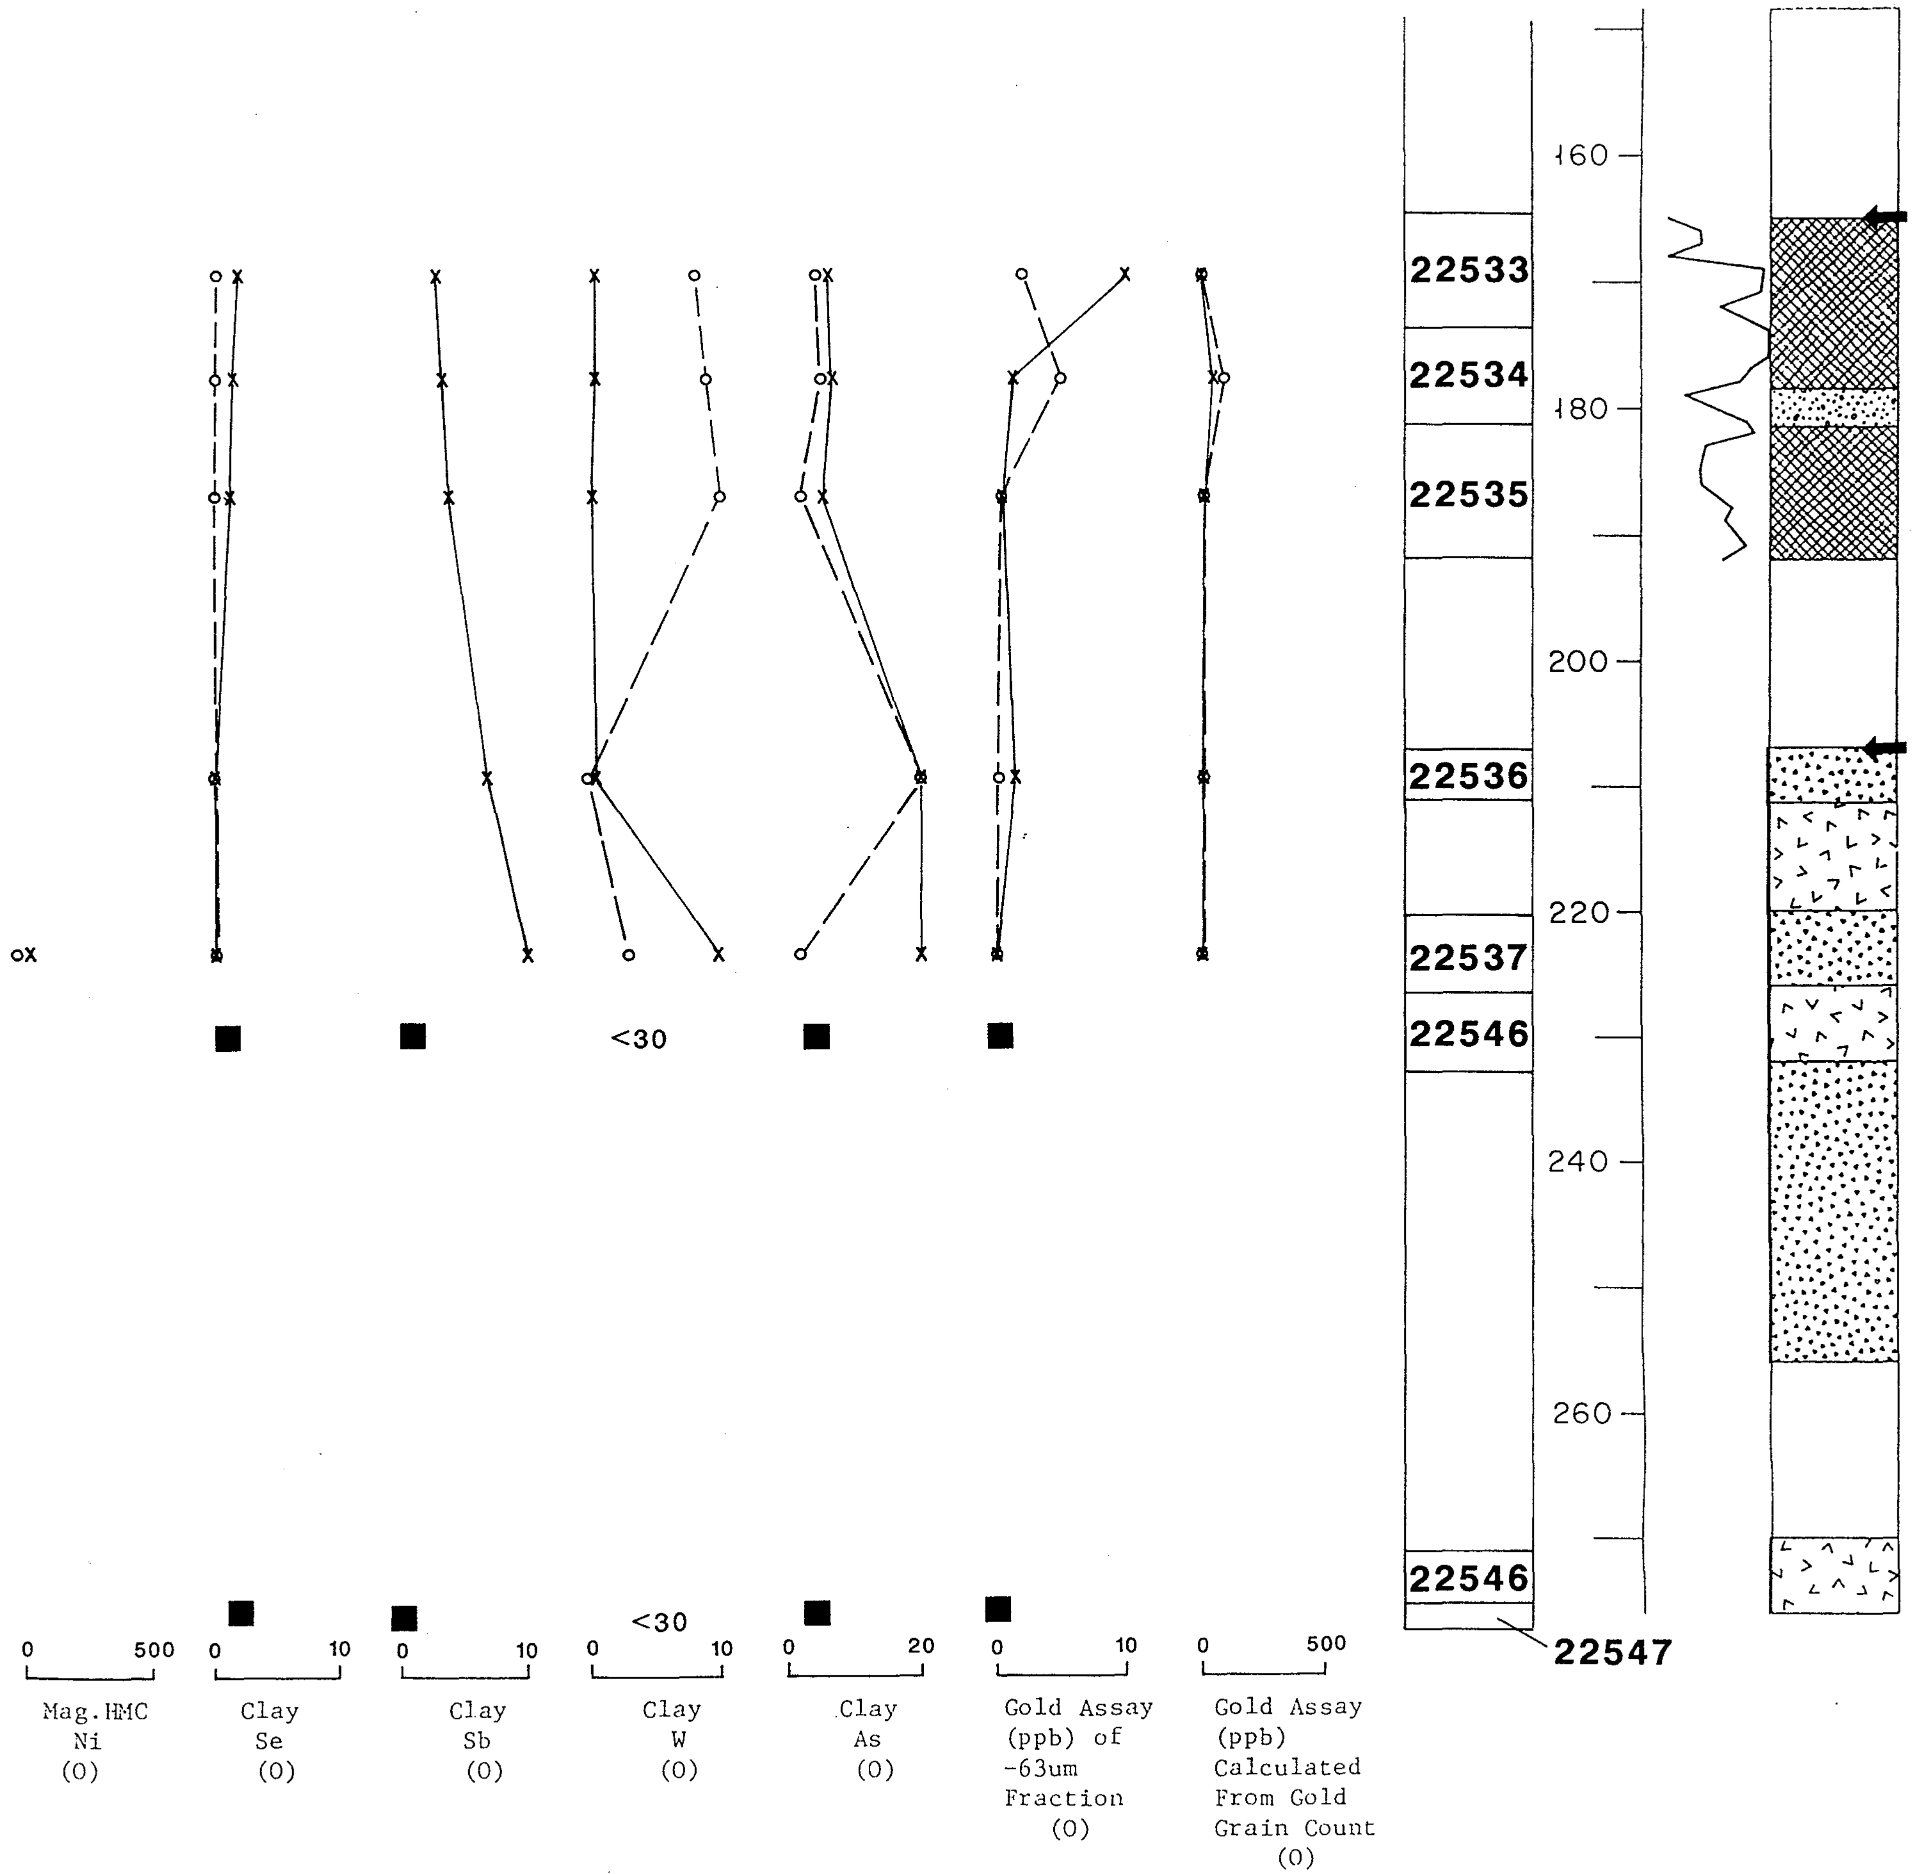
(119 - 124) VERY FINE SANDY SILT; UNOXIDIZED; little v fgr silty sand toward stop; dropstones from 121 ft; lens of till at 123.

