2018 WATERFOWL BREEDING POPULATION SURVEY, MINNESOTA

Steve Cordts, Minnesota DNR, Waterfowl Staff Specialist

ABSTRACT

The number of breeding waterfowl in a portion of Minnesota has been estimated each year since 1968 as a part of the overall inventory of North American breeding waterfowl. The survey consists of aerial observations in addition to more intensive ground counts on selected routes to determine the proportion of birds counted by the aerial crew. Procedures used are similar to those used elsewhere across the waterfowl breeding grounds. The 2018 aerial survey portion was flown from May 7-21. Spring ice-out dates in the southern 1/2 of the state were at or near record late and 3-4 weeks later than median dates. In the northern 1/2 of the state, ice out dates were about 1-2 weeks later than median dates. Temperatures in April averaged 11°F below normal statewide and was the 3rd coldest April on record based on 124 years of data. Temperatures in May averaged 6°F above normal statewide and was the 4th warmest May on record. Precipitation was 0.83 inches below normal in April and 0.2 inches above normal in May with drier conditions in the northern ½ of the state. Overall, wetland numbers (Types II-V) were 1% lower than 2017 and near the 10-year (-6%) and long-term (4%) averages.

The 2018 estimated mallard breeding population was 295,000, which was 38% above last year's estimate of 214,000 mallards, but statistically unchanged (P=0.15). Mallard numbers were 18% above the 10-year average and 30% above the long-term average of 228,000 breeding mallards. The estimated blue-winged teal population was 191,000, which was 20% above last year's estimate of 159,000 blue-winged teal, but statistically unchanged (P=0.74). Blue-winged teal numbers were 16% above the 10-year average and 10% below the long-term average of 213,000 blue-winged teal. The combined population index of other ducks, excluding scaup, was 207,000 ducks, which was 21% below last year's estimate and 7% above the 10-year average and 15% above the long-term average of 179,000 other ducks.

The estimate of total duck abundance (693,000), which excludes scaup, was 9% above last year's estimate and 14% above the 10-year average and 12% above the long-term average of 620,000 ducks. The estimated number of Canada geese was 162,000 and 7% higher than last year and 8% above the 10-year average and 2% above the long-term average. Due to the conditions in April, goose production was extremely late and likely will be below average.

METHODS

The aerial survey is based on a sampling design that includes three survey strata (Table 1, Figure 1). The strata cover 39% of the state area and are defined by density of lake basins (>10 acres) exclusive of the infertile northeastern lake region. The strata include the following:

Stratum I: high density, 21 or more lake basins per township.

Stratum II: moderate density, 11 to 20 lake basins per township.

Stratum III: low density, 2 to 10 lake basins per township.

Areas with less than two basins per township are not surveyed. Strata boundaries were based upon "An Inventory of Minnesota Lakes" (Minnesota Conserv. Dept. 1968:12). Standard

procedures for the survey follow those outlined in "Standard Operating Procedures for Aerial Waterfowl Breeding Ground Populations and Habitat Surveys in North America" (USFWS/CWS 1987). Changes in survey methodology were described in the 1989 Minnesota Waterfowl Breeding Population Survey report. Pond and waterfowl data for 1968-74 were calculated from Jessen (1969-72) and Maxson and Pace (1989).

All aerial transects in Strata I-III (Table 1) were flown using an American Champion Scout. Wetlands were counted on only the observer's side of the plane (0.125 mile wide transect); a correction factor obtained in 1989 (123,000/203,000 = 0.606) was used to adjust previous estimates (1968-88) of wetland abundance (Type II-V; Table 2) that were obtained when the observer counted wetlands on both sides of the plane (0.25 mile wide transect). All wetland and waterfowl data were recorded on digital voice recorders and transcribed by the observer from the digital files.

Visibility correction factors (VCFs) were derived from intensive ground surveys on 14 selected routes flown by the aerial crew. Many of these routes use a county road as the mid-point of the transect boundary which aids in navigation and helps ensure the aerial and ground crews survey the same area. Ground routes each originally included about 100 wetland areas; however, drainage has reduced the number of wetlands on most of the routes. All observations from both ground crews and aerial crews were used to calculate the VCFs.

