Statement of Purpose and Scope of Data

The Minnesota Department of Natural Resources (MNDNR) periodically conducts surveys of deer hunters and landowners to assess preferences for deer populations, experiences with deer hunting, and impacts of deer populations on private property to inform the deer population goal setting process. This report details one such effort. Results of this study directly inform decision making for deer populations. We randomly selected landowners and hunters from county tax parcel records, and MNDNR deer license information respectively for participation. Therefore, the results of this study are representative of the stakeholder group, and may differ substantially from results of self-selected public input processes, as a function of the scientific study design. The values in this report are estimates of the average for all individuals within a given population of interest (e.g., hunters in a deer permit area), not just respondents to the survey.

Data Collection Process

We conducted our surveys of hunters and landowners using a mixed mode design that included three solicitations. We sent selected participants a letter directing them to complete a questionnaire online. Non-respondents received a second letter requesting their participation, followed by a paper copy of the survey with a postage-paid self-addressed return envelope. Copies of these questionnaires are found in Appendices A and B of this report.

Hunters

Within a deer permit area (DPA), we randomly selected hunters from the list of all firearm deer license holders in the given year to receive a goal setting survey. We only included adults over the age of 18 at the time the sample was drawn. The number of hunters selected in each DPA was determined by estimating the minimum sample size needed to make statistically valid inference about the population at the DPA level at 90% confidence. Participants may not be residents of the DPA, but have indicated that the given DPA is the primary location where they hunt deer.

Landowners

Within a deer permit area, we randomly selected individual parcels from all parcels greater than or equal to 2 acres in size for inclusion. Stratification occurred by quantiles of parcels by acres to ensure a representative coverage of land use types and interests. Land acres strata were: 2-19, 20-79, 80-319, and ≥320 acres respectively. Similar to hunters, the number of landowners selected for each DPA was proportional to the total number of landowners in the DPA and after determining, the minimum sample size needed for statistically valid inference at the DPA scale, with 90% confidence.

Block 12: Blufflands Plateau

The data presented herein are from a statistically representative survey of Minnesota deer hunters and landowners in goal setting Block 12 (Blufflands Plateau). This area includes deer permit areas: 341, 342, 343, 344, 643, 645, 646, 647, 648, 649 and 655 in the southeastern part of the state (Figure 1).

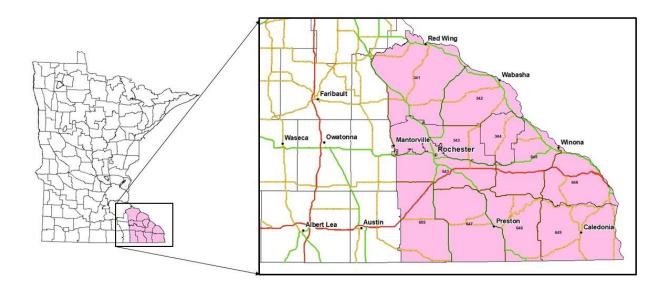

Figure 1. Goal setting Block 12 DPA boundaries

Response Rates and Weighting

Hunters

After accounting for undeliverable mail, the adjusted response rate for the Block 12 hunter sample was 38%. Response rates by DPA ranged from a low of 32% for DPA 344, to a high of 43% for DPA 649. A summary of response rates by DPA is located in Table 1.

We weighted responses in proportion to quantiles derived from the population of aged 18+ firearms deer hunters in Minnesota, during the 2020 hunting season. Respondents (M=52) were on average older than the population (M=46) from which the sample was drawn. To attend to this, we estimated population estimates according to the weight schedule presented in Table 2. Weights apply to the population rather than the block level, under an assumption that there is no correlation between age and preferred hunt location.

Landowners

After accounting for undeliverable mail, the adjusted response rate for the Block 12 landowner sample was 44%. Response rates by DPA ranged from a low of 33% for DPA 655, to a high of 52% for DPA 343. A summary of response rates by DPA is located in Table 3.

We drew samples of landowners equally within four strata (2-19, 20-70, 80-319, and 320+) corresponding to parcel acres to ensure representation of small, medium, and large landholders, and thus, the potential array of interests associated with different land uses. We calculated weights within Block to generate estimates representative of the population according to the schedule presented in Table 4.

Table 1. Response rates for hunter samples, by DPA

Summary of Deer Population Preferences

Figure 2 contains estimates of Goal Block 12 deer hunter and landowner preferences for change in the deer population where they hunt or their property is located respectively. Values are an estimate of the mean preferred percent change to the deer population by DPA, and its 95% confidence interval. Landowners reported deer population preferences ranging from a small reduction (-10%) for DPA 343 to small increase (+6%) for DPA 647. However, most 95% confidence intervals for estimates of landowners preferred change contained zero. Deer hunters, on average, and regardless of DPA preferred a small to moderate increase in the deer population. Estimates for deer hunters' preference for change to the deer population ranged from +12% for DPA 341 to +23% for DPAs 344 and 647.