(124 - 133) CLAY LOAM TILL; UNOXIDIZED; most pebs are carb; v hard, compact; silt lam at 128 ft, fewer & smaller pebs below; red streak at base.

(133 - 137 1/2) LOAM TILL; UNOXIDIZED; calc; less carb pebs than above; few inches of laminated silt & clay at top, also vertical rootlets at top, so is separate till.

(137 1/2 - 145 1/2) SANDY LOAM TILL; UNOXIDIZED; calc; brner that above, less carb; abrupt upper contact; few silty sand lam; mixed w/dark gray loamy till by 144 ft; couple sm cobs at base.

(145 1/2 - 148 1/2) LOAM TILL; UNOXIDIZED; compact; calc; carb common, few Cretaceous pebs.



(148 1/2 - 165) NO CORE

(165 - 178 1/2) LOAM TILL; UNOXIDIZED; calc; silt rich; compact; cob zone at 166 1/2 ft; reddish gray from 167 1/2 - 168; fair amount of sm cobs; couple silty, v cgr sand interbeds 174 - 174 1/2; uncommon carb; apar more sm cobs from 176.

(178 1/2 - 181 1/2) FINE SAND; UNOXIDIZED; interbedded w/sandy till to 180 ft; pebbly at base.
(181 1/2 - 192) LOAM TILL; UNOXIDIZED; calc; ox fgr to mgr sand 184 - 185 ft; compact; pebs about 10% carb; 188 1/2 - 189 mgr sand; brnish streaks 185 - 188 1/2.

(192 - 207) NO CORE

(207 - 211 1/2) SAPROLITE; top foot is cobbly gvl; 208 - 209 ft fractured rock; **illite** veins throughout core; blk to dark gray rocky clay from 209, graphitic argillite w/iron-formation lam.
(211 1/2 - 220) BEDROCK; MAGNETITE - CARBONATE IRON FORMATION; chert bands; fractured; 50 degree dip; few white veinlets perpendicular to bedding; pyrite veins bedding parallel, associated w/graphite beds.

(220 - 226) SAPROLITE; gritty clay; v dark gray w/hematitic lam; remnant pyrite disseminated throughout.

(226 - 232) BEDROCK; MAGNETITE - CARBONATE IRON-FORMATION; fractured; uncontorted bedding; more pyritic w/depth.

(232 - 256) SAPROLITE; 232 - 234 ft dark gray, graphitic, gritty clay w/ **illite**, **illite** vein at base; 234 - 244 decomposed massive sulfide (?)—dark olive grn, sl gritty **clay**, few sm cob size nodules (?) contain **illite**; 244 - 256 more graphitic, yellowish brn & dark gray gritty clay, some rock fragments, **illite** vein at 248, more brnish below, abundant **illite veins** 250 - 252.

(256 - 270) NO CORE; prob saprolite.

(270-276) BEDROCK; MAGNETIC IRON FM; limonitic lam; fractured; contorted lamination; argillite (?) at base.