The SAS computer program was modified in 1992 to obtain standard errors for mallard and blue-winged teal breeding population estimates. These calculations were based upon SAS computer code written by Graham Smith, USFWS-Office of Migratory Bird Management. Estimates for 2017 and 2018 were compared using two-tailed Z-tests.

SURVEY CHRONOLOGY

The 2018 aerial survey began on 7 May in southern Minnesota and concluded in northern Minnesota on 21 May. The survey start date was delayed for 1 week due to ice coverage still

present. Transects were flown on 9 days and completed in 51 flight hours. Flights began near 7 AM and were completed by 12:00 PM each day. The median date for survey completion was May 15, which was 9 days later than last year.

WEATHER AND HABITAT CONDITIONS

Statewide, April was the 3nd coldest in state history and May was the 4rd warmest in history based on 124 years of climate records. For the southern part of the state, ice out was extremely late with many lakes 3-4 weeks later than average. In northern Minnesota, ice-out dates were about 1-2 weeks later than average. In mid-April, much of southern Minnesota, mainly south of Willmar, received 8-20"+ inches of snow. Temperatures in April averaged 10.7°F below normal and precipitation was 0.83 inches below normal statewide. Temperatures in May averaged 6.2°F above normal statewide and precipitation was 0.2 inches above normal statewide (http://climate.umn.edu). Precipitation from early April until the survey was completed showed above average precipitation in southern Minnesota and below average precipitation in northern Minnesota (Appendix A).

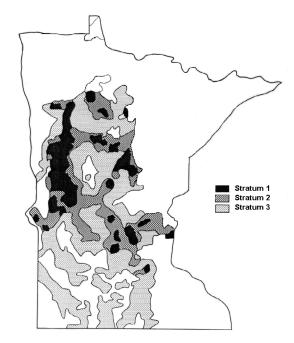

Figure 1. Location of waterfowl breeding population survey strata in Minnesota.

Overall wetland conditions in spring 2018 were similar to last year. In early May 2018, the U.S. drought monitor indicated 96% of the state was under no dryness designation. By late May, 44% of the state was under no drought designation and 56% was classified as abnormally dry, mainly in central and northern MN. On May 6, statewide topsoil moisture indices were rated as 1% very short, 6% short, 71% adequate and 22% surplus moisture. By May 29, statewide topsoil moisture indices were rated as 4% very short, 13% short, 76% adequate and 7% surplus moisture (http://droughtmonitor.unl.edu).

Wetland numbers (Types II-V) in 2018 were 263,000 ponds which was 1% below last year's estimate of 265,000 ponds. Wetland numbers were 6% below the 10-year average and 4% above the long-term average (Table 2; Figure 2). The number of temporary (Type 1) sheet water wetlands was 64% lower than last year and 67% below the long-term average.

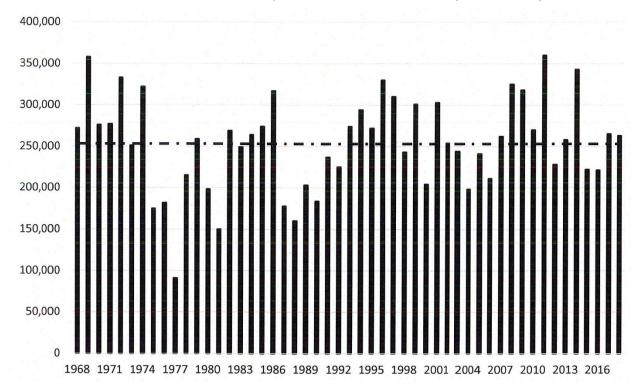

Figure 2. Number of May ponds (Type II-V) and long-term average (dashed line) in Minnesota, 1968-2018.

