23 December 2022

SUMMARY OF FINDINGS

The Minnesota DNR conducts a postcard survey of greater prairie-chicken (*Tympanuchus cupido pinnatus*) hunters each year to estimate hunter numbers and harvest and to evaluate hunter success and satisfaction. In 2022, 109 hunters were estimated to have gone afield and harvested 111 prairie-chickens and 46 sharp-tailed grouse (*Tympanuchus phasianellus*) during prairie-chicken hunts. Hunter success (0.60) was higher than last year but similar to recent years. Satisfaction (3.9 on a scale of 1-5) also was similar to recent years and consistent with improvement following changes to the permit areas and season in 2013 (i.e., longer length and earlier dates). Notably, in 2022, the number of applicants for the prairie-chicken lottery was the highest since 2009, indicating more interest in prairie-chicken hunting.

INTRODUCTION

Greater prairie-chicken (*Tympanuchus cupido pinnatus*) hunting in Minnesota was closed in 1943 because of population declines resulting from habitat loss. However, hunting was reopened in 2003 because prairie-chicken populations were considered robust enough to allow a limited season. During 2003-2005, a limited-entry 5-day hunting season was opened in 7 permit areas in western Minnesota. Permits were awarded through a lottery system, with a bag

and season limit of 2 prairie-chickens. In 2006, 4 new permit areas were added, and the number of permits was increased in some areas. Surplus licenses were offered for sale after the lottery for the first time in 2011, and in 2013, the permit areas were revised again. These most recent changes eliminated 801A and 802A, modified 803A to include portions of the former 802A and 803A, and added 812A and 813A to expand hunting eastward (Figures 1 and 2). The number of available permits also was reduced in some permit areas to more closely reflect opportunities to harvest prairie-chickens in each permit area. The season was lengthened from 5 days to 9 days to provide hunting opportunity on >1 weekend and was moved from mid-October to open in late-September. The earlier season was an attempt to improve hunter success and satisfaction by providing hunting opportunities before pheasant season opened (to reduce hunter interference and flushing distance). These changes were based on hunter comments received by DNR Wildlife Managers during prior years and input received during a public input survey during March 2013. Responses of surveyed prairie-chicken hunters in 2015 provided additional evidence that the earlier season is preferred by most, although hunter preferences were clearly divided. In 2022, the prairie-chicken season opened 24 September and closed 2 October.

Prairie-chicken hunting in Minnesota is a privilege that is only available to residents. Landowners or tenants of ≥ 40 acres of grassland within a permit area are eligible to apply for a landowner lottery that awards up to 20% of the available permits in a permit area. Remaining permits are then included with the regular lottery. Any landowner not receiving a permit through the landowner lottery can participate in the regular lottery. The lottery gives preference to persons that have applied for a permit unsuccessfully for the most years. Upon selection, lottery winners must purchase a prairie-chicken hunting permit before hunting. Although sharp-tailed grouse (*Tympanuchus phasianellus*) hunting is closed south of U.S. Highway 2 in the western part of the state (i.e., in permit areas 804A–813A), licensed prairie-chicken hunters may

also take sharp-tailed grouse while hunting prairie-chickens. Harvest is documented each year in this annual report.

METHODS

Lottery applicants, winners, and permit purchasers were recorded by the Electronic Licensing System (ELS). Registration of harvested birds has not been mandatory, except during 2003-2007, so I determined harvest through a postcard survey. I sent a postcard to each lottery winner the week before hunting season. Six weeks later I sent another postcard to people who had not yet responded. Postcards contained 6 questions: did you purchase a permit; did you hunt, and if so, for how many days; how many prairie-chickens did you harvest; how many sharp-tailed grouse did you harvest during prairie-chicken hunts; and how satisfied were you (on a scale of 1-5)?