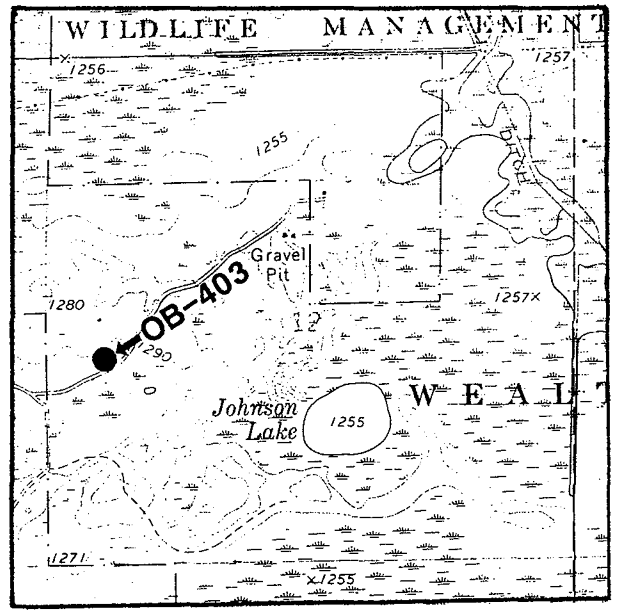
Appendix 1-26A. DRILL HOLE SUMMARY SHEET

IDENTIFICATION
DNR Drill Hole Number: OB-403
Drilling Completion Date: 6/30/88

LOCATION (see map at right)
S-T-R: NW¼-SW¼ - S12 - T45N - R27W
County: Aitkin
Quadrangle: Spirit Lake 7.5
Regional Survey Area: Ironton
UTM Coordinates: 445,780mE; 5137880mN; 15,N.



HOLE PARAMETERS
Surface Elevation: 1290 ± 3 ft.
Total Depth: 186 ft.
Elevation, Top of Precambrian Bedrock: <1104 ft.
Elevation, Top of Saprolite: Unknown
Drilling Method: Rotasonic
Sample Diameter: 3.5 inch
Sample Collection Method: Core: Sleeved & Boxed

SEE FOLLOWING PAGES

INFORMATION SUMMARY

Interval (ft.)	Interpretation	Library Samples Available	Subsamples Tested	Geochem Assays Worthy of Further Review
0-8	St. Louis sublobe	B,C,G	A,B	B=Sb
8-162	Rainy lobe	B,C,G	A,B	A=Fe B=Cu,Ni,Se,Sb
162-186	Old Rainy lobe	B,C,G	A,B	A=Fe B=Cu,Ni,Se,Sb

A = Silt/Clay Fraction
B = Heavy Minerals, Nonmag
C = Heavy Minerals, Mag
G = Core