Planting dates for row crops were late in 2018. By May 6, about 9% of the corn acres had been planted which was 9 days behind last year and 16 days behind average. By June 3rd, about 24% of alfalfa hay had been cut, 3 days behind last year and 1 day behind average (Minnesota Agricultural Statistics Service Weekly Crop Weather Reports, (http://www.nass.usda.gov/mn/).

WATERFOWL POPULATIONS

The number of ducks, Canada geese, coots, and swans, by stratum, are shown in Tables 3-5; total numbers are presented in Table 6. These estimates are expanded for area but not corrected for visibility bias. Table 7 and Table 8 provide the unadjusted population index (Unad. PI), which is multiplied by the visibility correction factor (VCF) to obtain the population index (PI) for ducks and Canada geese. The standard error (SE) of the estimate is also provided for mallard and blue-winged teal estimates.

The 2018 breeding population estimate of mallards was 295,370 (SE = 46,578), which was 38% higher than the 2017 estimate of 213,644 mallards, but statistically unchanged (Z = 1.44, P = 0.15) (Table 7, Figure 3). Mallard numbers were 18% above the 10-year average and 30% above the long-term average of 228,000 mallards. In 2018, the mallard population was comprised of 83% lone or flocked males, 9% pairs, and 8% flocked mallards. The 5-year average is 76% lone or flocked males, 16% pairs, and 8% flocked mallards.

The estimated blue-winged teal population was 190,695 (SE = 77,961), which was 20% higher than the 2017 estimate of 159,483 blue-winged teal, but statistically unchanged (Z = 0.33, P = 0.74). Blue-winged teal numbers were 16% above the 10-year average and 10% below the long-term average (Table 7, Figure 4). The blue-winged teal population was comprised of 6% lone males, 33% pairs, and 61% flocks. The 5-year average is 8% lone males, 42% pairs, and 50% flocks.

The combined population estimate of other ducks (excluding scaup) was 206,505 which was 21% below last year's estimate of 262,867 other ducks but 7% above the 10-year average and 15% above the long-term average (Table 7, Figure 5). Ring-necked ducks and wood ducks were the most abundant species of other ducks (Table 6). Scaup numbers (31,000) were 59% below last year's estimate and 48% below the long-term average.

The total duck population index, excluding scaup, was 693,000 ducks and was 9% above last year's index of 636,000 ducks and 14% above the 10-year average and 12% above the long-term average (Table 8, Figure 6).

The population index for total ducks was 724,000 ducks, which was 13% above the 10-year average and 6% above the long-term average.

Visibility Correction Factors (VCFs) were higher for mallards, blue-winged teal, and other ducks in 2018 compared to 2017 (Table 7, Table 8). The mallard VCF (2.76) was 9% above the 10-year average. The blue-winged teal VCF (3.45) was 8% below the 10-year average. The VCF for other ducks (2.88) was 6% above the 10-year average. The VCF for Canada geese (1.75) was 15% below the 10-year average.

The population estimate of Canada geese (adjusted for visibility) was 162,000, which was 7% above last year's estimate and 8% above the 10-year average (Table 8, Figure 7). A total of 2 Canada goose broods were observed, compared to 43 in 2017. This was the fewest goose broods observed in the past 15 years.

The estimated coot population, uncorrected for visibility, was 27,000 compared to 31,000 in 2017.

The estimated number of swans (likely trumpeters) was 22,850 swans compared to last year's estimate of 17,230 (Table 6; Figure 8). Lone swans are not doubled and the estimate is expanded for area but not visibility, although visibility of swans is extremely high. Trumpeter swans continue to expand their range and dramatically increase in number.

ACKNOWLEDGMENTS

Thanks to the ground crews and the pilot for all of their efforts. This project was funded in part by the Wildlife Restoration (Pittman-Robertson) Program.