Only responses from lottery winners who purchased a hunting permit or reported hunting were considered in the analysis. I compared responses from the first mailing to responses from the second mailing to examine possible nonresponse bias and adjusted as necessary. I calculated the number of birds harvested, birds per harvester, and hunter success (i.e., proportion of estimated hunters harvesting ≥ 1 prairie-chicken) for each permit area. Each of these metrics was calculated by permit area and for all areas combined.

RESULTS AND DISCUSSION

The combined quota for the 11 permit areas during 2022 was 125 permits, and 436 individuals applied in the lottery (Table 1). Of the 125 lottery winners, 112—including 3 landowners—later purchased a permit. All but 2 permit areas, 811A and 813A, had more applicants than permits available, so surplus permits were not available.

Ninety-one purchasers (81%, $n = 112$) responded to the survey; 76 (68%) responded to the first mailing and 15 (13%) to the second mailing. This response rate is the lowest survey response rate since 2010 (mean: 87%; range: 83-95%). I did not detect a response bias in the

number of respondents that hunted, which may have been due to the small number of responses to the second mailing and its effect on resolving differences. Respondents to the first mailing were as likely to have hunted as those responding to the second mailing (97% vs. 93% of respondents). Respondents to the first mailing also harvested prairie-chickens at a statistically similar rate to respondents to the second mailing (66% vs. 33%), harvested similar numbers of chickens (1.1 vs. 0.7 birds per hunter), spent a similar number of days afield (2.3 vs. 2.7, respectively), and harvested similar numbers of sharp-tailed grouse (0.6 vs. 0.1 birds per hunter, respectively). Respondents to the first mailing reported similar satisfaction (mean 4.0 vs. 3.5, median 4.0 vs. 4.0), with 86% and 80% of respondents reporting satisfaction scores ≥ 3 , respectively. Thus, I combined responses from both mailings this year for the analysis.

Eighty-eight respondents reported that they hunted prairie-chickens (Table 2). I estimated the total number of hunters to be 109 (i.e., purchasers who went afield) after accounting for hunting by non-respondents. Hunters reported harvesting 96 prairie-chickens, and total harvest after accounting for non-respondents was estimated as 111 prairie-chickens. An estimated 65 hunters bagged ≥ 1 chicken. Prairie-chicken hunter success during 2022 was higher than 2021 and similar to other years of the survey. Survey respondents also reported harvesting 46 sharp-tailed grouse while hunting prairie-chickens from permit areas 803A (15), 804A (7), 805A (13), and 806A (11) (Figure 1). Successful hunters reported higher average satisfaction (4.4) than respondents that were not successful (3.3), but satisfaction of prairie-chicken hunters was high overall.

Prairie-chicken hunter satisfaction was similar to 2013-2021, which is consistent with improved satisfaction following changes to the season framework in 2013 to accomplish this goal (Table 3). Hunter survey responses in the 2013 Wildlife Public Input Survey and through this postcard survey in 2015 indicated that hunter preferences are split, but that the majority of hunters support the current season framework. Both the 2013 and 2015 surveys asked hunters about their preference for a season opening on the last Saturday in September or an opener on

the Saturday nearest 20 October. The majority of respondents to the 2013 survey (64% of respondents who expressed an opinion) indicated a preference for the earlier season. Likewise, in the 2015 survey, 56% of respondents indicated a preference for the earlier season and 44% preferred a later season. Supporters of the early season indicated that the birds were less wary early in the season and pheasant hunting did not affect the hunt. Reasons provided in support of a later season included cooler weather for hunters and dogs, better plumage on birds, fewer standing crops, opportunity to harvest pheasants while hunting chickens, and no conflict with the waterfowl opener. Based on comments received in the survey this year, prairie-chicken hunters remain split in their preferences for season timing.

ACKNOWLEDGEMENTS

This survey was funded in part by the Wildlife Restoration (Pittman-Robertson) Program. I would like to thank Laura Gilbert for preparing and mailing the postcards and entering data. I would also like to thank Mike Larson for commenting on the report.