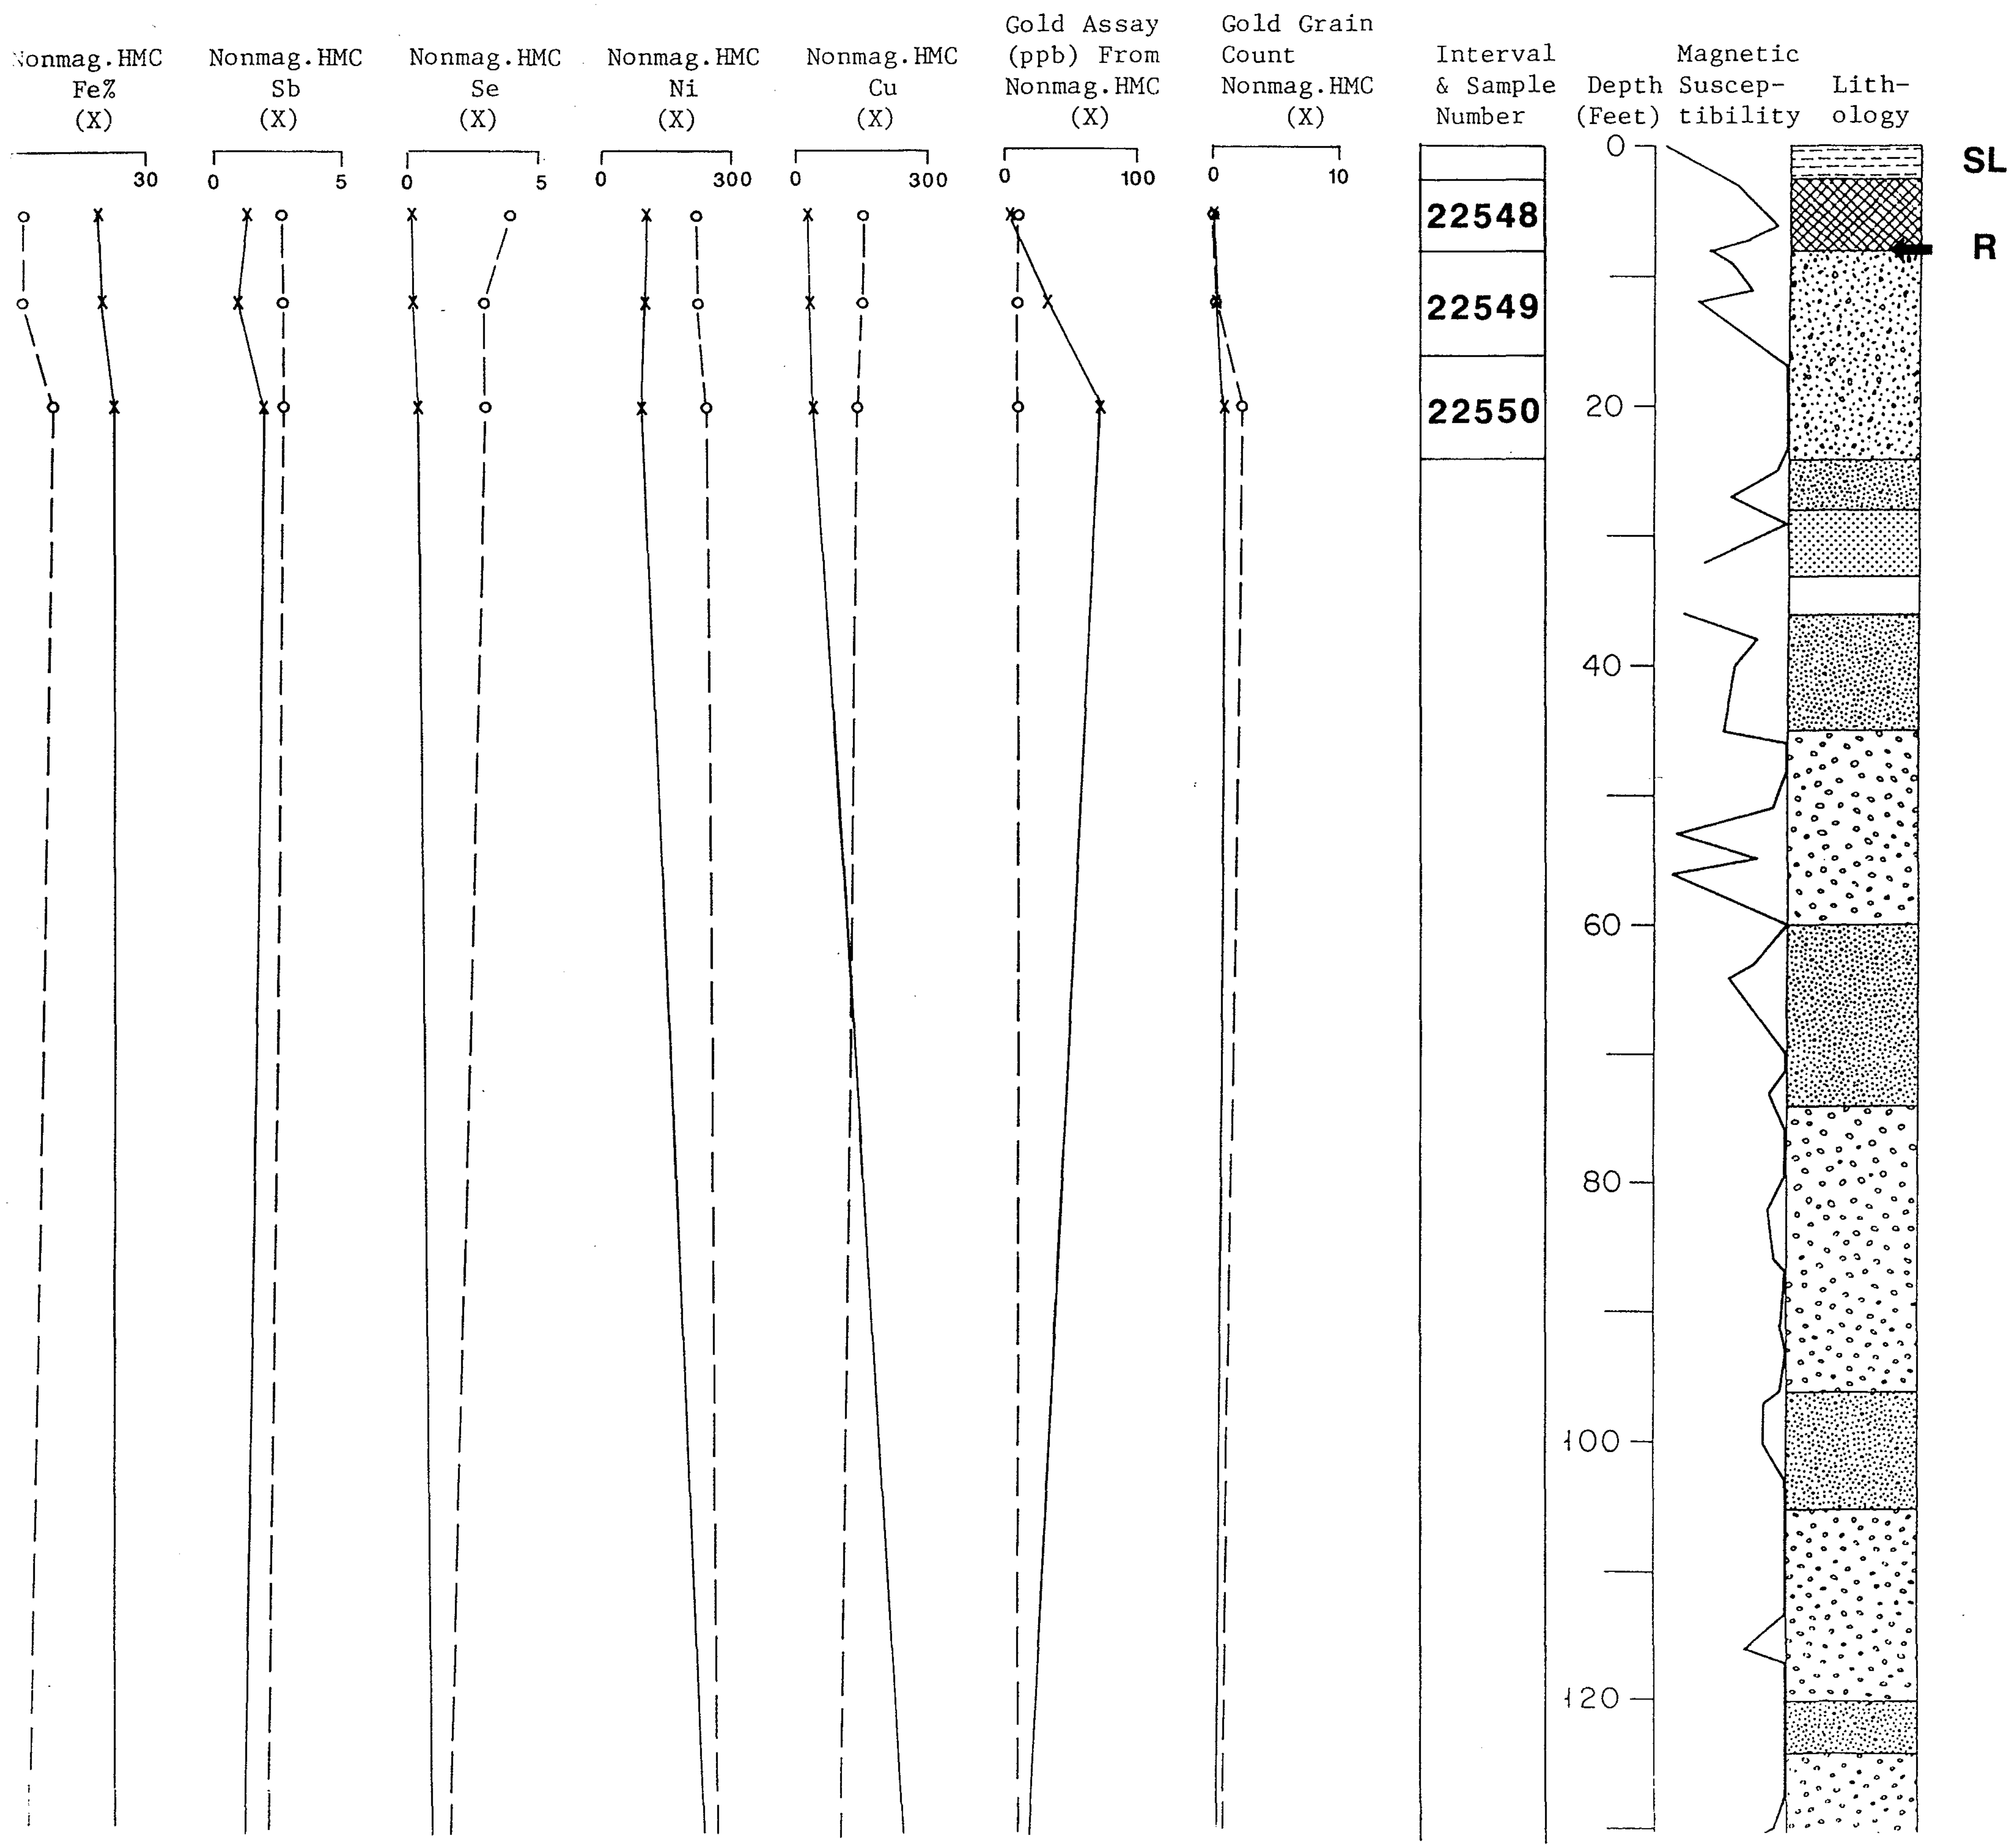
H = Thin Section
I = (Bedrock or Drift) Split of "Wholerock" Sample
J = Special Mineralogy

BEDROCK
No bedrock reached in this hole.

BLANK PAGE

OB-403

Appendix 1-26B.



Geologic Descriptions

(0 - 2 1/2) FINE SANDY SILT; OXIDIZED; yellowish brn; lake sed; pebbly in lower foot.

(2 1/2 - 8) LOAM - SANDY CLAY LOAM TILL; OXIDIZED; reddish brn; noncalc; pebs fairly common; gradational lower contact.

(8 - 24) SANDY LOAM TILL; OXIDIZED; brn; sl calc; cobs at 12 & 16 ft, other sm cobs below; carb grain at 16, sm peb at 19.

(24 - 28) GRAVELLY MEDIUM - COARSE SAND; OXIDIZED; little silt; mod calc; no carb grains noted; silty at base.

(28 - 33) MEDIUM - COARSE SAND; OXIDIZED.

(33 - 36) NO CORE

(36 - 45) GRAVELLY, VERY COARSE & GRAVELLY, SILTY MEDIUM SAND; OXIDIZED; mostly v cgr sand to gnl w/some silt from 39 ft; no carb noted.