Data supplied by: Minnesota Department of Natural Resources (MNDNR) and U.S. Fish and Wildlife Service (USFWS)

Air Crew:

Pilot/Observer: Bob Geving, Conservation Officer Pilot, MNDNR, Division of Enforcement

Observer: Steve Cordts, Waterfowl Staff Specialist, MNDNR, Division of Wildlife

<u>Ground Crew Leaders:</u> Kelly VanBeek, Migratory Birds, USFWS, Region III, Madison, WI; Wayne Brininger, USFWS, Tamarac National Wildlife Refuge; Dan Hertel and Kylie Jensen, USFWS, HAPET, Fergus Falls; Tom Cooper, Jim Kelley, Sean Kelly (retired), USFWS, Twin Cities; Ed Zlonis, Minnesota DNR; Kris Spaeth, USFWS, Sherburne National Wildlife Refuge

<u>Ground Crew Assistants</u>: Kevin Kotts, Minnesota DNR; Gina Kemper, Meta Griffin, Ken Mattson, Larry Michelson, USFWS, Tamarac National Wildlife Refuge; Jacob Hernandez and John Riens, USFWS, Private lands; Steve Lewis, USFWS, retired; Cody Carlstrom, USFWS, Sherburne National Wildlife Refuge

Appendix A. Precipitation in selected regions of Minnesota, 1 April - 21 May 2018 (Source: Minnesota DNR; http://www.dnr.state.mn.us/climate/historical/summary.html).

Region	Precipitation	Departure from normal
Northwest	1.86	-1.38
North Central	1.87	-1.93
Northeast	1.84	-2.40
West Central	1.91	-2.32
Central	2.48	-2.26
East Central	2.18	-2.80
Southwest	5.10	-0.07
South Central	7.18	1.53
Southeast	7.91	1.71
Statewide	4.00	-0.83

Waterfowl information is taken from the U.S. Fish and Wildlife Service report <u>Waterfowl</u> <u>Population Status, 2018</u> by Joshua Dooley, Walt Rhodes, and Nathan Zimpfer. The entire report is available on the Division of Migratory Bird Management website (http://www.fws.gov/birds/surveys-and-data/reports-and-publications.php).

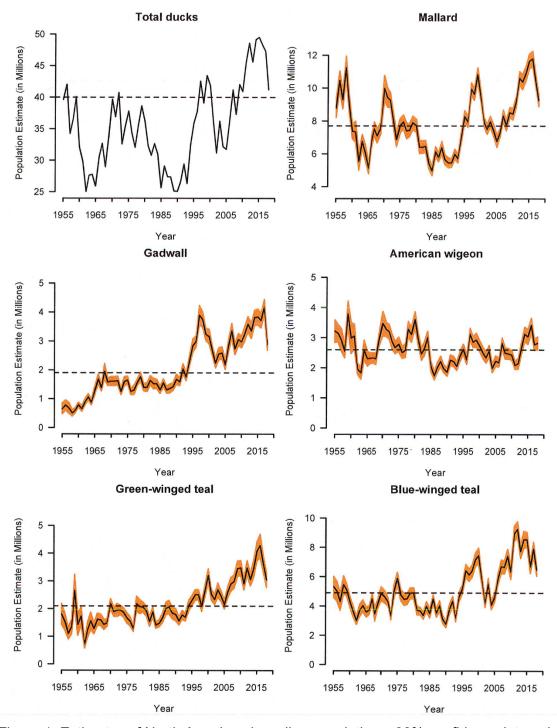

Figure 1 Estimates of North American breeding populations, 90% confidence intervals, and North American Waterfowl Management Plan population goal (dashed line) for selected species and number of water areas in May in Prairie Canada and Northcentral U.S (from: U.S. Fish and Wildlife Service 2017).

