APPENDIX A. Hunter Questionnaire
APPENDIX B. Landowner Questionnaire

Statement of Purpose and Scope

The MNDNR sets white-tailed deer (*Odocoileus virginianus*) population goals for Deer Permit Areas (DPAs) in accordance with the Minnesota Deer Management Plan. Deer population goal setting is a public engagement process that occurs in partnership between MNDNR, individual stakeholders and stakeholder groups, and in consultation with sovereign tribal governments that share a geography with the state. Decisions made about deer population goals dictate the management strategy for DPAs for the goal period. A deer population goal for a DPA may be to increase the population by 25% over 10 years, from the time the goal is set. Annual harvest within a DPA, and estimates derived from the Minnesota Deer Population Model, inform management designation in reference to the population goal over time. Many pieces of information go into decisions about deer population goals, including area wildlife manager's expert opinion, trends in harvest, disease management concerns, and the preferences of stakeholders, among many others.

The MNDNR periodically conducts opinion surveys of deer hunters and landowners to assess preferences for deer populations, experiences with deer hunting, and impacts of deer populations on property to inform the deer population goal setting process. Data presented in this report are of one such investigation. Results of this study directly inform decision making for deer population goals during the winter of 2021.

Results of this study are representative of the populations of deer hunters and landowners surveyed, and may differ substantially from results of self-selected public input processes, as a function of the scientific study design. The values in these reports are the average for all individuals within a given population of interest (e.g., hunters and landowners in a deer permit area), not just respondents to the survey.

Data Collection Process

We surveyed deer hunters and landowners during the winter and spring of 2020 using a mixed mode design that included two solicitations. Selected participants received a letter directing them to complete a questionnaire online, and non-respondents received a paper copy of the survey with a postage-paid self-addressed return envelope. Copies of these questionnaires are found in Appendices A and B of this report and cover a range of topics related to deer populations, deer hunting, property damage from deer, and deer management.

Deer Hunters

We randomly selected individuals with a valid firearms deer hunting license aged 18 years and older within DPAs to receive a goal setting survey. The number of hunters selected in each DPA was determined by estimating the minimum sample size needed to make statistically valid inference about the population at the DPA level at 90% confidence. Participants may not be residents of the DPA, but have indicated that a given DPA is the primary location where they hunt deer.

Landowners

We randomly selected individual land parcels within a DPA from all parcels greater than or equal to 2 acres in size to receive a goal setting survey, considering owners of multiple parcels in a DPA. Participant contact information associated with parcel ownership derived from county tax records. Stratification occurred by quantiles of parcels by acres to ensure a representative coverage of land use types and interests. Land acres strata were 2-19, 20-79, 80-319, and ≥320 acres respectively. Similar to hunters, the number of landowners selected for each DPA was proportional to the total number of landowners in the DPA and after determining the minimum sample size needed for statistically valid inference at the DPA scale with 90% confidence.

Block 13: Coteau-Plains

Goal setting Block 13 (Coteau-Plains) includes deer permit areas: 234, 237, 250, 252, 286, 288, 289, 294, 295, and 296 in the southwest part of the state (Figure 1).

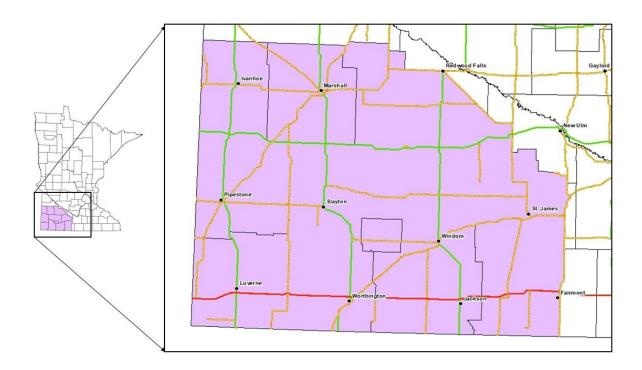

Figure 1. Goal setting Block 13 DPA boundaries

Response Rates and Weighting

Hunters

After accounting for undeliverable mail, the adjusted response rate for the Block 13 hunter sample was 43%. Response rates by DPA ranged from a low of 38% for DPA 238, to a higher of 46% for DPAs 250 and 295. A summary of response rates by DPA is located in Table 1.