(45 - 60) SILTY, COBBLY GRAVEL; UNOXIDIZED by 48 ft; cobs fairly ang; carb pebs less than 5%; 48 - 51 fine gvl, quite silty by 49; some cobs large below 51; gvl is dark, some red pebs also present.

(60 - 74) VERY COARSE SAND & GRANULES; sandy till ball at 68 ft; occ large pebs to sm cobs below; primarily dark grains w/few carb.

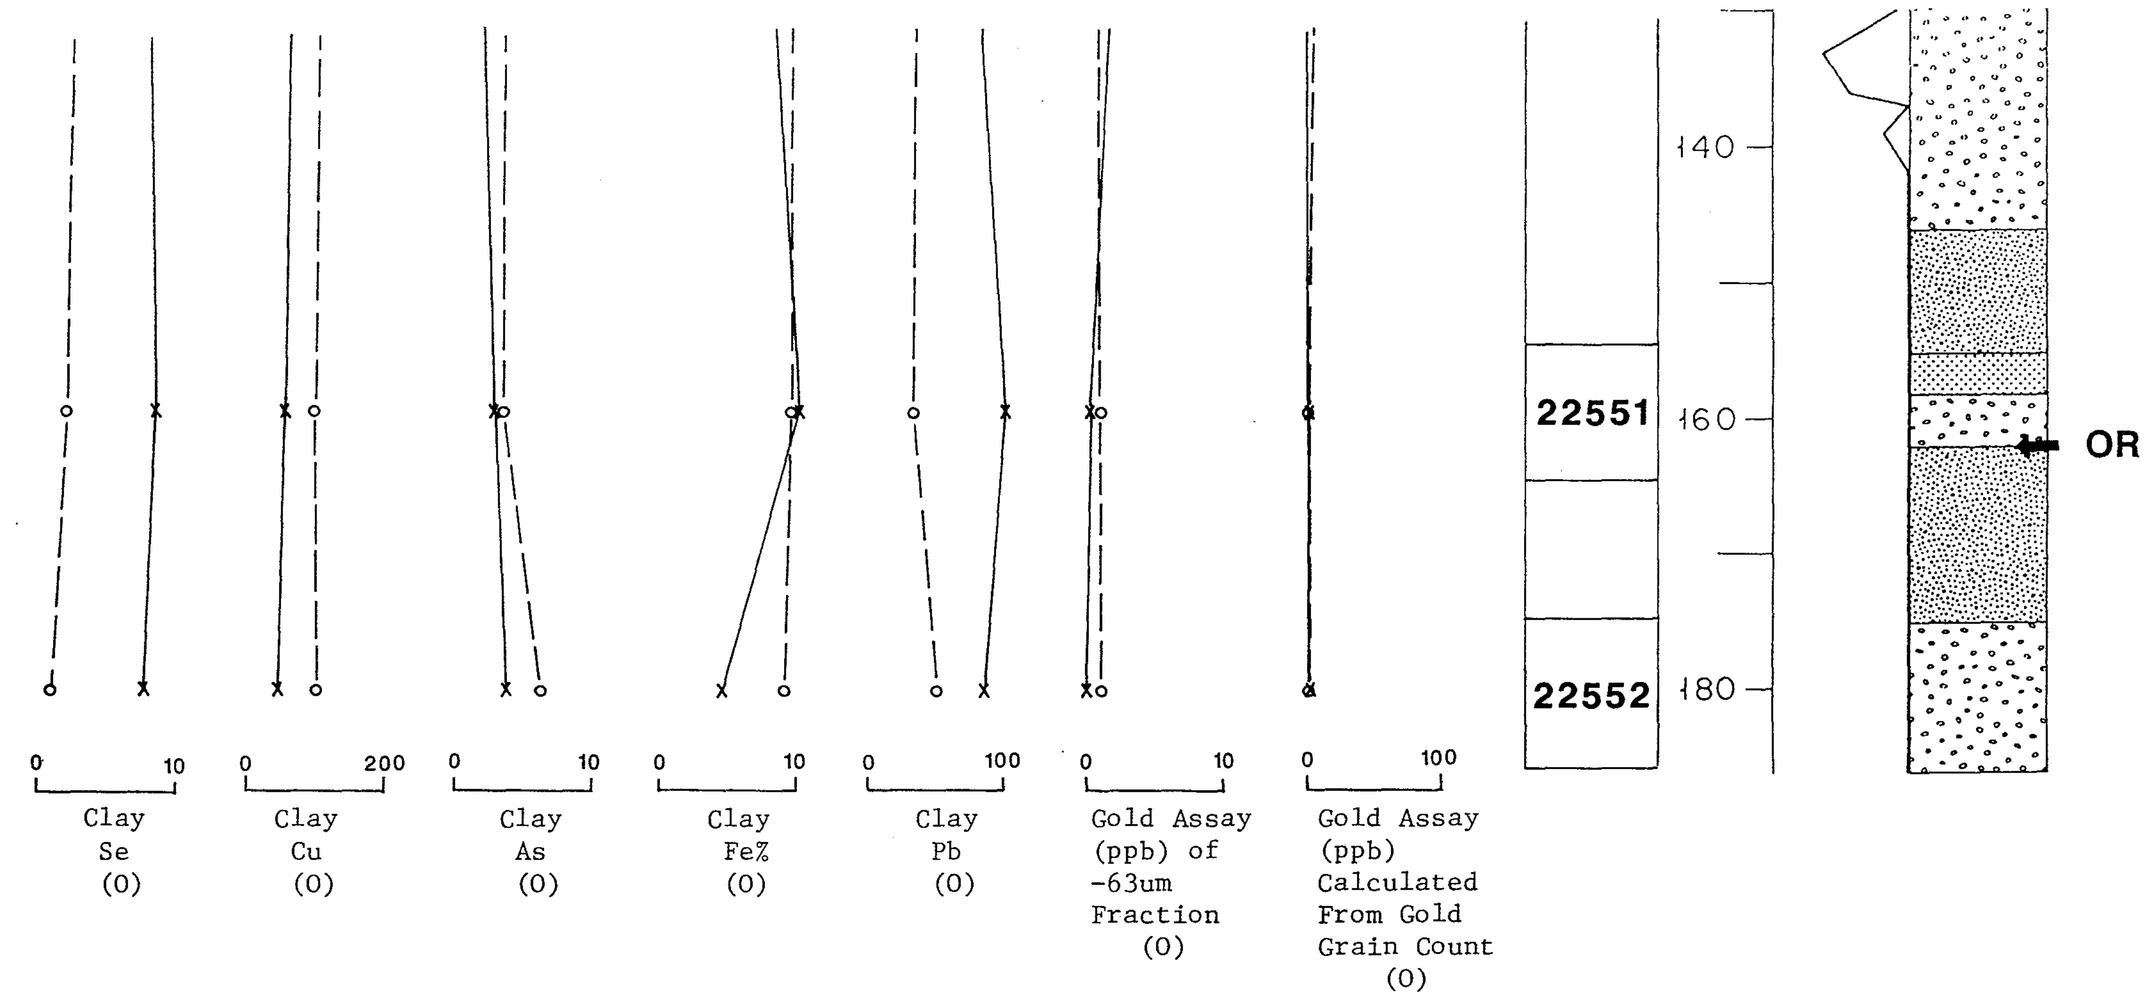
(74 - 96) COBBLY, SILTY COARSE SAND & GRAVEL; large hunk of graphitic silty clay saprolite at 91 ft.