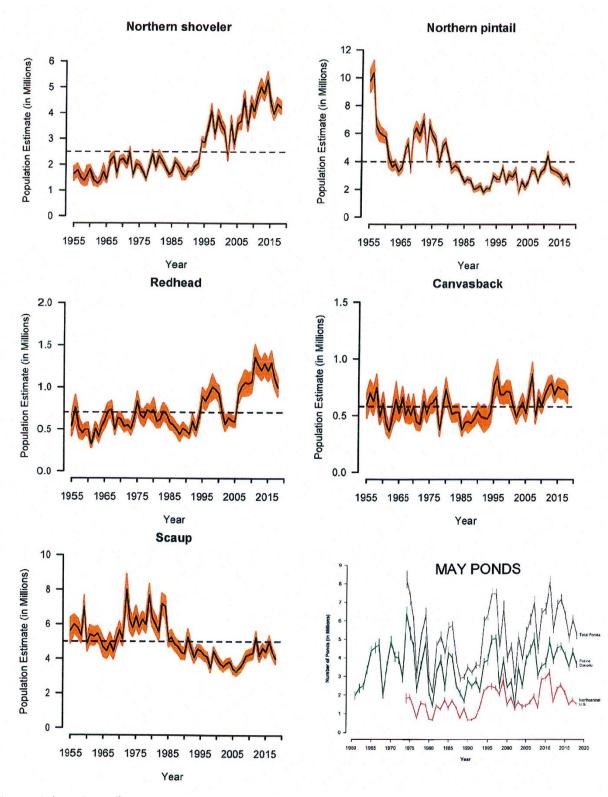

Figure 1 (continued).

Mourning dove information is taken from the U.S. Fish and Wildlife Service report by Seamans, M.E. 2018. Mourning dove population status, 2018. U.S. Department of the Interior, Fish and Wildlife Service, Division of Migratory Bird Management, Washington, D.C. 22 pp. The entire report is available on the Division of Migratory Bird Management web site

(https://www.fws.gov/migratorybirds/pdf/surveys-and-data/Population-status/MourningDove/MourningDovePopulationStatus18.pdf).

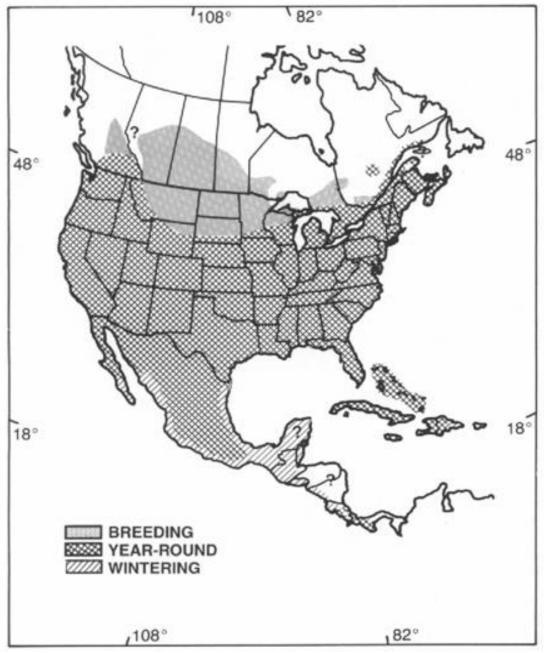

Figure 1. Breeding and wintering ranges of the mourning dove (adapted from Mirarchi and Baskett 1994). (From: Seamans, M.E. 2018. Mourning dove population status, 2018. U.S. Department of the Interior, Fish and Wildlife Service, Division of Migratory Bird Management, Washington, D.C. 22 pp.)

Figure 2. Mourning dove management units with 2017 -18 hunting and non-hunting states. (From: Seamans, M.E. 2018. Mourning dove population status, 2018. U.S. Department of the Interior, Fish and Wildlife Service, Division of Migratory Bird Management, Washington, D.C. 22 pp.)

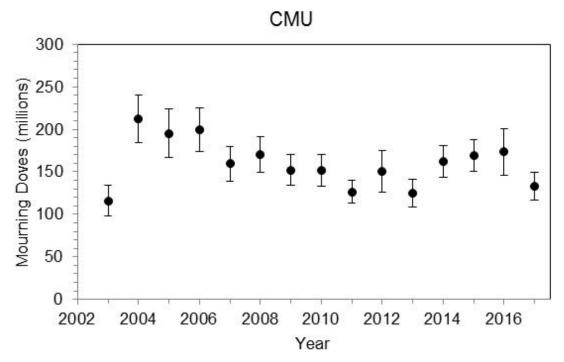

Figure 3. Estimates and 95% confidence intervals of mourning dove absolute abundance by in the Central Management Unit (CMU), 2003-17. Estimates based on band recovery and harvest data. (From: Seamans, M.E. 2018. Mourning dove population status, 2018. U.S. Department of the Interior, Fish and Wildlife Service, Division of Migratory Bird Management, Washington, D.C. 22 pp.)