We weighted responses in proportion to quantiles derived from the population of aged 18+ firearms deer hunters in Minnesota, during the 2019 hunting season. Respondents (mean=50) were on average older than the population (mean=46) from which the sample was drawn. To attend to this, we estimated population estimates according to the weight schedule presented in Table 2. Weights apply to the population rather than the block level, under an assumption that there is no correlation between age and preferred hunt location.

Landowners

After accounting for undeliverable mail, the adjusted response rate for the Block 13 landowner sample was 37%. Response rates by DPA ranged from a low of 34% for DPA 234, to a high of 45% for DPA 238. A summary of response rates by DPA is located in Table 3.

We drew samples of landowners equally within four strata (2-19, 20-70, 80-319, and 320+) corresponding to parcel acres to ensure representation of small, medium, and large landholders, and thus, the potential array of interests associated with different land uses. We calculated weights within Block to generate estimates representative of the population according to the schedule presented in Table 4.

Table 1. Response rates for hunter samples, by DPA

DPA	Initial Sample	Undeliverable	Respondents	Adjusted sample	Raw response rate	Adjusted response rate

80-319	.36	.25	1.428
320+	.15	.27	0.561

^{*}Weight = 1/(Sample Proportion/Population Proportion)

Summary of Deer Population Preferences

On average, and for most DPAs, deer hunters preferred a moderate increase in the deer population, with mean estimates ranging from a 9% increase for DPA 294, to a 27% increase for DPA 288. Landowners, on average, preferred either a small decrease in the deer population, with estimates ranging from -4% for DPAs 250 and 296 to -17% for DPA 238. Landowners in DPAs 252, 288, and 289 preferred no change in the deer population on and around their land. Figure 2 contains mean estimates with 95% confidence intervals of hunters' and landowners' preferred percent change in the deer population in the DPA where they hunt or their land is located respectively. We coded individuals that preferred no change in the population with a value of zero for this analysis.

Figures 3 through 12 contain DPA level estimates for the percent of hunters and landowners that preferred to see future deer populations decrease, stay the same, or increase. In most cases, the majority of hunters expressed a preference for an increase in the deer population in the DPA where they hunt. Majorities of landowners preferred either a decrease in the deer population on their land, or for the deer population to remain the same, depending on DPA.

Figure 2. Landowners' and hunters' mean desired percent change in the deer population, by DPA