Figures 3 through 8 contain DPA level estimates for the percent of hunters and landowners that preferred to see the deer population either decrease, stay the same, or increase. A near majority of deer hunters expressed a preference for an increase in the deer population in all Block 12 DPAs. Conversely, 50% or more of landowners expressed a preference for deer populations to remain the same, and a higher proportion of landowners indicated a preference for a reduction in the deer population, than deer hunters.

Hunters

We asked hunters to report their recent deer hunting activity. The vast majority (>85%) of hunters reported having hunted deer during the last three years, and 97% in 2020 (Table 5). Among these hunters, around 41% reported that they hunted during the archery season in 2020, while 31% participated in muzzleloader season, and 66% reported hunting during the firearms season A (Table 6). Fewer Block 12 hunters reported hunting during firearm season B (20%), and very few participated in the early antlerless season (9%). A quarter of Block 12 hunters reported spending all of their time hunting on private land that they own, while 14% reported spending most of their time hunting on private land that they own, 10% some of their time, and 52% reporting none. Hardly any (5%) Block 12 hunters reported spending any time hunting on land that they lease. Around half (48%) of hunters reported hunting all of the time on private land that they do not own. Sixteen percent of hunters reported spending all of the their deer hunting time on public land (Table 7).

Around a third (35%) of hunters reported feeling either "very dissatisfied" or "slightly dissatisfied" with their most recent deer hunting season. Conversely, around a third (64%) reported feeling either "slightly satisfied" or "very satisfied" (Table 8). Hunters also reported their agreements with statements about their satisfaction elements of their most recent deer hunting season (Table 9a-9e). Respondents reported the greatest agreement (68%) with the statement "I heard about or saw legal bucks while hunting", and "the number of antlerless deer I saw while hunting" (60% slightly or strongly agree).

Hunters evaluated the trend in the deer population over the last 5 years in the DPA where they hunt, their satisfaction with the deer population in the DPA where they hunt, and their likelihood to harvest an antlerless deer given the opportunity. Slightly more than half of hunters (51%) reported seeing either slightly fewer or many fewer deer compared to 5 years ago (Table 10). Forty-six percent of Block 12 hunters reported feeling either "slightly dissatisfied" or "very dissatisfied" with the deer population in the DPA where they hunt, while 41% reported dissatisfaction (Table 11). A clear majority (88%) of hunters reported that they would shoot an antlerless deer given the opportunity (Table 12).

Hunters rated the importance of several competing priorities MNDNR could consider when setting deer population goals on scale where 1= not at all important and 5= very important. Among these priorities, Block 12 hunters rated "deer hunting heritage and tradition" (M=3.9), "potential health risks to the deer herd" (M=3.7), and "hunter satisfaction with deer numbers" (M=3.7), the highest (Table 13).

Hunters evaluated the current deer population in the DPA where they hunt, on a scale of much too low to much too high. Half of hunters felt that the current population where they hunt is about right, while 42% believed it was either too low or much too low, and 8% believed it was either too high or much too high (Table 14).

When asked if hunters prefer to see the deer population decrease, stay the same, or increase, 55% reported a preference for an increase (Table 15). This compares to 39% that reported a preference for the population to stay the same, and 5% that preferred a decrease. On average, hunters in Block 12 wish to see a 17% increase in the deer population (Table 16). A majority of hunters in Block 12 (66%) supported establishing regulations to increase the proportion of adult bucks in the DPA where they hunt (Table 17).

We asked hunters how long they have been hunting deer in Minnesota, whether they place feed or minerals out for deer to consume, and if they belong to a deer hunting organization. On average, Block 12 deer hunters have been hunting in Minnesota for 28 years (Table 18). Given the regulatory prohibition on deer feeding given concerns about chronic wasting disease, only 1% of hunters reported that they set out feed for deer (Table 19), while 4% reported placing minerals for deer to consume (Table 20). Around 7% of Block 12 hunters reported that they belong to a deer hunting organization (Table 21).