Table 1. Preliminary estimates and 95% confidence intervals (CI, expressed as the interval half width in percent) of mourning dove harvest and hunter activity for the Central management unit during the 2015, 2016 and 2017 seasons ^a. (From: Seamans, M.E. 2018. Mourning dove population status, 2018. U.S. Department of the Interior, Fish and Wildlife Service, Division of Migratory Bird Management, Washington, D.C. 22 pp.)

^a Hunter number estimates at the Management Unit and national levels may be biased high, because the HIP sample frames are state specific; therefore hunters are counted more than once if they hunt in >1 state. Variance is inestimable.

^b No estimate available.

American Woodcock information is taken from the U.S. Fish and Wildlife Service report American Woodcock Population Status, 2018. Seamans, M.E. and R.D. Rau. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.

The entire report is available on the Division of Migratory Bird Management home page (https://www.fws.gov/migratorybirds/pdf/surveys-and-data/Population-status/Woodcock/AmericanWoodcock/StatusReport18.pdf)

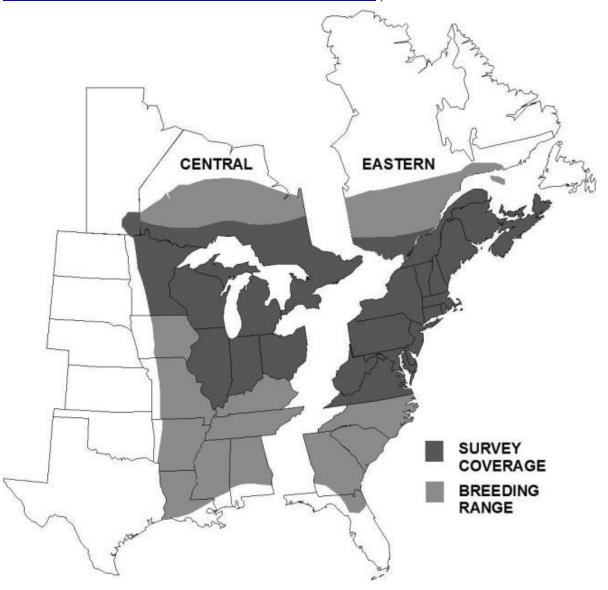

Figure 1. Woodcock management regions, breeding range, singing-ground survey coverage. (from: Seamans, M.E. and R.D. Rau. 2018. American woodcock population status, 2018. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.).

Table 1. Short term (2017 – 18), 10 –year (2008-2018), and long-term (1968-2018) trends (% change per year ^a) in the number of American woodcock heard during the Singing-ground Survey as determined by using the hierarchical log-linear modeling technique (Sauer et al. 2008) (from: Seamans, M.E. and R.D. Rau. 2018. American woodcock population status, 2018. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.).

^a Median of route trends estimated used hierarchical modeling. To estimate the total percent change over several years, use: 100(% change/100+1)^y)-100 where y is the number of years. Note: extrapolating the estimated trend statistic (% change per year) over time (e.g., 30 years) may exaggerate the total change over the period.

^b Total number of routes surveyed in 2018 for which data were received by 24 July, 2018.

^c Number of routes with at least one year of non-zero data between 1968 and 2018.

^d 95% credible interval, if the interval overlaps zero, the trend is considered non-significant.

^e Manitoba began participating in the Singing-ground survey in 1992.