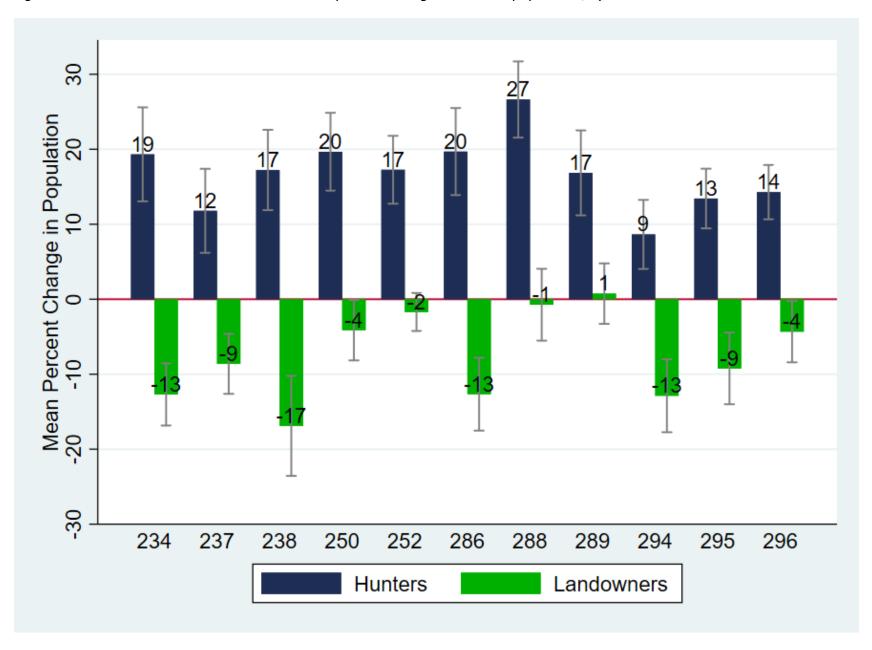

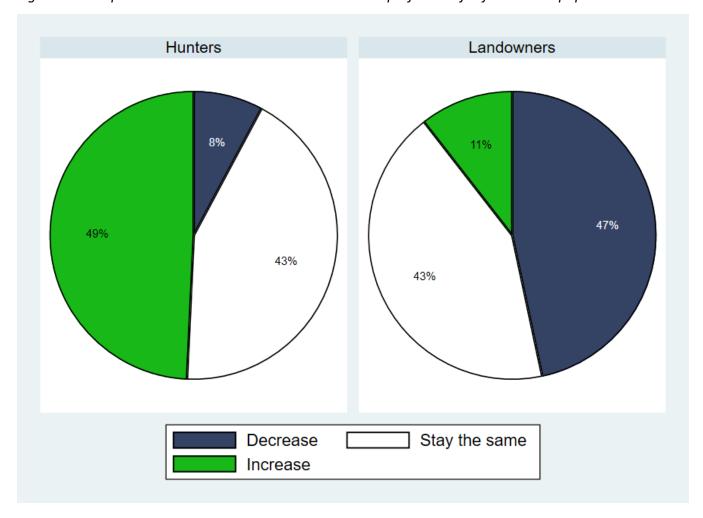

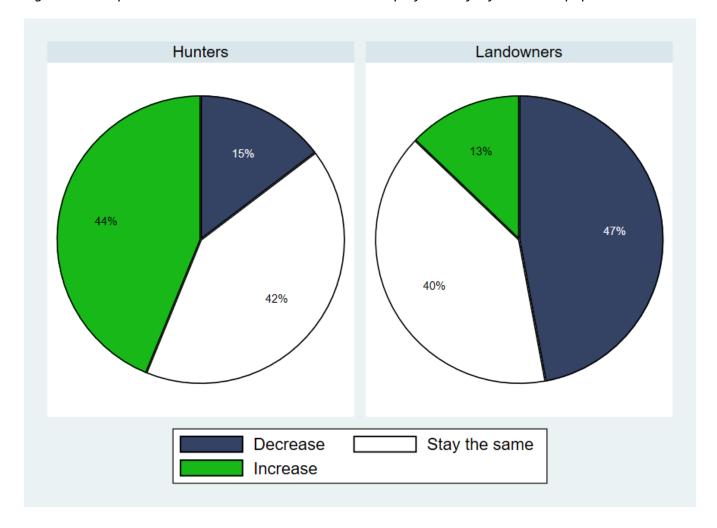

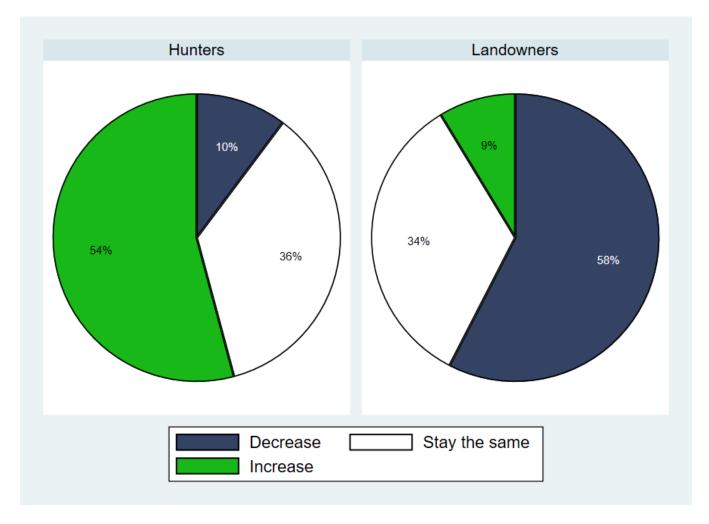

Figure 3. Deer permit area 234 landowners' and hunters' preference for future deer population