(96 - 105) SILTY, GRAVELLY VERY COARSE SAND; cob & sm till ball.

(105 - 120) SILTY, COBBLY GRAVEL; noted sev red sandstone pebs; no cobs below 116 ft.

(120 - 124) SILTY, GRAVELLY, VERY COARSE SAND; UNOXIDIZED.

(124 - 146) SILTY, COBBLY GRAVEL; UNOXIDIZED; some large cobs; few sm carb pebs.



(146 - 155) VERY COARSE SAND & GRAVEL; UNOXIDIZED; sm cob at 153 ft.

(155 - 158) SILTY, VERY COARSE SAND; UNOXIDIZED; mgr in upper foot.

(158 - 162) SILTY, COBBLY SAND & GRAVEL.

(162 - 175) GRAVELLY, COARSE - VERY COARSE SAND; OXIDIZED.

(175 - 186) SILTY GRAVEL; OXIDIZED; cobbly below 183 ft; sev carb grains.

Appendix 1-26C.

*hole near glacial striation measurement

Appendix 3-2. Discussion of the conceptual models for an Archean Superior Province gold mining-camp-scale-mineralization and also for landscape geochemistry.

A. There is very good potential for gold ore to occur in Minnesota within the Archean Superior Province, since 33 gold mines (each with production greater than 1 million ounces) exist in the same terrane in Canada (Hodgson & MacGeeham, 1982). It is fundamental to the design of this project that those gold deposits occur in clusters described by Colvine and Stewart (1984):

" Concentrations of gold deposits occur along linear zones that . . . have been variously termed "breaks," "growth faults" or facies changes . . . . Felsic and alkalic stocks, often porphyritic, are more common among these zones . . . . Gold mineralization is not uniformly distributed along these zones, but is focused in individual mining camps up to tens of kilometers long and normally less than ten kilometers wide.

In Minnesota, these potential occurrences are buried by layers of glacial drift which commonly contain clay layers that hinder many exploration techniques. A goal of this project is to utilize the glacial till that is so detrimental to other exploration methods. Basically, as the advancing glacial ice overrode any exposed bedrock, the ice eroded, transported, and deposited that bedrock some distance down its path. Ore clasts can occur within discrete dispersal trains[1] within the glacial drift (see Fig. 1 and 2) which provide geochemical trace element "targets" that in two dimensions can be orders of magnitude larger in size than the actual bedrock ore zone being sought.

In combination, a cluster of gold ore occurrences could be eroded and transported by the glacier and deposited as dispersal trains in till, thus providing the fundamental conceptual model for the widely spaced drilling of this reconnaissance survey (see example from literature in Fig. 3). That is, we sought large-scale targets of clustered dispersal trains of gold or pathfinder trace elements in the glacial drift. No intent was made to determine the nature of any specific gold occurrence; however, significant information is available for interpretation.

----

1 Dispersal trains are so call since the dispersal of subglacial sediment down-ice from its bedrock source assumes the form of a negative exponential decay curve which can be quantified by its decay constant, half-distance, and total transport distance (Shilts, 1976; Clark, 1987).

B. The following is an excerpt from Hoffman and Thomson (1986) that describes "landscape geochemistry":

"(For a complete discussion of landscape geochemistry, which originated in Russia during the 1930's, you are referred to the useful textbook by Fortescue (1980)). Landscape geochemistry is a holistic approach that involves consideration of the complete environment. Landscape is here defined as a dynamic system involving the relationships between vegetation, soils, underlying rocks, the atmosphere, surface and groundwaters, geomorphology and geology. It is these interrelationships at or near the daylight surface that govern the migration (dispersion) of elements.

Fortescue (1980) identifies six fundamental concepts within landscape geochemistry. These are:

(1) Element abundances--the absolute or relative (partial, selectively extractable, etc.) abundance of elements in a given medium.
(2) Element migration--the movement of elements, their absolute and relative mobility and the forms in which movement takes place.
(3) Geochemical flow--the pathways or plumbing systems along which element migration takes place and the speed at which this proceeds.
(4) Geochemical gradients--the rate of change in the abundance of elements. This is often descriptive of changes in substrate, geochemical flow and geochemical barriers.
(5) Geochemical barriers--these are caused by changes in conditions usually related to migration (Eh, pH, etc.) or flow (permeability, porosity, etc.).
(6) Historical development--the position in time in the evolution of the landscape such as partial or complete development of a process with a defined end point (e.g., podzolization of soil), overprinting by a change of conditions, pollution, contamination, etc.

. . . From these fundamentals it is an easy step to consider geochemical data as an expression of landscape. By recognizing that patterns of element abundances are an expression of changes in a given medium, geochemical barriers, gradients, flow and migration, it is possible to interpret a landscape and identify the underlying controls. The exploration geochemist can be more specific and focus on those features that permit recognition of the presence of potentially economic mineral deposits and may used to locate the site of the mineralization."

Appendix 4-1. Detailed description of weathered bedrock cores.

Hole No.: OB-303

Footage	Description	Color	pH	Interp
149 - 159	Greenish gray clay to weathered rock. Quartz is unaltered. Some of the feldspars are unaltered (still vitreous). Relic texture from parent rock. Slight yellow tint in some areas. Very calcareous.	5 GY 6/1	9.4	Saprolite
159 - 163	Moderate olive-brown clay to weathered rock. Quartz unaltered, feldspars are altered (white powder). Chlorite rich. 162-163 powdered by drill. Very calcareous to slightly calcareous. Less calcareous in the more olive colored areas.	5 Y 4/4	8.7	Saprolite
163 - 166	Dusky yellow-green weathered rock to gritty clay. Becomes very grainy at 165′ with a few black pebbles (3mm). Feldspars and quartz unaltered, calcareous.	5 GY 5/2	9.5	Saprolite
166 - 169	Similar to above except more clayey. Very dry, calcareous.	5 GY 5/2	9.4	Saprolite
169 - 171	Similar to 156-159. Core has a powdered rind. Calcareous to noncalcareous. More calcareous in more weathered areas.	5 GY 6/1	9.0	Saprolite

Hole No.: OB-313

Footage	Description	Color	pH	Interp
180 - 189	Core stones, fines were lost.			
189 - 193.5	Pale green to grayish green weathered rock. Contains many fragments of less weathered rock (dark gray aphanitic). Light olive-brown (5Y 5/6) coating along fragment surfaces. White, powdery area at 193′. Drilled wet up to 190′ and fines were lost.	5 G 7/2 10 GY 5/2	7.5	Saprolite

Hole No.: OB-319

113 - 115	Grayish yellow green sandy/gritty clay with large dark rock fragments (probably bedrock). Sand grains are mostly quartz and average .5 mm. Rusty-yellow staining in a few areas. Highly calcareous.	5 GY 7/2	8.8	Reworked Saprolite
115 - 125	Light greenish gray weathered rock and clay. Hard rock ("good core") for about 5" at 115′ (relatively unweathered). Rest is weathered rock fragments in a light greenish gray matrix. Fragments are lighter in color and contain a lot of quartz and altered feldspars. Blocky from 117 to 120.5 with larger fragments and blocks of hard rock with clay in between. Core becomes lighter at 117, and is very dry. Calcareous.	5 GY 8/1	8.8	Reworked Saprolite