Hunters reported their agreement with statements about their trust in the MNDNR on a scale where 1 = strongly disagree, 3 = neither, and 5 = strongly agree. On average, hunters reported moderate amounts of trust with mean values falling between 3.0 and 3.5 (Table 22).

responses measured on a bipolar scale, where 1 = strongly disagree, 3=neither, and 5 = strongly agree

Landowners

Landowners reported the number of acres that they own or lease within a DPA. On average, Block 12 landowners reported owning 162 acres. Among individuals in Block 12 DPAs, that reported leasing property the average lease was 243 acres (Table 23). Sixty-eight percent of landowners reported having agricultural land use on their property. Of these landowners, only 36% reported experiencing damage from deer. Landowners reporting damage to agricultural land, reported damages that were minor or negligible (44%), moderate (37%), and severe or very severe (19%) (Table 24). A majority of landowners (66%) reported owning land in forest. Of these individuals, 13% reported having experienced damage from deer. The severity of damage experienced by landowners with forest were split relatively evenly between minor/negligible (28%), moderate (41%), and severe/very severe (30%). (Table 25). Around 77% of landowners reported having residential land use on their property, and 25% experienced damage from deer. Landowners experiencing damage from deer to residential land use reported damage that was minor/negligible (46%), moderate (34%), and severe/very severe (20%) (Table 26).

Landowners assessed the damage they have experienced from deer compared to five years ago, and the change they have observed in the deer population on their property. Of landowners that have owned their property for five years or longer, the majority (61%) indicated that the amount of damage they have experienced from deer has remained about the same (Table 27). Landowners' perception of the trend in the deer population over the last 5 years split between those perceiving fewer (29%), about the same amount (37%), and more deer (34%) (Table 28).

Only 27% of landowners reported feeling satisfied or very satisfied with the deer population on their land, while 41% were neutral, and 32% either dissatisfied or very dissatisfied (Table 29). Hunting landowners reported slightly higher levels dissatisfaction (35%) than non-hunting landowners (29%), while non-hunters were more likely to report neutrality regarding their satisfaction with the deer population on their land (Table 30). Over half of landowners (55%) indicated that the population of deer on their land was "about right," compared to too low (18%) or too high (26%) (Table 31). Non-hunting landowners (58%) were more likely to a hold a belief that the current population on their property was "about right" than hunting landowners. Similarly, a higher percentage of hunting landowners (28%) than non-hunting landowners (8%) expressed a belief that the current deer population on their property was too low (Table 32).

When asked what they would like to see happen with future deer populations on their land, a majority (54%) of Block 12 landowners preferred to see the deer population stay the same, compared to 20% that would like to see the deer population increase, and 26% decrease (Table 33). A higher proportion of hunting landowners preferred an increase in the deer population (31%) than non-hunting landowners (8%) (Table 34). Landowners mean preferred change in the deer population was a 2% decrease (Table 35).

We asked landowners if they were aware that MNDNR offers technical assistance for deer damage issues, if they allow hunting on their property, if they lease any of their property for deer hunting, and if they impose any deer harvest restrictions on their property. Regardless of the number of acres a landowner owned, around a third were aware that MNDNR offers technical assistance for deer depredation issues (Table 36). The

proportion of landowners allowing hunting on their property increased with the amount of land they owned, where roughly 43% of landowners with 2-19 acres allowed hunting on their property. This compares to 92% who own 320 acres or more (Table 37). Very few (3%) of landowners lease their land for deer hunting (Table 38). The majority of landowners (80%) did not impose any restrictions on the deer that hunters could take on their property (Table 39).

We asked landowners several questions about their deer hunting activity. Over a third of Block 12 landowners reported hunting deer in each of 2018, 2019, and 2020 respectively. Roughly, 9% indicated that they hunt deer but did not hunt during one of those three years, and 47% indicated that they do not hunt deer at all (Table 40). Among deer hunting landowners, 47% reported doing all of their hunting on private land that they own, while 1%, 11% and 2% of landowners reported doing all of their hunting on land that they lease, private land that they do not own, and public land, respectively (Table 41). Around 81% of landowners indicated that they would shoot an antierless deer given the opportunity (Table 42), and landowners have been hunting deer in Minnesota for an average of 33 years (Table 43).

Landowners rated their agreement with five statements about their trust in the MNDNR on scale from 1 = strongly disagree, to 5 = strongly agree, and a mid-point of neither. Landowners, on average, were neutral regarding their trust in the MNDNR. Mean values ranged from 3.3 to 3.6 for trust items (Table 44).

Respondents rated the importance of several priorities MNDNR could consider when setting deer population goals. Responses were recorded on a scale where 1 = not at all important, and 5 = very important. Among the items evaluated, landowners placed the highest importance on "potential health risks to the deer herd" (M = 3.7), and "the number of deer vehicle collisions" (M = 3.7), as issues to consider when setting deer population goals (Table 45).

We asked landowners if they place food or minerals out for deer to consume. Given the rules surrounding chronic wasting disease management, a very small number of landowners (1%) reported feeding deer (Table 46), or placing minerals out for deer to consume (5%) (Table 47).