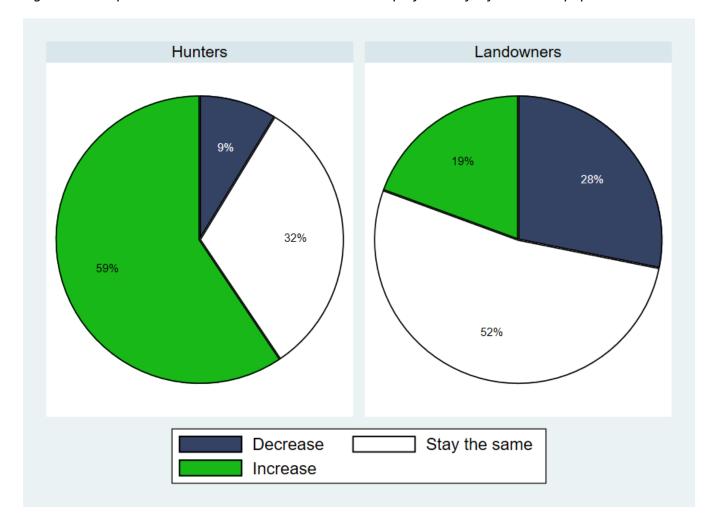

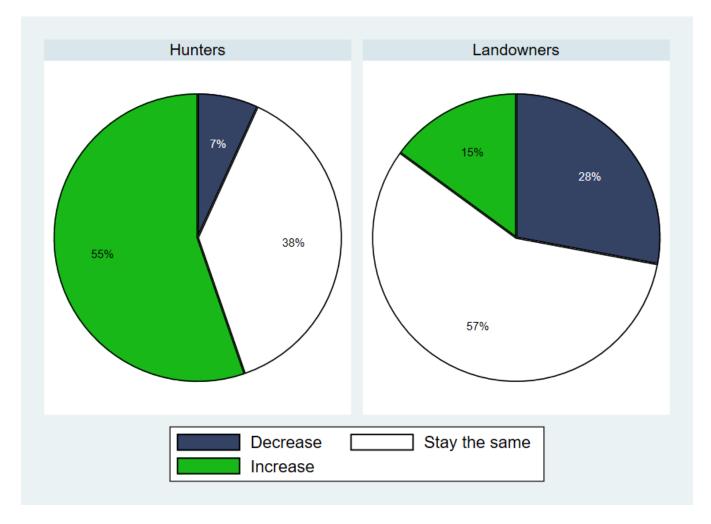

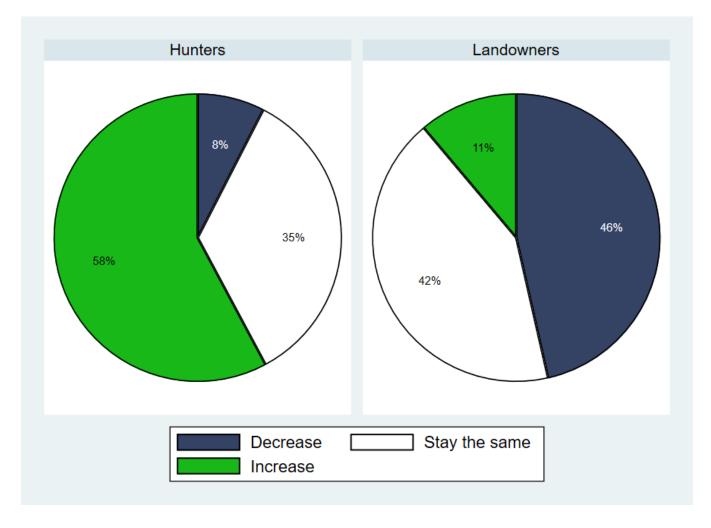

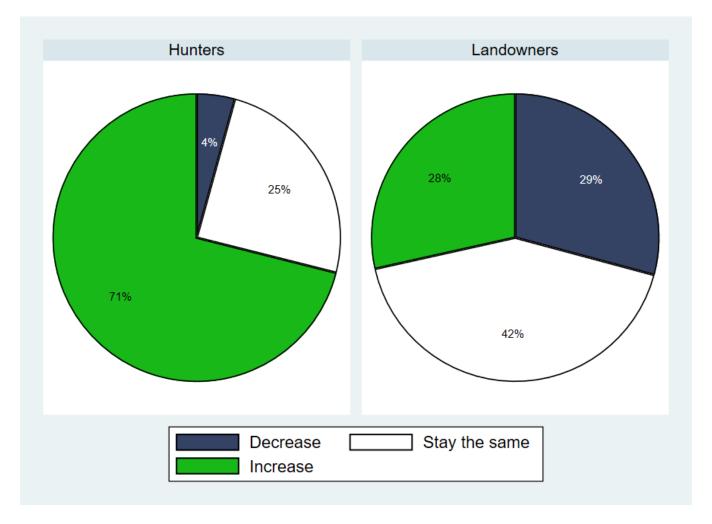

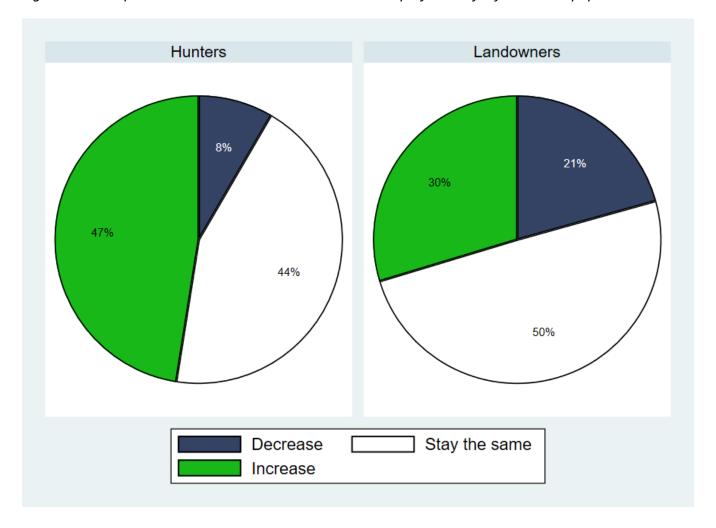

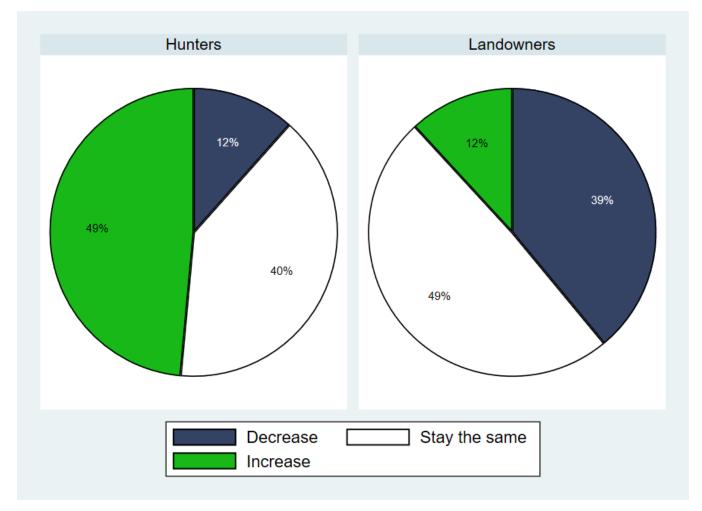

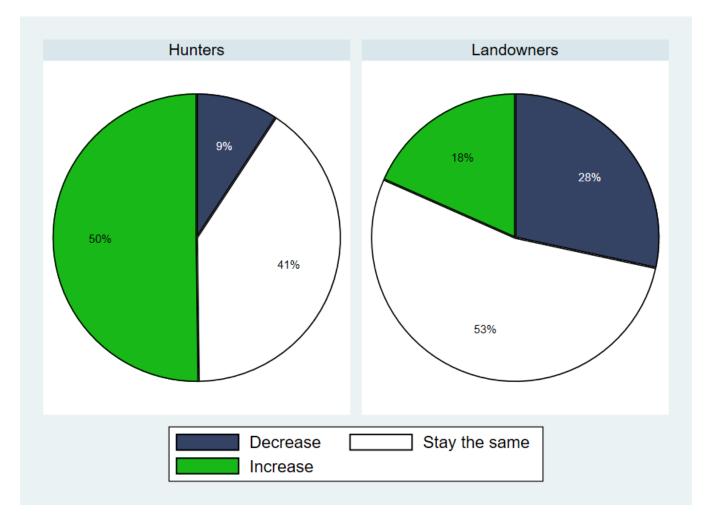

Hunters

We asked hunters to report their recent deer hunting activity. The vast majority (>90%) of hunters reported having hunted deer during the last three years (Table 5). Among these hunters, around 40% reported that they hunted during the archery season in 2019, while 40% participated in muzzleloader season, and nearly all reported hunting during the firearms season (Table 6). Around a quarter of hunters reported spending all of their time hunting on private land that they own, while 3%, 34%, and 10% of Block 13 hunters reported spending all of their hunting time on land that they lease, private land that they do not own, and public land respectively (Table 7). Roughly half of hunters reported that there were no harvest restriction in place on land they hunted in 2019 (Table 8).