Hole No.: OB-320

Footage	Description	Color	pH	Interp
198.5 - 201	Light greenish gray weathered rock and clay. Light olive-gray (5Y 5/2) 2 cm rind on core. Contains abundant quartz, powdery white feldspars and light greenish gray clay. Crystalline texture is somewhat preserved. Few areas of light brown clay (veins or staining?). Calcareous.	5 G 8/1	9.0	Saprolite
201 - 201.5	Dusky yellow-green clay. Still contains a lot of quartz up to 2 mm. A few areas rich in white, powdery feldspars. Core is very wet compared to above. Calcareous.	5 GY 5/2	9.1	Saprolite
202 - 203.5	Color change - same as above except color is grayish green. Abrupt contact with above color. Appears to be a zone of white powder along this contact. Core is very wet. Calcareous.	5 G 5/2	8.9	Saprolite
203.5 - 209	Dusky green and light greenish gray weathered rock and clay. Similar to 198.5-201 (except for olive-green rind) with dusky green clay marbled in. Some large pieces of quartz (1 cm). Slightly calcareous.	5 G 3/2 5 G 8/1	8.9	Saprolite
209 - 216	Light greenish gray weathered rock and clay. Same as 198.5-201. Calcareous.	5 G 8/1	9.1	Saprolite
216 - 224	Light greenish gray gritty clay. Almost all of rock texture is gone. More of a yellow cast or stain than above. Core is very dry. Slightly calcareous.	5 G 8/1	9.2	Saprolite

Hole No.: OB-326

Footage	Description	Color	pH	Interp
230.5 - 238	White to very light gray weathered rock and sandy/gritty clay. Some of the sand may be due to sluff material and drilling. Many 1 cm pebbles at 235-236. Less weathered fragments are talc-rich (greasy). Noncalcareous.	N9 - N8	9.1	Reworked Saprolite
238 - 251	Unknown			
251 - 270	Apparently rock and weathered rock. Drilled wet so fines were lost and recovered only rock.			
270 - 275	White, chalky clay (N9) and very light gray weathered rock (N8). Very similar to above without the sand and pebbles. Rock from 71.5-72. Noncalcareous.	N9	7.6	Saprolite

Hole No.: OB-327

220 - 225	Greenish gray, pebbly, sandy, soft clay. Many gray to dark gray pebbles at 219-219.5 (up to 2 cm) contain 2-4 mm lumps of pure clay. Quartz is unaltered although rock texture is not preserved. More clay 220-225, no sand, still small 2 mm black pebbles at 200. Quartz appears to be altered, light brown 5 YR 5/6 staining on grains and around them. Light bluish gray area at 220-221.5 in middle of the core. Quartz has not altered in this area. Sandy sluff material contaminates(?) outer surface of core and in between sections of core. Calcareous.	5 GY 6/1	8.6	Kaolinitic Saprolite

Appendix 4-1

Footage	Description	Color	pH	Interp
225 - 231	Greenish gray weathered rock and clay. The more clayey material is more yellow. Some pebbles of differing lithologies at 226.5 (reworked?) and a couple of cobbles at 225. Contains much quartz especially in the less weathered parts (10%). Core is rather broken up from 225-228. 228-231 "good core." Contains geothite. Noncalcareous.	5 GY 6/1	7.7	Kaolinitic Saprolite
231 - 234	Similar to above only dry and light in color. 232-234 rusty specs.	5 GY 8/1	8.0	
234 - 238.5	Light olive-gray weathered granite. Core is very hard. Noncalcareous. Feldspars are greenish gray. Biotite is unrecognizable and quartz is unaltered and in some cases stained red.	5 Y 6/1		Weathered Rock or Saprolite
232.5 - 242.5	Same as 225-231.	5 GY 6/1	7.3	Kaolinitic Saprolite
242.5 - 257	Light olive-gray weathered granite similar to 234-238.5.	5 Y 6/1		Weathered Rock or Saprolite
257 - 264	Greenish gray weathered granite (phenos 4 mm). Less weathered than above. Some biotite. Feldspars are white and chalky and quartz is unaltered. Becomes more weathered at about 263. Noncalcareous.	5 GY 6/1	8.3	

Hole No.: OB-329

Footage	Description	Color	pH	Interp
154 - 155	Dusky yellow-green pebbly clay - reworked saprolite. Red tint on the lower half. Most pebbles are dark gray and range up to 12 mm. One small limestone pebble. Appears to be some light gray lake clay worked in. Slightly calcareous.	5 GY 5/2	7.0	Reworked Saprolite
155 - 155.5	Light grayish green clay. 8 mm olive rind on outer edges of core (result of rotasonic drill). Slightly calcareous.	5 GY 8/1	8.0	Kaolinitic Saprolite
155.5 - 156.5	Moderate brown clay. Very homogeneous. Only a couple of green clay stringers. Slightly calcareous.	5 YR 4/4	8.0	Kaolinitic Saprolite
156.5 - 158	Yellowish gray clay. Clay is mottled with a light gray-green clay. Ranges from noncalcareous to calcareous.	5 Y 7/2	7.9	Kaolinitic Saprolite
158 - 159	Light olive-brown clay. Mottled with lighter and darker shades. Slightly calcareous to noncalcareous.	5 Y 5/6	8.6	Kaolinitic Saprolite
159 - 159.5	Dark yellowish brown clay. Has a small amount of green clay. Mostly noncalcareous except for a couple of calcite lenses at 159′.	10 YR 4/2	6.1	Kaolinitic Saprolite
159.5 - 160	Dusky yellow-green clay. Contains white powdery specs. Noncalcareous.	5 GY 5/2	8.2	Kaolinitic Saprolite
160 - 163	Core was drilled wet and so fines were washed away. Large pebbles of different lithologies were left. Result of drilling? They range in size up to 7 cm. There is one section of "good" core. It is moderate olive-brown pebbly clay. Most pebbles have weathered to soft material and range up to 10 mm in diameter. Dark purple in areas. Calcareous.	5 Y 4/4	9.0	Saprolite

Footage	Description	Color	pH	Interp
163 - 167	Hard weathered rock fragments in moderate olive-brown decayed rock material. Fragments/pebbles range up to 4 cm. Serpentine/chlorite giving green color. At 164' becomes much more clayey and more of a brownish gray color with some oxidized (red) areas that may be along relic fractures. Slightly calcareous.	5 Y 4/4	8.8	Saprolite
167 - 175	Moderate olive-brown clay/ weathered rock. Crystalline texture is still evident. Phenocrysts range from .5-2 mm. Contains chlorite/serpentine. Oxidized along some fractures. Slightly calcareous, very calcareous along some of the fractures. Texture becomes finer at 172.5-175.	5 Y 4/4	7.7	Saprolite
175 - 177.5	Fragments of dark yellowish brown weathered rock and clay. Light tan, muddy coating on core. Contains pink altered feldspars (less than .3 mm). Slightly calcareous to noncalcareous.	10 YR 4/2	8.8	Saprolite
177.5 - 181	Moderate yellowish brown to grayish green clay. Similar to above, only light tan is the more dominant color. Oxidized. Noncalcareous. Almost looks brecciated in areas.	10 YR 5/4	8.3	Saprolite
181 - 187	Dark yellowish brown pulverized saprolite. Result of drilling. Looks similar to above, only wet and muddy with rock fragments up to 4 cm. Noncalcareous.	10 YR 5/4		Saprolite
187 - 191	Light brown clay. Mottled with green clay in some areas. Slight relic rock texture is recognizable by lighter and darker shades. Noncalcareous.	5 YR 6/4	8.2	Oxidized - Saprolite
191 - 214	Core was drilled wet--much of it was washed away. Light olive-gray to light brown weathered rock and clay. Rock texture is still evident, but relatively fine - .5 mm. Weathered rock is relatively soft (can cut through with a knife). Noncalcareous.	5 Y 5/2 5 YR 6/4	8.6	Saprolite