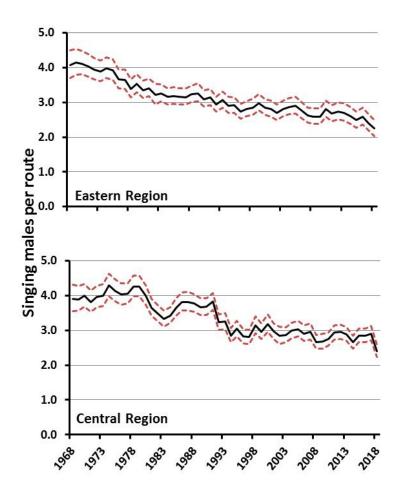

Figure 2. Annual indices of the number of woodcock heard on the Singing-ground Survey, 1968-2018. The dashed lines represent the 95 % credible interval. (from: Seamans, M.E. and R.D. Rau. 2018. American woodcock population status, 2018. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.).

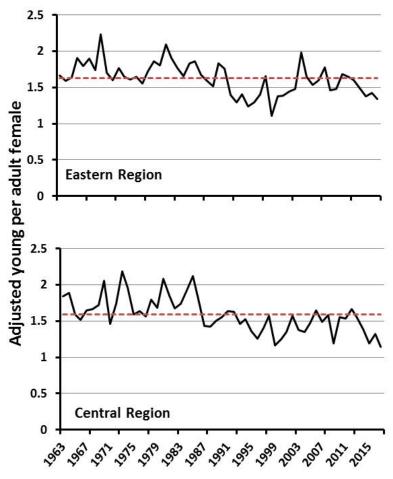

Figure 3. Weighted annual indices of American woodcock recruitment, 1963-2017. Dashed line is the 1963-2016 average. (from: Seamans, M.E. and R.D. Rau. 2018. American woodcock population status, 2018. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.).

Table 2. Preliminary estimates of woodcock hunter numbers, days afield, and harvest for selected states, from the 2014-15, 2015-16 2016-17, and 2017-18 Harvest Information Program surveys. (from: Seamans, M.E. and R.D. Rau. 2018. American woodcock population status, 2018. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.).

^a All 95% Confidence Intervals are expressed as a % of the point estimate.

^b. Regional estimates of hunter numbers cannot be obtained due to the occurrence of individual hunters being registered in the Harvest Information Program in more than one state.

^{°.} Days afield and Harvest estimates are for the entire 18 state Central Region.

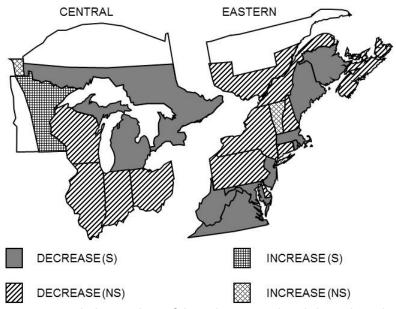

Figure 4. Ten-year trends in number of American woodcock heard on the Singing-ground Survey; 2008-18, as determined by the hierarchical modeling method. A significant trend (S) does not include zero in the 95% credible interval, while a non-significant (NS) trend does include zero. Note, Minnesota is the only state or province that had a significant increase. (from: Seamans, M.E. and R.D. Rau. 2018. American woodcock population status, 2018. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.).

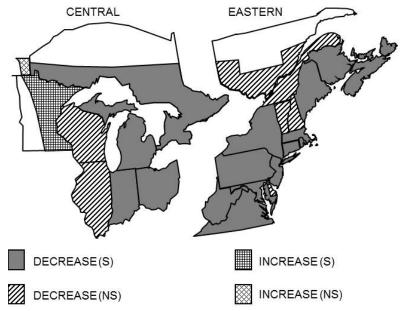

Figure 5. Long-term trends in number of American woodcock heard on the Singing-ground Survey; 1968-2018, as determined by the hierarchical modeling method. A significant trend (S) does not include zero in the 95% credible interval, while a non-significant (NS) trend does include zero. Note, Minnesota is the only state or province that had a significant long-term increase. (from: Seamans, M.E. and R.D. Rau. 2018. American woodcock population status, 2018. U.S. Fish and Wildlife Service, Laurel, MD. 20 pp.).