A majority (61%) of hunters reported they were either slightly satisfied, or very satisfied with their most recent deer hunting season in Minnesota (Table 9). This value did not vary substantial by DPA. On average, hunters disagreed with statements about their satisfaction with the number and quality of bucks. Majorities of hunters reported agreement with statements about their satisfaction with the total number of deer they saw, the number of antlerless deer they saw, and whether they heard about or saw legal bucks while hunting (Table 10).

Hunters evaluated the trend in the deer population over the last 5 years in the DPA where they hunt, their satisfaction with the deer population in the DPA where they hunt, and their likelihood to harvest an antlerless deer given the opportunity. Roughly, 36% of hunters reported seeing about the same number of deer, whereas 29% and 35% of hunters reported seeing more and fewer deer compared to 5 years ago, respectively (Table 11). Nearly half (47%) of Block 13 hunters reported feeling either slightly satisfied or very satisfied with the deer population in the DPA where they hunt (Table 12). A clear majority (86%) of hunters reported that they would shoot an antlerless deer given the opportunity (Table 13).

We asked hunters to rate the importance of several competing priorities MNDNR could consider when setting deer population goals. Among these priorities, Block 13 hunters rated herd health, deer hunting heritage and tradition, and the quality of bucks the highest (Table 14).

Hunters evaluated the current deer population in the DPA where they hunt, on a scale of much too low to much too high. Nearly half (49%) of hunters felt that the current population where they hunt is "about right," while, on average, 36% of Block 13 hunters felt it was too low or much too low, and 15% felt it was too high or much too high (Table 15).

We asked if hunters would prefer to see the deer population decrease, stay the same, or increase. Roughly, half of hunters indicated a preference for increase, while 37% preferred stability, and 9% preferred decrease (Table 16). On average, hunters in Block 13 wish to see a 17% increase in the deer population (Table 17). Outliers in open-ended responses to the question measuring preferred percent change in the deer population (e.g., +10,000%) were excluded from analysis if they were +/-3 standard deviations from the grand mean for the block, corresponding to a 99.7% confidence interval around the point estimate. A majority of hunters in Block 13 (68%) supported establishing regulations to increase the proportion of adult bucks in the DPA where they hunt (Table 18).