Hole No.: Becker 1-2

Footage	Description	Color	pH	Interp
621 - 628	Grayish pink to yellowish gray pisolitic clay. Pisolites up to 4 mm in diameter and range in color from dark reddish brown to white. Clay is very hard at 621' and becomes a lot softer at 626'. Also becomes lightly stained red at 621'. Noncalcareous.	5 YR 7/2 5 Y 7/2	7.1	Pisolitic Layer or Lateritic Duracrust
628 - 636	Moderate reddish brown, pisolitic clay. Abrupt color change to red. Pisolites are fewer in number and generally smaller although there are a couple large ones. Mottled red-gray zone at about 631' and then turns gray again from 634'-635', then red again from 635'-636'. Pisolites become smaller and fewer. Core is relatively soft. Noncalcareous.	10 R 6/6	8.2	Reworked Saprolite or Lower Pisolitic Layer
636 - 638	Grayish, yellow-green pisolitic clay. Pisolites average .3 - .5 mm. Large (15 mm) reddish purple pisolite at 638'.	5 GY 7/2	8.0	Kaolinitic Saprolite
638 - 647	Grayish, yellow-green clay. Very few pisolites. Relic texture from rock in patchy zones. Noncalcareous.	5 GY 7/2	7.5	Kaolinitic Saprolite

Appendix 4-1

Footage	Description	Color	pH	Interp
647 - 655	Pale reddish brown clay. No pisolites. A few visible stringers of goethite. At 651' many horizontal stringers of greenish gray clay and goethite. Relatively massive noncalcareous core.	10 R 5/4	7.9	Kaolinitic Saprolite
655 - 656	Yellowish gray and pale reddish brown mottled clay. Patchy relic texture from parent rock. Dark reddish brown phenos. of hematite. Noncalcareous.	5 Y 7/2	8.3	Kaolinitic Saprolite
656 - 660	Pale reddish brown clay, very broken. From 656-658 lenses of red-brown noncalcareous clay in sandy material with a high percentage of subrounded quartz grains (contamination?) and very calcareous. At 658 only reddish brown clay (noncalcareous). Core is broken up in small pieces.	10 R 5/4	8.8	Kaolinitic Saprolite
660 - 666	Pale, reddish brown and moderate olive-brown mottled clay. At 663' clay becomes very waxy with more serpentine and chlorite and the core becomes more broken.	10 R 5/4	9.0	Saprolite
666 - 674	Moderate olive-brown clay. Very broken up, noncalcareous, mostly talc, contains slickensides. Calcareous along fracture surface at 669'. Slight hint of parent rock texture in some areas.	5 Y 4/4	9.0	Saprolite

Appendix 8-1: Interpretation of 1988 drill hole data for seismic depth-to-bedrock estimates.

OB-401

Starting with the largest error using estimates made without a NMO correction, OB-401 has a +83 percent variation. We note that a large part of this error is corrected using a NMO correction. With the NMO correction the shallower estimate is almost correct. This suggests two problems. The first is an incorrect velocity profile which the NMO correction took care of.

On the preliminary drill log 0-35 feet is logged as silts and sand, then from 35 feet to 99 feet there are sandy tills, with silty tills and some loamy tills. The water table is calculated as being 23 feet. Therefore the velocity of the saturated sediments would be taken from saturated silts and sand. These should have a higher velocity than the sandy tills below it. With a high Vrms model from equation two and increased T (time) for equation three the depth (D) would increase. The bedrock updip minus downdip velocity is only 111 feet per second and there isn't a near surface velocity change therefore a NMO correction should and did work very well.

The second problem is apparently a reflector below the regolith-bedrock interface. At present we are working on a way to recognize or correct this problem. See the description of Reflectors Below Bedrock Ledge within the Introduction and Conclusions sections.

OB-402

OB-402 has a -23 percent variation for a depth estimate without NMO. With a NMO correction the error is -21 percent. Both are the deep or expected bedrock estimates. The depth to water table is 10 to 15 feet, meaning the velocity model is derived from clay till for the unsaturated sediments and loamy till for saturated sediments. Below this there is a mixture of clay tills, loamy tills and sandy tills. From the log there is no reason to believe the velocity model isn't correct. The bedrock updip minus downdip velocity is 538 feet per second and the NMO correction should work reasonably well. Looking at first breaks on the seismic wave forms, OB-402 has a near surface velocity change of 4,378 feet per second and this is the problem. This problem is clearly observed on forward and reverse seismic waveforms of OB-302, Figure 8-1.

OB-302

OB-302 has a positive +17 percent variation for a depth estimate without a NMO correction and a +38 percent variation with a NMO correction. The problem with the +38 percent variation has already been explained but we want to look at other factors in both figures. OB-302 has a shallow water table, about five feet. This means the saturated velocity is a clay with fairly high velocity. Below this is a lot of sand or sandy till with some loamy or clayey till. The Vrms model has a higher velocity than it should have which would increase depths. The bedrock updip minus downdip velocity change is only 434 feet per second. If there hadn't been a large near surface velocity change the NMO probably would have corrected the error. Since both the shallow depth estimates and the deep estimates are deeper than the actual saprolite-bedrock interface, there is probably a bedrock reflector below this interface.

OB-313

OB-313 had a -15 percent error without a NMO correction and -9 percent error with a NMO correction. The depth of the water table was twelve feet. There was a near surface velocity change of 1321 feet feet second. The least squared trend line on Figure 8-2 shows a nine percent error would be expected. We did not have good data from both directions to measure bedrock updip minus downdip velocities.

The twelve foot water table would be an interface between loamy to silty till and sandy silt. The Vs is 5,255 feet per second and Vrms is 4,339 feet per second. This is below the average Vrms of 4,777 fps. This suggests the error will be negative which it is. It is difficult to judge from the drill log why the Vs would be low. There is a lot of sand with considerable rocky till and some cobbles with boulders. Of 188 feet only eleven feet contain clay while seventy-seven feet have coarser deposits than the sandy silt where the Vs was measured. If anything the Vrms should be high. The NMO correction reduced the error by six percent. This suggests reasonable updip minus downdip bedrock velocities and if near surface conditions had been uniform the NMO correction would have worked satisfactorily.

OB-326

OB-326 had a -13 percent error without an NMO correction and -2 percent with a NMO correction, suggesting a velocity model problem corrected by the NMO. The Vs is 5,770 and the Vrms is 5,019 fps, 242 fps above average. The near surface velocity change was 1,429 fps. This indicates an eight percent error would be expected. We didn't obtain bedrock updip minus downdip velocity analysis but the good results with a NMO correction show a reasonably horizontal interface.

The depth to water table is six feet. That would place this interface in a clay. Most of the hole from forty six to 230.5 feet is sand with some sandy silt. If anything the velocity model should be high and the error a positive error rather than a negative error. However, the corrected Vrms is 5,666 fps. There may be more clay in the sand than was recognized in the preliminary log.

Other Holes

The five holes discussed here all have more than ten percent error without using a NMO correction. Three of these were reduced to less than ten percent error using a NMO correction. However, two holes with less than ten percent error were increased to over ten percent error using a NMO correction and for two others the error was increased although not over ten percent. The holes where percentage of error was increased were OB-301, OB-302, OB-306, and OB-320. These had respective near surface velocity changes in feet per second of 4,534, 7,703, 4,496 and 1,030. These near surface velocity changes would account for most of the errors. OB-320 increased from a +1 percent error without a NMO correction to -10 percent with a NMO, but a change of 1,030 in near surface velocity would plot at +or- 8 percent error on the least squares plot, Figure 8-2.