We asked hunters how long they have been hunting deer in Minnesota, whether they place feed or minerals out for deer to consume, and if they belong to a deer hunting organization. On average, Block 13 deer hunters have been hunting in Minnesota for 24 years (Table 19). Roughly, 92% of hunters reported that they do not set out feed for deer (Table 20), while 29% reported placing minerals for deer to consume (Table 21). Around 9% of Block 13 hunters reported that they belong to a deer hunting organization (Table 22).

Hunters reported their agreement with statements about their trust in the MNDNR on a scale where 1 = strongly disagree, 3 = neither, and 5 = strongly agree. On average, hunters reported moderate amounts of trust with mean values falling between 3.1 and 3.5 (Table 23).

responses measured on a bipolar scale, where 1 = strongly disagree, 3=neither, and 5 = strongly agree

Landowners

Landowners reported the number of acres that they own or lease within a DPA. On average, Block 13 landowners reported owning 266 acres and leasing 476 (Table 24). Roughly, 82% of landowners reported having agricultural land use on their property. Of these landowners, 41% reported experiencing damage from deer. Landowners experiencing damage to agriculture reported experiencing minor/negligible (42%), moderate (38%), and severe/very severe (20%) damage (Table 25). Less than a quarter (21%) of landowners, reported having forest land use on their property. Of these individuals, 7% reported having experienced damage from deer. Too few landowners experienced damage to forest land use to estimate severity (Table 26). Around 70% of landowners reported having residential land use on their property, and 31% experienced damage from deer. Landowners experiencing damage from deer to residential land use reported damage that was minor/negligible (37%), moderate (37%), and severe/very severe (25%) (Table 27).

Landowners assessed the damage they have experienced from deer compared to five years ago, and the change they have observed in the deer population on their property. Of landowners that have owned their property for five years or longer, the majority (58%) indicated that the amount of damage they have experienced from deer has remained about the same. The remainder split between experiencing more or less damage from deer over the last five years (Table 28). A plurality of landowners (44%) reported seeing more deer on their property compared to five years ago, while 39% reported seeing about the same number, and 20% reported seeing fewer (Table 29).

Only 19% of landowners reported feeling satisfied or very satisfied with the deer population on their land, while 42% were neutral, and 39% either dissatisfied or very dissatisfied (Table 30). Hunting landowners reported higher levels dissatisfaction (43%) than non-hunting landowners (36%), while non-hunters were more likely to report neutrality regarding their satisfaction with the deer population on their land (Table 31). Half of landowners indicated that the population of deer on their land was "about right," compared to too low (13%) or too high (37%) (Table 32). Non-hunting landowners (53%) were more likely to a hold a belief that the current population on their property was "about right" than hunting landowners (45%). Similarly, a higher percentage of hunting landowners (26%) than non-hunting landowners (5%) expressed a belief that the current deer population on their property was too low (Table 33)

When asked what they would like to see happen with future deer populations on their land, a plurality (46%) of Block 13 landowners preferred to see it stay the same, compared to 17% that would like to see an increase, and 36% a decrease (Table 34). A higher proportion of non-hunting landowners preferred stability in the deer population (50%) than hunting landowners (40%). Conversely, more hunting landowners indicated a preference for increase (30%) than non-hunting landowners (7%) (Table 35). Landowners mean preferred change in the deer population was -7% (Table 36). Outliers in open-ended responses to the question measuring preferred percent change in the deer population (e.g., +10,000%) were excluded from analysis if they were +/-3 standard deviations from the grand mean for the block, corresponding to a 99.7% confidence interval around the point estimate.

We asked landowners if they were aware that MNDNR offers technical assistance for deer damage issues, if they allow hunting on their property, if they lease any of their property for deer hunting, and if they impose any deer harvest restrictions on their property. Regardless of the number of acres a landowner owned,

roughly a quarter were aware of DNR technical assistance (Table 37). The proportion of landowners allowing hunting on their property increased with the amount of land they owned, where roughly 53% of landowners with 2-19 acres allowed hunting on their property. This is compared to 85% who own 320 acres or more (Table 38). Very few (~2%) of landowners lease their land for deer hunting (Table 39). The majority of landowners (85%) did not impose any restrictions on the deer that hunters could take on their property (Table 40).

We asked landowners several questions about their deer hunting activity. Slightly less than a third of Block 13 landowners reported hunting deer in each of 2017, 2018, and 2019 respectively. Roughly, 9% indicated that they hunt deer but did not hunt during one of those three years, and 58% indicated that they do not hunt deer at all (Table 41). Among deer hunting landowners, 35% reported doing all of their hunting on private land that they own, while 4%, 11% and 5% of landowners reported doing all of their hunting on land that they lease, privates land that they do not own, and public land, respectively (Table 42). Around three-quarters of landowners indicated that they would shoot an antierless deer given the opportunity (Table 43), and landowners have been hunting deer in Minnesota for an average of 31 years (Table 44).

Landowners rated their agreement with five statements about their trust in the MNDNR on scale from 1 = strongly disagree, to strongly agree, and a mid-point of neither. Landowners, on average, were neutral regarding their trust in the MNDNR. Mean values ranged from 3.1 to 3.5 for trust items (Table 45).

Respondents were asked to rate the importance of several priorities MNDNR could consider when setting deer population goals. Responses were recorded on a scale where 1 = not at all important, and 5 = very important. Among the items evaluated, landowners placed the highest importance on deer herd health, public health, and deer-vehicle collisions as issues to consider when setting deer population goals (Table 46).

We asked landowners if they place food or minerals out for deer to consume. A small number of landowners (6%) reported feeding deer (Table 47). However, a larger proportion (12%) of landowner indicated that they place minerals out for deer to consume (Table 48).

Q6. How much do you agree or disagree with the following statements about your most recent deer hunting season? (*Circle one number for each*).

	Strongly	Slightly	Neither	Slightly	Strongly
	disagree	disagree		agree	agree
I was satisfied with the number of legal bucks I saw	1	2	3	4	5
I was satisfied with the quality of bucks I saw	1	2	3	4	5
I heard about or saw legal bucks while hunting	1	2	3	4	5
I was satisfied with the number of antlerless deer I saw	1	2	3	4	5
I was satisfied with the number of deer I saw while hunting	1	2	3	4	5

Q7. Compared to 5 years ago, what trend have you seen in the deer population in the permit area where you hunt most often? (Circle one number). If you weren't hunting this area 5 years ago, please skip to Q8.

Many fewer deer	Slightly fewer deer	About the same number of deer	Slightly more deer	Many more deer
1	2	3	4	5

Q8. Overall, how satisfied are you with the current deer population in the permit area where you hunt most often? (*Circle one number*).

Very dissatisfied	Slightly dissatisfied	Neither	Slightly satisfied	Very satisfied
1	2	3	4	5
OO Mill van shaat an	antlarlace door given the on			

Q9. Will you shoot an antlerless deer given the opportunity?

Q10. Please rate the importance of the following factors used in making deer population goals. (*Circle one number for each*).

	Not at all important	A little important	Moderately important	Important	Very important
Amount of deer mortality during an average winter	1	2	3	4	5
Amount of deer mortality during a severe winter	1	2	3	4	5
Potential health risks to the deer herd	1	2	3	4	5
Public health (human-deer diseases)	1	2	3	4	5
Amount of crop damage from deer	1	2	3	4	5
Number of deer-vehicle collisions	1	2	3	4	5
Deer-over browsing of forests	1	2	3	4	5
Impacts of deer on other wildlife species	1	2	3	4	5
Deer hunting heritage and tradition	1	2	3	4	5
Hunter satisfaction with deer numbers	1	2	3	4	5
Public satisfaction with deer numbers	1	2	3	4	5
Impact of deer hunting on the local economy	1	2	3	4	5
Quality of bucks (e.g., Antler size)	1	2	3	4	5
Damage to gardens and landscaping	1	2	3	4	5
The ratio of bucks to does	1	2	3	4	5
Other (please specify):	1	2	3	4	5

Q11. Do you think the deer population where you hunt most often is: (Circle one number)
